This study's main aim was achieved as the influence of bank-related and clients' demographic variables on banks' relationship marketing efforts was identified. The study provides insight into the relationship marketing of banks in South Africa, Canada and the UK. More specifically, the study provided insight into variables influencing banks' relationship marketing based on the viewpoints of both banking clients and bank managers. The empirical findings of this study have established that the personalisation of banking products and/or services and the fair structure of fees are focus areas for banks aiming to improve their client relationships. In addition, it was evident from the empirical findings that demographic variables, such as clients' country of residence, population group and education level, influence clients' perceptions regarding banks' relationship marketing. The empirical investigation led to a number of recommendations which can be provided to banks with regard to their relationship marketing and the variables influencing their efforts to improve relationships with banking clients. Strategies related to banks' personalisation efforts, fees and relationship marketing efforts towards different groups or categories of clients are highlighted, and a detailed discussion of these strategies is hereby provided.

Banks should personalise their offerings by means of coaching employees to address profitable clients by their first names to ensure that clients feel valued. Banks should adapt banking products and/or services to fit the needs of individual clients. In addition, banks should create special banking offers or packages for valued clients to promote personalisation

and mutually beneficial bank-client relationships. Special events, for example a personal financial planning seminar, should be offered to valued clients. As it was evident from the country comparisons, South African banks in particular can adopt personalisation strategies from Canadian banks. For example, in terms of personalisation, Canadian banks offer personalised greetings on automated teller machines (ATMs), use ATMs to automatically select clients' preferred language and offer special banking arrangements for new country residents.

Fees charges to clients should be justified by banks. Clients should be knowledgeable on the fees to be charged, the amounts, when it is to be charged and for which banking products and/or services. Fee structures should be clearly communicated by banks to their clients and adapted fee structures for specific categories of clients, for example retired clients, should be explained and justified, for example the reasons for annual fee increases. Specifically, the empirical results showed that South African banks can learn from UK banks' fee structures. UK banks offer special fee benefits to loyal clients and often implement 'recovering' or lower fees on accounts, for example credit card account payments when identifying clients who struggle financially.

To specifically improve relationship marketing banks should:

- offer a variety of and newly designed banking products and/or services to clients;
- ensure that managers are available for face-to-face appointments with clients; and
- build strong client relationships through effective communication with clients.

Concerning the demographic characteristics of banking clients, banks should be aware that clients of European ancestry and those with higher educational qualifications may regard relationship marketing strategies of a lower standard than other clients. Following these conclusions, it is recommended that banks need to focus on their service delivery to European and educated clients, as it may be more difficult to maintain bank-client relationships with these clients, to ensure that they are satisfied with the bank's services and that they will maintain a positive relationship with the bank. For example, educated clients might read more, ask more questions or have more queries regarding bank matters. Therefore, banks should ensure detailed sources of communication when interacting with educated clients. Based on the findings concerning the country of residence of clients, South African banking clients had less favourable or positive perceptions regarding their banks' relationship marketing. Thus, it is important for South African banks to promote and deliver on their relationship marketing promises. This would possibly instil positive images of South African banks' relationship marketing. For example, the assistance offered to clients by Relationship Bankers of banking institutions could be a focus of marketing campaigns.

The mean scores obtained from the bank managers' results show that managers strongly agreed that their banks' personalisation efforts and fees are acceptable to clients. However, a

study by Rootman (2011) indicates that clients do not share this same view. Therefore, it is important that banks align their managers' viewpoints concerning relationship marketing with the views of their clients. Thus, those banking aspects important to clients to maintain bank-client relationships should also be the focus of banks' managers. This way the offerings of banks would be satisfactory to clients and ensure stronger bank-client relationships.

The effective implementation of these mentioned strategies could lead to banks' improved relationship marketing and this may lead to higher customer satisfaction levels, more successful banks and a stronger economy.

Abstract

The process of transition comprises those European countries that have underwent a change from socialism to capitalism in the last 25 years. One of those countries is the Republic of Croatia. The role of Internet, which with its democratic nature contributes to this process, is certainly significant. Internet has become a medium implemented in various spheres of society.

In this paper we will revise how and to what extent do Croatian citizens use e-technology and compare those indicators to the ones in the EU. By means of a survey conducted on a random pattern we will determine the level of using individual elements of e-technology such as: e-government, e-banking, e-business, e-health. The aim of this research is to determine how much and when the examinees use the Internet and e-technology. To what extent is the Internet used for e-banking, to what extent for e-trade, and to what extent in judiciary and state administration. The research was conducted with examinees that had the opportunity of using the Internet daily. Results gathered by survey were processed and compared with EU figures using various statistical methods.

Keywords: Internet, technology, education, banking, trade, Croatia

Introduction

Croatia is one of the European countries which have in the last quarter of the twentieth century underwent a transition from socialistic to capitalistic social system. This process of change in fact constitutes a transition that includes political as well as economic elements which contribute to the transition to neoliberal economy. That process brings both positive and negative effects in the political, socio-economic and socio-cultural spheres of life. One of the most important elements brought on by the process of transition is the growth of democracy and freedom of choice.

An unrelated, but simultaneous occurrence with the process of transition is a sudden increase in the implementation of Internet in everyday life. In this period Internet, so far a medium of complex utilization as a scientific tool, becomes an easy to use and cheap medium, available to general population. Strong implementation of the Internet lead to changes of

civilisation norms and cultures of living and brought new sociological phenomena which would never have existed without such a liberal, cheap and anonymous communication infrastructure. There is not a country in the world in which there is such freedom and human rights as there is on the Internet, but in the same time there is not a country in the world governed by such an uncontrollable, unregulated and anarchistic environment, as is the case with Internet. The Internet is based on three essential features: (1) spontaneity in the network development, which resulted in its uncontrollability, (2) the fundamental philosophy of its manifestation which manifested itself as a client-server architecture, (3) standardization of service, that is the services given by individual, individually and collectively, subjects via Internet. (Panian, 2002.) When investigating the relevance of Internet for the development of civil society, it constitutes one of the elements in the process of transition, as found in two extremely important elements: (1) free access to information on the Internet based on the economic possibilities of using the Internet and (2) civil freedom which incorporates freedom of expression and human rights when using this medium (Panian, 2002).

Thus it is unusually important in today's global society with great differences between the rich and the poor countries, as well as different priorities, but with a common goal of promoting social justice and equality, that all sectors, private, business and governmental, are actively included in the ICT process of making decisions. (Mijić, 2011)

Advantages that are offered in the development of an individual country by ICT refer to all parts of society, however it should be noticed that poor countries will in the future, due to the decreased possibilities of using these technologies, get even more behind wealthier countries, which have used access to information and the strong implementation of the Internet in all parts of society, especially economy, to create additional values and an improvement in the overall quality of life.

A medium this available, cheap and uncontrollable has offered the possibility of implementation in different areas, principally in the business of various economical entities which use it as means of promotion as well as distribution of their products to potential consumers. We therefore find the implementation of Internet within industrial production, that uses it as a promotional-distributive channel, in the sectors of banking, communication, tourism as well as education, health care systems and other areas of life.

Statistical Data on The Usage of The Internet in Croatia and EU 25

According to e-Europe 2005[1] : Benchmarking indicators of monitoring the development of the informational society consist of: (1) Internet indicators, (2) modern public institutions on the Internet, (3) dynamic business environment, (4) safe informational infrastructure and (5) broadband connections.

This paper will examine the elements of dynamics in the business environment and modern public institutions on the Internet in the Republic of Croatia as relevant elements of development of the informational society.

Internet indicators include access and use of the Internet in parts of citizenry and the business sector, as well as the costs of access. In Croatia according to Gfk [2] research conducted on a representative pattern in 2011, 58% of citizens used the Internet, approximately 2.000.000 citizens over 15 years of age respectively. According to Eurostat's data in 2009, 50% of all Croatian households and 68% of the households in EU 25 have access to the Internet. According to the data of the Croatian Bureau Of Statistics [3] for the year 2010, 95% of Croatian companies have access to the Internet, while 97% use computers in business, same as the share of companies which own and use a computer in business in EU 25.

According to the Croatian Bureau Of Statistics 73% of all Internet users in Croatia use it daily, which makes almost 1,5 million citizens. According to Eurostat's data from 2009, 44% of the total population of Croatia used the Internet regularly, while in the EU 64% of the citizens used the Internet regularly. The purposes of using the Internet vary from fun and information to shopping and selling products and services.

Table 1, The purpose of using the Internet in Croatian citizens

<i>PURPOSE</i>	<i>%</i>
<i>Sending / receiving e-mails</i>	<i>71</i>
<i>Information on daily events</i>	<i>64</i>
<i>Searching for information on products / services</i>	<i>60</i>

Modern public online services are usually divided on e-administration, e-education and e-health. It is precisely the use of these forms that contributes democratic openness and improves civil society in a country. The development of e-administration is measured through monitoring the level of availability of certain services intended for citizens and the

economy. According to the data given by the Croatian Bureau Of Statistics 63% of Croatian companies used the services of e-administration in the year 2010. E-health is one of the elements of democratic development especially manifested in the public creation of waiting lists and providing health related information for the citizens. In the social sciences, discussions of patients' use of home based e-health tools have concentrated on how health care service-initiated technologies govern patient identities and place new expectations on the patients, e.g. to act as "diagnostic agents" and take on responsibilities for tasks traditionally ascribed to health care professionals (Andreassen, 2011.). According to Eurostat's data 22,5% of Croatian citizens used the Internet to find health care information, while in the EU 25 33,9% of citizens used the Internet for the same purpose. When looking on the percentage of public services fully available online, there are 76% of such in the EU 25, and only 35% in Croatia.

As the main source of daily information 19% of Croatian citizens state the Internet as the primary medium. According to the data of the Croatian Bureau Of Statistics, 61% of Croatian companies have a web site in 2010.

E-business can be defined as the exchange of goods, services, and information and/or ideas using an electronic medium (for two good overviews of E-business, see Electronic commerce (E-commerce), including Web-based commerce, mobile commerce (M-commerce) and ubiquitous commerce (U-commerce), is based not only on developments pertaining to the Internet compound, but also on prior technological and organizational innovations arising from the combination of telecommunications and organizational computing (Zwass, 2003.). 67% of all companies in the EU 25 and 50% of all companies in Croatia have Internet access. The share of Internet commerce in the countries of EU 25 in the year 2007 was 4,2%, while that share in Croatia the same year was only 2,1%. Internet trade (e-trade) in Croatia is in a steady increase and according to the data given by the Croatian Bureau Of Statistics in the year 2010, 32% of companies purchase via Internet and 24% sell via Internet.

The banking and financial industry is transforming itself in unpredictable ways (Crane and Bodie, 1996), powered in an important way by advances in information technology (Holland and Westwood, 2001). Since the 1980s, commercial banking has continuously innovated through technology-enhanced products and services, such as multi-function ATM, tele-banking, electronic transfers, and electronic cash cards (Haghighi, Divandari and Keimasi; 2010.) In Croatia 85% of all companies used e-banking in 2010.

Research Methodology

Basic quantity data on the use of certain elements of e-business are available in the general statistical data. The aim of this paper is to define the type and level of using the Internet services by the citizens of Croatia, location of access to the Internet, as well as reasons of more significant use of certain services. The research was conducted beginning Academic year 2009/10 on the sample of 72 examinees in Zadar with 30%, that is 22 members of the male sex

and 70%, that is 51 members of the female sex. The survey included students (63%) and other citizens (37%). The examinees were given an anonymous structured questionnaire with thirty one questions to which they answered by circling one of the offered answers. The results were processed using Microsoft Excel and Statistic methods of descriptive statistics.

Finally the results of the research will be compared to the data from Eurostat and the Croatian Bureau Of Statistics.

Results and Discussion

Of 72 examinees 48,1% don't have any work experience, 46,5% worked part-time and only 5,4% work full-time. 19% of the examinees don't use computers at neither home nor at work, while 81% of the examinees use computers daily both at home and at work. The results are in accordance with the statistics of Croatian Bureau of Statistics.

Table 1 shows the results of the analysis of the answers on the question of Internet and computer usage. The offered answers are in form of a scale 1 to 7, where 1 signifies I don't use, and 7 means I use more than once a day.

Table 1, Analysis of Computer Use

Variables	Valid N	Mean	Minimum	Maximum	Std.Dev.
CHECKING E-MAIL	70	4,171429	1,000000	7,0000	2,18673
SURFING OF INTERNE	72	5,666667	1,000000	7,0000	1,85381
E-SHOPPING	72	1,444444	1,000000	4,0000	1,01937
E-BANKING	72	1,472222	1,000000	6,0000	1,26683
E-LEARNING	72	1,388889	1,000000	6,0000	0,98661
BLOGGING	72	1,500000	1,000000	5,0000	1,12588
FORUMS	72	2,194444	1,000000	6,0000	1,77335
FUN	72	3,500000	1,000000	7,0000	2,22027
OTHER	72	7,861111	1,000000	101,0000	15,95796

Looking at the results we notice that the survey participants use the computer most of all for surfing the Internet, then for checking e-mails, fun and access to forums. Participants use e-banking, e-shopping and e-learning very little. A large number of participants never heard of e-government (72,3%). Considerably more participants are familiar with the term e-health (66,7%) probably because they use the services of e-prescriptions and making doctor's appointments over the Internet. The number of participants familiar with the term e-banking is even larger (80,6%), and 27,8% of the participants would like to get education through e-learning. 75% of the survey participants use the services of e-banking, although a total of 80,6% are familiar with the term. The difference probably occurs because some of the participants are students and do not have their own bank accounts yet. Table 2 shows the results of the analysis of the answer to the question on using e-banking (average value, lowest

and highest grades and deviations from the average grade) in the purposes of household bills, personal finances, payment of loans, currency conversion, company business, other.

Table 2, The Analysis of Using E-Banking in the Purposes of.

Variables	Valid N	Mean	Minimum	Maximum	Std.Dev.
HOUSEHOLD BILLS	70	2,028571	1,000000	7,000000	1,992533
PERSONAL FINANCES	68	2,117647	1,000000	7,000000	2,055422
PAYMENT OF LOANS	66	1,363636	1,000000	7,000000	1,442608
CURRENCY CONVERSI	66	1,393939	1,000000	7,000000	1,445191
COMPANY BUSINESS	66	1,575758	1,000000	7,000000	1,627273
OTHER	64	2,156250	1,000000	7,000000	2,198259

By analyzing the data from the table, we notice that e-banking is rarely used, and when it is used, that is for the purposes of paying household bills and taking care of personal finances. We were interested to find out what are the advantages of e-banking, e-administration and e-health. Participants rated the listed advantages on a scale from 1 to 7 where 1 signified it is not an advantage, and 7 absolute advantage. In the following tables average grades, lowest and highest grades of a certain advantage and deviations from the average grade are processed.

Table 3, Advantages of e-banking

Variables	Valid N	Mean	Minimum	Maximum	Std.Dev.
SAFETY OF BUSINESS ACT	68	4,294118	1,000000	7,000000	2,233121
SPEED OF BUSINESS ACTI	70	5,800000	1,000000	7,000000	1,782361
COMFORT OF BUSINESS A	70	5,800000	1,000000	7,000000	1,782361
24 h AVAILABILITY	70	6,028571	1,000000	7,000000	1,659155
PROTECTION OF PRIVACY	68	5,235294	1,000000	7,000000	1,924839

Table 4, Advantages of e-administration

Variables	Valid N	Mean	Minimum	Maximum	Std.Dev.
SAFETY OF BUSINESS ACT	62	4,774194	1,000000	7,000000	2,314738
SPEED OF BUSINESS ACTI	62	5,548387	1,000000	7,000000	1,896307
COMFORT OF BUSINESS A	62	5,741935	1,000000	7,000000	1,881188
24 h AVAILABILITY	62	5,612903	1,000000	7,000000	1,978200
PROTECTION OF PRIVACY	62	5,612903	1,000000	7,000000	1,858563

Table 5, Advantages of e-health care

Variables					
	Valid N	Mean	Minimum	Maximum	Std.Dev.
SAFETY OF BUSINESS ACT	62	5,516129	1,000000	7,000000	1,981405
SPEED OF BUSINESS ACTI'	62	5,967742	3,000000	7,000000	1,546734
COMFORT OF BUSINESS A	62	5,806452	1,000000	7,000000	1,781864
24 h AVAILABILITY	62	5,580645	1,000000	7,000000	1,842560
PROTECTION OF PRIVACY	60	5,033333	1,000000	7,000000	2,170423

We notice that the mane advantages of e-banking, e-administration and e-health are quick business activity, comfort of doing business from home and 24 hour availability of service. All participants noticed all listed advantages of these services and graded them highly. Let us now analyze the disadvantages of e-banking, e-administration and e-health care. The data is shown in tables 6, 7 and 8.

Table 6, Disadvantages of e-banking

Variables					
	Valid N	Mean	Minimum	Maximum	Std.Dev.

LOW SPEED OF BUSINESS ACTIVITY	60	4,233333	1,000000	7,000000	2,573441
COMFORT OF BUSINESS ACTIVITY	60	1,766667	1,000000	7,000000	1,418601
UNAVAILABILITY OF SERVICE	60	4,100000	1,000000	7,000000	2,784339
PROTECTION OF PRIVACY	60	1,866667	1,000000	6,000000	1,556470

Table 8, Disadvantages of e-health

Variables					
	Valid N	Mean	Minimum	Maximum	Std.Dev.
LACK OF SAFETY OF BUSINESS AC	60	4,766667	1,000000	7,000000	2,479521
LOW SPEED OF BUSINESS ACTIVITY	58	4,344828	1,000000	7,000000	2,652716
COMFORT OF BUSINESS ACTIVITY	58	1,965517	1,000000	7,000000	1,486377
UNAVAILABILITY OF SERVICE	58	4,275862	1,000000	7,000000	2,525610
PROTECTION OF PRIVACY	58	2,137931	1,000000	6,000000	1,627055

By analyzing the tables above, we notice that the examinees indicated unsafe business activity, slow business activity and unavailability of service as the biggest disadvantages.

We can conclude that examinees have unpleasant experiences with the slowness of offered services and that in order for more of them to use e-banking, e-administration and e-health, there should be an appropriate software assistance that would give users confidence to do this kind of business activity.

Conclusion

Due to the process of transition in Croatia there is a sudden increase of information technology and Internet use. The aim of the paper was to define the type and level of use of online services of Croatian citizens, as well as the reasons for more significant use of certain services. We can conclude that in our country there is a high percentage of computer and Internet users, however our research on a chosen sample indicates that examinees still use the Internet and computer mostly for surfing the web, checking e-mail and fun, and are not sufficiently informed of the advantages of e-business and poorly use various forms of e-business. Given that investment in e-business, other than advantages for the user, also means a long term saving for employers, there should be more effort in the marketing of e-business, safety and availability of e-businesses such as e-banking, e-administration and e-health. Finally, the users should be educated on all the advantages of e-business and some currently present fears and doubts on e-business should be overcome.

DEVELOPING A STRATEGIC ALLIANCE: CASE STUDY OF PERUVIAN PHARMACEUTICAL LABORATORY

Roussakis, E. N.¹; Lizarzaburu, Edmundo R.²

¹Department of Finance and Real Estate, College of Business Administration, Florida International University, 11200 SW 8th Street, Miami, Florida 33199 USA. E-mail: emmanuel.roussakis@fiu.edu

Abstract

The case seeks to identify some of the issues encountered in the development and growth of a family-owned firm in the pharmaceutical business in Lima, Peru. Having overcome the initial challenges of its establishment, the company has become a visible and viable competitor in the Peruvian market and is poised to expand in cross border markets by exploring the prospect of a strategic alliance with a suitable pharmaceutical firm or a chain store in these markets. Senior management must evaluate the issues associated with an alliance that entails manufacturing for foreign companies.

Keywords: Brands, patents, lines of credit, outsourcing, horizontal sales, chains, third-country manufacturing, strategic alliances.

Introduction

Sofia Pernarella, an MBA student at ESAN University, Lima, Peru, was preoccupied with employment prospects upon completion of her studies when her advisor called her to his office to inform her of a six-month internship opportunity with a local pharmaceutical firm. He was quick to point out that it was a paid internship and that this opportunity could develop into a permanent position with the firm if the senior management was satisfied with her performance.

Sofia lost no time in following through and arranging for an interview with the designated company executive. A week later she started work at the Pharmaceutical Laboratory of Peru (in Spanish Laboratorio Farmaceutico Peruano or LAFAPE) and went through a month-long rotational training to gain insights into the company's operations and scope of activities. As she wondered on her next assignment, Sofia received a call from the office of the Chief Executive Officer (CEO), Mr. Fausto Libayro, who expressed the interest to meet with her. Apprehensive as to the nature of the meeting, she quickly felt at ease when Mr. Libayro asked her about her impressions of the company and listened to her very attentively. In the course of the meeting he encouraged her to undertake a thorough review of the company operations and make recommendations on its development prospects. She agreed to have the report ready in a month's time and make a presentation of the key issues.

Cognizant that this report could result in her full time employment with the firm, Sofia reflected on the need to look for information and combine data from three different sources. She felt appropriate to first familiarize herself with the pertinent literature on the international expansion of manufacturing enterprises and any leads that this venue offered for the company's potential development. Next she sensed the need to compile information about the state of the pharmaceutical industry in Peru and its relative importance for the country. The literature on international expansion and the domestic trends of the pharmaceutical industry provided, Sofia felt, the appropriate framework for discussion of the company's background and operations, financial performance, and objectives. Hence the sequence of the sections below.

The Internationalization Process in Literature

The development and growth of multinational corporations in response to the dynamics of a changing and increasingly competitive international environment, have given rise to a body of theory that addresses different aspects of this subject. This is to be expected considering prevailing differences in the extent, form and pattern of firms' international operations, and the variations in company-specific characteristics, products produced, and markets served.

One of the theories (Eiteman et al., 2010) that sought to explain the internationalization impetus of a firm, refers to this development as the *globalization process*. It describes this process as a progression in business activity entailing structural and managerial changes and challenging experiences for the firm. This theory identifies three distinct phases in this sequential process--the domestic phase, the international trade phase and the multinational phase. In the *domestic phase*, the firm (usually a family-owned business) builds its operations slowly as it tries to develop a competitive advantage. Its manufacturing and service inputs originate in local sources, and its product sales are directed to local customers. Transactions are denominated in local currency and the credit quality of all suppliers and customers is determined on the basis of domestic guidelines. Existence of a competitive home market can enhance a firm's visibility and viability and sharpen its competitive advantage. Expansion drive to take advantage of opportunities in foreign markets, or comparative advantages of particular locations, would thrust the firm into the *international trade phase*. Import of inputs from foreign sources and export of products and services to foreign buyers are typical of this stage and entail increased challenges for the firm's financial management. First, foreign currency payments and receipts expose the firm to currency fluctuations and consequently to foreign exchange risk. Second, differences in foreign business practices and legal systems render more difficult the evaluation of the credit quality of foreign buyers and sellers and hence the management of credit risk. As firms learn more about foreign market conditions, payment conventions and financial institutions, they feel more confident in increasing their physical presence abroad. At this stage the company progresses to the next phase, the

multinational phase. A variety of strategic alternatives are associated with this phase including the undertaking of foreign direct investments (FDI) and control of assets abroad.

The OLI paradigm (Buckley and Casson, 1976; Dunning, 1977) explains why multinational enterprises choose direct investment (wholly owned subsidiaries) to other alternative modes of entry in foreign markets (e.g., licensing, joint ventures, management contracts, and exporting). The paradigm identifies three important considerations for a firm's foreign direct investment to be successful--"O" or ownership of firm-specific competitive advantage in the home market that can be transferred abroad; "L" or (selection of suitable) location that will allow the firm to exploit its competitive advantage; "I" or internalization, maintaining effective control of the competitive advantage abroad by transferring it within the firm's own organization.

Ownership of assets and companies in foreign countries create a high profile for a multinational enterprise and consequently it exposes its FDI to political risk--political events that can undermine the economic viability and performance of the firm in these countries. Political risk can range from seizure of property (expropriation) to goal conflict between a multinational and its host government (governance risk) and limitations on the transfer funds out of the host country (blocked funds).

The Pharmaceutical Industry in Peru

With a population in excess of 30 million, Peru is establishing itself as one of the best performing economies in Latin America. While the 1990s stand out for the introduction of market-oriented economic reforms and privatizations that initiated the transformation of the country, economic policy from the turn of the century onward concentrated on the pursuit of sustained growth and macroeconomic stability. The country's economic performance in recent years is evidenced by its current record which includes one of the lowest inflation rates in the region and a gross domestic product (GDP) growth which is expected to attain an increase of 5.1 percent in real terms in 2011. With economic prosperity overly concentrated in Lima and other major centers, urban demand for improved healthcare and pharmaceutical products, has increased significantly. This development has contributed, in turn, to increased regulatory oversight to ensure against drug counterfeiting and piracy.

The pharmaceutical market in Peru at year-end 2010 amounted to a little over \$750 million which represented a fourfold expansion over the corresponding 1995 figure. Given current country projections for sustained economic growth between 2011 and 2016, the size of the pharmaceutical market will continue to expand throughout this period. Industry forecasts estimate market growth to remain in the same range, between 17 to 20 percent per year. Clearly, if one considers that the rural communities have yet to experience the benefits of improved healthcare, market prospects will increase further over time.

Lima, being the capital of Peru, has a sizeable urban population and concentration of economic prosperity, and accounts for 60 percent of the total market for pharmaceutical products. Overall, the national market is made up of three component parts, horizontal sales, chains, and institutional.

- **Horizontal Sales:** This market is made up of private clinics and pharmacies served by distributors (Distribuidora QS and Distribuidora AS). Spot sales amount approximately to 14,000 (stores, sales points).
- **Chains:** As implied, this market is made up of different chains operating in the Peruvian market. Some of the more important chains in this category are: Drogueria los Andes, Arcangel, Boticas y Salud, Mi Farma, FASA, BTL, America Salud, Norfarma, Boticas y Salud, and Cadena Nacional de Medicinas
- **Institutional:** This market is made up of Peruvian State agencies such as Social Security (ESSALUD) and the Health Ministry (MINSA). Accounting for about 30 percent of the total, this market underwent important changes in 2006 when the government agencies switched out of the brand products into the generic drug market. This move resulted from the government need to cope with the pharmaceutical needs of a rising population. Procurement of this market is provided by pharmaceutical firms.

Company Background and Operations

In the summer of 2002, Mr. Fausto Libayro, prompted by his pharmacist father, established in Lima, Peru, a family company owned jointly by himself, his father and his sister. The objective of the firm was to engage in the sale of pharmaceutical products both under its own brands as well as generic. He named the business Commercial Labo Medical Products (in Spanish Comercializadora Labo Medical or LABO). Once the company was formed he sought to comply with industry regulation by registering its brands with DIGEMID, the Peruvian drug control entity that is equivalent to the Federal Drug Administration (FDA) in the United States.

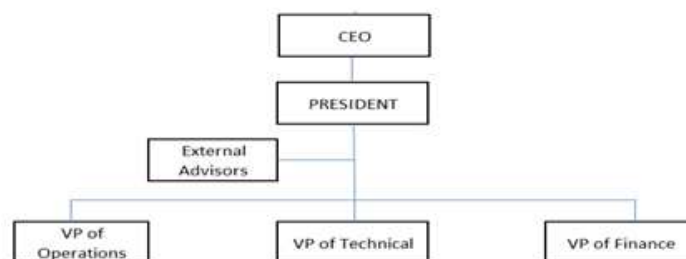

Initially the company strategy was to expand the scope of its activities by manufacturing pharmaceutical products for the account of different laboratories, both Peruvian and foreign, that were authorized by DIGEMID as third-party manufacturers. The targeted products ranged from such items as pills and syrups to ointments and creams.

The company's senior management consisted of Fausto himself and his older sister Macarena. Although they both had completed their undergraduate studies and had earned their MBA degrees from ESAN University, their professional interests diverged. Fausto was more focused in financial management while his sister was more experienced in the development of new business. As a result, Fausto addressed the company's financial aspects and oversaw operations while Macarena dealt with the expansion of existing products and markets and the entry into new ones.

The company had completed four years in operation when some important developments appeared to challenge its management and company strategy. In 2004 Peru initiated negotiations for a Free Trade Agreement with the United States¹ which it signed in April 2006. The agreement extended to U.S. exporters of pharmaceutical products greater market opportunities in Peru and afforded pharmaceutical companies favorable intellectual property rights on patented drugs. These provisions on brands and patents raised important concerns for the continued competitiveness of the company. These concerns preoccupied the owners who decided to address them by creating a new startup through investment in a manufacturing pharmaceutical laboratory. The new firm would manufacture both LABO products and those of other domestic and regional firms thus positioning itself to take advantage of the government overtures to sign free trade agreements with other countries and turn Peru into a regional operational hub.

It was against this background of developments that LAFAPE was created. The company's organizational structure, depicted in Figure 1, included three units--Technical (dealing with chemical issues), Operations, and Finance--each headed by a vice president with significant experience in the respective field. Aside from Macarena Libayro who was a LABO executive prior to assuming the company's presidency, the other administrators were hired after a careful search in the pharmaceutical industry both at home and abroad. Although the new hires were local nationals with some 30 years of experience in their respective fields, the company recognized the need to hire in the future foreign candidates to benefit from their knowledge of foreign markets. The new administrative team and their respective units were as follows: Cristian Tambor was placed in charge of the Technical unit, Guillermo Roma took over Operations, and Cesar Dewing Finance. The company's CEO position was given to the father in an honorary recognition of his reputation and experience in the field.

Figure 1 Organizational Chart

Once the new venture was legally established, the company's senior management set out to meet with the Peruvian banks that LABO had maintained a working relationship to apprise them of LAFAPE and the need for credit facilities to finance its operations. LABO's

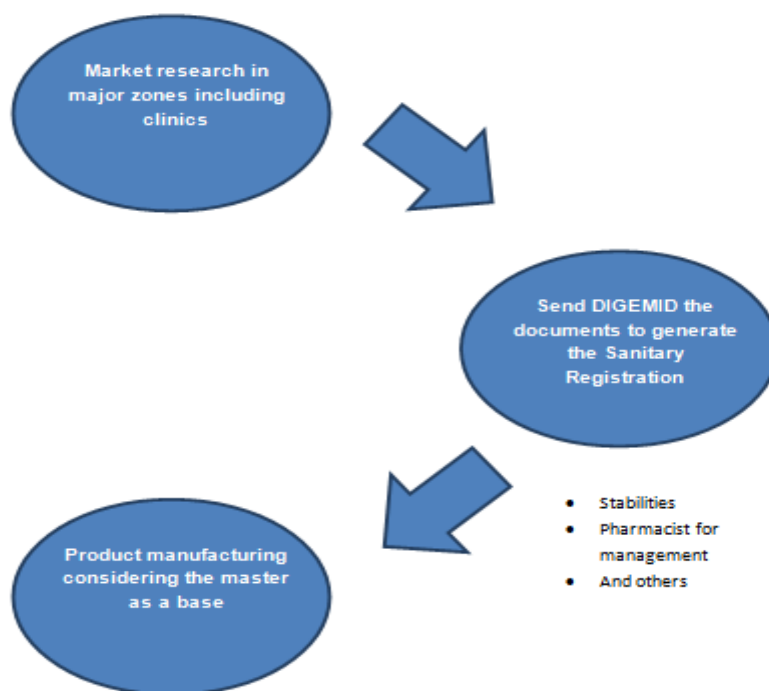

credit facilities with Peruvian banks are identified in Table 1. As seen in this table, the company had lines of credit with four institutions, totaling \$860,000.

Table 1 Available Lines of Credit to LABO

<i>Banking Institution</i>	<i>Amount of Credit Facility</i>
<i>PCB</i>	<i>\$350,000</i>
<i>Banco AVBB</i>	<i>250,000</i>
<i>Banco Canada</i>	<i>140,000</i>
<i>Banco Comercial</i>	<i>120,000</i>
<i>Total</i>	<i>\$860,000</i>

LAFAPE assumed immediately the manufacturing of LABO's 85 brand and 40 generic products, and sought to take on any other business originating from Peruvian, Latin American and global companies. For a pharmaceutical company to operate in Peru and manufacture products (medicines) for third parties, it ought to be accredited with Good Manufacturing Practices (BPM, for its name in Spanish Buenas Prácticas de Manufactura). BPM accreditation included GSP, that is, Good Storage Practices (BPA, for its name in Spanish Buenas Prácticas de Almacenaje). LAFAPE satisfied the requirements for these designations and was now also in the process to qualify for ISO (International Organization of Standardization²) 9001: 2008 (quality) and ISO 14000 certification (environment) .

Both the brand and generic products manufactured by LAFAPE enjoy a diverse market. The process to identify and size the market for each of these products has been a challenging process as it needs to take account of individuals who are end consumers and a variety of different entities (e.g., clinics and hospitals). Figure 2 identifies the process to establish the size of the market and its effect on product manufacturing.

Figure 2 Determining market size and its effect on product manufacturing

Over time LAFAPE has introduced cutting-edge technology which has increased its production efficiency. Its manufacturing activity has grown to include approximately 250 products while its current capacity amounts to about 500. Table 2 highlights plant capacity by production line and corresponding monthly output. This growth momentum has prompted relocation of the company's offices to the LAFAPE facility in the Lurín business center, a suburb of Lima.

Table 2 Plant capacity

<i>Production Line</i>	<i>Amount per Month</i>	<i>Turns used</i>	<i>Maximun Turns</i>
<i>Liquids</i>	<i>250,000 bottles of 60ml</i>	<i>1 turn</i>	<i>2 to 12 hours 3 to 8 hours</i>
<i>Tablets, capsules and pills</i>	<i>30,000,000 Small</i>	<i>1 turn</i>	<i>2 to 12 hours 3 to 8 hours</i>
<i>Tablets, capsules and pills</i>	<i>20,000,000 Medium</i>	<i>1 turn</i>	<i>2 to 12 hours 3 to 8 hours</i>
<i>Creams</i>	<i>150,000 Tube of 60 gr</i>	<i>1 turn</i>	<i>2 to 12 hours 3 to 8 hours</i>

The company buys its raw materials from a number of foreign sources. Inputs are identified in each master or layout or manufacturing log, which is specific to each product. The main countries, where raw materials or active ingredients (generic substances) are bought from include China, India, Germany and the United States.

In the early years of its operation, LABO had pursued the practice of outsourcing several of its assembly lines. This practice however contributed to the emergence of laboratories that registered their own products and evolved into LAFAPE competitors. Some of the more important such competitors include:

- Medco
- Induchemical
- Carrion
- Cipa

LAFAPE is active in the country's three main pharmaceutical markets--Horizontal Sales, Chains and Institutional. In the Chains category, LAFAPE serves the three large business: Drogueria los Andes, Arcangel, and Boticas y Salud.

Financial Performance

LABO and LAFAPE performance has grown significantly in the few last years. Although in the initial stage of its establishment LAFAPE had faced some financial difficulties these were effectively addressed and allowed the company to pursue a sustained growth momentum. The problems arose when the company fell behind payment of a land leasing instalment. This situation led one of the local banks to consider the termination of the credit facility it had extended to the company. Fausto lost no time in hiring a financing and restructuring consultant to address this problem. Improvement in the management of the company's cash cycle combined with a revised land and machinery lease agreement rectified the issue and averted any bank action that would have undermined the operations of LAFAPE.

LAFAPE sales policy has been 90 percent credit and 10 percent cash in an effort to build market share. The accounts receivable turnover is about 120 days. When clients send in their purchase orders, there is an inventory check and if the product is in stock it is dispatched to the client in no more than 7 calendar days. If the product is not in stock, the order is sent to the production facility for manufacturing. Manufacturing time schedules vary between 15 and 90 days, depending on the availability of raw material stocks.

Raw material supply accounts for almost 50 percent of production cost. Purchases are made on a 90 days credit. Past the payment due date, purchases are financed by the local banks for a maximum of a 60-day term. There are three main sources of raw materials procurement--Asia, America and Europe. Asia accounts for almost 50 percent of procurement while America and Europe for approximately 25 percent each.

The financial performance of both LABO and LAFAPE for the period 2008-2011 is depicted in the balance sheet and income statements cited in Tables 3,4,5 and 6. Expressed in Nuevo Soles, the national currency of the country, these statements were audited by the local office of a major U.S. accounting firm.

Source: Data provided by the LAFAPE management.

Of the LABO financial statements cited above it is worth noting that commercial activities generated revenues at year-end 2010 in the amount of 12 million Nuevos Soles (Table 3) which represented a 72.47 percent increase over the corresponding year-end 2008 figure. The manufacturing performance of LAFAPE during the same period of time, contributed to an asset base at year-end 2010 of 7.9 million Nuevos Soles (Table 6) which represented a 362 percent increase over the year-end 2008 figure. Company revenues for the same period increased by 5,282 percent resulting to a year-end 2010 net income of 0.847 million Nuevos Soles (Table 5), a rate of return on equity of 46.67 percent.

Company Objectives

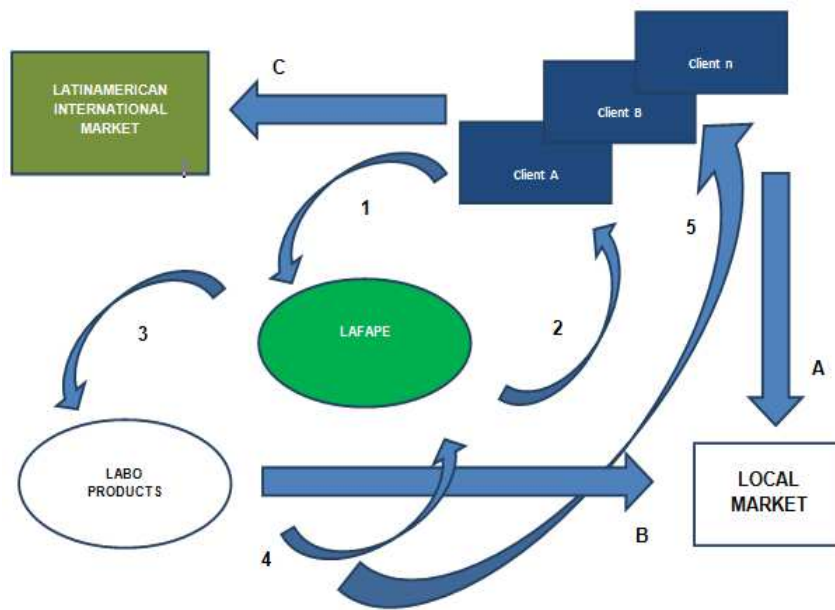

LAFAPE seeks to position itself not only as a major pharmaceutical firm in Peru but also in Latin America. The venue considered for attaining this objective is that of a strategic alliance. The term strategic alliance conveys a different meaning in different instances. In one form of cross-border strategic alliance, two firms exchange a share of ownership with one another--viewed as stable and friendly hands--to defend against a possible takeover. In a more comprehensive format this arrangement , in addition to exchanging stock, enables the establishment of a separate venture to develop and manufacture a product or service (e.g., this practice may be encountered in high tech industries where the cost of research and development is high and timely introduction of improvements is important). Another level might include joint marketing and servicing agreements in which a partner represents the other in certain markets.

For LAFAPE, the strategic alliance would be the vehicle to extend manufacturing capacity to foreign pharmaceutical companies, chains and other related clients. Although initially established to manufacture LABO products, LAFAPE has been authorized by DIGEMID, effective year-end 2009, to engage in third-party manufacturing for foreign pharmaceutical companies.

The free trade agreements that the Peruvian government is reviewing and signing, in the framework of the globalization trend, is creating major opportunities for the firm's growth potential. To capitalize on these opportunities LAFAPE would require additional credit lines to finance its working capital needs. Additionally, the firm would need to re-evaluate its credit strategy and currency exposure because of the resulting increase in sales to the "main chains." These clients invariably demand low product cost and high quality, which LAFAPE can easily meet. The company's installed capacity is up to date and in excellent condition. Its machinery is just three years of age and its useful life is 10 to 15 years. Appropriate preventative and corrective maintenance of the machinery would contribute to cost savings and enable the company to maintain its competitive edge.

Both LABO and LAFAPE complement each other with the former focusing on the marketing of its products to chains and directly (horizontal), while LAFAPE produces not only the "LABO" products, but also products for several chains and other laboratories. Figure 3 identifies this operational complementarity.

Figure 3 LABO/LAFAPE operational complementarity

The complementarity in the relationships of the two companies can permit the company to export its “services” to foreign laboratories (import the raw materials, produce the products and export them to foreign clients). Regional collaboration would result to important savings for the international clients, since Lima has maritime ports and an airport that offers easy and quick access to markets in regional proximity, such as Quito in Ecuador, Bogota in Colombia, and La Paz in Bolivia. Figure 4 shows the regional proximity of these markets and the respective potential for the participants in a strategic alliance.

Figure 4 Proximity to foreign markets in the region

Timely delivery of client orders would require expedient access to raw materials. Having expedient suppliers will improve not only delivery schedules but would also reduce costs and contribute to company competitiveness and increased visibility in international markets. This is especially important considering that the company's objective is direct product sales and manufacturing for third parties.

Table 7 identifies select important suppliers the company intends to contact through attendance to annual conferences in different countries. Their competitive pricing and delivery efficiency would translate into important financial benefits in the procurement of raw materials.

Table 7 Select key suppliers of raw materials internationally

-
- *Catalent, largest global CMO with a long-term supplier relationship with Wyeth*
 - *Lonza, key Swiss supplier in emerging markets (including China and India) with biopharmaceutical manufacturing capabilities*
 - *Boehringer Ingelheim, major firm offering extensive and well developed services*
 - *BASF, vendor of a full suite of pharmaceutical manufacturing services*
 - *Fareva, rapidly growing firm by purchasing facilities from pharma companies*
 - *Wockhardt, major India pharmaceutical and CRAMS company growing through acquisitions*
 - *DSM, significant operator in the United States, Europe and China. Owns the PER.C6 cell line and licenses it to various partners*
 - *Evonic, purchased remaining shares of its JV in China*
 - *Patheon, relationships with all of the top 20 pharma companies*
 - *Jubilant, Indian contract and research manufacturing company acquiring Canadian and US facilities*
-

Drafting the Report

Sofia spent sometime thinking about the format and structure of her report. Although the company's growth momentum has been impressive she realizes that continued breakthroughs in the field of medical research will keep expanding the company's pharmaceutical prospects. In fact, Sofia thought, there are pharmaceutical product lines that the company can continue developing, such as heart, gastric and retroviral drugs. As several thoughts run through her mind she settled to address the basic issues by drafting a three part report along the following lines.

1. Present the major strengths and weaknesses of the company using bullet statements or phrases. She felt that at least three but no more than five statements in each case would be adequate.
2. Identify the company's key priorities (short and/or long term) and discuss the strategy to attain them.

3. Determine the issues associated with the establishment of a strategic alliance that entails manufacturing for foreign companies?

Sofia felt confident that this format would enable her to perform her assignment in a complete fashion and address any questions asked by the senior management.

ORGANIZATIONAL JUSTICE AND PERFORMANCE: APPRAISAL AND FAIRNESS

Rowland, Caroline¹; Hall, Roger²

Abstract

In a changing economic climate, characterised by pressures to improve productivity and reduce costs, performance management has a more central role in helping to ensure competitive advantage. Appraisals have become an almost universal feature of modern organizations and it is essential that they are perceived as fair if they are to bring about commitment to discretionary effort, which is increasingly a key feature in gaining competitive advantage. This paper uses the concept of organizational justice to explore the outcomes, procedures and implementation of appraisal in contemporary organizations. It draws on a range of theoretical frameworks from both philosophy and social science, examines current practices and experiences and looks at future trends. Empirical research includes a ten year longitudinal study of practising managers and ethnography, questionnaires and interviews. It concludes that appraisal frequently creates both actual and perceived injustice in organizations and a tension between managing performance and encouraging engagement, which is dependent on perceptions of fairness.

Keywords: organizational justice, performance, appraisal, fairness

Introduction

As organizations have developed more formal strategic processes, there has been some movement towards integration of organizational strategy with a more strategic approach from Human Resource Management. This has involved many organizations in the introduction of formal performance systems, frequently characterised by appraisals or performance reviews.

As the prevalence of performance appraisal has grown so its importance in shaping employee perceptions of justice has become more important. Outcomes and processes which are perceived as unfair in an organization will result in a workforce whose contribution through enthusiasm and “going the extra mile” is not fully achieved.

Organizational Justice is concerned with: the fairness by which the benefits and burdens of an Organization are allocated; the fairness of the process by which decisions are made and; the fairness of interpersonal treatment and information (Greenberg 1987,1990; Folger and Bies, 1989; Beugre 1998;).

Organizational Justice is a useful concept through which to examine the outcomes and processes of performance appraisal. It is core to the central psychological contract and to employee engagement and discretionary effort. It is also helpful if new developments in performance appraisal can be examined through this lens.

Aims

This paper begins with an overview of the development of concepts of organizational justice, owing much to philosophers such as Plato to Rawls and moving on to the more recent contributions of social science. There is an examination of recent developments in appraisal from an organizational justice perspective and a statement of relevant research questions. The paper describes empirical work carried out by the authors, presents the findings from these studies and draws conclusions which are related back to other work and provides suggestions for future focus.

Literature

Organizational justice

Although social scientists have explored concepts of justice for over 60 years, it was not until the 1980s that the workplace became a focus for what has become known as organizational justice (Greenberg, 1987). Theorists have made a distinction between distributive justice – the fairness of outcomes- and procedural justice – the fairness of process to achieve these outcomes. More recently there has been a theoretical separation within procedural justice between how decisions are made and how they are implemented and communicated. This has led to a third category, that of interactional justice (Bies, 2001) which is sometimes subdivided into interpersonal justice- how people are treated and informational justice - how people are informed about why outcomes are distributed as they are and why particular procedures are used. Notions of distributive justice are grounded in political theory (Marx, 1969), they have also found applications in criminology to explain deviant behaviour (Lea and Young, 1996). Organizational justice began as Greenberg (1990:400) points out “to test principles of justice in general social interaction, not organizations in particular”. The early focus of Organizational Justice was in distributive justice grounded in the contributions of Homans (1961) and Adams (1963), whose equity theory suggested that workers compare their own input/output ratios with that of others. A corollary of this was that both behaviours and attitudes changed where there were disparities as workers attempted to achieve equilibrium.

Models of ethical outcomes go back considerably further. Aristotle considered justice to be people receiving that which they deserved. In the 18th Century Bentham(1789) considered the outcomes of utilitarianism/fairness to be happiness. Later commentators consider linkages of happiness to both work and personal performance (Blanchflower and Oswald, 2011).Stakeholder theory considers the ‘ sustaining corporation’ making a positive

contribution to human wellbeing (Clifton and Amran, 2011;123-124.). Deontological models consider rightness to be crucial and justice to be a reward in itself. Utilitarianism cites the importance of healthy, respectful and supportive organizational culture and fair treatment, security and recognition (Ashkanasy, 2011:25).

Appraisal

Appraisal systems can result in unfair or inequitable distributions of organizational rewards and punishments. It is useful to begin with the purpose of appraisal. It is customary to distinguish between two different purposes of appraisal; administrative and developmental. Administrative appraisal is usually part of a performance management system and can result in increased pay and other rewards such as promotion, career opportunities or actions to remedy disciplinary or capability issues, perhaps resulting in dismissal. Developmental appraisal is related to enhancing individual performance and usually sits uneasily within a formal system. However, it can often result in differential access to organizational resources such as education and training.

If the outcomes of appraisal are considered unfair then it might explain the attitudinal and behavioural outcomes predicted by Adams, including reduction of effort and a lack of engagement. Where disparities are large it is expected that responses will be proportionally great.

Outcomes of appraisal may be perceived as unfair even when the procedures are objective. Where procedures are perceived as unfair, however, there is little hope of outcomes being perceived as fair. Much of the research into appraisal systems has focused on procedural aspects such as the reliability and validity of performance measurement, stakeholder involvement and providing feedback.

Folger and Bies (1989) identify seven procedural elements important to managers. These are:

- giving adequate consideration to employees' viewpoints
- suppressing bias
- applying decision-making criteria consistently across employees
- providing timely feedback to employees after the decision
- providing justification for the decision
- being truthful in communication
- treating employees with courtesy and civility

They are a useful guide to examine findings of research into appraisal.

Appraisal and performance management

Since the late 1950s research into appraisal systems has shown repeatedly that schemes which link interviews with remuneration are at best unhelpful and at worst counterproductive (Maier, 1958; O'Neill, 1995; Oliver, 1996 and Prowse and Prowse, 2009). No evidence currently exists from any controlled study in the UK or USA to show that long-term improvements in the quality of performance result from appraisal-based extrinsic rewards. Nonetheless, providing information for remuneration purposes continued to be one of the major objectives of appraisal, along with objective setting and training needs analysis for employee development purposes (CIPD, 2009.)

A survey by IRS (1994) showed that managers ranked in descending order 'identifying training needs', 'improving individual/ corporate performance', 'encouraging manager-subordinate dialogue', 'bringing about cultural change' and 'succession planning and identifying individual potential.' These were all more important than 'assessing performance to determine individual performance-related pay' which was ranked as last in order of importance. These findings are reflected in more recent studies (Armstrong and Baron, 2005; CIPD, 2009.) Even when pay is removed from the equation, the remaining reasons for introducing performance appraisals are conflicting rather than congruent. American research indicates that appraisals are used for multiple purposes in addition to the above; these include promotions, lay-offs, transfers and terminations (Thomas and Bretz, 1994; Smith et al, 1996).

The diversity of reasons for using appraisal are reflected in the variety of assessment measures, which are employed. These can be classified as: traits, behaviours and outcomes (Marchington and Wilkinson, 1996). Traits such as commitment, reliability and conscientiousness have traditionally been measured by graphic rating scales. Behaviour has been measured through behaviourally anchored rating scales (BARS) and, more recently, through competence-based assessment. Outcomes have been appraised through management by objectives (MBO) or by direct measurement of output, sales, quality or other quantifiable criterion. There has been a tendency for more mechanistic systems to be used for manual workers (IRS, 1994).

Historically, line managers have carried out appraisals. Surveys (Smith et al, 1996; Wiese and Buckley, 1998 and CIPD, 2009) document the introduction of self-appraisal, peer appraisal, 360 degree appraisal and balanced scorecard approaches, to provide a wider perspective on performance. There is also evidence that many organisations are linking appraisal more closely to employee development and separating this from decisions about levels of pay (Armstrong and Baron, 1998). There are few reported instances of group or team appraisal. However, there is evidence of the evolution of e-appraisal carried out in a small number of organizations and in some instances there is an element of self appraisal (Payne et al, 2009.)

There is clearly a link between the methods in use, the reasons why appraisal is employed and the underlying philosophies of management. There has been a shift away from subjective judgements of desirable traits towards a multi-faceted review of process behaviour and outcomes and a collaborative approach to establishing objectives and analysing development needs (Neeley, 1998; Bennett, 2006.) This has been mirrored by a declining emphasis on linking appraisal to reward and a growth in employee development activities, through personal development plans (PDPs) and continuous professional development (CPD).

It may be thought that this shift in both the expressed purposes of appraisal and the methods employed signals a fundamental change in the underlying philosophies of human resource management, which inform the appraisal process. At face value the trend seems to support this interpretation. The values of utilitarian instrumentalism, typified by the Michigan school (Fombrun et al, 1984) appear to have given way to the Harvard approach of developmental humanism (Beer and Spector, 1985). Concepts of ideology, politics and power are replaced by ideas of empowerment, commitment, culture and consensus. There seems to be a congruence between espoused theory ('people are our greatest asset', 'we are a learning organisation') and theory in use. Yet, the approach taken may be subtler but, nonetheless, still instrumental.

It is clear that many organizations have taken a more strategic approach to human resource management and see performance management as fulfilling a pivotal integrative role in relating employee resourcing, reward, relations and development practices to strategic objectives (CIPD, 2009). However, the extent to which this strategic emphasis reflects a change in values remains largely unanswered and perceptions of fairness are not fully considered in a climate where discretionary effort is critical to success.

Research Focus

The recent downturn in economic activity has placed a premium on effective performance and the harnessing of discretionary effort for competitive advantage. At the same time the growth of scandals in the world of business has driven a pervasive interest in ethics and corporate social responsibility. This has been particularly true of university MBA programmes. Although there has been a continued interest in employee well-being (Baptiste, 2008) this has not usually been linked to ideas of organizational justice. The connection between performance management, ethics and fairness has not been adequately explored. The focus of our research was on whether employee perceptions of the fairness of appraisal have an impact on the effectiveness of performance management systems. The questions which interested us were framed in the context of organizational justice, business ethics and improving performance for competitive advantage.

Do appraisals contribute to disparities in organizational rewards and burdens?

Do employees perceive outcomes and procedures as fair and ethical?

Is there a tension between control and commitment and how does this influence the effectiveness of performance management?

Methodology

A mixed methods approach was used with documentary analysis, formal and informal interviews, questionnaires and observation as primary tools. Literature reviews were carried out to establish comparable current research findings and theoretical frameworks. The initial research started off in all cases with an exploratory phase using informal interviews followed by content analysis to identify emerging trends and patterns.

The information came from three main samples.

Sample one was a longitudinal study and comprised of over 100 managers engaged on management development programmes at two higher educational institutions over a period of ten years. The sample was also a convenience sample representing both the public and private sectors. There was a 100% response rates from these participants due to personal and prolonged contact with each participant. All participants in this sample were interviewed informally and also completed a postal questionnaire.

Samples two and three were taken simultaneously from two large service and manufacturing organizations and comprised of a purposive diagonal ethnographic survey of 40 employees followed by a postal questionnaire sent to all employees and completed by 500. Response rates were 30% from organization A and 16% from organization B. All participants were based in the United Kingdom and were in full time employment.

All participants in sample one (100 persons), and all those from samples two and three who had taken part in the ethnographic survey (40 persons) completed a semi-structured account of how appraisals and performance management took place in their organization. They were also asked to give their own perceptions of the effectiveness and appropriateness of any of the systems and outcomes they had experienced. Content analysis then took place and identified themes and linkages were used to design questionnaires with categories that could be interrogated by a mixture of quantitative and qualitative means. The emphasis of the questionnaires was to test the tools, systems, procedures and outcomes of appraisal and the participant's perception of linkages to individual performance, motivation and organizational effectiveness.

Significance testing was undertaken by means of Chi-Squared (Bhattachary and Johnson, 1977). The purpose of this was to examine whether there were any significant differences between responses from different organizations, sectors, occupations, length of service and gender.

Findings

Ethnographic survey findings

Several themes emerge from the ethnographic survey; that were common to both organizations. The common themes were a distrust of appraisal and performance related pay and a belief that there was an inequity of treatment between high and low producers centring on arbitrary standards of discipline. A large proportion of those interviewed were cynical about appraisal and although they believed that in an ideal world it could be a useful and positive experience, in reality it was often “just going through the motions” and was not carried out in a fair and systematic way. Many expressed a belief that appraisal was often about “whether your face fitted” and that there had been abuse “I am certain of it”. There was a fear that appraisal may be used for redundancy but this was not as widespread as concerns regarding subjectivity. Most participants were strongly against being rated for performance related pay even some that received it. The differences between organizations were not significant although participants from organization A although critical of some aspects of personal development, acknowledged the existence of a system that was having some impact and the majority saw it as a positive experience with some benefits, although a few did think it raised too many expectations. Improvements in training and support were also mentioned as were beliefs in the value of team working. The Personnel Section in both organizations came in for criticism for not understanding the nature of the job and not appearing to care for the workforce in general.

Some participants in organization B were highly critical of the lack of training and training opportunities and some participants commented about these being given as rewards and withheld as punishments.

Union views

Both organizations in the survey had strong union memberships representing over 75% of the workforce. Union officers from both organizations were interviewed using the same semi-structured format experienced by other participants.

There was a strongly held view from Union officers at both organizations that there were hidden agendas for the use of appraisal as other purposes evidenced from the use of yearly reviews by one of the organizations creating a matrix for redundancy purposes.

Appraisal: “nothing happens.” It was not taken seriously and was open to abuse. “It was never going to be objective.” There seemed to be no system or structure. The union were not optimistic that this could ever happen.

Appraisal was also described as “management driven.” They were not always carried out. Appraisal was seen as a control mechanism and not always a developmental mechanism. “If someone is perceived not to have met the requirements of their appraisal they can be taken down the disciplinary route and have been done so.”

“We are aware of individuals not being treated perhaps as fairly as others. It depends on the manager’s style and some are more subjective than others.”

However, personal development initiatives were seen in principle as positive but often “does not work. Again there was a perception of inequity operating for some at the personal discretion of managers.

Questionnaire findings

Data was interrogated to see if there were any groups that were unrepresented by the survey. No groups were unrepresented. The information was based on up-to-date personnel print outs from both organisations.

Almost 75% of those who responded had experienced some form of formal appraisal at their present organisation and many had also experienced appraisal in their previous organization.

39% of those from organization A and 44% of those from organization B felt that appraisal had not helped their job performance along with many who do not appear to know (13% and 21%.)

43% organization A respondents believed that appraisals had helped improve their job performance.

31% organization B respondents held the same belief.

It would seem that although some participants do think appraisal can help improve individual performance the majority felt that it did not help them improve their job performance with many not knowing if it did.

Over 30% of respondents in both organizations felt strongly that appraisal was carried out with favouritism and 25% claimed not to know if there was favouritism or not. This has important implications for organizational justice and ethical workplace practice in terms of the large numbers of respondents in this sample that do not trust the system or do not know if they can trust the system.

These findings were reinforced by similar findings from our longitudinal study.

There was no mathematical significance of frequency indicated by these results.

Respondents were asked to comment on anything not included in the questionnaire concerning appraisal, performance- related pay or company culture that they felt was important.

The comments that most commonly emerged from the questionnaires and combined with those from our participants in the longitudinal study were noted and cross-checked by means of the author and a secretarial supporter making independent notes of recurring sentiments. These were selected independently and then cross-checked. Quotes that best typified

responses were then selected. This approach was taken to increase the likelihood of obtaining typical responses and cross-checking and calibration occurred to ensure better standards of inter-judge reliability.

A selection of these comments included:

“There are no regular meetings to monitor progress”

“The better you are at your job the more work is pushed on you”

“Too subjective based on a manager’s perceptions”

“Very subjective and there are no specific objectives”

“There is too much favouritism in the company between supervisors, managers and the Leading Mechanic’s and mechanics.” (sic)

“PR pay will only be effective if individuals have the back up of the company in terms of training, advice and edification.”

“Appraisals are not carried out on everyone; we need rules and proper guidance.”

There was no statistical significance in expected frequency between organizations. These participants were found to be a representative sample consistent with the profiles supplied by both organizations in the form of personnel and departmental records. The findings of the questionnaire showed a marked consistency between organizations and also consistency between gender, occupation and length of service in the majority of cases. This allowed for generalisability in many areas.

Longitudinal Study Sample

There was a constant and almost universal concern about “fairness “from all participants in both the study of two organizations and the longitudinal study. There was no shift in emphasis over a ten year period up to and including 2009.

“I suppose you could say our appraisal is the personal development interview but we don’t seem to link this to practice.”

It is time consuming, there is favouritism.....and no rewards for high performers”

“We link performance related pay to appraisal but it is not fair.”

“It’s a joke.”

What’s the point, we are making people redundant and it is not the poor performers who are going.”

Content analysis showed a marked emphasis on the tension between the espoused theory of fairness and perceptions of inequality, inconsistency and subjectivity

Summary of Findings and Discussion

Information was volunteered freely by all participants. Employees at all levels spoke openly at both informal and formal exchanges. There were no significant differences between responses from males and females, different age groups, length of service and area of work. The most interesting thing from the researcher's viewpoint was the similarity in beliefs from a diagonal slice of the workforce taken in from organizations A and B and participants in the longitudinal study who were all managers.

There was a convincing raft of evidence from all sample groups based on anecdotes, chats, ethnographic surveys, formal interviews and questionnaires to make the following observations:

There was a strong belief in inequality of treatment between high and low producers centred on arbitrary standards of discipline. Both managers and workers found this frustrating and many spoke about fairness, equity and injustice.

There was a widespread distrust of both appraisal and performance related pay.

There was widespread confusion about performance management systems, interestingly many employees were unclear as to whether their performance was measured and if so what were the methods used to measure it.

Performance management systems were viewed as bureaucratic, costly and often a waste of time. Many workers and managers spoke at length about discretionary activity and their frustration with the organization's inability to deal effectively with disciplinary issues.

There was cynicism about appraisals and the subjectivity/competence of appraisers.

A fear/belief that appraisal was used for redundancy purposes. This belief was strongly voiced by union officers who gave examples of actual instances when they had seen this in practice. Some managers spoke of appraisal as being useful in cases of redundancy.

The majority of persons had experienced some form of appraisal in their present organizations and a significant proportion had experienced it in previous organizations. Whilst many perceived the notion of appraisal as being a good idea, they saw the procedure and its outcomes as being flawed. In this sense they felt that both procedural and distributive justice were unfair.

Appraisal was sporadic and not homogeneous and in many instances reflected the failure of several important elements in a manager's procedural inventory (Folger and Bies, 1989.) These flaws were seen: as not giving adequate consideration to employee's viewpoints; not applying decision making criteria consistently across employees; not providing timely feedback to employees after decisions; not providing justification for the decisions and not treating employees with courtesy and civility. In these cases interactional justice comprising of interpersonal and informational experiences was seen as negative.

Many did not believe that appraisals improved job performance.

Performance related pay was seen as being too dependent on variable outside the individual's control. This was seen as unfair by many who were unclear as to how it could consciously increase organisational performance.

Union officials stressed the difficulties of measuring activities and placing similar value on different activities. Statistics were often seen as open to manipulation and distrusted. Rewards for individuals were seen as counter to the Unions belief in equity and objectivity.

Equity was a central issue in all our research findings. It was mentioned by almost every participant and was of equal concern for both managers and employees. Perceptions of inequalities arose in many areas but most concerns occurred in the areas of discipline, payment and trust. Anecdotes, observations, interviews and questionnaires constantly referred to fairness, unfair treatment, inequity; and most involved strong emotions concerned with self-worth. Anecdotes of workers taking action to balance the perceived inequity were also related (Adams, 1963; Porter and Lawler, 1968.) There was widespread evidence of pervasive cultural beliefs holding equity as a lynchpin of working life. "I would like openness and honesty." The belief that everyone should work hard represented the normative culture of our participants. Both managers and workers spoke at length about different standards of performance management and many expressed anger and frustration concerning the procedural and distributive justice of discipline in their workplace. "Nothing happens here if people aren't pulling their weight." Trust was a concern for many participants and there were many complaints about managers and their different agendas. Some managers also spoke about the need to build and establish trust. The lack of trust may influence behaviour at appraisals and result in appraisees withholding relevant information concerning personal weaknesses and staff relationships. This has implications for the effectiveness of performance management and appraisal.

Equity and trust were found to be highly valued but it was debatable if they existed other than as espoused theory at organizational level. The notion of equity had been expected to be an important aspect of this research but the overwhelming pre-occupation of the majority of participants has provided a rich source for future research and discussion.

Conclusions

Our research builds on previous research in the following respects:

- It places appraisal within a framework of organizational justice; perceptions of fairness are important in harnessing goodwill.
- There is little evidence of appraisal systems having a significant impact on the widening disparities between earnings within organizations. However, they can influence differential access to other rewards and benefits, and as a way to justify the allocation of tasks, which are often perceived as important.

- They are in many cases perceived as being procedurally unfair in terms of the Folger and Bies (1989) criteria. Inadequate consideration is given to employee views; there is evidence of bias, inconsistency, poorly justified feedback and a lack of honesty in the process.
- Our research confirms findings that appraisal reinforces power relationships and is often perceived as being open to abuse (Geary, 1992)
- Dissatisfaction with processes and the resulting distributive justice had a negative impact on employee perceptions of fairness and could act as a barrier to organizational effectiveness (Cook and Crossman, 2004; Greenberg, 2006.)
- It also may conflate development with control measures resulting in “privilege training rather than work based learning,” (Bennet.2006:14.)
- It ignores systems factors (Deming, 1986; Soltani et al, 2006), particularly relationships in teams and between teams and can work against the establishment of a quality culture. It often seeks to act as an agent to bolster managerial power rather than to enhance quality.
- The hostility towards appraisal comes from those carrying out appraisals as well as from those being appraised. Our research supports the case put forward by others that effective performance will not be obtained unless all dimensions of organizational justice are satisfied within the performance management system and that there is a strong argument for all stakeholders views to be incorporated in the system (Cook and Crossman, 2004; Suliman, 2007; Simmons, 2008.)
- The move by many organizations to management systems, which espouse teamwork and a shared mission, lies uneasily with an approach to performance management, which is reliant on individual appraisals. It is also ironic that many of these same organizations believe that performance related pay is congruent with a unitarist value system.

The notion that appraisal is “a bad idea and it doesn’t work” (Armstrong and Baron, 1998), held by many academics, is not always echoed by those who engage in the process.

Performance measurement is approached with caution by both appraisers and appraisees. There is a reluctance to play God (Newton and Findlay, 1996) on the part of appraisers and distrust on the part of those being appraised, arising out of marked discrepancies between rhetoric and reality. Measurement is perceived as inconsistent, subjective and political.

The introduction of Behaviourally Anchored Rating Scales, 360-degree appraisal, on-line self-assessment and competence-based appraisal may have gone some way towards improving the reliability, consistency and objectivity of performance measurement. Yet,

where appraisal attempts to fulfil the twin aims of measuring performance and developing people, a paradox still remains.

For decades adherents of the human relations movement have argued that organizations, with their emphasis on control systems, discourage the full participation of their members. This may well be detrimental to performance and could affect competitive advantage (Deming,1986; Wiese and Buckley,1998.) Organizational experience is often demotivating rather than empowering.

Few organizations have thought through the notion that the development of teams and individuals is a key component of corporate strategy, and embedded it in all aspects of the organisation. The idea that individuals need to be controlled dies hard. If a control philosophy permeates notions of empowerment, personal development and lifelong learning it will render both control and development ineffective.

Too often appraisal interviews attempt to achieve both aims – to control performance and develop the individual. The two are clearly incompatible. The ritual charade of measuring performance may foster a cynicism about identifying areas for personal development.

Contribution

Our research clearly indicates that both managers and employees see a potential for appraisal, which is rarely achieved in practice. If the sole purpose of appraisal is to encourage personal and professional development, then the appraiser will act as counsellor, adviser and coach. This is almost universally seen as desirable and effective in gaining commitment. If, at the same time, the appraiser also acts as a judge or evaluator, then commitment degenerates into resigned compliance with widespread resentment and perceptions of inequity. Our research also confirms the findings of others most significantly in terms of reinforcing perceptions of dishonesty, mistrust, inequity and managerialism. Happiness and stakeholder interests are not addressed and appraisees are often left feeling aggrieved.

Organisations are purposive entities. They have goals and need to measure the achievement of those goals. But, weighing the calf does not fatten it. Indeed, the trauma of the measurement process may hamper development. Creating an environment where individuals can grow and develop is enhanced by appraisals designed for that purpose. Measurement of individual performance is of dubious relevance in team working environments. Judgements, about how individuals contribute to teams, are perhaps best made by teams themselves. Individual appraisal interviews are best suited to counselling and identification of development needs. Certainly, the inclusion of performance measurement clouds the process and leads to cynical beliefs about organisational value systems. If appraisal is to contribute to the achievement of an organisation's goals, then the organisation needs to be clear about why appraisal is in place and how it fits with strategy, culture and philosophy. Appraisal has to be fair and above all, it needs to be seen to be fair.

PORTUGUESE AND INTERNATIONAL ONLINE CONSUMERS OF WINE: A NICHE MARKET?

Santos, José Freitas¹; Ribeiro, José Cadima²

Abstract

Online retailing is growing rapidly; according to all estimates, it will account for a significant percentage of retail sales in the future. Shopping online has become part of some consumers' daily lives. For producers of wine, an online store is an important channel through which to provide product information and offer direct sales to their customers. In a hyper-fragmented industry, such as the wine industry, finding new niche markets could be a powerful tool in gaining a competitive advantage.

This paper investigates the Portuguese online consumer of wine using a survey to describe and analyse the main characteristics, buying habits, motivations, influences, and overall satisfaction of the Portuguese online consumers of wine. A comparative analysis with international online wine consumers assesses differences based on nationality.

Keywords: Online consumer behaviour, Portuguese and international online wine consumer, niche markets

Introduction

Portugal is known worldwide for its Port wine, which is produced in the northern part of the country and bottled in the city of Porto. However, other quality wines are produced all over the country and their importance to the domestic economy is undeniable in terms of both domestic consumption and exports. Invited by a group of Portuguese firms (public and private) to study the competitive advantages of Portugal, Porter (1994) identified this sector as a cluster and suggested emphasizing grape quality, firms' long-term investment, professional management, and quality certification; selecting target countries (the UK and the USA); studying consumer behaviour; increasing the number of super-premium wines; and protecting the Portuguese brand to improve its competitiveness (Monitor Group, 2003).

A possible source of competitive advantage for Portuguese firms is product differentiation. Product differentiation advantages derive from the product's physical properties and attributes that customers regard as unique (Balabanis, Mueller and Melewar 2002; Nicholls et al., 2003). Wine is a highly differentiated product but it faces intense competition in the main export markets (Stricker, Sumner and Mueller, 2003). The focus of the strategy is to build competitive advantage in narrow segments of a market using differentiation characteristics

with niche suppliers, primarily catering to speciality product demands (Porter, 1985; Hassan and Katsanis, 1991; Grant, 1993).

In the wine industry, a competitive advantage requires, on the demand side, international recognition of the wine's quality (or its image or reputation) and, on the supply side, a local collective dynamic of appropriation that qualifies the wine, either by the modification of an intrinsic characteristic (such as taste) or an extrinsic characteristic (such as packaging or labelling information). The success of this strategy depends upon the market's recognition of the wine (identity, specificity), the sustainability of the competitive advantage acquired (brand name, protection of the product's origin) and the ability of firms to appropriate the rents earned.

In the past two decades, an increasing number of Portuguese firms have produced and sold high-quality wine to foreign markets. The success of these firms is greatly facilitated by regional specificities, such as soil, climate, history, geography, culture, and local know-how, all of which confers a competitive advantage on Portuguese wines. One classic example is Porto wine, which has been marketed by Portuguese firms as *sui generis*; most Porto wine originates from the Douro region, where the soil, climate, and expertise are unique. However, some Portuguese firms are evolving from this classical approach to exploring niche markets, including the online wine market, to find new consumers. Shopping online has become part of some consumers' daily lives. An online store is an important channel through which to provide product information, conduct direct sales, and expand domestic market.

Based on the results of an online survey, this paper describes the characteristics of online shoppers and buyers and analyses the profile of this niche market in order to reveal developing opportunities to potential operators. Consumers' motivations for shopping online and their attitudes regarding e-commerce are also investigated in order to reveal online shopping behaviour. This study can help Portuguese firms interpret some of the key issues behind e-commerce and to apply the experiences from operating in this niche market to other products characterised by similar conditions.

Section 1 briefly discusses the concept of niche marketing in the context of the wine industry and provides examples of new niches in the Portuguese market. Section 2 provides some empirical evidence about online consumer behaviour, while section 3 assesses the profile of the international online wine consumer, online wine-purchasing behaviour, online purchasing patterns versus offline ones, and the main influences in the decision process. Section 4 presents the research methodology used in the study. Section 5 examines the results of a Portuguese survey in terms of the profile, buying habits, motivations, influences, and overall satisfaction of online wine consumers. Finally, we discuss our findings and advance the marketing and policy implications that can be drawn from the results of the study.

Niche Markets in the Wine Industry

Today's consumers are more selective and seek a greater variety of choices than ever. This change opens new opportunities for high-quality regional products and for a large range of small producers who want to reach niche markets. A niche is a micro-market consisting of a small group of consumers with similar characteristics or needs. Carving out a niche whose unique needs are not fulfilled requires niche marketing, which involves positioning a product into small, profitable, homogeneous market segments that have been ignored or neglected by others. This positioning is based on the integrated marketing concept and the distinctive competencies the company possesses. However, many small firms struggle, not with whether to use the integrated marketing concept, but with how to tailor the concept to fit each segment and how to make it work (Hunerberg, 1993; Dalgic and Leeuw, 2006; Cuthbert, 2008).

In the wine industry, niche markets exist (or can be created) based on unique product attributes and consumers' desires and preferences. To stay competitive, firms must know their consumers and their needs and be able to deliver products properly targeted to selected markets. To add value based on the consumer perceptions of the product, the firm can customise its products to meet consumer expectations, make new products to serve a market not well served, or improve marketing and sales by focusing on perceived quality or other service characteristics.

On the supplier side, segmentation analyses can be used to disaggregate a market into narrowly defined segments so their structural characteristics can be studied to appraise their attractiveness. The wine industry can be segmented based on many intrinsic and extrinsic wine attributes. Some of the most basic distinctions are region of origin (Alentejo, Douro, Dão) and the colour (white, red, rosé) or type of the wine (maduro, verde). A more refined distinction is based on the grapes used (domestic, foreign) or special references (harvest date) (Freitas Santos and Cadima Ribeiro, 2008). For example, in order to appeal to young consumers and women, the Portuguese firm Sogrape launched its first rosé wine variant in over sixty years in 2005 in the United Kingdom. Mateus Rosé Tempranillo is a single varietal wine that represents the culmination of over two years' investment as part of a focused effort to attract 20-35-year-old wine consumers by supplying a rosé with a colour, aroma, and taste geared specifically to them (www.talkinretail.com).

Another Portuguese firm, José Maria da Fonseca, recently launched Twin Vines, a new wine from the Vinho Verde region in the northern part of Portugal, which was designed specifically for the American market. Twin Vines is a lightly sparkling and refreshing dry white wine, a young and aromatic wine characterised by a low alcohol level, a good fruit-acid balance, and good value (Dentinho, 2008). Adega Cooperativa Regional de Monção, one of the largest Portuguese cooperative producers, launched its first rosé, Muralhas de Monção, which is made from a blend of indigenous local grapes. According to the president of the

cooperative, “initial responses have been very encouraging” (www.avenuevine.com). Even one of the oldest Port wine Portuguese producers (Croft) has complemented its portfolio of Port wines with Croft Pink, an innovative rosé Port wine (www.theportwine.com).

On the customer side, consumer characteristics and behaviour can be a powerful source of market segmentation if customer desires and preferences can be identified. Variables such as income, education, gender, age, wine knowledge, wine involvement, consumption frequency, preferred price level, preferred alcohol level, and preferred sweetness level are only examples of basic demographic characteristics and preferences that can be explored in segmenting wine consumers (Mueller and Umberger, 2009). For example, in the United States, the Millennial, or Echo Boomer, segment could be targeted by the wine industry because it has reached the drinking age range of 21-28 and has considerable size and buying power (Thach and Olsen, 2006). Another example is the South African wine consumer, whose key segmentation variables are age, gender, income, race, and wine drinking history (Ndanga, Louw and Rooyen, 2009); in addition, the black middle class differs from the white middle class, and several segments exist within the ‘Black Diamonds’.

Research in the area of consumer behaviour has established that consumers go through a sequence of stages in making buying decisions, including problem recognition, search for information, evaluation of alternatives, purchase decision, and post-purchase evaluation (Turban, 2002; Gebauer and Ginsburg, 2003). This process is influenced by the type of purchase and the extent of involvement in the purchase decision (Venkatesan, 1987; Turban, 2002; Fahy, 2006). Consumer buying behaviour is also influenced by consumer’s internal variables, such as motivation, perception, learning capacity and memory, attitudes, personality, and self-concept), and by socio-cultural variables, such as culture, subcultures, social class, social groups, family, and personal influence). These variables influence the ways in which the consumer proceeds through a decision process related to product acquisition (Loudon and Bitta, 1988; Turban, 2002).

Based on some of these variables, Wine Intelligence (2006) identified the characteristics of five consumer groups: i) adventurous connoisseurs (high-income broadsheet readers, high frequency, high spend, high wine involvement); ii) mainstream at-homers (suburban middle-income professionals, high frequency, average spend, high wine involvement, consumption mainly at home); iii) weekly treaters (younger singletons, low frequency, above average spend, moderate wine involvement); iv) sociable bargain-hunters (prosperous empty-nesters, high frequency on-trade, low spend, and low to moderate wine involvement); and v) frugal conservatives (low-income TV viewers, low frequency, low spend, low wine involvement).

This literature review raises the following question: can online wine shops be treated as a market niche?

The attractiveness of a niche is dependent on the following criteria: i) sufficient size of the market (estimated number of potential consumers), ii) purchasing power of the targeted

consumers, iii) market growth potential, and iv) negligible interest to competitors (Shani and Chalasani, 1992). The most appropriate variables in identifying niche markets are those that yield the most distinct criteria. The products offered tend to be higher-value specialty products directed to specific markets that value the unique attributes of a product with limited volume supply.

Online Customer Behaviour: An Empirical Review

The estimated number of internet users continues to grow rapidly. By the end of 2007, worldwide figures indicated that an average of one out of five people was online (ITU, 2009). In the 27 countries of the European Union, 83 percent of individuals who lived in a household with broadband access in 2009, with Portugal below the average, at 65 percent, and Sweden (95 percent), Denmark and Norway (94 percent) registering the highest percentages (Eurostat, 2010). Broadband is important as many of the most effective applications and services are available only through a high-speed internet connection.

The increasing number of online transactions has led many firms to take advantage of this new distribution channel. Automated buying profiles, networked buying clubs, and online auctions are only some of today's technologies. However, competing in this market space is very different from competing in the conventional marketplace: price comparisons are easy to do, relationships between buyer and seller are mediated by personal computer screens, and transactions are based on information about the product rather than on its physical appearance. Consumers and producers have flexible, fast, and inexpensive ways of participating in the market for products around the world; individual customers can approach the virtual marketplace in many different ways as the variety and depth of information speed up the decision-making process.

The literature has shown that technical expertise, online shopping familiarity, shopping intention (hedonic or utilitarian), time spent online, risk perception, income, age, gender, education, and product tangibility all influence the behaviour of internet shoppers (Sorce, Perotti and Widrick, 2004). These authors also tested the proposition that internet shopping behaviour is different for positive reinforcement products than for negative reinforcement products and concluded that people four times as likely to shop online for products that provide primarily positive reinforcement. For the purposes of this study, wine is considered a positive product because it generates enjoyable experiences for consumers.

A more recent review of literature (Zhou, Day and Zhang, 2007) found that online consumers tend to be more convenience-oriented, that shopping intention is adverse to perceived product risk, and that previous satisfaction has a positive effect on online shopping tendency. Other research has reported that goal-directed buying is facilitated online specifically because of convenience and accessibility, a unique and broad selection of products, the availability of accurate and comprehensive information, and the lack of sociality from salespeople, retail workers, spouses, and kids (Wolfenbarger and Gilly, 2008).

In the online environment, instilling trust in the consumer is critical because the perception of risk regarding products and transactions is very high. According to Quinton and Harridge-March (2008), there is a difference between the elements of trust that consumers use to determine whether to purchase wine online and the elements of trust they use offline.

Morgado (2003) proposed a model with customer characteristics, motivations and attitudes as predictors of purchase by Brazilian consumers and tested it with data from a survey. Results of this study showed that the socio-economic profile of online consumers was higher than that of non-consumers (buys more digital goods, is well educated in English, travels to foreign countries). The Brazilian online consumers were more oriented toward convenience/utility and used the internet for e-banking and to search information about products and services (prices and promotions). Brazilian online consumers also had a positive attitude toward the internet and were less worried about security and privacy and more willing to accept direct marketing than other consumers were. Motivational factors also played a key role in determining time spent on product searching and online shopping (Zhou, Day and Zhang, 2007).

The online wine consumer experiences some problems when attempting to purchase wine, such as the heterogeneous state laws regulating wine shipments, taxation, and age verification and the great diversity of the wine industry (Sheridan et al., 2009). Transport costs can also be an impediment for a growing diffusion of e-commerce in the international markets, as costs can attain around 40 percent of the total price per bottle of the wine (Stricker, Sumner and Mueller, 2003). Additional complexities arise because there is little similarity between selling books, CDs, suits, fruits or furniture online and selling wine (Gebauer and Ginsburg, 2003; Fahy, 2006). "Quasi-commodity products" and "look-and-feel goods" or "tactile goods" are purchased in a two-step process, and they require some hands-on experience by the user to access their quality (Gebauer and Ginsburg, 2003, p.63). During the first step, consumers select the product by its functionality or general features, based on information provided. A more refined selection based on brands or predefined intrinsic or extrinsic product cues and the shopping, itself come later.

Price competition and the importance of trust are also distinctive for online wine sales. For example, Brynjolfsson and Smith (2000) found that price dispersion (differences) among internet sellers was wider than expected. The same authors also found that one of the ironies of online selling was that, far from being a great equalizer of retailers and eliminating the need for branding, the internet heightens the importance of differences among retailers in terms of dimensions such as trust and branding. Similarly, Degeratu et al. (2000) found that, in some product categories, the importance of brands was greater online than offline, possibly because consumers use the brand name as a surrogate for the attributes for which information is missing or is costly to obtain (Degeratu et al., 2000). Thus, brands become more

relevant in the choice of sensory product attributes (e.g., tactile goods) than in the choice of non-sensory ones (e.g., commodities).

In addition, contrary to what was expected, the move to online markets did not necessarily result in market disintermediation (Stricker, Sumner and Mueller, 2003). This has been particularly true in the case of wine, where most wineries, large and small, did not choose to do direct marketing on the internet, as evidenced by the Australian, Italian and German cases (Stricker, Sumner and Mueller, 2003; Vecchio, 2009). That is, it is one thing to provide product information on the web and link consumers to traditional retailers and quite another to sell wine directly to final consumers using the online channel. As Vecchio (2009) explained, most Italian producers use their websites primarily as a sort of online catalogue and, in the worst cases, do not update the catalogue frequently.

Therefore, although the internet is often thought of as an new “world of opportunity”, following Vecchio (2009, p. 2), “the promises of the internet as a platform to reach new outlets, markets of global dimension, virtually infinite product selections, intimate customers relationships, low cost and streamlined distributions chains [...] have largely been dissatisfied”, in the wine industry, at least. However, this distribution channel does have a large business potential, part of which comes from its singular attributes and nature.

The International Online Wine Consumer: Results from a Survey

While the use of the internet has been increasing in the last years in the households of the European Union, there are differences among the European countries in terms of i) internet access and online shopping, ii) attitudes by age group and country, iii) preferences regarding online acquisition of products and services, and iv) logistic and legal constraints to cross-border internet shopping (Eurostat, 2008a; 2008b).

A survey conducted online between April 24 and May 12, 2007, by Vizu (2007) was used to develop a profile of the online wine consumer and assess wine purchasing behaviour, purchasing patterns (online versus offline), and purchase influences. Based on these results the online wine consumer can be characterised as follows: 20.3 percent are heavy consumers who drink wine daily, 33.2 percent are regular but less frequent wine drinkers (weekly, monthly), and 46.5 percent, the largest segment, drink wine rarely. Moreover, nearly half (45.7 percent) of the consumers buy their own wine, while 28.2 percent receive it as a gift of friends or business acquaintances. The members of the responders’ families (e.g., spouses) are less involved in wine purchasing than the responders are.

According to the survey, the online wine market remains small (Vizu, 2007), accounting for only 17.2 percent of wine consumers, with a subset of 7.1 percent that buy wine online daily or weekly. A majority of consumers kept an interest in buying more at traditional points of sale, rather than online; only 9 percent claimed to shop for wine more often online than offline.

The three main reasons for buying wine online were convenience (easy accessibility to a shop through a click), a broad selection of wines, and lower prices. The shipping was the largest obstacle to online trade, with a combined 46 percent of respondents citing shipping cost, time, or state restrictions as reasons for not purchasing wine online. Other impediments were lack of trust in the seller, the quality of the wine, and security of the transactions made online (Vizu, 2007). These results were in line with those of previous empirical research. Security reasons were also pointed out by 30 percent of the E.U. respondents, who had the opinion that carrying on transactions over the internet was “not really safe” or was “not safe at all” (European Union Commission Representation in Portugal, 2009b). In Portugal, the figures were similar, where 23 percent felt that online shopping was “not really safe” and 12 percent considered it “not safe at all”. The level of risk avoidance, that is, the percentage of those who said they did not carry out online transactions in order to avoid financial risk was 42 percent, both in the Portuguese and in the E.U.27 countries (European Union Commission Representation in Portugal, 2009b).

An E.U. Commission report (European Union Commission Representation in Portugal, 2009a) specifically addressed the issue of logistic costs and border trade barriers and found that, even though online trade has increased markedly in recent years, several barriers still exist. This could explain why border trade in 2008 did not exceed 7 percent of all online exchanged goods in the European Union, a figure quite close to the 6 percent registered in 2006 (European Union Commission Representation in Portugal, 2009a). However, more than just the logistic infrastructure explains this poor performance. Other factors include language differences, national market regulations and taxes applied to products, and consumer confidence in the market’s operators. As a result, the European Union Commission has pursued new laws and procedures regarding this trade channel. As Viviane Reding, the European Commissary for Information Society and Media, declared, “If one wishes consumers to shop through and take full profit from digital communication technologies, we have to be able to convince them that their rights are guaranteed” (European Union Commission Representation in Portugal, 2009b).

When purchasing wine online, consumers can be influenced by many factors. Personal recommendations by friends were the most influential factor (26.4 percent), followed by restaurant experiences (13.9 percent). Experts’ wine ratings and online and print reviews/recommendations, in aggregate, had the second-largest influence on purchase behaviour. Advertisements and the opinions of retailers (online and offline) were considered of less importance (Vizu, 2007).

Most respondents spent about the same amount of money per purchase, whether they shopped for wine online or offline. When there was a difference in spending, twice as many spent less money per purchase online than offline. This gap shrinks on a per bottle basis. There was no dominant online channel for wine purchases. Winery web sites were slightly

preferred over other sites (17.9 percent), such as online wine clubs (10.8 percent) or online wine shops (11.8 percent). The majority of online purchases were for personal consumption (13.7 percent) or gifts to offer to friends, family and acquaintances (Vizu, 2007).

Online wine shoppers searched for information via a wide variety of sources. The most important source of information was wine retailers (29.6 percent), whilst web blogs, community sites, and chat rooms were less researched. The type of online wine information most trusted by wine shoppers—by a wide margin—was user reviews and experts' ratings (73 percent). In some cases, the marketing of wine by online wine shops was made through interactive and rich media in order to boost sales by adding the excitement of virtual and video tasting (35.2 percent). Chatting with winemakers was also used to promote wine online. Celebrity endorsements hold little sway over wine shoppers, with four out of five respondents giving celebrity picks no weight in their purchase decisions (Vizu, 2007).

These results indicate two of the most important characteristics that define a niche market: a small size (no more than 24.3 percent of the survey sample indicated that they were regular online buyers) and similar needs (convenience, broad selection of wines, and low prices). To examine these results in terms of the Portuguese online wine consumer, we fielded our own survey.

Methodology

The information previously provided regarding the profile, attitudes, and motivations of the international online consumer is surely useful in understanding the situation and prospects of the online Portuguese market. Two types of online shops exist in Portugal: the general online shop, which is an extension of the main retailing groups (Continente, Jumbo or El Corte Ingles); and the specialized online shop, which sell wines as their main business. This exploratory study examines the characteristics of the Portuguese online wine consumers and assesses their shopping behaviours and preferences. The survey was conducted in an online wine Portuguese shop during the last three months of 2009. The questionnaire contained three groups of questions: questions about demographics, such as gender, age, income, and education; questions about the use of online wine shops (buying habits, satisfaction); and questions about motivations and the factors that influence online buying behaviour. The questionnaire was delivered to regular and new customers when a transaction was processed online. Of the 82 questionnaires received, 74 were sufficiently complete to be used in the study.

A descriptive statistical analysis of the completed questionnaires helped us to put into perspective the online buying habits of the Portuguese consumer, their motivations for buying online, the main influence factors behind their decision to buy online, and their satisfaction with online wine shopping. The viability of producing a comparative analysis between the international and the Portuguese wine online consumer restricted our use of some questions, as the two surveys were used for different goals.

The Portuguese Online Wine Consumer: A Survey

Internet access in Portugal is used primarily to search for health information; to read online news, newspapers, or magazines; to interact with public authorities; or to access home banking. According to 2008 data, the most common goods acquired by online shoppers were travel and holiday accommodations, clothing and sporting goods, and books, magazines and e-learning. These internet uses were ranked similarly in other European countries (Eurostat, 2008a; 2008b).

A market study conducted by Netsonda (2009) in Portugal, addressed to a panel of online shops, found that the main products and services sold through the internet were electronics and mobile phones (41.2 percent), CDs and DVDs (35.2 percent), games/play stations, informatics (26.5 percent each), and books/magazines (20.6 percent), amongst many other products and services. The Nielsen consultancy company (2010) estimated that more than 160 thousand Portuguese homes use the Internet to buy consumer goods, although such online purchases are more common in Lisbon and Porto, where 7.8 percent of the households shop on the Internet, than in rural areas. Over four percent of households in continental Portugal made online purchases of consumer goods between June 2008 and May 2009.

Data from the European Union (Eurostat, 2008a) show that e-shoppers in Portugal were no more than 10 percent of all individuals and that most belonged to the 16-74 age cohort. This figure makes a strong contrast with the E.U. average of 32 percent of population's doing online shopping, not to mention the cases of countries like Denmark, the U.K. or Sweden, where more than half of adults shop online. However, the data for Portugal represented significant progress, with the percentage of online shoppers doubling since 2004.

Similar to the general European data, the most represented age group among e-shoppers was those 25-34 years old, followed closely by those 16-24 years old and those 35-44 years old. As expected, the oldest generations showed just a residual wish (or capacity) to use this shopping channel. According to Netsonda (2008), the average general Portuguese online consumer was male (52 percent), young (70.3 percent were between 25 and 64 years old), well educated (37.5 percent had a secondary education and 49 percent had higher than secondary education), urban (small, medium and big cities represented 83.5 percent of online shoppers), living in small families (two or three members per household), with a moderate level of income (more than 60 percent earned between €10,000-€50,000 annually). In 2009, the Portuguese online consumer preferred to access the Internet from home (39 percent), while the workplace and school accounted for lower figures (20 percent and 8 percent, respectively).

Table 1 – Characteristics of the Portuguese online wine consumer

Variables	N. ^o (n = 74)	%
<i>Gender</i>		
<i>Male</i>	65	87.8
<i>Female</i>	9	12.2
<i>Age</i>		
16 – 29 years	8	10.8
30 – 39 years	27	36.5
40 – 49 years	32	43.2
>= 50 years	7	9.5
<i>Education</i>		
< 9 years of school	1	1.4
9 – 12 years of school	8	10.8
Higher Education	58	78.4
Post-graduation (Master's, PhD)	7	9.5
<i>Family Income (monthly)</i>		
<=1,000 Euros	1	6.8
1,001 – 3,000 Euros	27	36.5
3,001 – 5,000 Euros	34	45.9
5,001 – 7,000 Euros	6	8.1
>= 7,000 Euros	2	2.7
<i>Internet Access from:</i>		
Home	48	64.9
Work	22	29.7
School	4	5.4

The results of the Portuguese study (Table 1) show the differences between the general online consumer and the online wine consumer. The prevalence of males (87.8 percent), younger age cohorts (79.7 percent between 30 and 49 years), more educated people (78.4 percent have a higher education degree) and wealthier people (82.4 percent have an average monthly income between 1,000 and 5,000 Euros) differentiate the Portuguese online wine consumers from the online consumer of general goods. Moreover, this specific consumer tends to access the online wine shop mostly from home (64.9 percent).

The Portuguese online consumer of wine is not a heavy customer (Table 2), as the number of total transactions is relatively small (Less than ten percent have made more than fifty transactions). This explains why most visits are made on a monthly or semester basis. When a product is very specialized, as wine is, shoppers' tendency is to concentrate in one transaction, which is time-consuming to perform. This adds to the fact that shops frequently promote delivery costs according to the quantity of goods purchased, which tend to increase the total amount of the transaction (by an average of 41.9 percent, or between €101 and €150).

If we compare these results with those of Vizu's (2007) survey, considering only the consumers who buy wine online (daily, weekly, monthly, a few times a year), we see that the majority (59.5 percent) of the Portuguese consumers shop online just a few times a year, while

a large percentage of international wine online buyers make such purchases daily (almost 25 percent) or weekly (20.3 percent). Looking to these differences, we can infer that there is space for promotional campaigns conducted by the Portuguese online wine suppliers to induce the frequency of acquisition, the average amount of the orders placed, and the total number of transactions delivered. A reduction in transaction costs could also be used as a strategy to attract new consumers and create additional motivation to shop wine online.

Table 2 – Online Portuguese wine consumers' buying habits

Variables	N. ^o (n = 74)	%
<i>Frequency of buying wine online</i>		
Week	4	5.4
Month	26	35.1
Quarter	23	31.1
Semester	16	21.6
Annual	5	6.8
<i>Number of transactions</i>		
Fewer than 10 transactions	6	8.1
11-20 transactions	25	33.8
21-50 transactions	36	48.6
More than 50 transactions	7	9.5
<i>Average amount for transaction</i>		
Less than €50	5	6.8
Between €51 and €100	26	35.1
Between €101 and €150	31	41.9
More than €150	12	16.2
<i>For whom do you usually purchase wine</i>		
Myself	53	71.6
Closer friends and family	18	24.3
Business and casual acquaintances	3	4.1
<i>Occasion of consumption</i>		
At meals	47	63.5
On special occasions	18	24.3
Occasionally	9	12.2

Portuguese consumers buy wine online primary for their own consumption (71.6 percent) and less for friends or business acquaintances. If we consider only those who buy wine online, this result is similar to the one attained through the international consumer survey. This result indicates that nationality does not significantly explain the attitudinal differences found in terms of purchasing wine. Portuguese online wine buyers consume the wine predominantly at home, during the meals (63.5 percent), and on special occasions of social interaction (24.3 percent).

Table 3 shows that convenience is the main motivation for buying wine online. In fact, convenience is the only factor that no respondent included in the “less important” category, and it scores the highest statistical average of all available responses (2.78). A wide selection of wines offered by the online shops seems also to be very important for the consumer, while lower prices and promotions (with average scores of 2.35 and 2.32, respectively) follow behind. In the international survey, convenience and lower prices were among the more important motivational factors. Selection of wines by experts ranked worst in the Portuguese survey.

Table 3 – Motivations for buying wine online

<i>Variables</i>	<i>Less Important</i>	<i>Important</i>	<i>More Important</i>	<i>Mean (a)</i>
<i>Convenience</i>	0 (0.0)	16 (21.6)	58 (78.4)	2.78
<i>Selected wines</i>	17 (23.0)	24 (32.4)	33 (44.6)	2.22
<i>More choices of wines</i>	13 (17.6)	20 (27.0)	41 (55.4)	2.38
<i>More information about wines</i>	38 (51.4)	31 (41.9)	5 (6.8)	1.55
<i>Lower prices</i>	11 (14.9)	26 (35.1)	37 (50.0)	2.35
<i>Security in payments</i>	10 (13.5)	61 (82.4)	3 (4.1)	1.91
<i>Promotions</i>	15 (20.3)	20 (27.0)	39 (52.7)	2.32
<i>Anonymity</i>	13 (17.6)	46 (62.2)	15 (20.3)	2.03
<i>Delivery at home</i>	22 (29.7)	21 (28.4)	31 (41.9)	2.12

Note: (a) Less Important (1), Important (2), More Important (3).

Information about wines is ranked lowest in importance, at 1.55, so online consumers may have more knowledge about wine than the average offline consumer does. Security of payments is also of little importance in e-commerce since technology improvements in online transactions are providing consumers more security. Anonymity does not play an important role in the possibility of ordering wine online.

The e-consumer denotes that price is important (2.38), as are promotions (2.22), albeit to a lesser extent (Table 4). Loyalty to brand and/or region of origin is reported as having the most influence (2.61) on the e-shopper. The same conclusion, but for traditional retailing, was obtained by Freitas Santos and Cadima Ribeiro (2008), who found that region of origin and brand were the dominant factors in the acquisition of high-quality Portuguese wine. This factor is important regardless of the point of purchase.

Expert recommendations and online advertising have a minor influence on Portuguese purchasers of wine online, confirming the result obtained for the international online wine consumer (Vizu, 2007). These factors tend to be undervalued by the consumers, perhaps because they have sufficient knowledge of the product before purchasing online.

Table 4 – Main influences of wine e-shoppers (n = 74)

Variables	Less Important	Important	More Important	Mean (a)
Expert recommendation	45 (60.8)	20 (27.0)	9 (12.2)	1.51
Price	13 (17.6)	20 (27.0)	41 (55.4)	2.38
Past experience	9 (12.2)	36 (48.6)	29 (39.2)	2.27
Promotion	21 (28.4)	16 (21.6)	37 (50.0)	2.22
Online shop recommendation	12 (16.2)	26 (35.1)	36 (48.6)	2.32
Advertising online	58 (78.4)	12 (16.2)	4 (5.4)	1.27
Friend's recommendation	17 (23.0)	31 (41.9)	26 (35.1)	2.12
Loyalty to brand/region of origin	6 (8.1)	17 (23.0)	51 (68.9)	2.61
Experience of new wines	31 (41.9)	26 (35.1)	17 (23.0)	1.81

Note: (a) Less Important (1), Important (2), More Important (3).

The satisfaction in this specific type of online shopping (Table 5) is high, as almost 80 percent of the Portuguese online consumers of wine report being satisfied or totally satisfied with the process. Overall satisfaction, measured as the sum of the positive points (satisfy + totally satisfied), is also very good, attaining a total of 87 positive points.

Table 5 – Satisfaction with online wine shopping

Variables	N. ^a (n = 74)	%
Satisfaction with shopping		
Totally unsatisfied (-2)	1	1.4
Unsatisfied (-1)	5	6.8

Conclusion

Online retailing is growing rapidly and, according to all forecasts, will account for an important percentage of retail sales in the future. The online wine market can be considered a niche because of its small size: in an international survey, only 17.2 percent of wine consumers made use of this channel, and just a subset of 10.9 percent could be considered regular online wine buyers. Our empirical research did not include information about the size of the Portuguese online wine purchasing market, but the size of the online market in Portugal was estimated at between 4.3 percent, according to Nielsen (2010) data and 10 percent, according to Eurostat (2008a) data, of the overall consumer market. In any case, this

niche remains domestic, even in the European Union, because of legal issues like age verification and because of tax differences and transportation costs.

From the available literature and the empirical evidence provided, we can conclude that wine producers and specialized retailers are beginning to succeed in using internet technologies and associated marketing techniques, even if mostly for direct marketing rather than for selling online. In any case, to be effective in the online wine market firms need to know better the characteristics of the wine e-consumer.

As our empirical study shows, this segment is composed mainly of young, male, well-educated, high-income consumers who buy wine online from home. They tend to concentrate their wine orders, so their purchases are often more than a month apart. The main reason for their purchase is personal consumption. In addition, they are motivated by convenience, a wide selection of wines, availability, and price. As decision factors, they value the origin/brand of the wine, the price, the recommendation of the online shop, and their own experience. Overall, they are very satisfied with shopping for and buying wine online.

We recommend that before defining a strategy an examination of market partners (wine firms, delivery agents), wine offerings (selection of wines), and the communication mix (promotions, advertising) should be made in order to target this niche. Qualitative market research may also be needed in order to position the online seller optimally. The identification of specific online wine consumer segments in the niche market is another step, as is identification of the critical (minimal) size of the segments that should be taken into consideration. Finally, the process of approaching the opportunity of operating in such markets should include adapting the online shop's marketing mix to the special needs of wine consumers.

For example, a strategy that targets the premium segment of online wine buyers would include retaining hard-to-find and very high-quality wines, which will differentiate the shop from the mass market of traditional retailers (hypermarkets and supermarkets). On the other hand, if an online wine shop wants to target the segment of price-oriented consumers, the shop should offer better prices than offline shops do. Some online sellers are already promoting zero delivery costs when the order exceeds a certain amount, but they need to be more selective in the marketing-mix to attract new consumers.

To the best of our knowledge, this is the first Portuguese study made of the online wine market. As a first approach, as with all first attempts, it suffers from several limitations. One limitation results from the difficulties encountered when approaching the market operators, as few online shops are available to collaborate with research. The size of the sample reflects this limitation, and a small sample size can contain bias in terms of consumer demographics. Another problem found has to do with the comparability between the two surveys from which results are taken, as they were conducted at two different times (2007 versus 2009)

using different ways of collecting the data (online versus offline), and they included questions that were not exactly the same.

Further studies are needed to assess the impact of e-commerce on traditional retailing in Portugal, particular as regards the best-selling online products, such as software, games, music, movies. Comparing online habits, motivations and influence factors behind the market success of different types of products could help online wine stores to adjust their marketing mix to the needs of consumers.

**MEDICAL DOCTORS' PERCEPTIONS OF INFLUENCES ON PRESCRIBING
BEHAVIOUR AND THE IMPLICATIONS FOR SALES AND STRATEGIC
MARKETING PRACTICES IN THE PHARMACEUTICAL INDUSTRY**

Scott, Peter¹; McIntosh, Annette Elizabeth²; Stokes, Peter³

1Liverpool John Moores University, United Kingdom

2Faculty of Health and Social Care, University of Chester, United Kingdom

3Chester Business School, University of Chester, United Kingdom

Abstract

To determine the influences on doctors' drug prescriptions and the implications for strategic sales and marketing practices in the pharmaceutical industry.

The paper adopts an interpretive methodological approach and analysis. Data were collected using semi-structured interviews with a regionally located group of selected doctors (n=11) in Cheshire and the Wirral, United Kingdom.

The paper identified the powerful role of macro-national government health care structures on prescription medical doctors' decision-making. It also identified the questionable and diminishing role of sales representatives for the pharmaceutical industry.

The findings showed that, in contrast to findings under earlier structures, macro-organizational bodies such as Primary Care Trusts (PCTs) were the most commonly mentioned influence on the doctor's (hereafter termed GPs') medicine prescribing behaviour alongside cost considerations and drug budgets. In relation to previous studies in the field, the participants' views on the most important influence noted that PCTs and costs were indicated as significant as were clinical judgement and autonomy, with some resentment evident about a perceived loss of autonomy by GPs. Moreover, the influence of the government's drug accreditation body, the National Institute for Clinical Excellence (NICE), also appeared to have developed while the role and influence of the pharmaceutical industry and its sales representatives seemed to have declined.

The paper provides a valuable insight into the under-researched nexus of two paradoxically well-known organizational sectors – the interface of pharmaceutical marketing in relation to GPs. With regards to limitations, the paper recognises that, due to the challenging nature of access and confidentiality issues, it is based on a necessarily small sample size. Equally, the study takes place in a sector that is notorious for its ever-shifting context driven by governmental policies and changes.

The insights generated by the paper offer highly significant insights and impacts for providing enhanced understanding for medical doctor prescribing practices,

pharmaceutical sales and marketing strategy practices against the context of the dynamic changing organizational environment constituted by governmental health regimes.

Health care is a centrally important concern in all human societies. This research helps develop understanding in relation to marketing practices and environments at the micro-level doctor prescription/sales and marketing representative interface.

While there is significant research that has been in healthcare realm this has been less the case through an organizational and marketing perspective. The paper provides a rare insight into the doctor/pharmaceutical representative interface and interaction.

Keywords: Strategic Marketing, Pharmaceutical Sales and Marketing.

Introduction and Background: Health Care Organizational Structures and Pressures on Prescribing Behaviour

The background to this study encompasses a consideration of the sales and marketing activity of pharmaceutical industry representatives in relation to the family doctor medicine prescribing behaviour in the UK. Family doctors, in the UK context, are known as 'general practitioners' (hereafter referred to as GPs) and work within the National Health Service (NHS) framework of the United Kingdom.

It will be valuable to provide some background to the organizational structures within which GPs and pharmaceutical sales representatives are situated. When the NHS first came into existence in 1948, GPs opposed the prospect of becoming salaried employees. They retained their self-employed status but became independent contractors to the NHS. Numerous changes have been made to the contractual arrangements between the state and GPs over the years and, although there has been a considerable growth in the number salaried GPs in recent times, most GPs are still independent contractors to the NHS. Since 2004, contracts have been negotiated between Primary Care Trusts (PCTs) and general practices rather than between the Secretary of State for Health and individual GPs (Pollock, 2005). Primary Care Groups (PCGs), which subsequently became PCTs, were created between 1997 and 1999. During the period when some were still PCGs and others had completed the transition to PCTs, the organisations were known collectively as Primary Care Organisations (PCOs). Initially, PCTs had an advisory role but from 2003 they assumed responsibility for 75% of the total NHS budget including the prescription budgets of all general practices in their areas. Prior to this, local health authorities had endeavoured to persuade GPs to limit their medicine prescribing to an approved list of drugs that they considered efficacious and affordable, but had generally not controlled what GPs prescribed. PCTs currently have a fixed drug budget and have powers to ensure that their GP practices stay within it (Pollock, 2005).

This has led to a shift in the balance of power away from individual GPs to PCTs. Under the new contractual arrangements, PCTs supervise the quality aspects of GPs' work and authorise payments for the attainment of performance targets, such as managing chronic disease. Payments may amount to up to one third of a GP's practice income and this has allowed PCTs to exert considerable influence over the GPs behaviour within their boundaries (Pollock, 2005). However, with the arrival of the coalition government in 2010 this extant organizational structuring of healthcare has been subjected to review. Whilst heated debate continues over the details the government's current plan is for PCTs to be disbanded over the next two to three years. It is further planned that the commissioning of health services will be largely returned to GPs who will be encouraged to form themselves into commissioning consortia.

NICE, a mainly independent organisation with a brief to provide national guidance on the promotion of good health and the prevention and treatment of ill-health, was formed in 1999 (as the National Institute for Clinical Excellence NICE) and in 2005, the Institute was joined by the Health Development Agency. Currently, the Department of Health (DoH) commissions NICE to develop clinical guidelines for use within the NHS. Significantly, local NHS organisations (including the PCTs) are required to meet the cost of medicines and treatments contained in NICE guidelines once they have been published for three months (NICE, 2008).

Opinions as to the effectiveness of the original NICE have been divided. Wathen and Dean (2004) found that NICE guidelines in isolation had little impact on the prescribing behaviour of GPs. Scoggins et al.(2006) reported that GPs in their study found NICE guidelines to be an objective, but not a particularly useful, source of information. Tanday (2007) highlighted claims by NICE that GPs were increasingly following its advice, but also quoted a spokeswoman from the Royal College of General Practitioners who stated that around a third of PCTs fail to follow NICE guidance. In discussing criticism of NICE, Eastham (2006) pointed to its lack of true independence due to the fact that it must take its instructions from the DoH rather than decide itself which treatments to evaluate. Eastham (2006) also referred to a woman who was refused a cancer treatment by her PCT because it had not been approved by NICE. When the matter attracted extensive media interest, the Government Health Secretary, at the time, pronounced that the drug would be made available to any woman who required it, even though NICE had not been due to appraise the drug until the following August. Eastham (2006) believed that this action shattered the notion that NICE is independent, but he believed that the general consensus was that NICE is a force for good which should be reformed rather than removed.

In summary to this section of the discussion, it can be seen that the organizational context within which sales operatives in the pharmaceutical industry operate can be determined as a complex one (Daft, 2011). Moreover, it is prone to dynamic change and short-termist political

intervention. This creates a potent challenge for the pharmaceutical sales representative and their sales and marketing corporate operations and the next stage of the paper moves on to consider some of the implicit issues.

The Pharmaceutical Industry: Background and Sales and Marketing

Context

The pharmaceutical industry, like the NHS, is a giant both in a global sense and in terms of its importance to the UK economy. The Association of the British Pharmaceutical Industry (ABPI) is the trade organisation of the industry and represents more than 75 companies. These companies research, develop, manufacture and supply more than 80% of NHS medicines (ABPI, 2006). The ABPI pointed out that in 2004 the pharmaceutical industry invested more than £3.2 billion in research and development in the UK; a greater amount than any other sector and it also employed more scientists than any comparable part of the economy. In addition, the pharmaceutical industry employed 73,000 people and generated a further 250,000 secondary jobs. Exports in 2005 amounted to £12.2 billion, creating a trade surplus of £3.4 billion. It was claimed that the industry is consistently in the top three of all industries for export surplus and that 18 of the top 100 medicines in the world were discovered in the UK, which is more than any other country except the United States of America (USA) (ABPI, 2006).

A parliamentary report into the influence of the pharmaceutical industry substantiated the ABPI's claims in terms of the industry's importance to the economy and also recognised that it takes an average of 12 years and over £500 million investment to bring a single new drug to market (House of Commons, 2005). However, it was concerned by the fact that medicines cost the NHS in England over £7 billion every year and that this sum, of which 80% is spent on branded (patented) medicines, accounted for approximately 12% of the total NHS budget (House of Commons, 2005). Furthermore, the ABPI reported that around 14% of the UK pharmaceutical industry's expenditure is on marketing and promotion and that approximately 8,000 drug company representatives are employed in the UK. According to the report the cost of this expenditure in monetary terms amounts to some £1.6 billion (House of Commons, 2005).

With regard to commentary and literature on sales and marketing in general, and on the pharmaceutical industry and context, in particular, although there is a large body of literature relating to sales and sales management any existing frameworks designed to assist sales planning tend to have a narrow focus and lack a management orientation (Neves et al, 2010). According to Jones et al (2005) research into effective selling and sales management lags behind other areas and is predicated on models and assumptions that were often developed decades ago and which may need to be revised in the light of dramatic changes in the marketplace. This is despite the fact that selling and sales management activity is frequently crucial to the achievement of business and marketing objectives. This is substantiated by a

review of (strategic) marketing texts which typically, at best, dedicate very pages to sales forces and process and what is present echoes the above observations (see by way of illustration the treatment of sales in: Czinkota, Ronkainen and Zvobgo (211); Ferrell and Hartline (2011); Dubois, Jolibert and Muhlbacher (2007)). As a consequence, Jones et al (2005) argue that there is a compelling need to develop new theory around the sales and marketing interface in order to respond to the contemporary business environment.

How good is marketing in the pharmaceutical sector? A survey by Stuart-Kregor (2006) of healthcare marketers and their managers concluded that the industry seemed to believe it was doing a good job but that in terms of customer's perceptions of the value offered it was a long way short of excellence. As long ago as 2002, Doyle noted that as a result of the high costs of employing sales personnel, ethical pharmaceuticals is one of the very few remaining industries that can afford to sustain a huge sales force. Outside the pharmaceutical industry a trend has emerged towards an increasing concentration of buyers which has also led to a reduction in sales force numbers (Doyle, 2002). Moreover, this concentration of buyers has also been gradually increasing in the NHS since the formation of PCTs in 2004 but it seems that the UK pharmaceutical industry appears to have been slow in responding to these changes.

Traditional marketing planning suggests a 3-step approach to sales force design. (Neves et al, 2010). The first step begins with environmental analysis following which corporate objectives are set and a business plan is produced. In step two marketing objectives are determined and a marketing plan is compiled. Where the sales force is seen as a component of promotional activity in the marketing plan the third step is the production of a sales plan. From this, it follows that if there is any discrepancy between the environmental analysis and what is actually happening in the marketplace the sales plan may be unsuited to its' purpose. In relation to this point, Jolly et al (2005 p. 156) suggest that in the pharmaceutical industry 'innovation in the more strategic aspects of business and marketing is not well rewarded (being less well understood and more risky)' resulting in a tendency towards inertia in these areas.

In advocating timely organisational change of the sales function in the pharmaceutical industry Smith (2009) describes the industry as 'traditional and insular'. Zoltners et al (2009) urge pharmaceutical companies to embrace change and to adopt a structured approach in constantly refining their sales strategies in order to respond to uncertainties in the marketplace. Willink (2009) observes that the pharmaceutical industry is highly regulated and that the dominant culture within it is one of reliance on established practice. He reports encountering numerous great managers in the pharmaceutical arena but precious few genuine leaders and he urges pharmaceutical managers to adopt a transformational rather than a transactional approach to sales and marketing. Furthermore, Piercy and Rich (2009) note the global adoption of lean manufacturing principles as developed by Toyota, Japan. As

this requires modifications to the purchasing and supply processes of those companies who adopt lean principles it also demands a reorganisation of the sales and marketing efforts of their suppliers. Piercy and Rich (2009) believe that in order to adopt a true market led approach companies seeking to sell to organisations who are striving to become leaner in their operations should also adopt lean principles. Citing Jones and Mitchell (2006) Piercy and Rich (2009) observe that in the UK public sector the NHS has become one of the most significant adopters of lean processes and that this has focused on the way in which the NHS's £20 billion procurement budget is distributed. This has in turn required NHS suppliers to adapt their sales force activity to meet the new challenges.

There are empirical cases available to point up organizational adaptations in response to the challenges faced in pharmaceutical sales. In 2004, the Japanese company Takeda (one of the top 15 global pharmaceutical companies) identified that the principal feature of the UK healthcare market was its fragmentation into geographically based Primary Care Trusts. As a result Takeda replaced its traditional sales representatives with Regional Account Directors whose role was to engage with PCTs and other health trusts rather than with individual doctors in order to build long-term strategic relationships. This bold strategic move was rewarded by Takeda UK Ltd. being shortlisted for 'Company of the Year' in the Pharmaceutical Effectiveness Awards in 2005 and in a 25% growth in sales during the first six months of 2006 (Rogers, 2009).

The long range prospects for the pharmaceutical industry are discussed in a report called Pharma 2020 produced by management consultants PricewaterhouseCoopers. This report forecasts the outlook for the industry to the year 2020 and predicts that by the year 2020 the existing sales model with armies of representatives calling on GPs will be replaced by one where a much smaller number of key account managers will make their representations at a much more senior level to policy makers, regulators and providers (PricewaterhouseCoopers, 2007). This suggestion would represent a sea-change in the manner in which much of marketing and sales are conducted by the industry. David Quigley (2011), Director of Global Commercial Practice for Pharmaceuticals and Medical Products at the leading global consultancy McKinsey and Co. contends that despite any downsizing that has occurred, or which may occur, in future personal selling will continue to play a prominent and important role in pharmaceutical promotion. However he believes that the issue of sales force productivity will be a top priority.

While the House of Commons (2005) report saw prescription drugs as making a huge contribution to the health of the nation in terms of improving the quality of life, reducing the need for hospitalisation and saving lives, it also recognised the huge costs involved in developing drugs. The report criticised drug licensing procedures, marketing and promotion and recommended that tougher restrictions should be placed on GPs' prescribing activities (House of Commons, 2005). The ABPI countered by publishing a manifesto in which it

claimed that the prices of medicines have fallen by over 20% over the last decade, and that British doctors prescribe fewer medicines in general and fewer modern (patented) medicines than other comparable European countries (ABPI, 2006). The ABPI also asserted that despite the enormous costs of drug development only 1 in 10,000 compounds identified in research will ever make it to market and of these only 1 in 3 will ever recover their costs. It further stated that the cost of the average prescription is £11 but the cost of a day in hospital is close to £250 and that therefore pharmaceutical interventions can save money compared with the costs of hospitalisation (ABPI, 2006).

A focus on the Nexus of Medicine Prescribing, GPs and Pharmaceutical Representatives

The argument has now outlined the organizational and governmental structures that surround the healthcare and pharmaceutical environments in the United Kingdom context. The discussion then progressed to provide a range of comments and insights in relation to sales and marketing literature focusing on the pharmaceutical sector. It will now be pertinent to consider a number of points concerning the relationships and interactions between sales representatives in the pharmaceutical industry and GPs.

There have been numerous studies concerning elements of prescribing practice over the last decade. In relation to the role of the pharmaceutical industry, *Carthy et al.* (2000) reported that GPs felt they were not unduly influenced by pharmaceutical representatives. *Scoggins et al.* (2006), in their research concerning prescribing in primary care, found that there was no consensus on the influence of the pharmaceutical industry, although most GPs had reported confidence in their ability to withstand any sales pressure from pharmaceutical representatives. However, other studies have highlighted the role of pharmaceutical industry promotion, particularly pharmaceutical representatives, in influencing GPs' prescribing decisions. *Prosser et al.* (2003) explored the influences on GPs' prescribing decisions in the north west of England and found that on most occasions, a decision to prescribe a new drug derived from a number of factors, predominantly social, situational and psychological, which converged with clinical and pharmacological considerations. Some decisions to prescribe a new drug were motivated by its perceived economic or pharmacological advantage, but often a new treatment was initiated as a result of the suboptimal performance of the first-choice drug. However, it was pharmaceutical industry representatives who were the most frequently cited as having influence on prescribing which was viewed by the researchers as disconcerting because they believed that information derived from this source may be subject to bias (*Prosser et al.*, 2003). The findings of *Prosser et al.* (2003) mirrored those from the earlier work of *McGettigan et al.* (2001), conducted in the Republic of Ireland, which also emphasised the strong influence of sales and marketing activity by pharmaceutical industry in doctors' prescribing decisions.

Prosser and Walley (2003) investigated GPs' reasons for seeing pharmaceutical representatives. Their findings suggested that although GPs were very aware that representatives could influence prescribing, they did not feel that their own prescribing was unduly influenced. Despite this, the findings showed that the pharmaceutical representative was highly influential and that a key explanation for this influence was the method of marketing communications employed (Prosser and Walley, 2003). Jones *et al.* (2001) also found that drug company representatives were an important information source for GPs, though argued that the candour with which both consultants and GPs discussed the influence of the pharmaceutical industry suggested that they did not believe that the information from this source was significantly tainted by bias. Although neither Jones *et al.* (2001) nor Prosser *et al.* (2003) described it as such, Armstrong and Ogden (2006) argued that both sets of authors identified a 'multiple source model' which guides changes in GPs' prescribing behaviour. This relates to the multiple sources of information that GPs have been shown to combine in order to facilitate a change in prescribing behaviour.

In their 2005 study, Prosser and Walley researched GP and Primary Care Organizations (PCO) stakeholders' attitudes to the importance and influence of *cost* on prescribing behaviour. They found evidence of a conflict between a PCO commitment to cost control and GPs who were resistant to cost-cutting at the expense of individual patient benefit (Prosser and Walley, 2005). Prosser and Walley (2007) also looked at the impact of PCOs on GPs' prescribing behaviour. The fact that Primary Care Organisations are referred to in the title of the study rather than PCTs may be revealing as to the timing of data collection. This was in June and July 2001 when both PCOs and PCTs were in existence and before PCTs assumed the wider powers that they currently exhibit. Prosser and Walley found that at this time there was conflict between the views of PCO managers and GPs in respect of drug prescribing. They predicted that the incentivisation which was then practised by PCOs might not be sufficient to achieve the desired outcomes in prescribing behaviour and that in future penalties might need to be imposed on GPs in order to persuade them to comply with PCO policies (Prosser and Walley, 2007).

Authors in the field with professional status in, or links to, pharmacology, such as Aronson (2006), Cantrill (2000) and Maxwell (2005), have tended to focus their writing on apparently 'unscientific' and 'inappropriate' prescribing behaviour by doctors as they explored the reasons why doctors deviated from published guidelines in their prescribing behaviour. Other authors (Britten, 2001, Freeman and Sweeney, 2001, Greenfield *et al.* 2005), writing from a medical perspective, offered some justification for a more subjective approach to prescribing decisions, particularly in instances where patients express their views on treatment options. Maxwell (2005) was sympathetic to prescribers who may be faced with conflicting guidelines from differing but apparently expert sources, believing that while evidence-based medicine should be the goal, achieving this requires clinical experience, common sense and a firm grasp of clinical pharmacology principles. Cantrill (2000) explored

the appropriateness of GPs' prescribing measured against the recommendations made in the British National Formulary (BNF), a publication produced by a Joint Formulary Committee composed of representatives from the British Medical Association (BMA), the Royal Pharmaceutical Society and the DoH. The findings showed that GPs were prepared to prescribe outside the recommendations of the BNF, described as "emotional" prescribing (Cantrill, 2000). Moreover, Aronson (2006) discussed inappropriate prescribing with reference to NICE and other guidelines and stated that it was too early to evaluate the effectiveness of prescribing guidelines computer reminders to doctors, but cited negative experiences. In addition, Greenfield *et al.* (2005) studied the variation between GPs', cardiologists' and practice nurses' prescribing decisions in respect of medicine to prevent coronary heart disease and found that respondents concerns centred on five main areas. These were the risks and benefits of treatment, the patient's role in the treatment, patient characteristics, costs to the patients and costs to the health service. Their conclusion was that prescribing behaviour may be influenced by more subjective factors (Greenfield *et al.*, 2005). Freeman and Sweeney (2001) found the implementation of evidence by GPs to be a fluid and complex process; GPs' decisions were influenced by their personal and professional experience as well as by their knowledge and relationship with the patient. In their study, GPs appeared to view clinical evidence as a square peg which required modification in order to fit the round hole of the patient's life (Freeman and Sweeney, 2001). This air of conflict was captured by Britten (2001), who writing at the inception of NICE and PCOs, described prescribing in general practice as a battlefield where doctors and the State are fighting over the cause of clinical autonomy.

Armstrong and Ogden (2006) undertook a qualitative study exploring the influences on the prescribing decisions of a sample of British GPs and found that clinical autonomy formed the keystone of professional identity for GPs which made them resistant to change agents. Two themes were identified which were termed *clinical etiquette* and *clinical experimentation*; both of these elements allowed change to occur within a framework of commitment to clinical autonomy (Armstrong and Ogden, 2006). Moreover, Barber *et al.* (2005) investigated current methods of measuring the appropriateness of prescribing in primary care and found that the measures in place depended predominately on pharmacological criteria and did not take into account patients' views and contextual factors. This was further contextualised by government research. A questionnaire survey of almost 1000 GPs was conducted for the National Audit Office regarding various aspects of GPs' prescribing behaviour (doctors.net.uk, 2006). The findings showed that the BNF was seen as the most objective and the most useful source of information; NICE clinical guidelines were ranked 4th on both scales, with pharmaceutical representatives and company literature ranking at, or close to, the bottom in relation to both usefulness and objectivity. The majority of GPs reported that they still saw pharmaceutical representatives, but that their prescribing advisers had much more influence on them (doctors.net.uk, 2006). Scoggins *et al.* (2006) reported that they had found many factors that influenced GP prescribing behaviour; some of the major influences

were the availability of clear evidence in authoritative journals and the GP's own knowledge and professional experience. The GPs reported that they would change their prescribing behaviour on the basis of clear evidence, financial savings, the convenience of use and the perceived patient or practice benefit (Scoggins *et al.*, 2006).

Summary Comments on the Literature

A quantity of literature exists which is concerned with the subject of doctors' prescribing decisions. Some writers, including Greenfield *et al.* (2005), have focused on the patient perspective in prescribing decisions (or problem), while others such as Armstrong and Ogden (2006), Britten (2001) and Freeman and Sweeney (2001) stressed aspects central to the doctor. A third group represented by Cantrill (2000) and Maxwell (2005) has been concerned with clinical guidelines (or the social context). These factors do not exist in isolation but are inextricably linked components in a doctor's prescribing decision, as shown in the study of Scoggins *et al.* (2006).

However, the topic of influences on GPs' prescribing decisions has received less recent research attention than might be expected given the enormous economic, social and political implications consequent upon this activity.

There have been few published research studies conducted after PCTs and NICE had been established long enough to exert a significant influence. For the purposes of the present paper, the discussion has worked to indicate the extent to which these local and national bodies have changed, or have the capacity to change, the prescribing landscape. The argument also considers the affect that any changes to the changing organizational structure of health care provision might have on the UK pharmaceutical industry's' marketing strategy. From this consideration of the literature and empirical context a number of factors have been surfaced. Firstly, with regards to discussions on sales in the management and organization literature, there is a paucity of commentary on sales. What exists is allocated miniscule amounts of space in key texts and has tendency to offer rather dated views of the modern sales environment and realities. Secondly, in relation to considering sales within a pharmaceutical business context it is evident that sales forces and representatives have been a staple of the industry for through many recent decades. However, there are signs that this *status quo* is in transition and transformation as pharmaceutical companies begin to review the shape and practices of their businesses. This questioning of the effectiveness of pharmaceutical sales representatives is set against a healthcare sector that is one of continual change and transition. A large majority of this change is driven by politics and policy at a government level. In spite of this, GPs have repeatedly demonstrated a capacity to resist, to some greater or lesser, prescribing dictates. This nexus of the interaction between the GP and the 'sales rep', therefore, constitutes a substantially under-researched dimension of the outlined context. It is this above-discussed amalgam comprised of GPs, Pharmaceutical Sales

Representatives and government policy, with all three set in a turbulent environment, that the field work is now ready to elaborate.

Design/methodology/approach

The field work for the study was qualitative and interpretive in nature and used semi-structured interviews to collect the data (Van Maanen, 1998, 2010; Czarniawska, 1998; Gabriel, 2000, 2004; Watson and Harris, 1999, 2008; Weick, 1995, 2001). As a consequence, the approach was mindful of issues of reflexivity wherein it is acknowledged that the researcher-respondent are conjoined in a sense-making process which is unavoidable and inevitable (Alvesson and Sköldberg, 2009).

Robson (2002) cites studies focusing on the meaning of phenomena to their subjects and those studies where the individual perceptions of processes are sought through interviews, as being studies where a qualitative approach is most appropriate. These circumstances aptly describe the nature of this study.

Initial consideration was given to undertaking a postal survey either instead of or to complement the semi-structured interviews. However this approach was rejected because such surveys tend to produce a low level of response (Proctor, 2005) and many participants prefer to be interviewed because this enables them to be given assurances about the way in which information will be used (Saunders et al., 2003). Furthermore studies against which the research would be benchmarked also used semi-structured interviews (Carthy et al, 2000, Jones et al, 2001, Prosser et al, 2003, Prosser & Walley, 2003,).

The study had three main aims:

- to ascertain the main influences on GPs' prescribing behaviour;
- to explore the specific factors that influence GPs' prescribing behaviour in terms of local influences, national influences, the pharmaceutical sales representatives and industry and financial constraints;
- to determine what, if any, changes GPs foresaw in terms of future influences on their prescribing behaviour.

The GPs were asked a series of largely open-ended questions within a format which was generally consistent across the series of semi-structured interviews. Broadly the format of these questions revolved around 3 distinct questions with a follow-up question which enabled the participant to expand on previous answers or introduce a new perspective. The questions deliberately probed the GPs' opinions regarding the influences on prescribing decisions in general and were not specific to the individual GPs' own prescribing behaviour. Within the study, the influences on GPs' prescribing behaviour referred to those influences that exist after a diagnosis had been made, and not to the signs and symptoms which naturally influence a doctor's diagnosis.

An interview schedule was designed to guide the interviews. These were conducted with GPs (n=11) practising in Cheshire and the Wirral, England. Fourteen GPs were originally invited to participate in the study, with one declining and two subsequently dropping out due to problems with access. The participants were selected from three different PCT areas, with two female and nine male GPs taking part. These doctors formed a purposive, judgemental sample. The individuals invited to participate were judged to possess the necessary knowledge base, were accessible, suitably experienced and formed a part of the social structure on which the research focused.

With regard to research procedures, a standard letter sent to the participants set out the purpose of the research, the time allocation, a guarantee of anonymity and gave assurances of consultation with the Local Research and Ethics Committee. It is a requirement of the UK research governance framework for healthcare (NHS, 2005) that all research conducted within the NHS is referred to a Research and Ethics Committee. Approval for this study was sought and received confirmation that the project was not required to be ethically reviewed under the terms of the Governance Arrangements for Research Ethics Committees in the UK.

From an ethical standpoint, the study ensured adherence to the commonly held codes for conducting research. These included recruiting all participants through informed consent and upholding their right of self-determination (i.e. to take part or withdraw at any time without explanation). The principle of justice, requiring fairness and adherence to the notion that the needs of individuals must come before the research process, was met by meeting GPs at their convenience in their own surgeries if that was their preference (and it was throughout) and postponing or terminating the interview if the GP needed to give attention to their patients.

The participants were asked if they consented to the interview being tape recorded; two declined and written notes were taken of their interviews and written up immediately afterwards. The GPs were asked a series of largely open-ended questions which probed their opinions regarding the influences on prescribing decisions in general and were not specific to the individual GP's own prescribing behaviour. A final question enabled the participant to expand on previous answers or introduce a new perspective.

The tape recorded interviews were transcribed by the researcher and the transcripts were sequentially coded D1 through to D11. The data were analysed and coded to explicate themes in relation to the research questions. After the data had been gathered the transcripts were searched for references to discrete influences and when all these had been identified a matrix was constructed. Such an approach may be termed data reduction as advocated by Miles and Huberman (1994).

In summary to this methodological section, it is important to indicate that the principal limitation of this research was that the sample was not designed to be statistically representative and therefore care must be taken in attempting to extrapolate the results to a wider population. A limited degree of generalisability may have been achieved by the fact

that the sample was drawn from three different PCTs with no discernible differences in responses, but the size of the sample was such that no strong claim is made in this regard.

Findings on Interviews with GPs – What Role for Pharmaceutical Sales?

Preamble on Findings

The most commonly mentioned influences on GP prescribing behaviour in the current organizational health care structure were the quasi-governmental organizational structure such as the PCT, together with drug costs and drug budgets; these were cited by all of the GPs, followed by NICE and the GPs' previous experience or training (aligned with arguments provided above by Pollock, 2005; Scoggins, 2006).

Local hospital consultants were seen to exert an influence, as did drug safety, but the medical press, guidelines, the pharmaceutical industry, patient wishes, educational meetings, the BNF, familiarity, practice colleagues and drug interactions were all seen as being less influential. As will be discussed below, this has major implications for the

Sales and marketing practices of the pharmaceutical industry

The participants were asked which were the most important influences on their prescribing decisions and, while no new themes were introduced, more disparity was evident. Whilst the PCT and cost were universally cited when the GPs were asked about the main influences on prescribing decisions, these influences were only reported three times in the case of the PCT and once in the case of cost (in tandem with mention of the PCT). No real pattern emerged, but three of the GPs focused on their own clinical judgement, and by implication their own clinical autonomy, while the responses of another three other also alluded to clinical judgement.

The remaining discussion on the Findings is organized into a number of emergent themes:

Local influences on GPs' prescribing decisions

As the PCT and drug budgets were universally cited influences on prescribing decisions, with local NHS consultants also proving to be influential, it appeared from the data that local factors were dominant in prescribing decisions. Although the PCT and drug budgets were mentioned by all GPs, these were not generally regarded as benign influences and some resentment was evident. Comments included:

- I mean the underlying prescribing decisions GPs make is how they're going to help a patient. I feel that currently we are being a little bit restricted with PCT budgets and the way that the Department of Health are screwing us down to prescribe the cheapest drugs available rather than the best drugs available (D5).
- I think the other thing that does alter is the issue now of the interface with PCT and cost and funding and I think that's probably one of the most significant and frustrating aspects of prescribing these days because as I frequently say I think I'm a civil servant not a clinician....it is based on cost (D6).
- I am concerned at the constraints put on general practitioners by the Government through its various agencies such as the Primary Care Trusts which are limiting what we can and cannot do (D7).
- You're being railroaded into prescribing in a certain way dictated by cost – and dictated by PCT and government (D8).

A key finding emerging from the respondent comments is the very real power and influence exercised by factors that are not necessary clinical. Not only is the GP's expertise being occasionally compromised by this, equally, it is clear that they are not readily able to

take on board other information and indications, including, for example, sales representatives from the pharmaceutical industry.

National influences on GPs' prescribing decisions

National influences such as NICE, medical journals and the BNF were clearly influential although the data suggested that their influence was less important than local influences. For example:

- Some GPs may be influenced by what the PCT is telling them and what NICE is telling them (D1).
- My main source of drug information is still the BNF (D5).

The overarching nature of quasi-governmental bodies is all pervasive and insidious. It is clear that this presents a major 'competitor' to any influence that might be able to be exerted by the pharmaceutical industry.

The influence of the pharmaceutical industry on GPs' prescribing decisions

The pharmaceutical industry did receive several mentions as a factor in prescribing behaviour, but this seemed to be much less influential than other factors such as the PCT and NICE and when specifically asked about the current significance of the pharmaceutical industry in influencing prescribing decisions, many of the GPs confirmed perceptions of its waning influence under the extant organizational structure:

- And I suppose, let's be honest, at the bottom of the list comes what you hear from the drugs rep (D3).
- A lot less important now to be honest. I mean, when I was first in general practice, I think then drug reps did have a great influence really on what you did because I think you came out of medical school and we hadn't had much about drugs and prescribing and certainly you didn't bother about cost then. And I think it's different now with new GPs coming out. Much more aware of being a holder of a public purse than we probably were thirty years ago when I was first a GP (D2).
- I think the rebound effect on that is frustration from the reps' point of view in that even though they are portraying a good new drug, the doctors, even though they might want to try it, are being penalised if they do try it. And then there's the knock on effect of short term benefit for the PCT but a long term loss for people in general in the pharmaceutical industry in that there'll be less money available for funding new drugs (D8).
- It has no influence at present. I see many reps but I don't do anything for them (D10).
- Not very much. They provide the data sheet but little else. The pharmaceutical adviser gives most of the data nowadays (D11).

The picture that emerged from the study in relation to pharmaceutical sales representatives was an ambivalent and ambiguous one. The historical transformation of the sales 'reps' role was most apparent. Overall, there was a sense that power was slipping away from the 'reps' due to the influence of quasi-governmental structures (such as, for example PCTs and NICE) however this was far from being the definitive conclusion. Some GP respondents were still reporting the influence of sales representatives. There was very much a sense of the 'rep' being a person with whom the GP might discuss prescribing behaviour and enter a dialogue rather than simply being dictated to by a decree from a centralised body.

The influence of financial constraints on GPs' prescribing decisions

Financial constraints were clearly influential factors as cost or budgets were said by all the GPs to influence prescribing decisions:

- Cost can be the main driver for PCTs deciding on certain things (D1).
- They [the PCT] are always cautious about prescribing because of money, not in the interest of the patient (D9).
- PCT guidelines depend on the cost of the drug. Expensive drugs will be too much burden on the Trust. We tend to prescribe the cheaper drugs which are off patent (D10).

Future changes envisaged by GPs in influences on prescribing decisions

When asked how they saw the influences on prescribing changing in the future, the GPs produced a variety of answers with a common theme. The overwhelming opinion expressed was that PCTs were likely to become even more influential in future and that the cost of drugs is likely to come under even greater scrutiny. Some GPs saw NICE having a greater influence, mentioning an increased focus on guidelines. Some concerns were expressed about the future influences and the effect they would have on GPs' practice and a certain amount of resentment and frustration was evident regarding the perceived loss of autonomy. Comments included the following.

- I think the PCT influence will be much greater. I think the NICE driven and the guideline driven influence will be greater. ... I think more and more we're going to be restricted in what we can prescribe (D3).
- There is going to be a lot more pressure from PCTs to prescribe within budget which will become a more significant influencing factor (D4).
- I think the evidence will come less from pharmaceutical representatives. I think it will increasingly come through either journals or some electronic method. Things like the PCT are going to start being more of an impact because they already are (D6).

- I'm concerned at the pressures that we get to change prescribing which is often not to the benefit of the patient and is often not cost effective because very often consultation time is wasted in explaining it and then if the patient is unhappy with the changes that are made and having to revert back to the original having spent perhaps half an hour altogether in a pointless and fruitless exercise. But I feel that's the direction that they're trying to push us (D7).

Discussion

The main influences on the GPs' prescribing decisions were shown to be multi-factorial, in line with the findings of Scoggins *et al.* (2006). Local influences appeared to dominate over national influences and the pharmaceutical industry, whilst still a factor, was not a main influence on prescribing behaviour.

Local influences on GPs' prescribing decisions

All the GPs in the current study cited local influences in the form of the PCT and (local) drug budgets as influences on prescribing with the evidence further suggesting that this was not always seen as a welcome prospect. Prosser and Walley (2005) also found evidence of conflict between PCO commitment to cost control and GPs who were resistant to cost constraints if they were not in the interests of patients. In 2007, Prosser & Walley again reported evidence of conflict between the views of PCO managers and GPs in respect of drug prescribing; these data were collected before the advent of the PCTs and NICE. Prosser and Walley (2007) predicted that the incentivisation which was then practised by PCOs might in future be insufficient to achieve the desired outcomes in prescribing behaviour and that it might be necessary to penalise GPs in order to encourage them to conform to PCO policies. It does appear that PCTs and cost control are now very much stronger influences on GPs' prescribing in the eyes of the GPs in the current study, although the element of conflict was still present.

National influences on GPs' prescribing decisions

National influences on prescribing decisions received relatively little attention in the academic press until recently.

While Wathen and Dean (2004) reported that NICE guidelines in isolation had little impact on the prescribing behaviour of GPs, Scoggins *et al.* (2006) found GPs reported that they considered NICE guidelines to be an objective, but not a particularly useful, source of information, though NICE was ranked fourth in relation to both elements by GPs in the doctors.net.uk survey (doctors.net.uk 2006). Tanday (2007) referred to claims by NICE that GPs are increasingly following its advice with some circumspection, while Aronson (2006) cited negative experiences in this respect.

The findings of the current study showed that NICE was one of the most frequently mentioned influences on prescribing decisions, indicating that NICE may be becoming more influential.

Cantrill (2000) explored the appropriateness of prescribing with reference to the BNF which she described as a very well respected publication which is in widespread use. The doctors.net.uk survey showed that the BNF was seen as the most objective and the most useful source of information by GPs (doctors.net.uk, 2006). While the BNF was cited as an influence by GPs in the current study, as were guidelines and medical journals, none of these were among the most frequently mentioned influences. This suggested that, at least amongst the group of doctors in the current study, local influences presided over national influences.

The influence of the pharmaceutical industry on GPs' prescribing decisions.

According to the GPs interviewed, the pharmaceutical industry is not currently a major influence on prescribing decisions. These findings accorded with those of Carthy *et al.* (2000) and the doctors.net.uk study, (2006), but were at odds with the earlier findings of Jones *et al.* (2001), McGettigan *et al.* (2001) and Prosser *et al.* (2003), all of whom found that the pharmaceutical industry was an important influence, and in the case of Prosser *et al.* (2003), that the pharmaceutical representative was the most frequently cited influence on GPs' prescribing decisions.

The findings from these earlier research studies can be contextualised in light of the work being conducted before PCTs and NICE either existed or could have had any influence on prescribing decisions. A later study by Scoggins *et al.* (2006) reported no consensus from GPs on the influence of pharmaceutical representatives. The findings of the current study showed that the GPs felt that the PCT, drug budgets and NICE were stronger and more important influences on their prescribing behaviours than the pharmaceutical industry. This strongly suggests that the influence of the pharmaceutical industry is waning, lending support to the findings of the doctors.net.uk (2006) survey, which ranked pharmaceutical information near the bottom in terms of usefulness and objectivity. However, as the UK approaches yet another transformation and the current PCT structure is about to be transformed, the role of the pharmaceutical sales and marketing representative may have the potential for a resurgence.

Conclusions about the influence of financial constraints on GPs' prescribing decisions

Drug costs or drug budgets are both derived from, and are inextricably linked to, local PCT policy and were mentioned as an influence on prescribing by every GP in the current study. However, the data implied that the GPs were not entirely content that cost should have such a great bearing on prescribing decisions. Evidence of conflict between GPs and PCOs was found in the work of Prosser and Walley in both their 2005 and 2007 studies.

If such conflict or detachment does exist, it would be interesting to know whether this derives solely from an altruistic desire to help patients irrespective of the cost or whether it is motivated more by a resentment of PCT interference in an area where GPs previously enjoyed greater autonomy.

Future changes envisaged by GPs in influences on prescribing decisions

There was a widespread belief that quasi-governmental organizations such as PCTs were likely to become even more influential in future and that the cost of drugs was likely to become an increasingly important influence on prescribing decisions. It was evident that the GPs expected that in future they and their colleagues would be increasingly subject to PCT strictures in prescribing matters. There was a degree of resentment and frustration at this prospect; this seemed to be largely due the loss of autonomy. Britten (2001) and Armstrong and Ogden (2006) have highlighted the importance of GPs' autonomy as being a key factor in their professional identity. The current study showed that while GPs were cognisant of the requirements of working within the current framework of healthcare organisation, for many the constraints placed upon them diminished their autonomy and led to feelings of resentment and frustration.

Pollock (2005) had anticipated a shift in the balance of power in the favour of PCTs as a result of the new GP contract. Prior to this, Britten (2001) had likened general practice as a battlefield upon which doctors and the state were fighting over the cause of clinical autonomy. Using this analogy, the comments of the GPs in the current study suggested that they believe that this battle was currently going firmly in favour of the PCTs and that the cause may have already been lost. However, with the planned organizational changes, some adjustment may occur in future.

The issue at the heart of these matters is – where should the judgement reside? Should it be with the highly-trained GP who has specific knowledge of the patient's symptoms, co-morbidities and desired outcomes, or at the other extreme, should it lie with the State (in the form of PCTs and NICE), which may be concerned with ensuring that prescribed medicines are evidence-based but which also needs to control the costs of prescriptions issued to an ageing population with increasing life expectancy and with increasing expectations of the medical profession.

In many ways the pharmaceutical industry has been too successful for its own good. Largely as a result of pharmaceutical innovation life expectancy in the Western World has increased to the point where the working population faces an increasing tax burden in order to pay for the healthcare requirements of the retired population. It remains to be seen how the multi-billion pound UK pharmaceutical industry can exert its influence in future.

Conclusion

This study set out to discover what the main influences on GPs' prescribing decisions are. If the main influences are synonymous with the most frequently cited influences then the answer to the research question is unequivocal: it is the organizational structure of the PCT together with drug costs and drug budgets, followed by NICE and previous training and experience.

These may well be the main influences; however it may be imprudent to draw this conclusion too readily. When the GPs were asked which were the most important influences on prescribing decisions, the GPs' clinical judgement appeared to be at least as important as the PCT and much more important than cost considerations. Therefore it appears that, in the opinion of the GPs in the study, the PCT may be the most potent influence on GPs' prescribing decisions as long as the PCT advice is consistent with the GPs' clinical judgement. This suggests that although GPs currently value their clinical autonomy highly, they envisage that it may well be at risk in the future. The principal party for whom the findings of this study may have implications is the pharmaceutical industry. It appears that the UK pharmaceutical industry may have been slow to recognise the significant changes that were occurring in its market. Major strategic change may be indicated to the way in which the pharmaceutical industry targets its marketing and promotion. In particular the need to target organizational structures rather than individual GPs is indicated whether those organizational structures be PCTs or groups of GPs acting in commissioning consortia. Such an approach would be consistent with PriceWaterhouseCoopers' report which forecasts a much smaller and more specialised pharmaceutical sales force by the year 2020 (PriceWaterhouseCoopers, 2007)

Pharmaceutical companies are accustomed to targeting their promotional activity towards individual GPs who treat individual patients. PCTs by contrast are concerned with the health of large populations or at least significant cohorts of patients rather than individuals. This may mean that clinical data in support of drug promotion may in future need to be supplemented with pharmacoeconomic data which demonstrates the cost-effectiveness of treating large groups of patients in order to provide an attractive proposition for PCTs to make purchasing decisions. In consequence it may well be the case that the future and the way forward may consist more of a collaborative and allied approach, rather than the current one which can be seen more as contested and adversarial. Pharmaceutical marketing departments and governmental infrastructures may yet find common ground to work to the benefit of the overall healthcare aims and objectives.

Abstract

This paper presents empirical evidence on the relationship between corporate governance deficiencies and the incidence of management perpetrated fraud. Based on a sample of Australian public companies that had encountered management perpetrated fraud during the period 1991 to 2006, it was found that inadequate corporate governance was associated with the likelihood of a firm experiencing management perpetrated fraud. The key finding was that as the proportion of independent directors on the board increased the likelihood of a company experiencing management perpetrated fraud decreased substantially. Notably none of the other possible corporate governance mechanisms were found to substantially decrease management perpetrated fraud. In aggregate, these results offer further support to the agency theory assertion that the appointment of independent directors to the board is an effective control over agency conflict. Therefore, the empirical evidence of the paper is supportive of the appointment of mandatory levels of independent directors to the boards of public companies.

Keywords: Corporate governance, fraud, company directors, independent boards

Introduction

Historically, management perpetrated fraud has been considered to be a significant factor in the failure of many companies throughout the world. In many countries, including the USA, the cost of fraud is high. In the USA, The Association of Certified Fraud Examiners has estimated that the cost of fraud against organisations is \$400 billion annually. The Association also provides evidence suggesting that management perpetrated fraud is a significant component (Association of Certified Fraud Examiners, 1998).

Agency theory suggests that in situations of potential conflict, shareholders' interests are best protected when firms implement effective corporate governance mechanisms. Given that executive fraud represents the extreme embodiment of agency conflict it is not surprising that recent studies have found a significant link between poor corporate governance and management misconduct (Agrawal and Cooper, 2006; Chapple, Ferguson and Kang, 2007; Farber, 2005; and Agrawal and Chadha, 2005). This paper extends the existing literature in two ways. Firstly, it tests whether findings from other countries (primarily the USA) of a relationship between poor corporate governance and management perpetrated

fraud apply in other national context. Secondly, it tests for a relationship between fraud and an expanded set of governance variables. It is the intention of this paper to address the following research question. "Are companies who experience management-perpetrated fraud more likely to have poor corporate governance than companies that do not experience management perpetrated-fraud?" This study aims to provide empirical evidence on the relationship between corporate governance mechanisms and the incidence of management perpetrated fraud in an Australian setting

The paper proceeds as follows. Section 2 discusses the literature regarding corporate governance and management misconduct and develops the hypotheses to be tested. Section 3 explains the research methodology employed. Section 4 reports the results of logit regression model. Section 5 provides some concluding comments and limitations of the paper.

Literature Review and Hypothesis Development

There is a reasonably lengthy literature on fraud and its relationship with corporate governance inadequacies. Beasley's 1996 study of financial statement fraud in US companies was among the earliest. He found a significant *negative* relationship between the percentage of non-management (outside) directors on the board and the likelihood of financial statement fraud (see also the 1999 Report of the Committee of Sponsoring Organisations of the Treadway Commission, COSO).⁷⁸ Beasley also found that financial statement fraud was more likely to occur in companies with larger boards. Further, where outside directors were appointed to the board they had longer tenures and held lower levels of equity ownership in the firm. McMullen (1996) showed that audit committees were an effective mechanism in limiting management misconduct. She found that companies with audit committees were less likely to be subject to shareholder litigation alleging management fraud or experience quarterly earnings restatements, regulatory actions or illegal acts. Dechow, Sloan and Sweeney (1996) also found that companies were more likely to overstate earnings when they did not have an audit committee.

Corporate governance factors were also prominent in a comprehensive study by Beasley, Carcello, Hermanson and Lapides (2000) of US public companies subject to Securities Exchange Commission breaches for fraudulent financial reporting. They found firms reporting fraud were less likely to have an audit committee, internal audit support and independent boards, than firms not reporting fraud. They also found that where audit committees existed in fraud firms, the committees were less independent, and met on fewer occasions than audit committees of no-fraud firms.

The findings of recent studies are consistent with those of prior studies. For example, Dunn (2004) shows that financial statement fraud is more likely to occur when the board of directors is not independent. Sharma (2004) reports that fraud firms are more likely to have less independent boards, duality of the CEO/chair positions and lower levels of institutional shareholders. Farber (2005) also

⁷⁸ COSO also reported that the boards of companies committing financial statement fraud tend to be dominated by management or other directors that were closely affiliated with the management of the company.

reports that fraud firms have fewer independent directors on the board, audit committees meet infrequently and contain fewer financial experts, are less likely to be audited by a top-tier auditor and have a higher percentage of CEOs who are also the board chair. Uzun, Szewczyk and Varma (2004) also report a significant negative relationship between the proportion of independent directors on the board, audit and remuneration committees and the likelihood of a firm experiencing management perpetrated fraud. Helland and Sykuta (2005) also find a similar negative relationship between the independence of the board and the probability of shareholder litigation for fraud.

Empirical Proxies and Control Variables

The preceding review of the empirical literature highlights several key corporate governance mechanisms that are associated with limiting the incidence of management-perpetrated fraud. They form the basis for the hypothesis testing conducted in this paper. These hypotheses were grouped as the independence hypothesis, board size hypothesis, board dominance hypotheses, director equity hypotheses, director experience hypotheses and the auditor quality hypotheses. The hypotheses tested are as follows.

The *independence* hypothesis expects that a firm with a greater proportion of independent directors on its board is less likely to encounter management-perpetrated fraud than a firm with a lower proportion of independent directors on its board.

H1: Firms with a higher proportion of independent directors on the board are less likely to experience management-perpetrated fraud than firms with a lower proportion of independent directors on the board.

The *board size* hypothesis expects that firms with smaller boards are less likely to experience management perpetrated fraud than firms with larger boards.

H2: Firms with smaller boards are less likely to experience management-perpetrated fraud than firms with larger boards.

The *board dominance* group of hypotheses expects that firms are less likely to experience management perpetrated fraud when they segregate the roles of CEO and board chair, have a CEO who is not the founder of the company, and directors do not share family relationship.

H3a: Firms that segregate the roles of CEO and Board Chair are less likely to experience management perpetrated fraud than firms that do not segregate the roles of CEO and Board Chair.

H3b: Firms with CEOs who are not the founder of the company are less likely to experience management perpetrated fraud than firms with CEOs who are the founder of the company.

H3c: Firms with lower proportions of directors who share family relationships are less likely to experience management-perpetrated fraud than firms with a higher proportion of directors who share family relationships.

The *director equity* group of hypotheses expects that firms will be less likely to experience management perpetrated fraud when their independent directors hold greater proportions of the firm's equity and when inside directors hold lower proportions of the firm's equity. It is also expected that firms will be less likely to experience management perpetrated fraud when fewer inside directors hold options over the firm's equity.

H4a: Firms with independent directors holding larger proportions of the firm's equity are less likely to experience management-perpetrated fraud than firms with independent directors holding smaller proportions of the firm's equity.

H4b: Firms where inside directors hold smaller proportions of the firm's equity are less likely to experience management-perpetrated fraud than firms where inside directors hold larger proportions of the firm's equity.

H4c: Firms where fewer inside directors hold equity options are less likely to experience management-perpetrated fraud than firms where greater proportions of inside directors hold equity options.

The *director experience* group of hypotheses expect that firms are less likely to experience management perpetrated fraud when the independent directors have financial experience, qualifications and hold fewer directorships in other unrelated companies, and when their inside directors hold a greater number of directorships in unrelated companies.

H5a: Firms with independent directors that hold fewer directorships in unrelated companies are less likely to experience management perpetrated fraud than firms with independent directors holding greater numbers of directorships in unrelated companies.

H5b: Firms with inside directors that hold greater numbers of directorships in unrelated companies are less likely to experience management perpetrated fraud than firms with inside directors that hold fewer directorships in unrelated companies.

H5c: Firms with more independent directors with accounting or finance qualifications or experience, are less likely to encounter management-perpetrated fraud than firms with fewer independent directors with accounting or finance qualifications or experience.

The *auditor quality* group of hypotheses expects that firms will be less likely to experience management perpetrated fraud when they employ a top-tier auditor and when that auditor provides minimal levels of other services to the firm.

H6a: Firms that are audited by top-tier auditors are less likely to experience management perpetrated fraud than firms that are not audited by top-tier auditors.

H6b: Firms that engage their external auditors to perform minimum levels of non-audit services are less likely to experience management perpetrated fraud than firms that engage their external auditors to perform significant levels of non-audit services.

Control Variables

The control variables of rapid firm growth, poor financial performance, and existence of block holders are also included in the research model, as they are known to affect both the likelihood of management perpetrated fraud and the effectiveness of corporate governance environments.

Research Methodology

The focus of this study is a set of Australian public companies where one or more senior executives perpetrated fraud (ie. fraud firms). Each fraud firm is paired with a control firm where management-perpetrated fraud did not occur (no-fraud firm) selected as its closest match in terms of size, industry and period of reporting. By comparing the corporate governance environments of each matched pair the association between ineffective corporate governance and the incidence of management perpetrated fraud is investigated.

The Fraud Sample

The sample of fraud firms was drawn from a population set consisting of Australian public companies that had been listed on the Australian Securities Exchange (ASX) during the period January 1991 to June 2006. Fraud companies were identified from disclosures in the Australian Securities and Investment Commission (ASIC) media releases. In total 5,602 media releases were reviewed. Table 1 provides a summary of the sample selection process.

Table 1- Sample Selection Process

<i>Total ASIC Media Releases -1 January 1991 to 30 June 2006</i>	<i>5,602</i>
<i>Stage 1: Identify investigations of public company fraud</i>	<i>142</i>
<i>Stage 2: Exclude all subsequent acquittals and successful appeals</i>	<i>(56)</i>
<i>Stage 3: Exclude all unlisted public company frauds</i>	<i>(36)</i>
<i>Stage 4: Exclude all public company frauds where annual reports for the year the fraud commenced were not available</i>	<i>(3)</i>
<i>Final data set</i>	<i><u>47</u></i>

As shown in Table 1 the selection process resulted in a data set consisting of 47 Australian listed public companies associated with the conviction of management for fraud related offences. Despite the relatively small data set, it is reasonable to assume it is representative of, or close to, the population of all large public company frauds reported in Australia, given the importance ASIC places on disclosing prosecution of frauds.

Logit Regression Model

In view of the previous discussion, the following variables will be included in a logit regression model.

$$Fraud_i = \alpha + \beta_1 INDDIR_i + \beta_2 BDSIZE_i + \beta_3 CEODOM_i + \beta_4 FIRSTCEO_i + \beta_5 MANREL_i + \beta_6 INDEQ_i + \beta_7 MANSHARE_i + \beta_8 MANOPT_i + \beta_9 INDJOB_i + \beta_{10} INDFIN_i + \beta_{11} MANEXP_i + \beta_{12} AUDIT_i + \beta_{13} AUDITFEE_i + \beta_{14} FASTGRO_i + \beta_{15} FINLOSS_i + \beta_{16} BLOCK_i + \varepsilon_i$$

Where:

i = company 1 through 94

Fraud = indicator variable with the value of one when a company reports management perpetrated fraud and a value of zero where it does not;

INDDIR = percentage of board members who are independent;

BDSIZE = number of directors serving on the board;

CEODOM = indicator variable with a value of one if the chairperson of the board holds the chief executive officer position and a value of zero otherwise;

FIRSTCEO = indicator variable with a value of one if the chairperson of the board was the founder of the company and a value of zero otherwise;

MANREL = cumulative percentage of directorships in the firm held by directors sharing family relationships;

INDEQ = cumulative percentage of shares in the company held by independent directors;

MANSHARE = cumulative percentage of shares in the company held by inside directors;

MANOPT = percentage of inside directors that hold equity options in the company;

INDJOB = average number of other directorships held by independent directors;

INDFIN = percentage of independent directors on the board that hold either professional or academic qualification in accounting, finance or business or financial executive experience with another company;

MANEXP = average number of other directorships held by inside directors;

AUDIT = indicator variable with a value of one when a firm is audited by a top-tier auditing firm and a value of zero when it is not;

AUDITFEE = proportion of fees paid to the auditor for non-audit services relative to the fees paid for audit services;

FASTGRO = average percentage change in total assets for the two years ending with the year the fraud commenced;

FINLOSS = average percentage change in net profit before income tax for the two years ending with the year the fraud commenced; and

BLOCK = cumulative percentage of shares held by block-holding shareholders who each hold at least 5% of the company's voting shares.

Results

This section reports the empirical findings on the relationship between a company's corporate governance environment and the incidence of management perpetrated fraud.

Descriptive Statistics - Fraud Sample Characteristics

Type of Fraudulent Acts by Directors

Table 2 provides a summary of the various convictions recorded against management that resulted from the prosecution of frauds examined in this study.

Table 2 - Type of Fraudulent Acts Committed by Directors

<i>Type of Fraud</i>	<i>Frequency</i>
<i>Using position to derive advantage for private company or relative</i>	<i>17 (36%)</i>
<i>False or misleading statements/fraudulent financial reporting</i>	<i>11 (23%)</i>
<i>Embezzlement of company funds/assets</i>	<i>11 (23%)</i>
<i>Unauthorised dealings in company shares</i>	<i>4 (9%)</i>
<i>Unauthorised borrowings from company</i>	<i>4 (9%)</i>
<i>Total</i>	<i>47 (100%)</i>

Table 2 shows that the most common fraud perpetrated related to managers misusing their position to derive a private advantage (36%). These frauds often involved the awarding of non-commercial contracts to director related parties. The second most common fraud related equally to direct embezzlement of company assets (23%) and fraudulent financial reporting and disclosures (23%). The remaining frauds related to unauthorised dealings in the company's shares (9%) and unauthorised borrowings from the company (9%).

Table 3 provides comparative descriptive statistics between fraud and fraud firms.

Table 3 - Descriptive Statistics – Fraud Firms vs. No-Fraud Firms

<i>Variable</i>	<i>Statistic</i>	<i>Fraud Firm</i> <i>n=47</i>	<i>No-Fraud Firm</i> <i>n=47</i>
<i>INDDIR</i>	<i>Mean</i>	12.9%	44.8%
	<i>Std. Dev.</i>	15.6%	22.5%
<i>BOARDSIZE</i>	<i>Mean</i>	5.19	5.91
	<i>Std. Dev.</i>	2.18	2.24
<i>MANSHARE</i>	<i>Mean</i>	38.2%	17.5%
	<i>Std. Dev.</i>	28.2%	22.1%
<i>MANOPT</i>	<i>Mean</i>	39.2%	37.6%
	<i>Std. Dev.</i>	42.5%	41.8%
<i>MANEXP</i>	<i>Mean</i>	0.58	1.06
	<i>Std. Dev.</i>	0.88	1.78
<i>CEODOM</i>	<i>Proportion</i>	22 (46.9%)	6 (12.8%)
<i>FIRSTCEO</i>	<i>Proportion</i>	24 (51.1%)	6 (12.8%)
<i>MANREL</i>	<i>Mean</i>	6.5%	4.3%
	<i>Std. Dev.</i>	16.9%	13.7%
<i>AUDIT</i>	<i>Proportion</i>	22 (46.8%)	35 (74.5%)
<i>AUDITFEE</i>	<i>Mean</i>	1.94	0.97
	<i>Std. Dev.</i>	4.74	1.40
<i>FASTGRO</i>	<i>Mean</i>	245.4%	53.6%
	<i>Std. Dev.</i>	924.2%	128.9%
<i>FINLOSS</i>	<i>Mean</i>	-150.0%	+16.3%
	<i>Std. Dev.</i>	688.9%	216.4%
<i>BLOCK</i>	<i>Mean</i>	25.9%	36.8%
	<i>Std. Dev.</i>	27.8%	26.8%

Some key observations from Table 3 are as follows. In relation to director independence (INDDIR) there was a marked difference between the proportion of outside directors on the boards of fraud and no-fraud firms. On average, fraud firm boards contained only 12.9% independent directors compared to the average board of a no-fraud firm which comprised 44.8% independent directors. Overall board size (BOARDSIZE) was similar across the two groups with the average fraud firm board (5.19 directors) marginally smaller than the average no-fraud firm board (5.91).

With respect to board domination, fraud firms appear much more likely than no-fraud firms to have a CEO who is also board chair (CEODOM) (46.9% of fraud firms compared to 12.8% of no-fraud firms), and a CEO who is also a founder of the company (FIRSTCEO) (51.1% of fraud firms compared to 12.8% of no-fraud firms). Both fraud firms and no-fraud firms showed a low incidence of inside directors sharing family relationships (MANREL). On average only 6.5% of fraud firm inside directors were related, compared to 4.3% of no-fraud firm insiders.

Director experience, as measured by outside directorships held (MANEXP), also varied considerably across the two groups. Inside directors of fraud firms held on average only 0.58 outside board positions, compared to the 1.06 outside board positions held by their no-fraud counterparts. On average 40.6% of fraud firm independent directors possessed financial experience compared to 44.5% of no-fraud firm independent directors.

Financial profile, shareholder structure and auditor qualities all varied across the two groups. Fraud firms reported on average a 245.4% growth in total assets (FASTGRO) over the year leading to the fraud, compared to a 53.6% growth in total assets reported by no-fraud firms. Fraud firms were also more likely to report poor profitability (FINLOSS) prior to experiencing fraud compared to no-fraud firms. On average, fraud firms reported a decrease in reported profit before tax of 150.0% in the year leading to the fraud, compared to an average increase in corresponding profits of 16.3% reported by no-fraud firms. Fraud firms also had lower proportions of their equity held by block-holders (BLOCK), when compared to no-fraud firms. On average, 25.9% of the equity of fraud firms was held by block-holders, compared to 36.8% of no-fraud firm equity. Auditor quality and independence also appear to vary significantly across both sample groups. Top-tier audit firms (AUDIT) audited only 46.8% of fraud firms compared to 74.5% of no fraud firms. Fees for non-audit services (AUDITFEE) on average represented 1.94 times the audit fees of fraud firms, and only 0.97 of the audit fees of no-fraud firms.

Univariate Analysis

The development of the statistical model used to test the hypotheses outlined follows the process recommended by Hosmer and Lemeshow (2000) for logistic regression analysis of a one-to-one matched study. Those variables shown to be statistically significant at the univariate level are then further examined using a multivariate logistic model. Table 5 presents the results of fitting the univariate models.

Table 4 - Univariate Logistic Regression Models Outcomes

<i>Variable</i>	<i>Coefficient</i>	<i>Standard Error</i>	<i>P value</i>	<i>Odds Ratio</i>	<i>95% Conf Interval</i>	<i>Discordant Pairs</i>
<i>INDDIR – % Independent Directors</i>	-.079	.022	.000	0.924	(0.884, 0.965)	<i>n/a</i>

<i>INDJOB – Ind. Director Other Boards</i>	-.391	.138	.005	0.676	(0.516, 0.886)	<i>n/a</i>
<i>INDFIN – Ind. Direct Financial Expert</i>	-.017	.007	.010	0.983	(0.971, 0.996)	<i>n/a</i>

As shown in Table 4 the univariate logistic regression analyses indicate a significant statistical difference (at the 5% significance level) between fraud companies and no-fraud companies with respect to several variables: the proportion of independent directors on the board (INDDIR, $p < 0.001$); company founder serving as CEO (FIRSTCEO, $p = 0.002$); duality of the CEO/chair role (CEODOM, $p = 0.003$); inside director shareholding in the company (MANSHARE, $p = 0.003$); auditor type (AUDIT, $p = 0.009$); the existence of block-holding shareholders (BLOCK $p = 0.044$); other directorships held by independent directors (INDJOB, $p = 0.005$) and independent director financial experience (INDFIN, $p = 0.010$). Two variables,

board size (BDSIZE, $p=0.081$) and the level of shareholding in the company by independent directors (INDEQ, $p=0.095$), were statistically significant at the 10% significance level.

The analysis showed no significant statistical difference between the two groups with respect to firm growth (FASTGRO), the number of other directorships held by inside directors (MANEXP), the proportion of related directors (MANREL), firm profitability (FINLOSS), executive option holding (MANOPT) and the level of fees paid to auditors for non-audit services (AUDITFEE) at the 10% significance level. All ten variables shown to be statistically significant, at either the 5% or 10% significance level, were included in the final model.

Fitting the Multivariate Main Effects Model

Table 5 - Odds Ratio and P-values for all Variables included simultaneously in the initial main Effects Diagnostic Model

<i>Variable</i>	<i>Odds Ratio</i>	<i>p value</i>
INDDIR	0.865	0.063
BDSIZE	3.799	0.169
FIRSTCEO	1.252	0.896
CEODOM	0.056	0.304
MANSHARE	1.013	0.669
AUDIT	898.146	0.135
BLOCK	0.970	0.278
INDEQ	0.024	0.180
INDJOB	0.810	0.546
INDFIN	0.997	0.882

As shown in Table 5 when all variables are added to the main effects model the proportion of independent directors on the board (INDDIR) has the most statistically significant explanatory power. All other variables are no longer significant at the 5% significance level. An explanation for this effect was found by examining the correlations between INDDIR with all the other variables in the model. Table 6 shows the Pearson Correlation values resulting from this process.

Table 6 - Correlation of INDDIR with other Variables in the initial main Effects Model

Variable	Pearson Correlation INDDIR	Significance (2- tailed)
INDDIR	1	
BDSIZE	0.253*	0.014
FIRSTCEO	-0.316**	0.002
CEODOM	-0.441**	0.000
MANSHARE	-0.499**	0.000
AUDIT	-0.182	0.080
BLOCK	0.148	0.154
INDEQ	0.281**	0.006
INDJOB	0.392**	0.000
INDFIN	0.334**	0.001

*significant at the 0.05 level **significant at the 0.01 level

The Pearson correlation p values in Table 6 show a statistically significant correlation between the proportion of independent directors on the board and the variables representing board size, CEO/founder duality, CEO/chair duality, the proportion of shares held by executives and the three variables relating to independent director characteristics (independent director equity holding, other directorships held and financial expertise). It is likely the large degree of correlation between these variables and INDDIR resulted in the increase of p values considerably from their univariate significance levels. Such correlation is not surprising given the importance director independence is given in the corporate governance literature. Only auditor type and the existence of block-holding shareholders are not correlated with the proportion of independent directors on the board. The strong correlation evident between INDDIR and other variables in the initial main effects model required a revised modeling approach to determine an appropriate multivariate main effects model. This process involved pairing the variable INDDIR with each individual variable shown to be significant at the univariate level.

Table 7 shows the results of applying the resulting nine individual paired logit regression models.

Table 7- *P-values of each Variable Modeled with Independent Directors*

<i>Model Number</i>	<i>p value INDDIR</i>	<i>Paired Variable</i>	<i>p value Paired Variable</i>	<i>95% Confidence Intervals</i>
1	0.001	BDSIZE	0.468	(0.607, 1.258)
2	0.001	FIRSTCEO	0.308	(0.491, 9.499)
3	0.001	CEODOM	0.878	(0.236,5.402)
4	0.001	MANSHARE	0.716	(0.981,1.029)
5	0.001	AUDIT	0.144	(0.624, 25.520)
6	0.001	BLOCK	0.15	(0.957,1.007)
7	0.001	INDEQ	0.279	(0.234, 1.520)
8	0.001	INDJOB	0.670	(0.711,1.245)
9	0.002	INDFIN	0.871	(0.983,1.020)

Table 7 shows that when each variable of interest was included in a model simultaneously with the variable INDDIR only the variable INDDIR retained statistical significance in each case. This suggests that the proportion of independent directors on the board is the primary corporate governance parameter with respect to predicting management perpetrated fraud. For the purposes of this study the inclusion of other corporate governance variables in the final model offered no additional explanatory power.

Results of the Final Model

The results of applying the final main effects model, containing the variable INDDIR as sole predictor, showed independence of the board is a statistically significant determinant (at the 5% significance level) of the likelihood of a company experiencing management perpetrated fraud ($p < 0.001$, Odds Ratio = 0.92 with 95% confidence intervals 0.88 and 0.97). Accordingly hypothesis H1 (i.e. that firms with a higher proportion of independent directors on the board are less likely to experience management perpetrated fraud than firms with a lower proportion of independent directors on the board) is not rejected based upon the evidence available. The remaining hypotheses H2 to H6 were rejected.

Quantifying the Effect of Board Independence on Management Perpetrated Fraud.

The odds of a firm experiencing management perpetrated fraud are provided in Table 8. These results were obtained by comparing varying proportions of board independence to a reference group of a board comprised of at least 50% independent directors. The reference group was selected as representative of corporate governance best practice, as recommended by prominent market regulators. The three comparative segments (0%, >0% to <25% and 25% to <50% independent directors) were selected as representative of the distribution of proportion of independent directors across the range of INDDIR% in the study sample.

Table 9 - Proportion of Independent Directors and the Odds of Firms Experiencing Management Perpetrated Fraud

% Independent Directors	Odds Ratio	Odds Ratio 95% Confidence Interval		% of Fraud Firms Sampled	% of No-Fraud Firms Sampled
0%	121	7.7	1894.8	47%	4%
>0% to 25%	14.3	1.5	136.8	23%	15%
>25% to <50%	7.7	0.9	65.4	23%	47%
50% or more	1			7%	34%

As shown in Table 8 the odds ratio for a company having a board with no independent directors is 121. This suggests that the odds of such a company experiencing management perpetrated fraud is estimated to be 121 times larger than the odds of a company with a board comprising at least 50% independent directors experiencing management perpetrated fraud. The confidence interval suggests these odds may be as much as 1,894.8 times or as little as 7.7 times the odds of the reference group experiencing management perpetrated fraud. The analysis also shows the odds of a company with a board containing up to 25% independent directors experiencing management perpetrated fraud is 14.3 times the odds of the reference group experiencing management perpetrated fraud.

Concluding Comments and Limitations

These results offer further support to agency theory's assertion that the appointment of independent directors to the board is an effective control over agency conflict. The results of the research model showed that a firm's corporate governance was associated with the likelihood of it experiencing management perpetrated fraud. In particular, the model provided evidence that as the proportion of independent directors on the board increased the likelihood of a company experiencing management perpetrated fraud decreased. Notably none of the other corporate governance mechanisms were found to substantially decrease management perpetrated fraud.

An inherent limitation in any study of corporate fraud is the inability to identify all firms in which corporate fraud has occurred. Evidence suggests that to avoid adverse publicity, a sizeable proportion of fraud is not reported by firms. For example, the 1997 KPMG study found that only 69% of Australian frauds were reported to authorities. As a result, the findings of this study relate only to publicly reported fraud. This may possibly impact on the external validity of the findings. In addition the following methodological limitations need to be noted:

Firstly, the data set of 47 Australian listed companies reporting management-perpetrated fraud is smaller than comparative studies in the USA. A smaller data set was expected given the large number of publicly listed companies in the US compared to Australia. However, studies utilising similar methodology to this research have been successfully

applied to samples of similar size. Despite the small data set, it is reasonable to assume it is representative of, or close to, the population of large public company frauds reported in Australia, given the importance ASIC places on disclosing prosecution of frauds.

Secondly, identifying the fraud commencement date was critical in determining the appropriate period when reviewing the firm's corporate governance. The fraud commencement date reported in ASIC media releases may be inaccurate given that a perpetrator on trial may be motivated to understate the extent of their crime. However, as most frauds detailed in the study occurred over an extended period of time, analysing corporate characteristics at a given time within this period is considered to provide a reasonable snap-shot of the firm's corporate governance ethos and environment.

Thirdly, the process of determining directors' independence from management relied on evaluating disclosures from the relevant company's annual report. It is possible that these internal disclosures are subject to bias. In addition, limited disclosure in some cases meant that the determination was sometimes partially subjective. Another inherent limitation is that annual report disclosures are only useful in evaluating the physical characteristics of a company's corporate governance mechanisms. Other non quantifiable factors, such as directors' personal relationships, may override the physical controls established.

Finally, the use of control groups to analyse the sample, requires that the characteristics of the control group be identical to those of the sample. In practice no two companies are identical, a problem that is compounded by the relatively small population of publicly listed companies in Australia. Each fraud firm included in the sample was paired with a firm that was its closest match in terms of size and industry. While the control firm was as similar to the fraud firm as possible, it was unlikely to be identical.

**THE IMPACT OF GLOBALIZATION IN SUSTAINABLE TOURISM
IN MEDITERRANEAN COUNTRIES (INCLUDING ALBANIA
SITUATION NOW DAYS)**

Shqau, Gjergji¹

¹Lecturer in Department of management- marketing, Faculty of Economy Elbasan. University "Aleksander Xhuvani" Elbasan. Email: gjergjishqau@yahoo.com

Abstract

The aim of this paper is to study the role of globalization in sustainable tourism focusing on the area (region) of the Mediterranean and then to Albania, which is one of the members of this area. The paper addresses the concept of globalization by linking it with sustainable tourism. Focusing in the Mediterranean area treated different theoretical problem and the specific characteristics of sustainable tourism in the context of globalization, such as environment, food, number of achievements, historical and cultural values of countries in this region, etc.. Then the article goes on describing tourism in Albania, the characteristics of this country, various forms of tourism that exist and the obstacles faced and opportunities that he has in the field of tourism. Various data showing the flow of tourists and revenues in years as well as their structure, from which can be understood well the current state of Albania in the process of globalization in sustainable tourism . At the end of the article provides some conclusions and recommendations that should be considered for the future. The methodology of this article is based on collecting data from various sources, books, articles, internet, newspapers, magazines, images and footage, interviews that were done to tourists and visitors who have spent vacations in Albania. Then they are collected, selected, processed and adjusted according to the structure and purpose of the article.

Keywords: globalization, sustainable tourism, Mediterranean, Albania, tourists, travel

Globalization and Sustainable Tourism

Globalization, simply put, denotes the expanding scale, growing magnitude, speeding up and deepening impact of transcontinental flows and patterns of social interaction (Mc Grew,2002). The term relates to the process in which technology, economics, business, communications, and even politics dissolve the barriers of time and space that once separated peoples (Eckes, 1999). Globalization with its transcontinental flows, patterns of social interaction, and so-called global mass has given the tourism industry free reign to develop throughout the world. In fact, tourism has led the globalization process in the areas of transportation, communications, and financial systems (McLaren, 1999). The ability of tourism to generate foreign exchange revenue, create employment, and absorb

unemployment has provided it with a political and social legitimacy. Furthermore, tourism has become part and parcel of multilateral financial institutions' package for financial bailouts for countries in distress (Gonsalves, 2003). Tourism is now being pursued as a serious development strategy for the Developing World. However, the economic benefits of tourism are, the results of a fundamental process by which expressions and forms of environmental and cultural capital are traded. On the one hand, environmental capital, in terms of natural resources and more intangible aesthetic constructs of landscape and built heritage is clearly recognized as a platform for tourism development. On the other hand, cultural capital, in its art factual form and mosaic of local cultures, together with its way of life and tradition dimensions, is also recognized to be at the root of tourism phenomenon. The rapid expansion of tourism is responsible for adverse environmental and socio-cultural impacts. Although the tourism industry is regarded as being kinder to the environment in general than most other industries, it's very size and wide spread presence has created negative environmental impacts, both of a physical and socio-cultural nature. Natural resource depletion and environmental degradation associated with tourism activities undermine the important ecological systems and pose severe problems to many tourism destinations. With globalization, these threats will be exacerbated. International agreements that open up access to the local tourism industry by big travel and tourism transnational cooperation's (TNCs) will only speed up exploitation of the natural resources, culture, and way of life of indigenous peoples (Gonsalves, 2003). Tourism should thus be involved in sustainable development, because it is a resource-based industry, which is dependent on nature's endowment and society's heritage. We can safely ascertain that sustainable development in tourism is premised on the notion that the economy and the environment - physical as well as socio-cultural are but two sides of the same coin, in other words, the two are intimately linked. The continuation of tourism as a dynamic and viable industry is thus dependent upon the adoption of a strategic approach to planning and marketing (Faulkner, 1994). Sustainable Tourism is a phenomenon of the 1990s, however its origins lie in the wider concept of sustainable development (Swarbrooke, 1998). Sustainable tourism operates in harmony with the local environment, community and culture, so that these become the permanent beneficiaries and not victims of tourism development. Achieving sustainability depends on a balance of private initiative, economic instruments and regulation, translating global principles into focused local action, and new public-private sector delivery mechanisms. This may give birth to a new and necessary tourism culture that bestows more importance to the environment as a valid raw material for sustainable tourism development. According to the World Tourism Organization (WTO) sustainable tourism development meets the needs of present tourists and host regions while protecting and enhancing opportunity for the future. Sustainable tourism development can thus be envisaged as leading to management of all resources in such a way that we can fulfill economic, social, and aesthetic needs while maintaining cultural integrity, essential ecological processes, biological diversity, and life support systems (Murphy, 1994). The need for resource management reaffirms that tourism is

an economic activity, which must be capable of making a profit in order to survive and benefit the community. The fulfillment of social obligations, means more than inter-generational equity, it means respect for other livelihoods and customs. Such variety and heritage is a major resource for tourism in a world that is fast becoming homogenized into a global economy. The ecological process needs to be understood so that tourism intrusions will have the minimal impact, especially in sensitive coastal areas. The concern over maintaining our biological diversity is particularly germane to tourism, which thrives on the appeal of different flora and fauna along a distinctive sense of place. Finally, the need to sustain our basic life support systems is paramount. If these basic needs are not yet met, then our higher level needs, like travel will fail to materialize.

Sustainable Tourism Development along the Mediterranean countries

Mediterranean countries have one of the fastest growing tourism industries in the world. Vast cultural and natural resources constitute principal attractions for visitors. Dramatic natural features of the region exemplified in the pristine coral reef ecosystem, rare but beautiful mars as, sharms and beaches, uncluttered coastal landscapes, and landforms carved out by wadis constitute a particular tourist attraction. However, these ecosystems are vulnerable and their protection requires special attention in the planning and design of tourism developments. On the one hand, the fragile coastal reef ecosystem is easily damaged by intensive development of tourist facilities and the impact of tourist numbers. Land filling of coastal zones to provide sandy beaches destroys reefs and increases seawater turgidity damaging flora and fauna and resulting in the contamination of coastal sites. On the other hand, the increased demand and pressures of projected expansion of tourism activity in the central core of tourism developments undermines the cultural and built heritage, and places a strain on the existing infrastructure, leading to visual pollution, crowding and traffic congestion, and socio-cultural changes in the local population, ultimately affecting the well-being of the host community. Minimizing visitor consumption to reduce environmental impacts has negative consequences for economic development because the opportunities for revenue generation are reduced. Therefore, because eco-tourists typically spend less than the average tourist, creative alternatives to simply increasing visitor inflows must be found to increase the economic benefits derived from ecotourism in host locations. (WTO, 1998). Food tourism is not a new concept within the tourism industry, but rather that current academic research on the theme of food tourism has made food tourism pertinent for further analysis, perhaps in the area of responsible tourism. Traditionally food consumption by tourists had been very much part of the travel experience, with significant cultural, social, environmental and economic implications. Globalization of food products has emerged in the last few decades, this being named MacDonaliation as some academics. (Symoms, 1999, cited by Hall, 2003). Globalization has resulted in a 'new' form of tourism as food is an integral part of the global village. Food becomes 'the other' as opposed to the norm of the eating experience

at home. Food therefore allows the tourist to confirm their sense of the other and emersion in another culture. Food gives the tourist a 'sense of place' (Hall, 2003). Globalization has resulted in the boundaries of national and cultural identity becoming blurred. In the post-modern cuisine at the local level will be inevitably be influenced by external food imports. (Hall, 2003). Cohen, E and Avieli, N. (2004) state that for local cuisine to become a popular attraction in its own right dishes must be filtered through a tourism-oriented culinary establishments. Local foods are transformed to suit tourist tastes and at the same time foreign dishes are introduced by tourism into local cuisine and transformed to suit local tastes. This could be envisaged as a new art form in that tourist cuisines are new cultural products. The authentic experience of food tourism endorses the principle of hotels and restaurants committed to the procurement of locally grown products and produce whilst at the same time encouraging the protection of the environment. The Mediterranean region is the leading tourist destination. Tourism is mainly concentrated in the coastal areas which receive 30% of international tourist arrivals. The most widely used tourism development model used in the region is based on seaside summer holidays and the attainment of quantitative goals. Of the total 46,000 km of coastline, 25,000 km is urbanized and have already exceeded a critical limit. In the last fifty years, the number of non-resident tourists has multiplied exponentially in the Mediterranean, which is currently the main tourist destination on the planet with more than 232 million international tourists per year, accounting for thirty percent of the totality of the world market and twenty-five percent of the tourist income. At present, three quarters of Mediterranean tourism is concentrated in four EU member countries: France, Spain, Italy and Greece. The Mediterranean is under threat due to the inappropriate practice and development associated with mass tourism. With current development models based on quantity, the projected growth of tourism development in the region will continue to damage landscapes, cause soil erosion, put pressure on endangered species, further strain available water resources, increase waste and pollution discharges into the sea and lead to cultural disruption. With the accession of Slovenia, Malta and Cyprus, the EU will be even further strengthened in this respect. The rest of the Mediterranean region also has a great dependency on tourism as an economic activity and strategy of development, especially Egypt and Tunisia. In relation to accommodation, France, Spain and Italy are also host to around seventy percent of the overall industry in the Mediterranean. Most of this accommodation corresponds to flats and second homes, followed by hotels and other types of non-hotel accommodation such as campsites and caravan parks. Within the non-community countries there is further inequality, given that Turkey, Tunisia and Egypt receive most of the international tourists, especially from the EU countries, and even compete with them for the business of the new republics of the USSR's dismemberment. A joint effort by the different agents is necessary, on the part of the public authorities, international institutions, companies, experts, NGOs and civil society in general, in order to guarantee the implementation of sustainable tourism in the Mediterranean. One of the main problems is tourist seasonality, given that it is calculated that between the months of June and September the Mediterranean

basin receives around forty-five million national tourists and more than fifty million foreign tourists, mainly concentrated on the coast and the islands. This fact leads to a high concentration of visitors and an unequal distribution of tourist income over the course of the year. Most of the tourist products and services on offer focus on the sun and beach scenario, although in the past few years a diversification of these offers has been planned. This pressure of tourism has had both direct and indirect effects on the area such as the totally uncontrolled modification and urbanization of bays and beaches with construction of residences, services and public access. The lineal concentration and the pollution of the coast are issues that are related to an intensive urbanization and indiscriminate land occupation. According to the WTO, the four most important sectors of the tourist market in the Mediterranean countries are those of sun and beach holidays, cruises, and nautical and cultural getaways. The sun and beach package directed at mass tourism is based on tourism of fixed residence. The mature destinations, especially those of the Latin Mediterranean arc, have prompted campaigns for the improvement of hotel infrastructures and the offers of the tourist industries. Apart from meeting halls, the tourism related to business and conventions, and the controversial golf courses which have spread through all the various forms, we should point out other infrastructures such as thematic parks, casinos, as well as sporting ports and cruiser terminals. The Mediterranean represents twenty percent of the world market in cruise holidays. This is a market that is in expansion, and a dynamic phase of growth, and which has evolved from a product directed primarily to elite groups of customers to a product of mass tourism, with all the risks that this evolution may involve. Nautical tourism still preserves a certain exclusivity despite the fact that it has been popularized in recent decades. It is a growing sector among the societies of developed countries which has allowed higher numbers of people to benefit from enjoying nautical tourism activities. This market, consolidated in France, Spain, Italy, Monaco, Gibraltar, Malta, Greece, Cyprus and Turkey has had an equally strong development on the Adriatic coasts (Slovenia, Croatia) as in the north of Africa (Morocco, Tunisia, and Egypt). Cultural tourism is also experiencing a growth in the Mediterranean region. It includes important sectors such as tourism of heritage sites (archaeological sites, monuments, museums, industrial heritage, and traditional festivals and fairs), the tourism of festivals and cultural events, and is especially related to religious tourism, rural tourism and gastronomic tourism. The countries of the Mediterranean basin are home to 212 of the 754 places listed as world cultural and natural heritage sites by UNESCO, which is twenty-eight percent of the world total. Most of these areas of tourist attraction do not have suitable management plans for tourist usage, and investigations into the capacity and management of visitors have not been implemented. Cultural tourism is particularly concentrated on big cities such as Barcelona, Rome, Naples, Athens, Istanbul, Damascus, Jerusalem and Cairo. Medium-size cities employ an exploitation of tourism that centers on weekend packages or city-breaks, or that forms part of the travelling city-route tourism by bus (especially in the cases of Spain, Italy, Greece and Turkey). This industry exerts an excessive pressure on determined museums and monuments

, with a stay and consumption in the city of only a few hours, in many cases with more detrimental effects than benefits. In the case of cities such as Venice, most of the public are day visitors who spend the night in other cities, a fact which is more evident in towns such as Arles, Nîmes, Pisa, Siena, Avila or Segovia where excursionists prevail. A further strategy adopted by Mediterranean cities to position themselves within the international market are cultural events.

Others characteristics of Mediterranean countries in tourism

The Mediterranean countries in 2009, received 295 million international tourists, that is, around 31% of the global aggregate. Up to 2025, inflows are likely to reach 665 million tourists in the Mediterranean countries, of which 312 million in the coastal regions alone. International tourism earnings stood at over 208 billion US\$ in 2010 for the Mediterranean countries as a whole, which represents an average spending of 803 US\$ per international tourist. Air transport is significantly on the increase for tourism flows in the Mediterranean: from 23% of the arrivals in 1988 to 42% in 2010. However, the arrival of international tourists still takes place, for the major part, by road: 54% in 2010, as against 67% in 1988. Cut down by 3 between 1988 and 2010, arrivals by rail experience a slump, while arrivals by sea have picked up slightly: +2% over the same period.

Fig.1. & Fig.2 & Fig.3

They are some other different characteristics among the countries of the Mediterranean area. As you can see the various from one country to another. This can be one factor to go or leave it, but it's not fundamental one. Some countries can have other specific or different profits than can pass those average distance marinas.

Fig4 & Fig.5

The arrivals tourist number varies from country to country and it depends from different factors and as you can see at the fig.4, France, Spain and Italy are on top from arrival number and the monies collected. Maybe the culture, environment, level of tourism services and hotels, heritage, quality of services, high level of human resources on tourism sector, variation in the time of entertainment, the nature of people, flexibility and adaptation with different people around the world, etc can be the most important factors of this classification. Those reasons are then the fundamentals of globalization in sustainable tourism for the progress in the Mediterranean countries. Those elements and trends will tend in the recent future to absorption of the tourist in this area and to change the tourism structure in favor of the Mediterranean area. Globalization in sustainable and progress tourism can be advantageous for both parties like the two pieces of one coin. In one side the host countries can learn from different cultures and foods requests of foreign people around the world that they need to find some time they way of leaving as they leave in their countries, but some time they need something new, that is one the most important motivation that they are abroad they country. The host countries can profit more monies and good image being sustainable and developing more and more this sector, thinking for the better future of their tourism sector. In another side if the tourists will reach the target performance planned before going on the vacation, they will repeat it next time and it will be possible to become group referees or opinion leaders for other peoples. So the market segments will grow more and more. They can profit new experiences on foods, culture, education, communication; life style etc, so will become more relaxed and more productive in their jobs too.

Tourism in Albania

Albania has a key geographical position of strategic importance in south-eastern Europe. It is a crossway between the West and East and the coastal border lies along two Mediterranean seas. Because of this favorable geographical position near the current tourism market in the Mediterranean, it creates the opportunity to be included in the international tourism destinations. In a natural sense, Albania has a relatively unique environment because of its variety of landscapes. An especially high tourist potential is presented by the long lowland type coastline of the Adriatic and Ionian Riviera with its long summer season. There are long stretches of beaches, approximately 472 km, alternating sandy zones with rocky massifs. (Beka, 2009). The mosaic relief has a variety of forms: hills, high-unexplored mountain ranges, fields, and valleys. As a result of the specific physical and geographical conditions, there is a dense network of rivers and streams and there are many large lakes of special beauty, which are very rich in fish of many kinds and quality. In addition, Albania is one of the richest countries in terms of floral variety (structure and combinations) and fauna. It has a good Mediterranean climate, which is attractive to tourists. Balkan Enterprise Facility (BEF, 2000) identifies that the summer in Albania is hot and dry with plenty of sunshine, with more than 200 sunny days (second to Spain amongst European countries). Albania is rich also in culture, both material and spiritual. Above all, this country is distinguished for the hospitality of its people. In the last report of the World Economic Forum (2010) on travel and tourism competitiveness, Albania ranked 44th in a list of 124 countries according to human, cultural and natural resources. Based on one of the receipts reports of the UNWTO, the Government has stated that Albania earned USD 16,500 for every tourist that visited the country during the 2009 holiday season. Gorica (2005) suggests that income from the tourism industry in Albania is very low compared to other Balkan countries next to Mediterranean. She argues that the statistics in Croatia suggest USD 5,000 - 6,000 millions per annum, in Montenegro USD 2,000 - 3,000 millions per annum, but in Albania not more than USD 400 million per annum(Caku, 2008). According to WTTC (2010), the contribution of Albania's travel and tourism economy to total GDP is estimated at 14.8 per cent in 2009 ,15.2 per cent in 2010 and is expected to rise to 18 per cent by 2017. Albanian environment provides conditions for the existence of over 3200 species of higher plants, making up 30% of European flora and 756 species vertebrae , where 91 of them are in our country and world have a protection status. Changing social life in Albania in recent years, according to environmental specialists, has brought a great number of environmental problems, which both represent the negative historical legacy as well as that of the transition period. So the earth as an important natural element is not properly protected and exploited in a sustainable manner, but is significantly affected by erosion. (Çeku et al, 2010)

Globalization and sustainable tourism in Albania

Currently Albania has a small number of tourist offerings and the most important ones we can mention coastal tourism, mountain, historical and cultural, tourist parks. Coastal tourism is concentrated in the west of the country and especially in Velipojë, Shën. Gjin, Durrës, Vlora and Saranda Riviera, Ksamil is all too frequent. These cities offer and a large number of services, hotels and restaurants, pulling in recent years the attention of foreign tourists. Tourism tourist parks historical sites as Apollonia and Butrint, have significantly increased foreign tourist groups. Increased interest has come as a result of an advertisement more intense in the Albanian media and international culture, traditions and history of our country, especially by the Albanian Ministry of Tourism. Mountain tourism in the north is open 40 inns project but lacks assistance to Albania in the south. In difficult moments for example snow climate impact positively on the development of mountain tourism as white or made activities such as skiing, skating etc. Are under development cultural tourism, health, hunting and agro tourism. Tourism in general is a sector which depends from different factors: economic, political, socio-cultural, environmental, etc. In this regard, Albania has problems in these areas which could affect the sustainability of tourism and globalization. Tourists of different countries will want to find tourist services and high diversity of domestic product separate and distinct from other countries, and adapted to different cultures and their ways, Albania in terms of difficulty of a first sensed the truncated Bid, which dominates the coastal tourism and this not extended to the coastline. On the other hand, adaptation to different requirements of tourists from different countries of the region and beyond requires the capacity to prepare human resources, equipment and technology conducive to tourism and hotel sector. Roads under construction and not well maintained beaches and many other environmental factors, or the bureaucracies of many local and central government, for the moment and in the next few years, projecting that inhibit this country in the process of globalization in tourism sustainable. According to the data so far in Albania, more than 21 percent of tourists who entered our country are from Macedonia. Behind them, about 18 percent come from Kosovo generally have frequented beaches. There are few and Montenegrins who have come to our country, although tourism may have been their day. According to records, the rest of the tourists reach countries like Italy, Germany, Czech Republic, Greece, etc. Along with tourists and immigrants originating this year have started to enter our country and groups of tourists from Great Britain, Holland, Germany, Russia, France, USA etc. Tourists other than attendance at the most picturesque places of our country were also interested to conduct real estate purchases and other things in our country. More and more tourism is becoming the main supplier of the economy with income. But as one of the sectors where growth is expected to focus on the future of the country, tourism is still not finds itself in the government's priorities, especially in support of funding. Under the central banking authority, the annual income from tourism is estimated at around 23 per cent. Growth of this sector, in fact, turns out to be higher than in any other sector. Experts explain

that the space for a higher growth is huge, but precise estimates are lacking. Under the current strategy for tourism development, which is currently in force, the income from this sector by 2012 should reach 464 million dollars. World Tourism Organization Albania suggests following a different model of tourism development from Croatia and Montenegro, models that are considered not very successful in streamlining the tourism industry. But without resolving the issue of ownership in the tourist areas there are very few opportunities to offer serious investors and consequently to provide services in the near future competitive with other countries in the region. "Albania is turning into" a new love Mediterranean "and less time will be an unexplored tourist trail. " With these words, Lonely Planet, an international company that provides information for the tourism industry throughout the world considers Albania as one of the most beautiful tourist destinations for 2011.

Conclusions and recommendations

Globalization in sustainable tourism has its positive side and negative. With the developments that are taking the world today it becomes more evident and inevitable. Mediterranean countries, especially France, Italy and Spain may respond better to this process due their economic development, qualified human resources, technologies in this sector, the diversity of tourism offerings, the ancient culture and traditions, their flexibility etc. These sites can create a good model not only for the region for many other countries in the world that want and intend to turn tourism into a profitable industry or sector. Albania is a country that emerged from the various problems that have accompanied and have made unfortunate for many decades. Currently entered in the path of progress, especially after association with several conditions in the EU, but there are still problems with the environment, economy, roads, politics, bureaucracy and corruption in the central and local levels. These obstacles will be overcome if, as quickly, will open possibilities of natural resources, historical and cultural traditions in Albanian cuisine, becoming a greater opportunity to be visited by different tourists not only from neighboring countries. It is recommended that globalization be accompanied by preservation of the best local and national authorities and exchange of experiences and lifestyles of different countries around the world and the region, and given the same time benefiting cultural values, badly needed for the revitalization of the country life different and their progress. Success depends on the skills that they will have to be managing them.

**AN APPLICATION OF THE WIN-WIN-WIN PAKONSTANTINIDIS MODEL AS
AN INNOVATIVE BARGAINING SOLUTION ANALYSIS IN COOPERATIVE SALES
PROMOTION CAMPAIGNS**

Spais, George S.¹; Papakonstantinidis, Leonidas²

¹Email: gspais@otenet.gr

²Email: lpap@ta-teikal.gr; papakon@gmail.com

Abstract

Cooperative promotion is an important instrument for aligning manufacturer and retailer decisions in marketing channels. On the other hand, bargaining seems to be critical for marketing channel coordination, e.g., for vertical cooperative promotion. Based on our previous study (Spais, Papakonstantinidis and Papakonstantinidis, 2009), we propose an extension of the win-win-win papakonstantinidis conceptualization, which may lead us to a more valuable “win-win-win spais-papakonstantinidis-papakonstantinidis model”, as an innovative bargaining solution analysis for cases of optimal allocation of a promotion budget in a cooperative sales promotion campaign in vertical marketing channels. The proposition includes three (3) adjusted utility functions. In accordance to the research question of the study, the literature review findings allow us to extend the three adjusted utility functions considering the parameters of sales response budgeting method, the break-even sales analysis and the independent variable of the trade promotion goals for the existed level of sales of the marketing channel member. Based on the assumptions of the win-win-win papakonstantinidis model, we present the referee solution in order to be accepted by all three cooperating players; and the constraints. The basic initial assumption of this study is that specific contexts of marketing and promotion planning and decision-making in a cooperative level need adjusted bargaining solution analyses.

Keywords: cooperative promotion campaign, bargaining solution analysis, win-win-win spais-papakonstantinidis-papakonstantinidis model, utility functions and vertical marketing channels

Introduction

According to He, Prasad and Sethi (2009), cooperative promotion is an important instrument for aligning manufacturer and retailer decisions in marketing channels. On the other hand, bargaining seems to be critical for marketing channel coordination, e.g., for vertical cooperative promotion (Ailawadi, Beauchamp, Donthu, Gauri and Shankar, 2009; Huang, Li and Mahajan, 2002) or resolving channel member conflicts as well as for setting trade terms such as transfer special prices and margins, according to Coughlan, Anderson, Stern and El-Ansary (2001). There is a significant literature on constructs such as bargaining problem (Xie and Wei, 2009) and tendency to conflict (Zhuang, Herndon and Zhou, 2005). In

contrast, the normative and behavioral principles governing marketing channel dependency and coordination regarding the tendency to sovereignty, tendency to improvement and mistrust are relatively unexplored. Encouragingly, as the literature reaffirms the critical role of bargaining in marketing channels (Coughlan, Anderson, Stern and El-Ansary, 2001), we strongly believe that the Papakonstantinidis win-win-win conceptualization as a bargaining solution analysis will receive a significant attention in the marketing literature in the nearest future.

In accordance with the framework of a cooperative marketing campaign process as presented by Fux, Mathieu and Myrach (2007), Merzenich (2005), Schumacher and Meyer (2004), a cooperative promotion management campaign process with the members of a vertical marketing channel (on both planning and cooperation levels) can be presented as follows (see Fig.1).

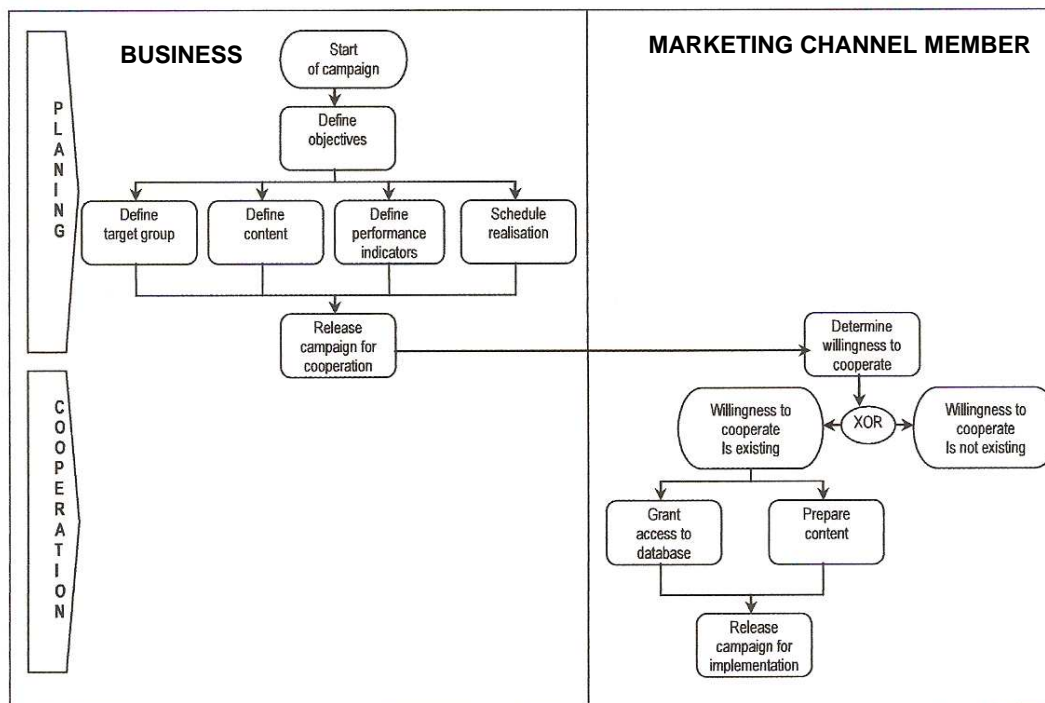

Fig. 1. An adjusted framework of a cooperative promotion management campaign process with a marketing channel member in accordance to Fux, Mathieu and Myrach (2007), Merzenich (2005), Schumacher and Meyer (2004).

Although literature clearly shows the raising issue of reinforcing customers' participation in marketing management activities of customer-centric organizations (such as: idea generation, idea screening, concept development and testing, process design, test marketing, building promotion campaigns etc.), (e.g. Lovelock and Young, 1979; Bowen, 1986; Dabholkar, 1990; Wilkstrom, 1995; Youngdahl and Kellogg, 1997; Sundbo, 1997; Johne and Storey, 1998; Sheth, Sisodia and Sharma, 2000; Wind and Rangaswamy, 2001; Alam, 2002; Piller, 2005; Galbraith, 2005; Hip and Grupp, 2005; Lusch, Vargo and O'Brien, 2007; Etgar, 2007; Chen and Lu, 2007;

Fang, 2008; Payne, Storbacka and Frow, 2008; Awa, 2010; Hu, Jianyou and Na, 2010), unfortunately there is no theoretical framework including the customer (as a “third party” or “third player”) in a cooperative marketing or promotion planning process.

Research aim, initial assumption and research question

Based on our previous study (Spais, Papakonstantinidis and Papakonstantinidis, 2009), we proposed an extension of the win-win-win papakonstantinidis conceptualization, which led us to “win-win-win spais-papakonstantinidis-papakonstantinidis model”, an innovative bargaining solution analysis for cases of optimal allocation of a promotion budget in a cooperative sales promotion campaign in vertical marketing channels. The proposition includes three (3) adjusted utility functions. In accordance to the research question of the study, we intend to extend the three adjusted utility functions considering the parameters of *sales response budgeting method*, *the break-even sales analysis* and the independent variable of the *trade promotion goals* for the existed level of sales of the marketing channel member. Based on the assumptions of the win-win-win papakonstantinidis model, we intend to present the referee solution in order to be accepted by all three cooperating players; and the constraints. The basic initial assumption of this study is that specific contexts of marketing and promotion planning and decision-making in a cooperative level need adjusted bargaining solution analyses.

According to the available empirical evidence, the SMEs seem to be oriented to the Sales School rather than the Communication School regarding to the goals of promotion campaigns (Huang and Brown, 1999; Thrassou and Vrontis, 2006; Elmazi and Bazini, 2008; Bazini, 2008; Demetriou, 2008; Tsiotsou, Rigopoulou and Kehagias, 2010; Vrontis, Thrassou and Czinkota, 2011) and sales response budgeting method seems that becomes quiet popular (Luxton, Hodge and Reid, 2002; Little, 2004; Thrassou and Vrontis, 2006; Miller and Pazgal, 2007; Du, Hu and Ai, 2007; Akanbi and Adeyeye, 2011).

Based on the above, the research question is if the ‘win-win-win spais-papakonstantinidis-papakonstantinidis papakonstantinidis’ utility functions can be extended incorporating *the sales response budgeting method*, *the break even sales analysis* and *the trade promotion goals* in order to be applied as a bargaining solution analysis for vertical cooperative sales promotion management decisions?

Theoretical and conceptual framework

The win-win-win papakonstantinidis model is a methodological tool for conflict resolution, especially in the case of decision-making, or in forming "instant reflection winning strategies" the

BARGAIN (which is the frame). For the needs of the study, we adjust the conceptualization, in order to deal with the development of vertical cooperative promotion management

decisions. It has to prove that building a strong competitive advantage in a market mainly depends on the trust links among the partnerships in the vertical marketing channels.

Cohesion in partnership in the supply chain may be measured by the diversification Rate (R^*) from strict rules: from this point of view, customers intervention should be useful, so as to diversify these “rules” at customized level adjusting them to their needs, wants, consuming identity, including communication codes, customs, ethics, culture. The win-win-win methodology, as a marketing channels’ development model, should facilitate customers to “readjust” bargaining rules in each market, through a sensitization process: Community of customers is defined as a discrete spatial/cultural entity at its sensitization process’ limit.

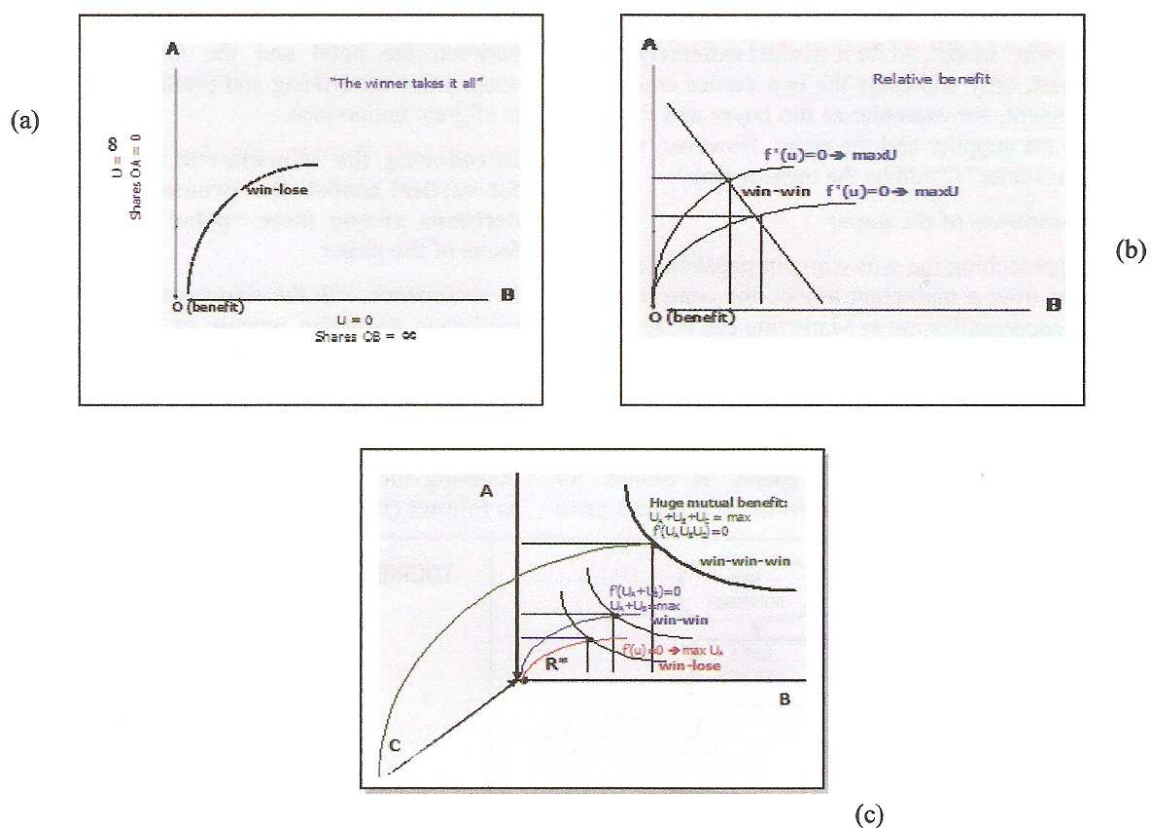

Fig. 2. Conceptual framework – the “win-win-win papakonstantinidis conceptualization” (c) compared to “win-lose” (a) and “win-win” (b) approaches

1.1. Definitions. 1.1.2. *Win-win perception:* It is based on when each side of a dispute feels they have won. Since both sides benefit from such a scenario, any resolutions to the conflict are likely to be accepted voluntarily. The process of integrative bargaining aims to achieve, through cooperation, win-win outcomes.

It is necessary to analyze the Nash “non cooperative-instant reflection game”/or a “win-win perception” as follows: Non-co-operative game is a game between two (2) players/individuals who have opposite interests (Aumann, 1987). Each player makes his own choices, based on

instant reflections' rational movements and his physical cleverness. The game (bargain) is determined by the result (pay-off) and not by player's expectations. It presupposes best choices by both players towards meeting individual interests ("winning strategies" – Harsanyi, 1973). Players (negotiators) do not regret, a posteriori, for their own decision taken, based on personal choices, during the bargain. Each of the players knows a priori that the other negotiator (or player) is as clever as he is. During the bargain, "mutual respect" between the two bargainers to each other's best choices is necessary. It is recognized that the more DETERMINED the breakdown of the negotiation (=less utility), the more satisfied (=better shares) – the more risk, the more profit.

Social behavior is not recognized as an acceptable one in the bargain, thus deriving unfair results: That means, "who needs the agreement as the result of a bargain, has to loose in shares, by accepting any result". Information may be the "link" between knowledge creation and the bargaining process. In particular, "Information" is a power factor in pure individuals winning strategies (Aumann, 1987). The more information, the better winning strategy, the more profit. Each of the players (negotiators), starting negotiations with the other, expects to gain the maximum profit. Interaction, based on instant reflection individual winning strategies, is the base of the Nash Non Cooperative Games Theory.

1.1.2. Win-win-win perception: It is based on the assumptions of information accessibility and diffusion that characterize the modern globalized societies as well as the complexity in the decision-making values that the "third win" (the "C" factor) could unlock a series of obstacles. Another assumption is that the individual (although his/her doubts) must believe that there is a "third" distinguishable part in the bargain (based on behaviorist analysis through the "neural networks"). Sensitization is introduced (regarding the integrated information) as a main variable of the bargain (the "third invisible part of the negotiation"/ the "C" factor). It is about an encephalic hard process in the bargain, which smoothes the angles of conflict or the shares/utilities (according to Nash). The "third win" functions as an umbrella, which conjoins different "dipolar relationships". Especially, in the business context, it must be understood that the existence of a "distinguishable entity", depends upon the degree of understanding and sensitization of knowing better the other polar (the partnerships in a supply chain), even through pecuniary values.

1.1.3. Bargaining. It is defined as a form of energy between two distinguishable entities with different expectations and controversial interests, where each part intends to sovereign. Practically, the social relationship "imitates" the natural relation, which is by nature conflictive; in order, the distinguishable entity acquires independent presence and action. This action is directed by the motive of gaining an individual profit. (Nash, Nasar and Kuhn, 2001).

1.1.4. Bargaining problem. A two-person bargaining situation involves two individuals (Von Neuman and Morgenstern, 1947), who have the opportunity, either to be competitors to each

– other (win-lose), or to make coalitions, or even to create pure individual strategies, based on bargainers' instant reflection behavior (win-win) (Nash, 1950; Arrow and Debreu, 1954; Aumann, 1987; Crawford, 1997). Nash (1951) focused on payoff shares/utilities combination. Bargain may result in either agreement or disagreement (Nash, Nasar and Kuhn, 2001). Utility expresses the constraint or the "fear factor" of disagreement for the negotiator who desires negotiations to be led in agreement more than the other one. Who needs more, negotiation leading to an agreement expects more utility, but – probably there is a loss in terms of "shares", due to lack of risk. On the contrary, who is indifferent about "agreement" or expects less utility per unit, has- to win in "shares" under the dogma "the more risk, the more profit" (Crawford, 1997).

So, bargaining problem is mainly based on "Utility Theory" – a mathematical theory of the Neoclassical School of Thought, able to explain (satisfactory) the individual expectations/anticipations, of a possible outcome. Usually, it is expressed in the form of a mathematical function: $f(u) = u^{1/2}$. Individual winning strategies are corresponding 1-1 to utilities $U(A)$ and $U(B)$ (Chun and Thomson, 1990). Utility theory of the individual is mainly based on the "concept of anticipation". In the "two-person utility theory", two (2) individuals in a bargain have the opportunity to collaborate for mutual benefit in more than one way. In its simple/initial version, no action, taken by one of the two individuals without the consent of the other can affect the well-being of the other one, but in real terms, there is only ONE decision, taken by the individual involved in a bargain.

1.1.5. Tendency to conflict. Refers to the tendency to competition between the two parts of the bargain with different expectations and controversial interests, results from the combination of: a) the case of the distinguishable entity, b) mistrust of each distinguishable entity, and c) the tendency to improvement. Based on the above, the motive of individual benefit leads with mathematic precision to the conflict, the tendency to sovereignty and from there to a competition climate, which is the corner stone of our economic system.

1.1.6. Tendency to sovereignty. The reason for which it is repeated is stressing the importance of "the need" for sovereignty, which finally "shapes" the expectations. Therefore, we have the following paradox: the expectation determines the motive (individual benefit, sovereignty, competition etc.) and simultaneously "is determined" by the internal need of dominance-sovereignty, something that characterizes our natural world.

1.1.7. Tendency to improvement. Constitutes the core requirement of the above tendency to conflict.

1.1.8. Mistrust of each distinguishable entity. Deals with the intentions of the other. Two distinguishable entities have different expectations; otherwise, the expectation of each one would be identified with the expectation of the other. Therefore, there would not be a bargaining and, of course, no "conflict" and no "distinguishable entities". If we had two "players" with precisely opposite interests and expectations, then the (A) would doubt the

intentions of (B) and (B) would doubt the intentions of (A). We would have thus a “never-ending circle of expectations” (Varoufakis, 2001).

1.2. Assumptions. According to Papakonstantinidis (2002, 2004a, 2004b, 2007), the conditions describing the bargaining situations of the win-win-win papakonstantinidis model are as follows:

1. In a bargaining situation, there are two distinguishable entities with opposite expectations and opposite interests.

2. These distinguishable entities, with the precisely opposite expectations, should be motivated (for individual benefit), so that they are activated and they transform the opposite expectations in opposite interests and from there in opposite “strategies of victory, or sovereignty”.

3. Since we accept the existence of the “distinguishable entity” and the motive of individual profit, we must accept the following condition: the mistrust of each pole of the bargaining situation, regarding the intentions of other. Two distinguishable entities have different expectations; otherwise, the expectation of each one would be identified with the expectation of other.

4. The natural tendency of individuals to improve continuously their position, results as basic consequence of the above assumptions, but simultaneously recommends the reason for all above. This natural tendency is permanent. It does not have upper barrier, while on the contrary it has a lower one.

5. Tendency to conflict, which refers to the tendency to competition between the two parts of the bargain with different expectations and controversial interests, results from the combination of: a) the case of the distinguishable entity, b) mistrust of each distinguishable entity and c) tendency to improvement.

6. Tendency to sovereignty, which refers to the reason for which it is repeated, is in order to stress the importance of “need” for sovereignty, which finally “shapes” the expectations.

7. The strategic choice, the decision and the strategic plan: If all the above aim to achieve the strategic goal of sovereignty, then the strategic plan is the means for accomplishing such a goal.

8. The respect of each one of the two poles, in the rationalism of the other, without moral or other extensions. This is essential and necessary condition for the establishment of the bargaining (in opposite case, there is no negotiation, but simply a “sovereignty” of the one pole to the other). Each one from the two opposite poles just simply respects the “bargaining power of the other”, or the “rationalism of the other”, which is about “a better organized strategic plan for the achievement of sovereignty”.

9. The two “opposite” poles are involved in a bargaining situation through the STRICT choices (that have resulted from rationalism and strategies for sovereignty that shape their final decisions), they never regret for their choices and for their final decisions.

1.3. Theoretical implications and limitations of the “win-win-win papakonstantinidis model” to the marketing literature regarding to bargaining in cooperative marketing programs. According to Spais, Papakonstantinidis and Papakonstantinidis (2009), the importance of this theory is arisen from the transfer of the pure trust theory to a marketing context, which can be achieved in order to analyze marketing phenomena of bargaining especially in cooperative promotion programs characterized by conflict and mistrust. Marketing phenomena refer to understanding of the bargaining problem resolution and the types of negotiation in which the marketing channel member and the business dispute the price, which will be communicated and the exact nature of the transaction that will take place and eventually come to an agreement in terms of a promotion management strategy.

The theory considers the information accessibility and diffusion that characterize the modern marketing environment, and the complexity in the decision-making of marketing channel members values that the “third win” (the “C” factor: the customer) could unlock a series of obstacles. The individual (although his/her doubts) must believe that there is a “third” distinguishable part in the bargain. The ‘win-win-win papakonstantinidis’ theory supports the significance of the tendency to sovereignty, the tendency of conflict, which results from the combination of: a) the case of the distinguishable entity, b) mistrust of each distinguishable entity, and c) tendency to improvement in a vertical marketing channel.

Based on the assumptions of the ‘win-win-win papakonstantinidis’ conceptualization, the limitation in contexts such as the cooperative promotion programs, as identified in our previous study (Spais, Papakonstantinidis and Papakonstantinidis, 2009) is that utility assessment and cost-utility analyses such as costs/quality-adjusted expected profits model from the partnership for A and B factors and the demand model for C factor are frequently presented to demonstrate the value of many utility options in the marketing literature. However, utility indicators require various methods that introduce significant methodological challenges, which directly influence the results and ensuing cooperative promotion management decisions in vertical marketing channels.

The existed proposition for a bargaining solution analysis in the case of optimal budgeting in a cooperative sales promotion campaign

The three (3) adjusted utility functions introduced by Spais, Papakonstantinidis and Papakonstantinidis (2009) for a bargaining solution analysis in the case of optimal budgeting in a cooperative promotion campaign of a hotel and a tourism operator considering Sriram’s and Kalwani’s functions (2007) are presented below:

A factor (expected profits for the hotel)

$$\max U_{\hat{e}st} = (W_{st} - c_s - Pr_{st}) * ms_{st} (MD_t, SO_t, AD_t, PR_t, \xi_{st}) - AD_t$$

$$s = 0, 1, 2, \dots, S, t = 0, 1, 2, \dots, T \quad (1)$$

where $\hat{e}st$ – is the per period profit; \hat{e} for the hotel's service s at period t ; W_{st} – is the wholesale price W of hotel's service s for the operator at period t ; c_s – the marginal cost of hotel's service s ; Pr_{st} – is the promotion, respectively of hotel's service s at period t ; ms_{st} – is the hotel's market share for period t ; MD_t – is the marketing decision for period t ; SO_t – is the sales objective for period t ; AD_t – is the total advertising budget at period t ; PR_t – is the total promotion budget at period t ; ξ_{st} – is the mean utility to hotel's customers from services s at period t due to unobserved variables.

B factor (expected profit for the tourism operator)

$$\max U_{\hat{e}st} = (c_s - Pr_{st}) * ms_{st} (MD_t, SO_t, AD_t, PR_t, \xi_{st}) - AD_{st}$$

$$s_{op} = 0, 1, 2, \dots, S_{op}, s = 0, 1, 2, \dots, S, t = 0, 1, 2, \dots, T \quad (2)$$

where $\hat{e}st$ – is the per period profit \hat{e} for the tourism operator service s_{op} from the partnership at period t ; c_s – the marginal cost of tourism operator's service s_{op} from the partnership; Pr_{st} – is the promotion, respectively of hotel's service s at period t ; ms_{st} – is the tourism operator's market share at period t ; MD_t – is the tourism operator's marketing decision cost for period t ; SO_t – is the tourism operator's sales objective for period t ; AD_t – is the total advertising budget at period t ; PR_t – is the total promotion budget at period t ; ξ_{st} – is the mean utility to hotel's customers from services s at period t due to unobserved variables.

C factor (expected profits for the hotel's customers)

$$\max U_{cst} = \beta_{0cst} + \alpha_c P_{st} + \beta X_{st} + \gamma_c Pr_{st} + \xi_{st} + \varepsilon_{cst},$$

$$s = 0, 1, 2, \dots, S, t = 0, 1, 2, \dots, T \quad (3)$$

where β_{0cst} – is the utility that hotel customer c derives from hotel services s at period t ; P_{st} – is the regular price, respectively of hotel's service s at period t ; X_{st} – is a vector of factors that influence the hotel's customer's utility including demand drivers such as seasonal factors at period t ; Pr_{st} – is the promotion, respectively of hotel's service s at period t ; ξ_{st} – is the mean utility to hotel's customers from services s at period t due to unobserved variables; ε_{cst} – is the loyalty of customer c to the hotel's service s at period t .

Literature review

A review of the research activity for the bargaining solution analysis for vertical cooperative promotion management decisions

Based on the analysis of 56 published research works (Spais, Papakonstantinidis and Papakonstantinidis, 2009), we can summarize the following findings:

- It seems that *cooperative bargaining solution analysis results* based on mathematical models can show us how to share the profit gain between the two parties in a vertical marketing channel and determine the associated pricing and advertising policies for both parties.

- The *bargaining problems* are:
 - the complex issue of promotion activities,
 - the reputation that both parties bring to the bargaining table, and
 - the perceived uncertainty in the lateral environment (competitive sector).
- Regarding the *tendency to conflict* in vertical marketing channels: it seems that communication is the main source of conflict followed by different expectations and organizational structure.
- Regarding the *tendency to sovereignty in vertical marketing channels*: there is a growing dominance of large retailers, which alter the traditional channel incentives.
- Regarding the *tendency to improvement for each member of the vertical marketing channel*: it seems that bargaining without side payments is not effective as cooperation at reducing beggar-thy-neighbor effects, it is a welfare-improving alternative to non-cooperation and is likely more practical in many situations.
- There is mistrust between the members of the vertical marketing channels.

Modern empirical evidence focus on the Customer as the third “player”/“pole” of the bargaining solution in cooperative sales promotion management process between the business and the marketing channel member (e.g. Gabrielsena and Roth, 2009; Bontems, Dhar and Chavas, 2007).

Customer as the third “player”/“pole” of the bargaining solution in cooperative sales promotion management process between the business and the marketing channel member

According to Misra and Mohanty (2008), bargaining can be seen as the process of distributing the gains obtained from trade among the participants of the trade. In the present context, the gains from trade (between the business or the manufacturer and the marketing channel member) are the total marketing channel profits. Since the wholesale price determines the proportion in which the gains from the trade (total marketing channel profit) are split between the marketing channel members, this wholesale price turns into the decision variable that is bargained over by marketing channel members. An alternative approach to measure bargaining power based on a Nash Bargaining Model between manufacturers and retailers has been recently proposed in the literature (Iyer and Villas-Boas, 2003; Misra and Mohanty, 2008; Draganska, Klapper and Villas-Boas, 2010).

There are two solution concepts for the above-mentioned bargaining problem - the cooperative approach and the non-cooperative approach (Muthoo, 1999). The asymmetric Nash bargaining solution is the cooperative approach to bargaining problems in which the asymmetry in bargaining power between the parties is taken into consideration.

Encouragingly, modern empirical evidence show the raising importance of the customer to be considered as the “third party” in delegated bargaining in vertical marketing channels (between the manufacturer and the marketing channel member), (e.g. Bontems, Dhar and Chavas, 2007; Gabrielsena and Roth, 2009).

Optimal allocation of promotion budgets, the sales response as a budgeting method and break even sales analysis as parameters influencing bargaining solution analyses of cooperative sales promotion campaigns

The optimal allocation of the promotion budgets is an issue of practical importance (Sriram and Kalwani, 2007; Albadvi and Koosha, 2011). According to Gómez, Rao and McLaughlin (2007) and Gómez, and Rao (2009) the theme categories in promotion management can be classified as follows: i. the explanation of the growth; ii. the allocation of promotion budgets; iii. the extent of pass-through; iv. the balance of power between the business and the marketing channel members.

Regarding to the extent of marketing channel’s member pass-through it seems that it ranges widely depending on the product category and retail price zone (e.g. Tyagi, 1999; Besanko, Dubé, and Gupta 2005); According to Cannondale Associates (2003), only 13% of manufacturers reported receiving a good value for their promotion expenditures and, furthermore, claimed that only about half of trade funds were actually passed on to consumers. Kumar, Rajiv, and Jeuland (2001) reported higher retail margins from promotion budgets depend on the product market characteristics, such as the retailer’s clientele and the heterogeneity in consumer search costs, and on frequency and budget of manufacturer deals.

For example, Drèze and Bell (2003) and Gómez, and Rao (2009) report that marketing channel members prefer discount-based promotions flexibility and manufacturers prefer performance-based promotions. Regarding to the research thrust related to the inefficient resource allocation due to the relative power between the business and the marketing channel member as discussed in research works (e.g. Scheffman, 2002; Sullivan, 2002; Paik and Bagchi, 2007; Stet, 2008), correlated to the distortions of demand because of the promotion campaigns.

According to Sriram and Kalwani (2007) promotions besides their strong positive effect on a brand’s performance, they may also have some detrimental effects that need to be accounted for while allocating the marketing budget. Based on this observation, Naik, Raman and Winer (2005) consider interaction effects between advertising and sales promotions in addition to modeling their main effects.

Regarding to the role of the budgeting method to the bargaining solution analysis for optimal budgeting in a cooperative sales promotion campaign, Dant’s and Berger’s study (1996) models the cooperative determination of franchisor's and franchisee's advertising contributions under conditions of differing perceptions of the sales response functions to

advertising. The authors report such decisions are frequent source of conflict and the disagreements persist because of the win-win potential of vertical cooperative advertising is not well appreciated.

Ending, regarding to importance of break even sales analysis in bargaining solution analyses of cooperative sales promotion campaigns, it seems that indeed it plays a very crucial role (e.g. Dant and Berger, 1996; Morton and Zettelmeyer, 2000; Ailawadi, 2001; Yue, Austin, Wang and Huang, 2006; Misra, 2008; Roma and Perrone, 2010).

Trade promotion goals influencing bargaining solution analyses of cooperative sales promotion campaigns

The issue of trade promotion goals seems to be underlined in terms of bargaining process in a cooperative sales promotion campaign adopting win-win trade promotion approach by Drèze and Bell (2003).

According to Sigué (2008), the long-term effects of promotions on sales are increasingly linked to the supposed shift of economic power within channels from manufacturers to retailers. However, formal knowledge about how they influence channel decisions under different promotional arrangements and the distribution of channel profits remains very sparse. Sigué's findings indicate that retailers always invest in retailer promotions, while manufacturers may find it optimal to not invest in consumer promotions. Economic power shifts from manufacturers to retailers when consumer promotions significantly expand the baseline demand in the long-term. Otherwise, manufacturers remain more powerful. Trade promotions or other profit-transfer mechanisms may be indispensable in easing conflicts over who should undertake promotions, especially when these promotions substantially increase future sales.

Based on the literature review findings, we extend the three adjusted utility functions (1), (2) and (3) incorporating the parameters of *sales response budgeting method*, *the break-even sales analysis* and the independent variable of the *trade promotion goals* that lead us to the utility functions (4), (5) and (6). The extended adjusted utility functions and the constraints (8), (9) and (10) derived from the win-win-win papakonstantinidis model are presented in the next section.

The new proposition: An extension of the utility functions of the "win-win-win spais-papakonstantinidis-papakonstantinidis model"

"A player" – Business – Promotion Planner (expected profits model for A player):

We consider the business, which is the promotion planner as the A factor, with utility maximizing the profits ϵ in a given period t ($t= 0, 1, 2, \dots, T$) for the brand p ($p= 1, 2, \dots, P$). We can compute the per period profit for the brand as:

$$\max U_{\acute{e}pt} = (W_{pt} - c_p - Pr_{pt}) * S_{pt} (MD_t, SO_{ptBS}, AD_{t ds/dt}, PR_{t ds/dt}, \zeta_{pt}) - AD_t$$

$$p = 0, 1, 2, \dots, P, t = 0, 1, 2, \dots, T \quad (4)$$

where:

\acute{e}_{pt} – is the per period profit; \acute{e} for the brand p at period t ;

W_{pt} – is the wholesale price W for the brand p at period t ;

c_p – is the marginal cost for the brand p ;

Pr_{pt} – is the promotion, respectively of brand p at period t ;

S_{pt} – is the business' existed level of sales for brand p at period t ;

MD_t – is the marketing decision cost at period t ;

SO_{ptBS} – is the objective of minimum sales volume for brand p at period t based on the break-even sales;

where *break even sales*:

$$\text{Break-even sales} = \frac{\text{fixed costs}}{\text{contribution margin}}$$

where *contribution margin*:

$$\text{Contribution margin} = \frac{\text{brand's price} - \text{variable cost}}{\text{brand's price}}$$

$AD_{t ds/dt}$ – is the total advertising budget at period t considering dS/dt ;

where dS/dt according to Vidale-Wolfe model (1957):

$dS/dt = rA(t)(M-S)/M - \lambda S$, where:

S = sales volume at period t

dS/dt = change of sales volume at period t

r = response constant

$A(t)$ = rate of advertising expenditure

M = saturation level of sales

λ = exponential sales decay constant (lost sales) when $A(t)=0$

$PR_{t ds/dt}$ – is the total promotion budget at period t considering dS/dt ;

ζ_{pt} – is the mean utility to consumers/customers from the brand p at period t due to unobserved variables.

“B player” – Marketing Channel Member (expected profits model from the partnership with the Business for B player):

We consider the marketing channel member as the B factor, with utility maximizing the profits \acute{e} for the marketing channel member from the partnership with the business in a given period t ($t=0, 1, 2, \dots, T$) for the marketing channel member (mediating, facilitating and sales) services to the business s_{op} ($s_{op}=1, 2, \dots, S$). We can compute the per period profit for the marketing channel member services as:

$$\max U_{\acute{e}st} = (c_p - Pr_{pt}) * ms_{pt} (MD_t, SO_{ptBS}, TPG_{pt}, AD_{t ds/dt}, PR_{t ds/dt}, \zeta_{st}) - AD_{st}$$

$$s_{op} = 0, 1, 2, \dots, S_{op}, s = 0, 1, 2, \dots, S, t = 0, 1, 2, \dots, T \quad (5)$$

where:

$\tilde{\epsilon}_t$ – is the per period profit; $\tilde{\epsilon}$ for the marketing channel member for brand p at period t ;

c_p – the marginal cost for the brand p for the marketing channel member;

Pr_{pt} – is the promotion, respectively of brand p at period t ;

ms_{pt} – is marketing channel member's existed level of sales for brand p at period t ;

MD_t – is the marketing decision cost for the marketing channel member at period t ;

SO_{ptBS} – is the objective of minimum sales volume for brand p at period t based on the break-even sales;

where *break even sales*:

$$\text{Break-even sales} = \frac{\text{fixed costs}}{\text{contribution margin}}$$

where *contribution margin*:

$$\text{Contribution margin} = \frac{\text{brand's price} - \text{variable cost}}{\text{brand's price}}$$

TPG_{pt} – are the trade promotion goals of brand p at period t ;

where *typical trade promotion goals*:

- a. expanding distribution
- b. inventory control
- c. encourage retail promotion

$AD_{tds/dt}$ – is the total advertising budget at period t considering dS/dt ;

where dS/dt according to Vidale-Wolfe model (1957):

$$dS/dt = rA(t)(M-S)/M - \lambda S, \quad \text{where:}$$

S = sales volume at period t

dS/dt = change of sales volume at period t

r = response constant

$A(t)$ = rate of advertising expenditure

M = saturation level of sales

λ = exponential sales decay constant (lost sales) when $A(t)=0$

$PR_{tds/dt}$ – is the total promotion budget at period t considering dS/dt ;

ξ_{pt} – is the mean utility to consumers/customers from the brand p at period t due to unobserved variables.

“C player” - Customers/Consumers (expected profits for customers/consumers):

We consider a market with utility-maximizing customers/consumers c who while visiting the point of sale in a given period t ($t= 0, 1, 2, \dots, T$) may choose to purchase the brand p ($p= 1, 2, \dots, P$) within a category or may purchase a competitive brand (equivalent to not purchasing in the category, denoted by $p = 0$). The presence of the

outside alternative in our model allows for the potential sales increase. We represent the utility that customer/consumer c derives from brand p , at period t .

$$\max U_{c,t} = \beta_{0cst} + \alpha_c P_{st} + \beta X_{st} + \gamma_c Pr_{st} + \xi_{st} + \varepsilon_{cst},$$

$$p = 0, 1, 2, \dots, P, \quad t = 0, 1, 2, \dots, T \quad (6)$$

where:

β_{0cst} – is the utility that customer/consumer c derives from brand p at period t ;

P_{st} – is the regular price, respectively for brand p at period t ;

X_{st} – is a vector of factors that influence the customer's/consumer's utility including

demand drivers such as seasonal factors at period t ;

Pr_{st} – is the promotion, respectively of brand p at period t ;

ξ_{pt} – is the mean utility to consumers/customer from brand p at period t due to unobserved variables;

ε_{cpt} – is the loyalty of consumer/ customer c to the brand p at period t .

In Equation (3), we assume that the consumers/customers in each period will choose to purchase one of the brands at the point of sale p or settle for the outside good depending on the utility that they expect to derive from each choice alternative. So, their purchase choice is based on a consideration of the: a) characteristics of competitive brands, b) regular prices of competitive brands, c) promotional deals, d) seasonality, and e) marketing channel member's corporate name.

The referee solution, the optimal solutions for the three players and the constraints derived from the win-win-win papakonstantinidis model

$$[\text{profit}_a(\text{Coop}) - \text{profit}_a(\text{Non-coop})].[\text{profit}_b(\text{Coop}) - \text{profit}_b(\text{Non-coop})].[\text{profit}_c(\text{Coop}) - \text{profit}_c(\text{Non-coop})] \Rightarrow \max! \quad (7)$$

The constraints presented below (8), (9) and (10):

$$\text{Profit}_a(\text{Coop}) \geq \text{profit}_a(\text{Non-coop}) \quad (8)$$

$$\text{Profit}_b(\text{Coop}) \geq \text{profit}_b(\text{Non-coop}) \quad (9)$$

$$\text{Profit}_c(\text{Coop}) \geq \text{profit}_c(\text{Non-coop}) \quad (10)$$

$\text{Profit}_i(\text{Coop})$: Profit of the i -th player from the optimal solution of cooperation,

$\text{Profit}_i(\text{Non-coop})$: Profit of the i -th player from the optimal solution of non-cooperation (threat point).

Based on the above, the three "players" should only share the additional profit that results from the cooperation while receiving in advance that part of the profit that they could have

achieved anyway in the case of non-cooperative behavior. The rationale behind this is that the profit cannot be shared in total because the players have different threat points, i.e. profits in the case of non-cooperation. It is thereby plausible to share only the additional profit resulting from the cooperation. Constraints (8), (9) and (10) ensure that the players only accept solutions that are better than the one they could achieve in the case of non-cooperation. For our case, marketing managers have to search for a solution that maximizes the additional joint profit from cooperation (i.e. by operating a cooperative sales promotion campaign) over the respective profits in the case of non-cooperation (i.e. by operating separate sales promotion campaigns).

Discussion

In this study, we propose an extension of the win-win-win papakonstantinidis conceptualization, which may lead us to a more valuable “win-win-win spais-papakonstantinidis-papakonstantinidis model”, as an innovative bargaining solution analysis for cases of optimal allocation of a promotion budget in a cooperative sales promotion campaign in vertical marketing channels. The proposition includes three (3) adjusted utility functions. In accordance to the research question of the study, the literature review findings allow us to extend the three adjusted utility functions considering the parameters of *sales response budgeting method*, *the break-even sales analysis* and the independent variable of the *trade promotion goals* for the existed level of sales of the marketing channel member. Based on the assumptions of the win-win-win papakonstantinidis model, we present the referee solution in order to be accepted by all three cooperating players; and the constraints. The basic initial assumption of this study is that specific contexts of marketing and promotion planning and decision-making in a cooperative level need adjusted bargaining solution analyses

Cooperative promotion is an important instrument for aligning manufacturer and retailer decisions in marketing channels. On the other hand, bargaining seems to be critical for marketing channel coordination, e.g., for vertical cooperative advertising (Ailawadi, Beauchamp, Donthu, Gauri and Shankar, 2009; Huang, Li and Mahajan, 2002) or resolving channel member conflicts as well as for setting trade terms such as transfer special prices and margins, according to Coughlan, Anderson, Stern and El-Ansary (2001). There is a significant literature on constructs such as bargaining problem (Xie and Wei, 2009) and tendency to conflict (Zhuang, Herndon and Zhou, 2005). In contrast, the normative and behavioral principles governing marketing channel dependency and coordination regarding tendency to sovereignty, tendency to improvement and mistrust are relatively unexplored. The literature reaffirms the critical role of bargaining in marketing channels (Coughlan, Anderson, Stern and El-Ansary, 2001). The research activity until 1987 is quite low. Only a few research works are presented in the leading marketing journals (such as the Journal of Marketing and the Journal of the Academy of Marketing Science). Quite impressive, research activity was over-triplining during the decade (1988-1998) and the research interest remained on the same level

in the decade of 2000. For an analytical presentation of the time evolution of the research activity regarding to the above win-win-win papakonstantinidis constructs, see Spais, Papakonstantinidis and Papakonstantinidis (2009).

No study, till now, has offered new bargaining solution analysis conceptualizations and especially the bargaining games theory analyzing individual winning strategies, through the utilities/shares possible combinations among three (3) “poles” in vertical cooperative promotion management decisions.

We strongly believe that the win-win-win papakonstantinidis model can be extended and as an innovative and valuable methodological tool for bargaining problems in vertical marketing channels regarding cooperative promotion management decisions and will receive a significant attention in the marketing literature in the following years. The importance of this try is arisen from the transfer of the pure trust theory to a marketing channels context, which can be achieved in order to analyze marketing phenomena of bargaining in marketing alliances characterized by conflict and mistrust.

Practical implications

The ‘win-win-win spais-papakonstantinidis-papakonstantinidis model’ is a methodological tool for conflict resolution, especially in the case of decision-making, or in forming “instant reflection winning strategies” the BARGAIN (which is the frame) in vertical marketing channels for cooperative promotion management decisions. Marketing managers must realize that building a strong competitive advantage in a market mainly depends on the trust links among the partnerships in vertical marketing channels. Cohesion in the vertical marketing partnership in the marketing channel may be measured by the diversification Rate (R^*) from strict rules: From this point of view, customers’ intervention is useful, so as to diversify these “rules” at customized level adjusting them to their needs, wants, consuming identity, including communication codes, customs, ethics, culture. The ‘win-win-win spais-papakonstantinidis-papakonstantinidis model’, as a vertical marketing channels’ bargaining solution analysis for cooperative promotion management decisions can facilitate customers to “readjust” bargaining rules in each market, through a sensitization process: Community of customers is defined as a discrete spatial/cultural entity at its sensitization process’ limit.

Conclusion

Based on our previous study (Spais, Papakonstantinidis and Papakonstantinidis, 2009), we propose an extension of the win-win-win papakonstantinidis conceptualization, which may lead us to a more valuable “win-win-win spais-papakonstantinidis-papakonstantinidis model”, as an innovative bargaining solution analysis for cases of optimal allocation of a promotion budget in a cooperative sales promotion campaign in vertical marketing channels. The proposition includes three (3) adjusted utility functions. In accordance to the research question of the study, the literature review findings allow us to extend the three adjusted

utility functions considering the parameters of *sales response budgeting method, the break-even sales analysis* and the independent variable of the *trade promotion goals* for the existed level of sales of the marketing channel member. Based on the assumptions of the win-win-win papkonstantinidis model, we present the referee solution in order to be accepted by all three cooperating players; and the constraints. The basic initial assumption of this study is that specific contexts of marketing and promotion planning and decision-making in a cooperative level need adjusted bargaining solution analyses

**MANAGEMENT AND LEADERSHIP IN THE PUBLIC AND STATE
ADMINISTRATION SECTOR**

Spanò, Isabella¹

¹University of Modena and Reggio Emilia (Italy), Labor Inspector – Chief of Operational Unit – Ministry of Labor and Social Security, “Direzione Territoriale del Lavoro di Parma” – piazza G. Matteotti, 9 – 43125 Parma (Italy)

Introduction

Which is the best method of Human Resources management – or, better, for the “management of people” – for the public sector? And which is the best leadership style? In this paper we try to focus and summarize both, theory – the latest theories – and practice – the operational everyday practices, according to the importance that Avallone (1994) attributed to this linkage. This purpose appears particularly significant, since, unlike in the private sector, HR management in public administration area affords a fundamental obstacle: there is not the aim of profit maximization. The mission of the organization, thus, does not result quantitatively measurable, but is situated on an ideal plan. So this mission is less clearly identified and less perceptible by the actors involved than that of the private sector, and organizational efficiency and individual productivity may then heavily suffer from this.

Theoretical trends in the EU area

The two pillars of modern management are the system of Total Quality Management (TQM), widespread in the eighties, and the process of self-assessment.

TQM underlines that the quality must accompany each organizational process. Operational planning and strategic planning of the organization must include the operational and strategic planning of its improvements.

In this respect, the self-assessment becomes essential. Self-assessment is a unique opportunity to make an overview of the overall strengths and of the areas of organizational improvement to implement quality management, being thus the platform of the whole organizational development.

Quality development and self-assessment represent together a “joint project” for managers and employees, both in the private and in the public sector.

For this, at the European level the Common Assessment Framework (CAF) model and its procedure were elaborated, resulting from the cooperation among EU governments in the field of public administration. Its first version was presented in May 2000 and next versions in 2002 and 2006. A CAF Resource Centre (CAF RC) was funded at the European Institute of

Public Administration (EIPA) in Maastricht, that works jointly with the network of CAF national correspondents.

The CAF is a simple free tool for TQM in EU public administration. In fact, it is based on the main Total Quality models in general, and on the Excellence Model of the European Foundation for Quality Management (EFQM) in particular, shaped according to the characteristics of public sector organizations. The CAF model presumes that great results in organizational performance are obtained through leadership driving strategy and planning, relating to people, partnerships, resources and processes.

The main goals of CAF model are: a) to familiarize public administrations to the principles of TQM and self-assessment; b) to encourage this self-assessment with the aim to make a diagnosis and to reach a practical effective improvement by the consequent action; c) to synthesize the various models used in quality management; d) to help public organizations in bench-learning.

By the CAF model the staff involvement is implemented, because management and staff must meet in order to analyze the current organizational situation and then promote quality at all levels.

The CAF model gained popularity among EU public administrations, so that in 2009 the CAF External Feedback was established to support such various organizations by peers and experts in TQM providing an external feedback (CAF-Common Assessment Framework).

But even if the above mentioned method is now provided by the evidence of results and by a certain number of good practices, it should not be forgotten that in public management science in general the major limitation is the lack of application of experimental methods (Hood, 2011). For example, in the United Kingdom, the shortage of experiment-based projects affected the 2004-10 Public Service research programme launched by the Economic and Social Science Research Council.

To escape from this impasse, the digital-era governance give us today a great opportunity: it makes possible a new form of theorization, that results from the opportunities of web resources and thus reduces the costs of experimentation, according to Margetts (2011). An example of this is the effort of the Public Sector People Managers' Association, that in the whole UK provides online services, from its website, to the community of the national public HR managers (UK Public Sector People Managers' Association). The presence of an apposite blog means that, since a two-way relationship can take place, there may be an interplay between theory and practice (UK Public Sector People Managers' Association Blog). Quite the same is done by the Public Sector HR Podcast, which defines itself as "the online radio show for People Managers in the Public Sector", providing the listening of

monthly interviews with top HR professionals and industry experts (UK Public Sector HR Podcast).

So, the reality of facts shows that scientific theory and practical evidence can and must proceed even more together. By the ex-post analysis of operational results, the current guidelines of scientific research in the field of management of people demonstrates the theoretical truth of value concepts such as "Empowerment" and "Commitment".

In fact, even if relating to the knowledge firms, Amar et al. (2009) demonstrated the exceptional results obtained relinquishing authority and giving employees great autonomy and in the same time leaving them self-motivation by the free expression of their talents and interests; this strategy, being funded on a sort of co-decision, can be called "mutualism". Other keywords related to those above mentioned, in this case, are Creativity, Innovation, Responsibility and Trust.

The actual emphasis on these aspects within public organization (Folador, 2006; Batstone, 2005) can help to fill the gap of the psychological distance from the organizational goal, as just said.

For instance, again, in France the control-based model definitively cease, giving way to a conception where people are no longer "employees", but "accomplices" (AA. VV., 2006), self-motivated enhancing their engagement but also their emotionality and sensibility; but the difficulties in delegating are still hard to be removed. France has been involved in a large movement of modernization of public administrations from 2006, when the "Loi organique relative aux lois de finances" (LOLF) was introduced. This law represents not only a budgetary reform, but also a general administrative reform, so that in it we must include the willingness to organize and motivate employees in the public sector, deepening also specific means like non-monetary approvals.

In The Netherlands, too, emphasis is put on the role playing by local communities and stakeholders to enhance and reinforce the organizational mission and thus the involvement of public employees to achieve organizational goals.

Quite the same orientation is seen in Italy, where drawing up the state to citizens and enterprises, according to an orientation towards internal and external customers, appears crucial, as public organizations have a certain problem of human resource productivity (Cavaliere, 2003). The need of people of approval for the efforts in their work and of adequate praise are also often theorized and verified (Wolf, 2010).

In general, the major theoretical assumptions followed by practical evidence is that people, in every business asset, need for meaning and positive value / evaluation. It is therefore revealed as essential the focus on existential needs of personal and professional

growth and development, as well as to those of empathy / harmony, sense of belonging, interpersonal communication, satisfaction with the realizations obtained. In the public sector, even more than in the private, a good leader must be able to implement all the above mentioned aspects and to bring them, so to speak, to their "full maturity."

Instead of the role of power, the leader must play a role of service (Folador, 2006; Amovilli, 1995).

The leader takes a coaching function, supporting and accompanying the internal client to achieving the objectives of the public authority.

In this operational framework, training is a key-precondition: it is necessary that the leaders first and then, as in a cascade, gradually the remaining staff are affected by a process of continuous training to increase awareness and responsibility. Just for the importance of what one can broadly define lifelong education, career paths must be constructed refocusing on that.

Practical evidence at the workplace

The daily experience of management in a governmental office led to add other aspects to the considered framework. The case that we show concerns a territorial office of a state administration. A team of officials was formed and their manager was appointed. The group was composed of four officers and a team leader. Officials were three men, two older and one younger, and a woman, young. The manager was a woman. The problem was the relative inefficiency and non-productivity of the group with the assigned tasks, which derived mainly from the characteristics of each subject; at a glance:

1- the most senior officer had willingness and had much experience, but family problems distracted him enough to put into the work;

2- the another middle-aged officer, in turn, had family problems that distracted him, but he applied; but, despite this, the experience was not specific enough to allow him to be sufficiently productive;

3- the younger officer was quite prepared and motivated, but highly insecure and anxious and still inexperienced;

4 - the young officer woman was well prepared and very motivated, but had just arrived in the office and tackled for the first time that kind of work (Goleman et al., 2002; Robinson, 1990).

The approach adopted by the team leader was different for each person in the group, but towards all of them were used empathy and support.

In details:

1 - more dialogue was initiated, allowing the subject to develop a relationship of greater confidence, the team leader has shown a sincere interest in the family situation of the official, so that he felt more relaxed at work and at the same time more optimistic about the resolution of his personal problems, and this allowed to him fewer distractions and a greater productivity; the team leader assigned vicarious tasks to the officer, increasing his self-esteem and enhancing his experience within the group, while making him responsible towards colleagues;

2 - even with this official was engaged a dialogue, through which he could feel valued and encouraged as a person and not just as a worker; since he was a more reserved person, the team leader respected this side of character and didn't force him to open up; this behavior of respect was appreciated by the official, who, as the other above mentioned did, became more passionate about their work;

3 - the team leader sought to reduce his anxiety by giving repeated assurances to this colleague on his abilities and urging him to show their positive potential;

4- the team leader made that the oldest official instructed the newcomer, and put the younger colleague side by side to her; this way, the two youngest in the group supported themselves mutually by compensating and helping each other.

Towards all her staff, the team leader have tried to maintain a friendly, sympathetic attitude, and to avoid sudden changes of mood. Sometimes it was necessary to show some more bossy attitude to maintain the fixed road map, but first of all called to their mind the organizational and personal ethics. To support the scheduled road map, instead to blame, she taught them the principles of time management. In addition, the team leader always endeavored not to divide but to keep the group cohesive despite the differences in character among members.

At the end of this process, that is at the end of the year, the fixed performance objectives were totally achieved. In addition, the next transfer of the head of the team leader to another group led to the request by members of the first group to get themselves transferred to the new group along with the team leader.

Strategic implications and conclusions

Finally, the focus now is on these critical needs to be satisfied in order to achieve the best management of people in the public administration:

1 – to have a good reputation, by implementing the internal and external communication, because HR function and communication function must go on together; this reflects itself on the people productivity;

2 – to maintain a strict relationship between the HR function and the customers and stakeholders feedback to the public administration: in fact, employees will be more motivated if it is really everyday tangible the satisfaction of the local community;

3 – to create and change organizational culture if it seems necessary.

In public administrations, it is important that people be helped to have a clear idea of both organizational mission and vision and thus to aim at ambitious goals, even when the challenge may seem great: in fact, often the effort required to achieve a modest goal is no different than what you need for a bigger. This concept is particularly important where the public good is the primary objective and idealism must play a determinant role, as Goleman et al. (2002) stressed yet.

**ETHNO-CULTURAL CONSIDERATIONS IN NEGOTIATION:
PRETENSE, DECEPTION, LIES AND FORMAL CONTRACTS IN GREECE**

Stefanidis, Abraham¹; Banai, Moshe²

¹Department of Management, The Peter J. Tobin College of Business, St. John's University, 8000 Utopia Parkway, Queens, NY 11439, USA. E-mail: stefania@stjohns.edu

Abstract

A retrospect into ethos, this study endeavors to illuminate the impact of individualism, collectivism, idealism and trust on business people tendency to endorse questionable negotiation tactics and to sign formal contracts in Greece. A thousand survey questionnaires were administered to Greek employees, of which 327 usable responses were collected. The use of an online platform allowed the rigorous management and control of the acquired data. The research findings highlight the significant role of ethical idealism in negotiation processes and agreements. The impact of individualism/ collectivism on the endorsement of questionable negotiation tactics and the propensity to sign formal contracts is corroborated. This research does not investigate respondents' actual negotiation behavior; it rather explores perceptions about preferred negotiation tactics, and attitudes towards ethical behavior, general trust and formal contracts. The findings may deviate from real-life behavior in the Greek setting.

Emphasizing the non-US and non-Western European nature of the empirical data collected, the originality of this research stems from the development of a comprehensive research framework about questionable negotiation tactics and formal contracts.

Keywords: Negotiation tactics, formal contracts, individualism, collectivism, general trust, ethical idealism, culture, Greece

Introduction

Aristotelian ethics summarized the ancient debate on ethical behavior and human well-being. Aristotle, following Socrates' and Plato's insights on ethical virtues, systematically discussed the significance of *ethos* on individual and collective excellence. Yet, it wasn't until the 1980s, when ethical behavior gained importance in the business world. It was the period when *code of ethics* became the buzzword in business research and a separate field of study emerged (Farrell et al., 2002).

A framework in which individual values and contextual psychological perceptions gain applicability has been that of negotiation tactics (Lewicki and Robinson, 1998). In negotiation, two or more parties try to work out a trade of items or services that would satisfy all involved parties. Not always the tactics adopted by the counterparts can be considered ethically

acceptable. For instance, in some cases, one or both sides may attempt to mislead each other, or keep secret information that could benefit the other party. Such tactics have often been challenged as questionable (Reitz et al., 1998).

Existing literature in the areas of social psychology and international business suggests three types of factors that relate ethical attitudes and behavior in negotiations: cultural, economic, and personal factors (Volkema, 2004). Although a stream of research acknowledges the role of these factors in ethical negotiating, the field has still been fertile for further examination.

Culture is a factor that influences negotiators' values, thoughts, behaviors and approaches, and thus one of the major variables present in the negotiation process (Cohen, 1993). Culturally diverse individuals interpret questionable negotiation behaviors differently, demonstrating different levels of tolerance towards questionable negotiation tactics. Also, the propensity of culturally distinct individuals to adopt questionable negotiation tactics varies significantly (Gelfand and Realo, 1999; Triandis, 1995; Volkema, 1998; Volkema, 2004; Volkema and Fleury, 2002; Zarkada-Fraser and Fraser, 2001). For example, in collectivist cultures people tend to comply with the norms that they are expected to follow, and frequently opt for questionably ethical activities when this is required by their family, community or other in-groups (Triandis, 2001; 2006).

A number of personal or demographic factors have been suggested to influence negotiators' propensity to use various questionable negotiation tactics. Most research of personal factors has focused on gender and age discrepancies as predictors of the actor's negotiating behavior (Kronzon and Darley, 1999; Lewicki and Robinson, 1998; Volkema, 2004). Male, rather than female, and younger, rather than older, individuals have been reported to have lower ethical standards (McDonald and Kan, 1997; Weeks et al., 1999). Other researchers have tested the influence of factors such as personality (Ma, 2005), problem-solving approach (Ma, 2006; Mintu-Wimsaat et al., 2005), and emotional intelligence (Foo et al., 2004) on the counterparts' bargaining behavior. In this study we highlight the role of two personal factors that have attracted minor research interest: ethical ideology (Al-Khatib et al., 2005), and general trust (Elahee et al., 2002).

The researchers in this study expand on the existing literature in negotiations, examining the impact of cultural and personal factors on questionable negotiation tactics. However, the ultimate purpose of every negotiation procedure is to reach the point of the parties' agreement. For this reason, the scope of this work extends beyond negotiation tactics to negotiators' tendency to sign formal contracts. We investigate whether cultural and personal factors relate negotiators' tendency to sign formal contracts. Consequently, this study's innovation and contribution consist in extending a comprehensive framework of business people tendency to endorse questionable negotiation tactics or to sign formal contracts to Greece, and beyond traditional western cultures.

We decided to test our instrument in Greece, a geographic region where, very early, the concepts of ethics, trust, and collectivism were systematically studied and codified. The choice of Greece as our research setting was motivated by three principal reasons. First, in an era of increasing globalization, much of the research on culture and negotiation tactics has been largely limited to US and Western European samples, a fact that emphasizes the need for more international evidence (Gelfand et al., 2001; Ma, 2007). Second, Greece is located at the crossroads of Europe, Asia and Africa, and Greek culture interestingly combines a collectivistic mentality (Hofstede, 1983) with several individualistic elements (Georgas, 1989). Third, ethics, negotiation tactics and formal contracts in Greece have sparsely been researched and previous literature does not present adequate empirical work (Kavali et al., 2001).

Theoretical Framework

The Greek Context

Greece has been classified as a collectivist culture (Georgas, 1989; Vassiliou and Vassiliou, 1973). For many centuries, the prevalent word and the highest virtue within the Greek milieu has been that of *philotimo*, loosely translated as the *love of honor*. The traditional concept of *philotimo* connotes that Greek people must act as is expected of them by their larger in-groups, such as family and friends (Triandis, 1989). The implicative meaning of *love of honor*, one of the regulatory components of the Greek behavior, embodies specific norms that dictate to the person the proper conduct as described by the prevailing standards of morality.

During the past decades, Greek society has experienced rapid changes, such as the increasing involvement of women in all sectors of social life, extensive immigration waves towards Athens, a steady influx of Albanian, African and Middle-eastern migrant laborers, and a systematic urbanization of many peripheral to the capital cities. The most recent milestone that intensified Greek social reformation was the country's admission into the Euro zone in 2001, a catalytic change reflected into the impressive surge of the annual GDP per capita.

The transition to a more complex and demographically diverse structure has generated alterations in the degree to which collective norms regulate individual social conduct. Analogous shifts have been reported in earlier studies of the Greek social setting (Georgas 1991; Vassiliou and Vassiliou, 1973). Following the typical individualist-collectivist classification, Greece ranked in the middle between individualist and collectivist countries (Hofstede, 1980; House et al., 2004; Triandis et al., 1986). Interestingly, Greek respondents scored the lowest of all 62 countries on Societal Institutional Collectivism in House et al.'s (2004) GLOBE study, thereby being classified as a discrete cluster by the study's researchers. These findings indicate that Greek collectivism may encompass different virtues than western collectivism or that individualist values are gradually replacing the traditional Greek

collectivist values. This fact makes the current study even more valuable in its potential to shade light on the concept of collectivism.

Embedded within a rather collectivist environment, Greek business is vastly characterized by extensive close relationships among in-group actors. Compared to other cultures, Greek people maintain long-lasting, emotionally close, and frequently overlapping ties with their family, friends, and relatives (Kafetsios, 2006; Stefanidis, 2009). Very often, business and kinship or friendship bonds are strongly tangled, nurturing a 'community of common fate' climate. High levels of trust are based on common interests and mutual benefits, limiting opportunistic behavior among in-group members (Stefanidis et al., 2007). Drakopoulou-Dodd and Patra (2002) comment eloquently that professional problems are often resolved not by asking 'what shall we do?', but 'who we should call?' or 'do we have anyone (an acquaintance)?'.

Within this context, the exploration of the interrelations among the dimensions of ethics, trust, questionable negotiation tactics and formal contracts gains particular interest. Kavali et al. (2001) highlight this need, introducing to the discussion specificities of the Greek economic structure, such as the presence of many small and medium enterprises (SMEs), which externally depend for their survival on government, the existence of a bureaucratic public sector, and relevant problematic phenomena associated with political 'clientelism', questionable business funding and tax favoritism. Indeed, Greeks have been proven to be tolerant of marginally ethical behaviors, such as extortion payments and bribery, compared with samples from countries such as the United States (Kavali et al., 2001; Tsalikis and LaTour, 1995).

Questionable Negotiation Tactics

Individuals may use a number of negotiation tactics that do not comply with contemporary ethical standards (Anton, 1990; Lewicki, 1983). Lewicki and Robinson (1998) and Robinson et al. (2000) classified marginally ethical negotiation tactics into five groups: traditional competitive bargaining, attacking opponent's network, false promises, misrepresentation, and inappropriate information gathering. While traditional competitive bargaining is considered rather ethical, the other four tactics are considered questionable (Al-Khatib et al., 2005).

Relatively acceptable tactics include examples such as endearing oneself to the other party, pretending to be angry or happy, and making high opening demands. These tactics are often classified as 'pretense' or 'traditional competitive bargaining'. At the same time, negotiating behaviors such as misrepresenting facts, making extortion payments or feigning friendship for information, are considered relatively unacceptable by negotiators. These tactics are classified as 'bluffs', 'deception' and 'lies'. In line with this classification, our study examines unethical negotiation attitudes described as 'pretense', 'deception' and 'lies'.

Although the adoption of ethically questionable negotiation tactics provides transient benefits (Curhan et al., 2006), it also breeds adverse business consequences, including financial loss, and jeopardizes future business agreements (Scroth, 2008). Additionally, public relations and corporate image are considerably affected, provoking the loss of trust between negotiating parties (Cramton and Dees, 1993). In the long-run, opposing negotiators may choose to adopt more rigid attitudes, and consequently, established relationships may be imperiled, and future opportunities may be missed (Reitz et al., 1998). The fact that unethical negotiation tactics cause a negative climate between parties makes difficult the joint reach of mutual objectives and cultivates distrust (Tenbrunsel, 1998). Boles et al. (2000) report that negotiators who detect unethical behaviors feel less enthusiastic about the success of future negotiations.

Particularly in Greece, negotiators tend to regard 'traditional competitive bargaining' and 'bluffing' tactics as relatively acceptable. In their study, Zarkada-Fraser and Fraser (2001) observe that Greek negotiators are more tolerant towards the adoption of 'threatening' tactics, compared to other negotiators from countries such as USA, Russia and Australia. When faced with moral dilemmas, Greeks primarily adopt those negotiation tactics that are dictated by their organizational in-group culture and their superiors. Also, they tend to demonstrate feeble moral objection towards the use of threatening to make the other party's negotiators look foolish in front of their boss (Zarkada-Fraser and Fraser, 2001).

Tendency to Sign Formal Contracts

Under various circumstances negotiation process can be either time-consuming or brief. Irrelevant to its duration, every negotiation concludes when involved parties achieve a mutually acceptable agreement (Reitz et al., 1998). Frequently negotiations result in the signing of a formal contract, while in certain cases negotiating sides reach non-contractual agreements.

Formal contracts represent promises or obligations that the co-signing parties will perform particular actions in the future (Zhou, Poppo and Yang, 2008). Contracts decrease uncertainty and attenuate risks that stem from opportunism or other moral hazards (Williamson, 1983). Relational literature suggests a number of social norms that hold an essential role in the conduct of the negotiating parties. These norms set the grounds of acceptable behavior, control relationships and regulate individual activities (Macneil, 1985). Personal bonds and relational consequences of adopted behaviors determine parties' expectations and constitute 'principles of right action' (Gundlach and Achrol, 1993).

Personal characteristics, propensity to trust or distrust, ethical standards, and local cultural dimensions affect differently individual propensity to form contractual relationships. In this study we examine whether cultural and other personal factors relate to negotiators' tendency to sign formal contracts rather than rely on non-formal agreements.

Individualism/ Collectivism

Although the concepts of individualism and collectivism date back to ancient Greek literature and philosophy, Hofstede (1980) was the first scholar who systematically measured this cultural dimension (Triandis and Gelfand, 1998). Following Hofstede, several authors have highlighted different dimensions of cultural diversity (Banai and Reisel, 2007). In collectivist societies, individuals tend to form groups within which mutual dependence is high and group objectives' prioritization over personal is predominant.

In Greece, it has been documented that the social context has been rather collectivistic (Gelfand and Christakopoulou, 1999; Georgas et al., 1997; Hofstede, 1983; House et al, 2004). However, after the late 1980s, Greek society has been experiencing a widespread transition characterized by the acquisition of multiple individualistic attributes (Georgas, 1989). Analyzing their research findings, Triandis et al. (2001) observe that Greece deviated from Hofstede's ranking; the sample participants displayed higher levels of individualism than those originally expected. The authors attribute Greeks' increasing individualistic attitudes to the recent enlargement of the national product per capita.

Although, the selection and use of negotiation tactics varies between collectivist and individualistic societies, there has been no consensus regarding the relationship between collectivist/ individualist societies and ethical decision-making in negotiations. Some researchers suggest that individualist societies demonstrate more examples of unethical behavior, due to the dominance of self-interest. Others state that collectivist societies display more incidents of unethical behavior, due to the increased levels of competitive behavior even amongst the manifold social in-groups (Rivers and Lyle, 2007). Research findings provide support for both arguments (Elahee et al., 2002; Volkema, 1997; Volkema, 1998; Volkema, 2004). Voronov and Singer (2002) propose that individualism/ collectivism variables cannot explain sufficiently complex cultural dimensions and, thus, predict various negotiating behaviors. Moreover, in non-homogeneous cultures, like that of Switzerland, there may be simultaneously variable individualistic and collectivist trends (Kozan, 1999).

Triandis (1995) argued that individualism/ collectivism may be further classified as horizontal, emphasizing equality, or vertical, emphasizing hierarchy. He related individualism/ collectivism to Hofstede's 'power distance' attribute, associating vertical collectivism with collectivist societies, and horizontal individualism with individualistic societies. Triandis (2001) divided individualism/ collectivism into four dimensions: 'horizontal individualism' (HI), 'vertical individualism' (VI), 'horizontal collectivism' (HC), and 'vertical collectivism' (VC).

In horizontal individualist cultures, such as Australia and Sweden, the values of uniqueness, independence and self-reliance are emphasized, while hierarchical differentiation is less important (Triandis and Gelfand, 1998). According to the Berlin Corruption Index, the

levels of corruption in horizontal individualist countries are very low. In general, horizontal collectivists make the least use of deceiving tactics (Triandis et al., 2001).

Hypothesis 1: Higher levels of horizontal individualism are negatively related to the endorsement of 'Pretending', 'Deceiving', and 'Lying' negotiation tactics.

In vertical individualist cultures, such as the United States, diversity and status are important; individuals try to differentiate from their counterparts (Triandis and Gelfand, 1998). Vertical individualists are competitive, they focus on the maximization of their earnings, and they try to be 'the best' in order to climb the hierarchy (Triandis and Suh, 2002). Vertical individualists frequently use competitive conflict management styles and employ unethical negotiation tactics (Kaushal and Kwantes, 2006; Komarraju et al., 2008).

Hypothesis 2: Higher levels of vertical individualism are positively related to the endorsement of 'Pretending', 'Deceiving', and 'Lying' negotiation tactics.

In horizontal collectivist cultures, individuals perceive themselves as equal members of their groups, and they emphasize empathy, sociability, and cooperation (Triandis et al., 2001). They seek to establish mutually respectful relations, to share objectives, to communicate and to socially comply with the other members of their groups (Triandis and Gelfand, 1998). In conflict resolution, horizontal collectivists prefer cooperative, accommodating, and compromising conflict management styles (Komarraju et al., 2008), avoiding unethical tactics.

Hypothesis 3: Higher levels of horizontal collectivism are negatively related to the endorsement of 'Pretending', 'Deceiving', and 'Lying' negotiation tactics.

Vertical collectivism has been associated with individuals' tendency to be submissive to authority and to endorse conventionalism (Triandis and Suh, 2002). Vertical collectivists accept that some group members are more important than other, and that individuals should be self-conscious of their position in the hierarchy. In this context, authority is unconditionally accepted and self-sacrifice for the group is seen as valuable (Triandis and Gelfand, 1998). Triandis et al. (2001) suggested that most vertical collectivist cultures would practice high levels of deceptive behavior in their negotiations, an argument supported by the Berlin Corruption Index. Vertical collectivists demonstrate avoiding and competitive conflict management styles (Kaushal and Kwantes, 2006; Komarraju et al., 2008) and tend to adopt

even more deceitful negotiating behaviors than horizontal individualists (Triandis et al., 2001).

Hypothesis 4: Higher levels of vertical collectivism are positively related to the endorsement of 'Pretending', 'Deceiving', and 'Lying' negotiation tactics.

Individualism and collectivism influence people's attitudes towards relationships (Triandis and Suh, 2002). In conflict situations, collectivists are primarily concerned with maintaining the relationship in the future, whereas individualists are largely concerned with achieving justice even if this is damaging for the relationship (Ohbuchi et al., 1999). Triandis and Suh (2002) refer that collectivists tend to prefer conflict resolution methods that do not harm relationships, whereas individualists would be willing to even go to court to resolve disputes. Additionally, collectivists tend to emphasize more the emotional proximity to their in-groups, the interdependence with others, the family integrity and sociability. Norms, rather than attitudes, and communal, rather than exchange relationships, are prioritized (Triandis and Gelfand, 1998). Koehn (2001) emphatically states that both Japanese and Chinese businessmen have been loath to sign formal contracts. In many collectivist societies, individuals do not adhere to the contracts and they often not even read them. Contracts are merely 'letters of intention' that express the parties' intention to cooperate. Relational ties outweigh formal contracts (Zhou, Poppo and Yang, 2008).

Hypothesis 5: Higher levels of individualism are positively related to the individuals' tendency to sign formal contracts.

Hypothesis 6: Higher levels of collectivism are negatively related to the individuals' tendency to sign formal contracts.

Trust

Trust is an essential element of all exchange relationships (Granovetter, 1985; Zaaher and Venkatraman, 1995). Trust facilitates communication and strengthens relationships (Elahee et al., 2002; McAllister, 1995; Ross and La Croix, 1996). Levels of trust between negotiating parties have been reported to affect the negotiation process and the tactics adopted.

Specifically, negotiators who trust each other communicate their thoughts more comfortably and they are more receptive to the other party's ideas. Several researchers have demonstrated that, in negotiation, mutual trust increases cooperative behavior, expedites information-sharing between parties (Butler, 1995), encourages problem-solving behavior (Mintu-Wimsatt et al., 2005), and increases earnings (Olekalns et al., 2007).

Trust also tends to make negotiators more considerate concerning ethical patterns of behavior (Rodgers, 2009). Elahee et al. (2002) and Elahee and Brooks (2004) observed a statistically significant inverse relationship between general trust and unethical behavior. Negotiators who detect unethical behaviors feel less enthusiastic about future negotiation outcomes (Boles et al., 2000). Trust further reflects whether negotiations between parties are fair (Anderson and Narus, 1990). High perceived levels of trust decrease the use of deception as a negotiation tactic and promote fair trade (Olekalns and Smith, 2009).

Hypothesis 7: High levels of trust are negatively related to the endorsement of 'Pretending', 'Deceiving', and 'Lying' negotiation tactics.

The presence of trust in trade relationships indicates that one party believes that its requirements will be fulfilled through future actions undertaken by the other party (Anderson and Weitz, 1989). High levels of trust are more likely to be present in situations in which past commitments have been accomplished (Mayer et al., 1995; Anderson and Narus, 1990). Trust frequently holds the role of a psychological contract that minimizes opportunistic behavior and betrayal (Gullett et al., 2010; Olekalns and Smith, 2009; John, 1984). Zaheer et al. (1998) observe that high levels of trust decrease the costs associated with contracting, such as negotiating and renegotiating, and allow parties to address issues of mutual interest without resorting to legalistic remedies. Trust transforms informal commitments into established, mutually accepted norms and routines.

Hypothesis 8: High levels of trust are negatively related to the individuals' tendency to sign formal contracts.

Ethical Idealism

Ethical idealism is evidently one of the factors that determine individuals' attitudes towards negotiation tactics and contracting. Personal moral philosophy provides the standards for judgments, stances and behavior (Ferrel et al., 1989) and therefore affects negotiators' decision-making.

Hitt (1990) classifies ethical decision-making into four different categories: end-result ethics, rule ethics, social contract ethics, and personal ethics. In general, individuals oriented towards results adopt an end-result ethical approach, while communities set their ethical norms under the social contract approach. Conversely, Forsyth (1980) described ethical decision-making employing the concepts of idealism and universalism. The former implies that universal rules are valid for everyone, and that individuals make decisions following these rules, whereas the latter rejects rules on the basis of relativism. Vitell et al. (1993) found

that high-idealists and low-relativists tend to adopt more ethical behaviors than individuals who score low on idealism and high on relativism.

Banas and Parks (2002) detected an inverse relationship between ethical ideology and unethical behavior; while high-idealist individuals consider unethical behaviors less acceptable, high-relativists tend to accept them. Al-Khatib et al. (2005) observe that idealism is negatively correlated with unethical behavior, which, in turn, is positively correlated with relativism. In their study among university students, Perry and Nixon (2005) report that individuals who accept (highly idealistic) rule ethics show lower levels of unethical behavior, whereas individuals who accept (less idealistic) end-result ethics display higher levels of unethical behavior.

Hypothesis 9: High levels of ethical idealism are negatively related to the endorsement of 'Pretending', 'Deceiving', and 'Lying' negotiation tactics.

Ethical decisions vary significantly between individuals (Tsalikis and LaTour, 1995). Besides, ethical behavior may differ under different negotiation circumstances. Nielsen (2009) cites cases of extortion payments in Greece, the UK and the US to illustrate that such unethical behavior can be adopted due to environmental contingencies and loose implementation of contractual agreements. Individuals active in highly relativist contexts are expected to be averse towards the signing of detailed contracts that are binding for the co-signing parties (Koehn, 2001). Heugens et al. (2006) refer that those that benefit the most from the signing of an explicit contract are actors that already possess 'high' moral standards.

Hypothesis 10: High levels of ethical idealism are positively related to the individuals' tendency to sign formal contracts.

Research Method

Data collection

An ambitious data collection plan was designed and implemented. Based on evidence from the existing literature, the research constructs were compiled to a self-administered questionnaire. The questionnaire was translated from English to Greek with the assistance of two bilingual reviewers. To confirm the validity of the constructs, ten Greek employees were invited to participate in the pilot test of the questionnaire. Participants were asked to make comments about the translated questionnaire items. All the observed comprehension discrepancies were addressed and the questionnaire was revised.

Before the launching of the survey, an online platform was set up. The translated questionnaire was uploaded, and a thousand participation invitations were sent out during a four-month research period. The use of the online platform provided several advantages associated with the rigorous management and control of the input data. A 32.7% response rate was achieved. The 327 usable responses were collected from participants geographically dispersed all over Greece.

Participants represented a diversity of backgrounds with regard to their socio-economic status, education, and professional hierarchical ranking. The survey respondents were employed in various areas of the Greek private and public sectors, including telecommunications, manufacturing, construction, retailing, tourism, insurance, banking, and public authorities. 52% of the participants were male and 48% were female. The average respondent age was 34 years. 78% of the sample population had received at least 4 years of college education. 48% earned an annual income of at least 20 thousand euro where the national GDP per capita at current market prices is 21,300 euro (European Commission, 2010).

Reliability and validity considerations

To ensure the reliability and validity of our research, a number of successive precautions had to be taken. Apart from pre-testing the consistency of the pilot questionnaire, all used scales were assessed with regard to their internal reliability employing Cronbach's Index.

Due to the self-report nature of the survey, we recognized potential common method bias issues and thus we employed the Harman single-factor test (Podsakoff and Organ, 1986). We did not observe any unusual variations in the collected responses. Not a single factor accounted for the majority of the covariance in the measured variables. Thus, we regarded that common method variance issue is rather limited.

Close examination of the online database allowed us to further confirm that no random responses were counted as usable. All respondents devoted adequate amount of time to the completion of the questionnaire. Towards the same direction, we controlled for the development of response patterns, reversing a number of anchor scales in different parts of the questionnaire.

Finally, the several email messages and feedback comments we received from the participants, strengthened our belief that the validity of the collected responses is particularly high. Our confidence was later supported by the finding that our results were in line with published literature.

Measures

Negotiation Tactics

Based on Lewicki et al.'s (2006) classification of highball tactics, we employed seventeen questions to measure questionable negotiation tactics. A seven-point Likert-type scale was

used to indicate responses that ranged from 1=strongly disagree to 7=strongly agree. Respondents were asked to recall a negotiating situation very important to them and their business and choose the appropriate tactic.

To validate the structure of the construct, factor analysis (varimax rotation technique) on the 17 items describing tactics was conducted (Churchill, 1995). The three-factor solution that provided the best fit explained 53.63% of the overall variance. The first factor, named 'Lying', included five items and explained 20.01% of the variance. The second factor, named 'Deceiving', included four items and explained 18.55% of the variance. The third factor, named 'Pretending', included four items and explained 14.99% of the variance (Table 1). The internal degree of reliability was confirmed using Cronbach's Alpha test that yielded a coefficient of .83. The Cronbach's Alpha coefficients of the three components were .73, .75, and .63, respectively.

Table 1
Factor Analysis Matrix of the Negotiation Tactics Variables

	Components		
	Lying	Deceiv g	Pretending
<i>Pretend to be disgusted at the other party's comments.</i>	.78		
<i>In return for concessions from the other party now, offer to make future concessions that you know you will not follow through on.</i>	.74		
<i>Intentionally misrepresent information to the other party in order to support your negotiating arguments or positions.</i>	.73		
<i>Gain information about the other party's negotiation position by cultivating his friendship through expensive gifts, entertaining, or personal favors.</i>	.53		
<i>Convey a false impression that you are in absolutely no hurry to come to a negotiated agreement, thereby trying to put time pressure on your opponent to concede quickly.</i>		.72	
<i>Make an opening demand so high/low that it seriously undermines the other party's confidence in his/her ability to negotiate a satisfactory settlement.</i>		.70	
<i>Overwhelm the other party with so much information that they have trouble determining which factors are important and which are merely distractions.</i>		.66	
<i>Make an opening demand that is far greater than what you really hope to settle for.</i>		.62	
<i>Deny the validity of information, which your opponent has that weakens your negotiating position, even though the information is true and valid.</i>		.56	
<i>Get the other party to think that you like him/her personally despite the fact that you don't really.</i>			.78
<i>Express sympathy with the other party's plight although in truth you don't care about their problems.</i>			.64
<i>Promise that good things will happen to the other party if s/he gives you what you want, even if you know that you cannot (or will not) deliver these things when the other's cooperation is obtained.</i>			.60
<i>Pretend that an issue of little or no importance to you is quite important.</i>			.55
<i>Eigenvalue</i>	2.61	2.41	1.94
<i>Percent of variance</i>	20.09	18.55	14.98

Extraction method: principal component analysis. Rotation method: varimax with Kaiser normalization.

Tendency to Sign a Formal Contract

To measure respondents' tendency to sign a formal contract, we employed a 5-item construct designed by the authors. A five-point Likert-type scale was used to indicate responses that ranged from 1=strongly disagree to 5=strongly agree.

To validate the structure of the construct, factor analysis (varimax rotation technique) was conducted. One factor that included four items was extracted. The one-factor solution, named

'Tendency to sign a formal contract', explained 46.36% of the total variance. The internal degree of reliability, which was measured using Cronbach's Alpha coefficient, was .60.

Ethical Idealism

To measure ethical idealism we used a six-item construct adopted from the 'Ethics Position Questionnaire' (Forsyth, 1980). A five-point Likert scale that assessed the degree of idealism of the respondents was used (1=strongly disagree, 5=strongly agree).

The factor analysis (varimax rotation) led to the extraction of a single factor, named 'Ethical Idealism'. The extracted factor included all six items and explained 51.02% of the total variance. The Cronbach's Alpha reliability coefficient of the construct was .80.

Trust

The levels of trust between the negotiating parties were measured employing an 8-item scale adopted from Mayer et al. (1995). Respondents were asked to self-report agreement or disagreement with regard to their levels of general trust towards other individuals. Levels of general trust ranged between 1=strongly disagree (minimal levels of trust) and 5=strongly agree (maximal levels of trust).

Following the literature, factor analysis (varimax rotation) was conducted on the 8 items describing levels of general trust. One factor that included five items was extracted. The 5 items of the 'Trust' factor explained 43.98% of the total variance. The Cronbach's Alpha reliability coefficient of the construct was .68.

Individualism/ Collectivism

Respondents' orientation towards individualism and collectivism was measured using a 32-item construct developed by Singelis et al. (1995). A nine-point Likert-type scale was employed to measure horizontal individualism, vertical individualism, horizontal collectivism and vertical collectivism (1=strongly disagree, 9=strongly agree).

Following the literature on individualism/ collectivism (Triandis and Gelfand, 1998), factor analysis (principal component/ varimax rotation) on the 32 items was performed (Churchill, 1995). For the extraction of the factors, we adopted a reflective perspective based on the findings of the relevant literature (Chiou, 2001). After the purification of the items, 19 elements were retained. Four components that account for 54.72% of the total variance were extracted: horizontal individualism, vertical individualism, horizontal collectivism and vertical collectivism (Table 2). Horizontal individualism included 5 items and explained 13.56% of the variance, vertical individualism included 5 items and explained 14.44% of the variance, horizontal collectivism included 5 items and explained 15.82% of the variance, and vertical collectivism included 4 items and explained 10.89% of the variance. The Cronbach Alpha reliability coefficient of the scale was .74 ($\alpha_{\text{Horizontal Individualism}}=.73$, $\alpha_{\text{Vertical Individualism}}=.78$, $\alpha_{\text{Horizontal Collectivism}}=.79$, $\alpha_{\text{Vertical Collectivism}}=.70$).

Table 2
Factor Analysis Matrix of the Individualism/ Collectivism Variables

	Component			
	Horizontal Collectivism	Vertical Individualism	Horizontal Individualism	Vertical Collectivism
<i>The well-being of my co-workers is important to me.</i>	.77			
<i>I feel good when I cooperate with others.</i>	.76			
<i>If a co-worker gets a prize, I would feel proud.</i>	.73			
<i>I like sharing little things with my neighbors.</i>	.71			
<i>It is important to maintain harmony within my group.</i>	.62			
<i>Without competition, it is not possible to have a good society.</i>		.79		
<i>I enjoy working in situations involving competition with others.</i>		.77		
<i>Competition is the law of nature.</i>		.72		
<i>Winning is everything.</i>		.68		
<i>It is important that I do my job better than others.</i>		.66		
<i>I like my privacy.</i>			.79	
<i>One should live one's life independently of others.</i>			.69	
<i>I prefer to be direct and forthright when in discussion with people.</i>			.66	
<i>I often do "my own thing."</i>			.62	
<i>When I succeed, it is usually because of my abilities.</i>			.57	
<i>I would sacrifice an activity that I enjoy very much if my family did not approve of it.</i>				.76
<i>Before taking a major trip, I consult with most members of my family and many friends.</i>				.76
<i>I would do what would please my family, even if I detested that activity.</i>				.72

Results

The descriptive statistics and correlations between the dependent and independent variables are presented in Table 3. 'Deceiving' negotiation tactics rank first (Mean = 3.84, S.D. = 1.20), followed by 'pretending' negotiation tactics (Mean = 3.58, S.D. = 1.06) and 'lying' negotiation tactics (Mean = 2.53, S.D. = 1.19).

*. Correlation is significant at the 0.05 level (2-tailed).

** . Correlation is significant at the 0.01 level (2-tailed).

Vertical individualism was found to be positively correlated with all four dependent variables, namely, the 'Pretending,' the 'Deceiving,' and the 'Lying' negotiation tactics and the 'tendency to sign formal contracts'. A negative statistically significant correlation between ethical idealism and questionable negotiation tactics was traced. Ethical idealism was positively correlated with individuals' tendency to sign formal contracts. General trust was not significantly correlated with questionable negotiation tactics. Lower levels of general trust appeared to significantly increase individual propensity to enter contractual relationships.

To further investigate the explanatory power of the statistically significant correlations, multiple regression analyses were conducted. We tested our hypotheses employing four separate two-step hierarchical regression analyses; one for each dependent variable. Employees' rank, business industry, gender, age, education, and income were treated as control variables. No significant hierarchical regression model emerged from the first step of the four regression analyses. Independent variables HI, VI, HC, VC, ethical idealism and trust were entered in the second step of the regression analysis. The enter method was adopted, and following Hair et al. (1998) special emphasis was laid on the independence of the relationship among the independent variables (correlation coefficient < .80).

The hierarchical regression analysis results for the 'Pretending' negotiation tactics are presented in Table 4. The first step of the analysis did not provide a statistically significant model ($F=2.23$). The deriving model of the second step of the hierarchical regression was statistically significant ($F=3.01$, $p<.001$). Employees' age, VI and ethical idealism significantly explained 8.7% of the total variance of the endorsement of the 'Pretending' negotiation style. The coefficient of the control variable age was negative ($\beta=-.13$, $p<.05$), the coefficient of the VI was positive ($\beta=.15$, $p<.05$), while the coefficient of the idealism was negative ($\beta=-.14$, $p<.05$). These findings suggest that: (a) younger individuals, (b) vertical individualists, and (c) individuals who score low in ethical idealism tend to accept pretending negotiation styles.

Table 4
Hierarchical Regression Analysis on 'Pretending' Negotiation Tactics

Variable	FIRST STEP		SECOND STEP	
	β	<i>t</i>	β	<i>t</i>

<i>F</i>		2.23		3.01***

* $p < .05$ ** $p < .01$ *** $p < .001$

'Deceiving' negotiation tactics' hierarchical regression analysis results are presented in Table 5. The first step of the analysis did not provide a statistically significant model ($F=1.76$). The second step of the hierarchical regression led to a statistically significant model ($F=3.12$, $p < .001$). Employees' age, VI and ethical idealism significantly explained 9% of the total variance of the endorsement of the 'Deceiving' negotiation style. The coefficient of the control variable 'age' was negative ($\beta = -.13$, $p < .05$), the coefficient of the VI was positive ($\beta = .17$, $p < .01$), while the coefficient of the idealism was negative ($\beta = -.16$, $p < .01$). These findings suggest that: (a) younger individuals, (b) vertical individualists, and (c) individuals who score low in ethical idealism tend to accept deceiving negotiation tactics.

Table 5
Hierarchical Regression Analysis on 'Deceiving' Negotiation Tactics

Variable	FIRST STEP		SECOND STEP	
	β	<i>t</i>	β	<i>t</i>
Gender	.00	.01	.04	.73
Age	-.14	-2.37	-.13*	-2.09
Rank	.09	1.58	.06	.94
Education	.02	.43	.00	.07
Horizontal Individualism			.08	1.30
Vertical Individualism			.17**	2.88
Horizontal Collectivism			-.01	-.09
Vertical Collectivism			.05	.87
Ethics			-.16**	-2.55
Trust			.01	.16
<i>R</i> ²		.02		.09***
Adj. <i>R</i> ²		.01		.06***
<i>F</i>		1.76		3.11***

* $p < .05$ ** $p < .01$ *** $p < .001$

For the dependent variable 'Lying' negotiation tactics, hierarchical regression analysis' results are presented in Table 6. No significant model derived from the first step of the regression analysis ($F=82$). Yet, the second step of the regression analysis provided a statistically significant model ($F=7.63$, $p < .001$). HC, VC, ethical idealism and trust explained 16.9% of the total variance of the acceptance of the 'Lying' negotiation style. The coefficient of the HC was negative ($\beta = -.14$, $p < .05$), the coefficient of the VC was positive ($\beta = .16$, $p < .01$), the coefficient of ethical idealism was negative ($\beta = -.33$, $p < .001$), and the coefficient of the trust variable was positive ($\beta = .17$, $p < .01$). Our results suggest that (a) low levels of HC, (b) high levels of VC, (c) low levels of ethical idealism, and (d) high levels of trust are associated with the 'Lying' negotiation tactics.

Table 6
Hierarchical Regression Analysis on 'Lying' Negotiation Tactics

Variable	FIRST STEP		SECOND STEP	
	β	<i>t</i>	β	<i>t</i>
Gender	-.04	-.77	.07	1.33
Age	-.09	-1.50	-.10	-1.83
Rank	.02	.31	.02	.42
Education	-.06	-.98	-.08	-1.41
Horizontal Individualism			-.04	-.61
Vertical Individualism			.08	1.41
Horizontal Collectivism			-.14*	-2.30
Vertical Collectivism			.16**	2.79
Ethics			-.33***	-5.74
Trust			.17**	3.35
<i>R</i> ²		.01		.19***
Adj. <i>R</i> ²		-.00		.16***
<i>F</i>		.81		7.62***

* $p < .05$ ** $p < .01$ *** $p < .001$

Based on the regression analyses on the questionable negotiation tactics, we conclude that only hypothesis 9 was fully corroborated. Hypotheses 2, 3, and 4 were partially supported. Hypotheses 1 and 7 were rejected.

The results from the hierarchical regression analysis on the 'Tendency to sign formal contracts' are presented in Table 7. As was the case with the previous three analyses, no significant model derived from the first step of the regression analysis for the 'Tendency to sign formal contracts' ($F=1.25$). The control variables explained 0% of the total variance of the dependent variable. The second step regression model was found to be significant ($F=10.10$, $p < .001$). Employees' rank within the organization, HI, VI, ethical idealism and trust explained 21.8% of the total variance of the individuals' propensity to sign formal contracts. The coefficient of the employees' rank was negative ($\beta = -.14$, $p < .05$), the coefficient of the HI was positive ($\beta = .20$, $p < .01$), the coefficient of the VI was positive ($\beta = .16$, $p < .01$), the coefficient of ethical idealism was positive ($\beta = .31$, $p < .001$), and the coefficient of the trust variable was negative ($\beta = -.18$, $p < .01$). In particular, individuals will be characterized by a higher tendency to sign formal contracts under the following conditions: (a) the lower their hierarchical position in the organization, (b) the more horizontally and vertically individualists they are, (c) the more ethically idealists they are, and (d) the less general trust they display towards people around them.

Regression analysis on the 'tendency to sign formal contracts' discloses that hypotheses 5, 8, and 10 were corroborated, while hypothesis 6 was rejected. Table 8 provides a detailed summary of all the significant and non-significant relationships of the examined dependent and independent variables.

Table 8
Summary of the significant relationships between examined variables

#	Hypothesis	Significant Relationships
H1	Horizontal Individualism – Questionable Negotiation Tactics	Not Supported

H8	Trust – Tendency to Sign Formal Contracts	Trust \hat{u} – Formal Contracts \hat{u}
H9	Ethical idealism – Questionable Negotiation Tactics	Ethics \hat{u} – Pretense \hat{u} , Deception \hat{u} , Lies \hat{u}
H1	Ethical idealism – Tendency to Sign Formal Contracts	Ethics \hat{u} – Formal Contracts \hat{u}

Discussion

Tactics, ethical idealism, trust, and personal attributes hold an integral role both during the negotiation process and afterwards, during the signing of a formal contract. The present

study sought to address the lack of empirical evidence from cultures that do not demonstrate purely individualistic properties, taking as context of reference that of Greece. The explicit objective was to examine the impact of horizontal and vertical individualism-collectivism, ethical idealism, and general trust on the endorsement of questionable negotiation tactics and on the tendency to sign formal contracts.

A preliminary look at the descriptive statistics of the measured variables provides some interesting insights into Greek perceptions, stances and attitudes concerning our studied field. Among the three categories of negotiation tactics examined, 'deception' ranks first, higher than the somewhat more acceptable traditional bargaining-'pretense' tactic. The vertical individualists were found to endorse more the tactics of 'deception' and 'pretense,' but not that of 'lying'. In other words, individualists that emphasized social status, competition and hierarchical climb endorsed more 'deception' and 'pretense.' This finding follows at large existing literature (Kaushal and Kwantes, 2006; Komarraju et al., 2008; Triandis and Gelfand, 1998; Triandis and Suh, 2002). 'Deception' and 'pretense' were also accepted more by younger individuals, an observation that has been previously attributed to the egocentrism of youth, the pressure to perform and succeed early in life (Weeks et al., 1999), and differences in economic and social conditions compared to those experience by older people (Volkema, 1999; 2004). Also, relativists as compared to idealists endorsed more 'deception' and 'pretense'.

Based on mean values, we conclude that 'lies' is the least acceptable negotiation tactic. In agreement with previous literature, individuals who score low in HC and individuals who score high in VC tend to accept more 'lies' as a negotiation tactic. Indeed, quite often, vertical collectivists who hold low hierarchical positions or social status, use lies to feel more secure, whereas vertical collectivists who hold high hierarchical positions and social status, may prefer to adopt a competing style and therefore opt for lies (Kaushal and Kwantes, 2006; Komarraju et al., 2007). General trust has been referred to as one of the most important factors relevant to ethical negotiation behavior (Butler, 1999; Elahee et al., 2002; Olekalns and Smith, 2008). Trust was found to be significantly and positively related to 'lies': higher levels of trust were found to lead to more 'lying' behavior. The direction of the relationship is not supported by the literature. A probable explanation could be that negotiators who trust others expect others to trust them and, consequently, they feel that they could take advantage of these trustful relationships and lie without being exposed. With regard to questionable negotiation tactics, this survey's outcomes do not identify any significance of 'trust' as an explanatory variable of the acceptance of questionable negotiation tactics. Although existing literature provides strong evidence about this relationship, our findings appear to be in accordance with those of Erkus and Banai's (2011) study conducted in the non-Western Turkish cultural context. Exactly as in the cases of 'deception' and 'pretense', 'lies' were favored more by individuals who scored low in 'ethical idealism' scale. The most significant impact on questionable negotiation tactics originates from individuals' ethical idealism levels. Low

levels of idealism are clearly associated with the presence of marginally ethical negotiation tactics, such as 'deception' and 'lies'.

A major contribution of this study has been the discussion of the largely neglected impact that culture, ethical idealism, and general trust have on individuals' tendency to sign formal contracts. Interestingly, our original contention that personal attributes and ethical attitudes affect tendency to sign formal contracts was supported by the outcomes of our analysis. Specifically, we discovered that professional hierarchical ranking, HI, VI, ethics and general trust explain tendency to form formal contractual relationships.

Employees' low hierarchical positions seem to result in an increased willingness to sign a formal contract, a reality that can be explained by the low levels of power and the increased need for contractual safeguards that eliminate opportunistic behaviors (Williamson, 1983). Individualists tend to rather stick with justice and collectivists tend to prioritize relational norms (Koehn 2001; Ohbuchi et al., 1999; Triandis and Gelfand, 1998; Triandis and Suh, 2002). In accordance with this statement, our research observed that both HI and VI increase significantly individuals' tendency to sign formal contracts. According to the literature the presence of trust plays a substantial role in the decision to sign formal contracts (Gullett et al., 2010; John, 1984; Olekalns and Smith, 2009; Zaheer et al., 1998). Our survey results detect a significant inverse relationship between levels of general trust and tendency to sign formal contracts. It seems that the less negotiators have trust in others, the more they would tend to generate a signed document, with the hope that a written document, more than a verbal agreement, could secure the implementation of the contract. Finally, in line with reports of other researchers (Heugens et al., 2006; Koehn, 2001), this study indicates that low levels of ethical idealism are connected to individuals' aversion towards the signing of formal contracts. In short, actors' tendency to sign formal contracts would be higher, whenever (a) hierarchical rank is low, (b) HI and VI are high, (c) ethical idealism scores are high, and (d) levels of general trust are low.

From a country-specific perspective, research outcomes propose that Greece is a 'horizontal' society in between collectivism and individualism (Hofstede, 1980; House et al., 2004; Triandis et al., 1986). Previous studies state that Greek society has been undergoing a transition from collectivism into individualism (Kavali et al., 2001; Tsalikis and LaTour, 1995); we reflect that, essentially, Greeks combine equally collectivistic and individualistic traits. Concerning ethical orientation, Greeks appear to be reasonably inclining towards idealism, while they are lenient towards deceptive negotiating styles and fairly wary of the strangers – general trust levels are low. These findings can be considered in combination with the fact that Greece ranks very low –last within the Euro zone– in terms of transparency (Transparency International, 2009). Our empirical evidence does not differentiate considerably from the observed phenomena described by other researchers (Kavali et al., 2001; Tsalikis and LaTour, 1995). Several arguments, such as the affluence reflected in the past

decade's skyrocketing of the Greek GDP per capita, or the accommodation of extensive bribery and extortion payment cases, have been previously employed in various efforts for credible moral interpretations. The available evidence implies that Greek society has indeed changed from the era when the superior virtue of Greek ethics was *responsibility* and *sacrifice* (Kazantzakis, 1960).

Research Implications

The authors of this study strived to illuminate dim spots within business ethics and negotiation tactics research. The results, discussion and conclusions of our work pioneer several implications.

From a theoretical perspective, the tested interrelationships provide a preliminary coherent basis for the creation of a comprehensive inductive research framework. Our proposition for simultaneous implementation of cultural, ideological and personal factors for the interpretation of the endorsement of marginally ethical tactics requires further evaluation. We expect that our original conclusions about the impact of the independent variables on individuals' tendency to sign formal contracts will introduce the discussion around formal contracts both at conceptual and empirical level.

From a practical perspective, practitioners, especially international business executives, should not overlook the importance of cultural dimensions and ethical standards in the negotiation process and the signing of formal contracts. Recognition and exploitation of cultural and ethical perceptions, stances and attitudes would potentially signify synergies regarding the amount of time and effort devoted to the negotiation and the achievement of a contractual agreement. Those managers conducting business in Greece have to recognize the importance of individualism within the Greek society, strive to comfort themselves with the flexible ethical ideals of their Greek counterparts, and attempt to ease Greeks' low levels of general trust.

Limitations and Future Research

In general, the results of this study display consistency with those of previously conducted surveys in the areas of business ethics and negotiation tactics. Yet, the authors of this study consider that there are several limitations inherent in the design and implementation of their research work.

First, the results of our study are country-specific. The insights gained from the Greek culture are not necessarily applicable in diverse cultural settings, outside that of Greece. More specifically, research studies which take into account variables such as those of collectivism/individualism and ethical idealism, are cross-cultural in nature. Consequently, the comparative examination of multiple cultural environments would be a more secure direction towards the arrival at comprehensive conclusions.

Second, the generalization of the findings obtained from the current study is limited, due to weaknesses attributed to the use of convenience sampling. This issue would be attenuated if the developed framework and construct of our study would be tested in different samples in the future.

Lastly, in this study we did not investigate respondents' actual negotiation behavior; we rather explored perceptions about preferred negotiation tactics and propensity to sign formal contracts. Similarly, the survey participants were asked to report their attitudes towards ethical behavior and general trust. As a result, the findings may deviate from real-life behavior in the Greek setting. Future studies should focus on the collection of real-life data employing observation as a complementary method to the survey method. The necessity for real-life data is highlighted by the fact that, in the existing literature, conclusions about variables such as the 'tendency to sign a formal contract' or the 'general trust' have been rather equivocal.

ENHANCING THE COMPETITIVENESS OF PALESTINIAN SMEs THROUGH CLUSTERING

Sultan, Suhail Sami¹

¹Palestine Polytechnic University. E-mail: sultan@ppu.edu

Abstract

The research aims to discuss the competitiveness of SMEs working in the food processing sector in Palestine through clustering. To benefit from the regional experiences, the Jordanian and Israeli food processing sectors were studied. A combination of quantitative and qualitative methods is used in the research. The analysis of data shows that the Palestinian experience in clustering is frail, where there are weak collaboration between businesses and the related and supporting industries such as universities, banks, research institutes, insurance companies and governmental institutes. The weakness in the ties between the businesses and related and supporting industries has a negative impact on the competitiveness of SMEs working in the food processing sector in Palestine. Thus, building and formalizing a dynamic cluster within this sector will lead to enhance the competitive advantage of these firms. On the other hand, the research encourages the regional cooperation between the food processing clusters. This cooperation will lead to create economies of scale and technology and research and development transfer.

Keywords: SMEs, Competitiveness, Clustering, Palestine

Introduction

Almost 99% of the industrial firms in Palestine are SMEs compete solely on the basis of price. As well, very few SMEs have direct access to foreign markets. However, Palestinians should think seriously to shift the sector to the innovation-driven stage. The shift to an innovation-driven stage implies many changes: a new mindset, new ways of doing things in production, marketing and buying. It is very important to ensure that people's skills, investment capital, technology, infrastructure, business climate and quality of place support the transformation (Porter 1990).

The quality level of the industrial production in Palestine has improved greatly in the last decade. The percentage contribution of this sector in total GDP has increased from 8% in the mid-eighties to 17% in 2010. The industrial sector has employed an average of 85,000 workers (an average of 13% total work force). The sector includes the following subsectors: stone and marble, textiles and garments, food processing, engineering and metallurgical industries, chemical industries, pharmaceuticals and veterinary, construction industries, handicrafts, paper and printing, furniture, leather and shoes, and plastics (PFI 2010).

The food sector is growing rapidly both vertically and horizontally. The official figures of the sector indicate that there are 225 manufacturing firms including the large scale milk cow farms; 152 of them are active members of the food industry association, which is a strong association. The labor force is estimated with 8000 worker. The sector is comprised of a wide variety of products. These are: meats, vegetables (fresh and frozen), oils and fats, dairy, flour mills, animal feed, chocolates and confectionaries, spaghetti, water and soft drinks and beverages, chips and snacks and others (PFI 2010).

The researcher aims to discuss the competitiveness of the firms working in the food processing sector in Palestine through clustering based on the experiences received by studying the food processing sectors in Jordan and Israel.

Literature Review

Story (1994) defines the SMEs as follows: (a) enterprises with a relatively small share of their market; (b) enterprises managed by owners or part-owners in a personalized way, and not through the medium of a formalized management structure; and (c) enterprises acting as separate entities, in the sense of not forming part of large enterprise or group. While it is acknowledged that using the number of employees as a measure of firm size may create a number of anomalies. Storey (1994) discusses the general differences between large and small firms in terms of centrality of owner-manager, structure, resources and number, and variety of products and range of markets served. In smaller firms, owner-managers are less able to influence competitive environment than larger firms. Besides, smaller firms' organization structures are likely to be organic and loosely structured rather than mechanistic and highly formalized (Jennings and Beaver 1997). In smaller firms, all the roles will either be performed by one manager or by a very narrow range of managers who may have been appointed because they are family members or friends rather than on the basis of ability or education. However, small firms generally have little commitment to research and development (R&D) and are highly dependent on external knowledge sources (Vossen 1998).

The size of the SMEs in the developed countries is interlinked with the size of the international niche markets where they compete, while the size of the SMEs in the developing countries is mostly determined by the domestic markets where they operate. Moreover, the SMEs in developed countries are more likely to be highly specialized compared to those in the developing countries. Most of the SMEs in the developing countries are one-person businesses, and the largest single employment category is working proprietors (Fisher and Reuber 2000). The informal relationships of the family dominate formal, explicit relationships when trust, loyalty and family ties are important to advancing the businesses (Habbershon and Williams 1999).

In order to improve the competitiveness of SMEs is not only about understanding problems confronting businesses, but also about better understanding of how to overcome these barriers. Although many factors are hypothesized to impact on business outcome, there is no

consistent pattern to the characteristics, which contribute to business competitiveness, success and growth (Gibb 1996; Audretsch 2001). Employment generation may be an appropriate growth function (Smallbone and Wyrer 2000). However, not all small firms are growth-oriented, and the majority of owner-manager focuses on day-to-day survival. As pointed out by Storey (1994), the numerically dominant group of small businesses is those that are small, and even if they survive they are always likely to remain small-scale operations. Jennings and Beaver (1997) show that in smaller firms all the roles will be either being performed by one person or by a very narrow range of managers who may have been appointed because they are family members or friends rather than on the basis of capability or education.

Competitiveness, as explained by Porter, can be defined at three levels: firm, industry and nation. Measures of the competitiveness at the firm level include firm's profitability, firm's exports, and market share. Measures of the competitiveness at the industry level include the firms' profitability, the industry's trade balance, and the balance of outbound and inbound foreign direct investment. While at the national level, competitiveness means the citizens' ability to achieve a high and constantly rising standard of living. A high and rising standard of living for all nationals can be sustained by the continuous improvement of productivity. This research discusses, in particular, the competitiveness of the SMEs working in the food processing sector in Palestine.

Competitiveness is the mean by which entrepreneurs can improve their firm's performance, and which can be measured according to a number of dimensions including market share, profit, growth, and duration. At the same time, Man and Chan (2002) stress the importance of links between competitiveness and performance as having a long term rather than a short-term orientation. They conclude that their theoretical framework is complex and therefore difficult to be operationalized.

The SMEs belong to clusters and networks are often more competitive and innovative than those operating in isolation (OECD 2000). Some clusters are structured and formal while others are informal. Some clusters are shared at general information, while others deal with more specific objectives. Networking allows the SMEs to combine the advantages of smaller scale and greater flexibility with economies of scale and scope in larger markets – regionally, nationally and globally. A large number of firms result in greater competition for new ideas and facilitates (Porter 1990). Competitiveness of small firms is strongly influenced by the level of the inter-firms collaboration. The links take different shapes in which different firms join together to co-produce, co-market, or co-purchase, cooperate in new product development, or share of information.

While networking is viewed as an important requirement in enterprises of all sizes, these learning opportunities are argued to be of particular importance to small firms in order to offset the vulnerability of size acting as the key determinant of organizational success. Pecos and Henriques (2006) argue that the collaboration between universities and the SME

companies should be based on a small-projects base. These projects must be focused in localized and specific problematic areas in the industrial companies. Ramsden and Bennett (2005) provide a better understanding of the form of intangible benefits that businesses receive from advice.

Related and supporting industries measure the presence or absence of related and supporting industries that are internationally competitive. The presence of internationally competitive supplier industries in a nation creates advantages in downstream industries. That could be achieved by providing efficient and rapid access to the most cost-effective inputs. Moreover, close working relationships between suppliers and firms help firms perceive new methods and opportunities to apply new technologies and to gain quick access to information and new ideas.

Related industries are those in which firms can coordinate or share activities in the value chain. Creating an efficient network can affect the competitiveness of the SMEs by increasing their productivity, and deriving the direction and pace of innovation. Working within a network allows the SMEs to benefit as if they had greater scale or merged together without requiring them to sacrifice their flexibility.

In this research, the competitiveness of the SMEs is measured by the Balanced Score Card (BSC). The Balanced Score Card is a mean to implement organizational strategy. In the Balanced Score Card, strategy is translated in a set of critical success factors, which are translated into one or more performance measures. In that manner, strategy turns into operational objectives and measures (Kaplan and Norton 1992). The four categories for Balanced Score Card are: financial performance, customer knowledge, internal business processes, and learning and growth.

In Palestine, the market share of food products varies between 90% for meat products to 30% for dairy products; the average is around 50%. The food industry has experienced export mainly to Arab countries. Olive oil and other fair trade products have been exported to many countries around the world. The total investments in the sector are estimated by USD 480 million (PFI 2010).

In Jordan, however, from 2001 to 2010, Jordan's agricultural exports have grown rapidly by an average 22% per year, increasing more than two-fold by 2005. Jordan's fastest growing agricultural exports include a mix of raw agricultural commodities and processed foods such as olive oil, malt extracts, fatty acids, and live sheep and goats. Other significant exports include fresh tomatoes and other fresh vegetables. While a substantial share of agricultural goods are destined to other Middle East countries (GAFTA accounted for 76.5% of Jordan's agricultural exports in 2005), an increasing share (8%) is being exported to the EU (fresh fruits & vegetables, vegetable oil, and fruit & nuts). Because of Jordan's chronic water shortage, a large portion of the technical components of development projects address that issue (Medibtikar 2009).

While in Israel, the climate ranges from semi-arid to arid so that shortage of high quality water is one of the main constraints facing Israeli agriculture. Extensive greenhouses production under the climatic conditions in Israel enables vegetables, fruits and flowers to be grown for export to the European markets during the winter off-season. Israeli's agriculture is supported by both basic and applied research. Intensive production systems in Israel are the result of close cooperation and interaction between scientists, extension advisors, farmers and agriculture-related industries (Medibtikar 2009). The Israeli (civil) research expenditure is very high at 4.7% of GDP and industry contributes a much bigger part than in the EU. Israel has excellent universities and research organizations, and there is strong university-industry collaboration which is actively supported by the government. Agricultural research in Israel is carried out by the public and private sectors. In the public sector, the Ministry of Agriculture and Rural Development (MOARD) supports research in agriculture as does, to a lesser extent, the Ministry of Science and Technology (MST). Private sector research is carried out by manufacturers of agriculturally related products (e.g. fertilizers, seeds, irrigation equipment pesticides etc.) with the support of the Office of the Chief Scientists (Medibtikar 2009).

Research Problem

The food processing firms in Palestine are positioned in the factor-driven stage. The industry draws its advantage almost from the basic factors of production, natural resources and inexpensive semi-skilled labor pool. The firms solely compete on the basis of price and very few firms have direct access to foreign markets.

The Palestinian food firms are not allowed to sell their products in Israel, not even to the Arab-Israeli community. The main reasons for this are:

- Inability to obtain relevant authorization from Israel's Ministry of Health, necessary for all imported food products into Israel.
- Lack of Kosher certification of Palestinian food products, necessary for imported food products.

The Palestinian participants also emphasized the security obstacles to bringing food products into Israel, even in the case of food products sent from the West Bank to the Gaza Strip:

- At border crossings, trucks carrying food products have to go through lengthy security checks.
- Products have to be switched to Israeli vehicles (within containers) for transportation within Israeli territory.
- The Palestinian producers have no way of monitoring what becomes of their consignments once they have crossed into Israeli territory.

By contrast to these problems, the Palestinians pointed out the Israeli food products enter Palestinian territory with relative ease, and that 99% of manufactured inputs and raw materials designated for the Palestinian food industry are imported from Israel. In addition, there is a lack of necessary laboratory testing; these labs are very important for the survival of the industry.

Research Objective

The main objective of the research is to discuss how to enhance the competitiveness of the Palestinian SMEs working in the food processing sector through clusters. In addition, the research aims benefit from the experiences of the food processing clusters in Jordan and Israel.

Research Hypothesis

The research aims to testify the following main hypothesis:

(H_2): There are no significant differences in the related and supporting industries on the competitiveness of the SMEs working in food processing sector between Palestine, Jordan and Israel.

Research Methodology

An academic literature and some business, and other appropriate literature sources search were conducted. As part of the literature review, books, journal articles, tertiary literature such as indexes and catalogues, company minutes, government surveys, CD-ROM in university libraries, Internet sites, chambers of commerce surveys and professional association surveys have been used. A combination of quantitative and qualitative methods is used in the research. Employing both qualitative and quantitative data offers an opportunity to probe deeply into the issues raised by the research questions. Although questionnaires may be used as the only data collection method, it is usually better to link them with other methods in a multi-method approach.

The clustering random sampling is used. Four-hundred fifty (450) questionnaires were collected from Palestine, Jordan and Israel; 150 questionnaires from each country. The purpose of the survey is descriptive-exploratory with some explanatory analysis. The questionnaire was developed. The questionnaire consists of three parts. Part one covers the different elements of the related and supporting industries. Part two covers the firms' performance, and part three covers the demographic data. The scale items were tested on the reliability and validity of the final test to examine the consistency of the constructs and related the items.

The interviewees were asked about their competitiveness by asking about the Balanced Scored Card (innovation, customer's satisfaction, internal business and financial performance) of their firms as an indication of their competitiveness. It was measured with a five-point

scale (very negative to very positive). Furthermore, the respondents were asked to evaluate the different elements of the related and supporting industries. These elements were also measured with a five-point scale (1 = very negative and 5 = very positive).

Findings and Discussion

Based on the survey method described above, 450 questionnaires were received from Palestine, Jordan and Israel. As shown in table (1), there are significant differences in the extent of relations with banks, insurance firms, research centers and universities, local manufacturers, public institutes, government, firms working in the same sector, firms working in other sectors, and supplier buyer relations. Palestine has the lowest rank, in comparison with Jordan and Israel, in all of the abovementioned elements. It means that Palestine has a weak food processing cluster.

Table 1. Kruskal-Wallis Test – Related and Supporting Industries

No	Variable	Chi-Square	Sig
1	Supplier buyer relations	125	.00*
2	Relation with banks	319	.00*
3	Relation with insurance firms	213	.00*
4	Relation with research centers and universities	293	.00*
5	Relation with local manufacturers	168	.00*
6	Relation with public institutes	121	.00*
7	Relation with government	198	.00*
8	Relationship with food processing firms in Palestine, Jordan, and Israel	173	.00*
9	Relation with firms from other sectors	261	.00*

* Significant (values are less than or equal 0.05) with DF = 2

Table (2) presents results of the balanced scored card. The results of the survey show that there are significant differences in the financial indicators, innovation, customer satisfaction and internal businesses between the three countries. The Palestinian SMEs have a lower rank, in comparison with Jordan and Israel, in all of the elements of the four perspectives of the balanced scored card. This is not a surprising result since the related and supporting industries are relatively poor in Palestine in comparison with Jordan and Israel.

Table 2. Kruskal-Wallis Test – Clustering and Balanced Scored Card

No	Variable	Chi-Square	Sig.
<i>Innovation</i>			
1	<i>Percentage of new products of total turnover</i>	98	.00*
2	<i>Time necessary to develop new generation of products</i>	125	.00*
<i>Customer Satisfaction</i>			
3	<i>Customer satisfaction</i>	65	.00*
4	<i>Market share</i>	69	.00*
5	<i>Customer loyalty</i>	57	.00*
<i>Internal Business</i>			
6	<i>Employees satisfaction</i>	15	.00*
7	<i>Employees loyalty</i>	10	.00*
8	<i>Productivity of your employees</i>	25	.00*
<i>Profitability</i>			
9	<i>Return on Investment</i>	76	.00*
10	<i>Profitability</i>	150	.00*
11	<i>Revenue growth</i>	135	.00*
12	<i>Cost reduction</i>	10	.00*
13	<i>Exportation</i>	140	.00*

* Significant (values are less than or equal 0.05) with DF= 2

Innovation

The data shows that the innovation is low in Palestine in comparison with Jordan and Israel. Innovation perspective is a measure of potential future performance. Adequate investment in this area is critical to all long-term success. However, innovation should be taken in its broad definition and not limited to creating a new product. Innovation could be creating new methods in production, purchasing, selling... etc. To achieve that, there should be adequate investment in the human and infrastructure and the government should start creating the environment that is necessary for innovation.

Customer Perspective

The data shows that the satisfaction of the customers, retention ratio, and market share are low in Palestine. The Palestinian SMEs lack the competitive elements such as the lowest prices in comparisons with Jordanians, or highest quality in comparison with Israelis, while they have the advantages in fast delivery time and flexibility in production. Understanding this perspective may help the owners of the SMEs to assess their clients' happiness and to make needs clear.

Internal Business

The result of the survey shows that the efficiency of the manufacturing process is relatively low. The manufacturing cycle time, employee's productivity, and employees' satisfaction. The

family business could be a reason for this result since most of the employees are hired based on relatively-basis criteria rather than qualifications. Another reason could be the old machinery and production methods the Palestinian SMEs are using.

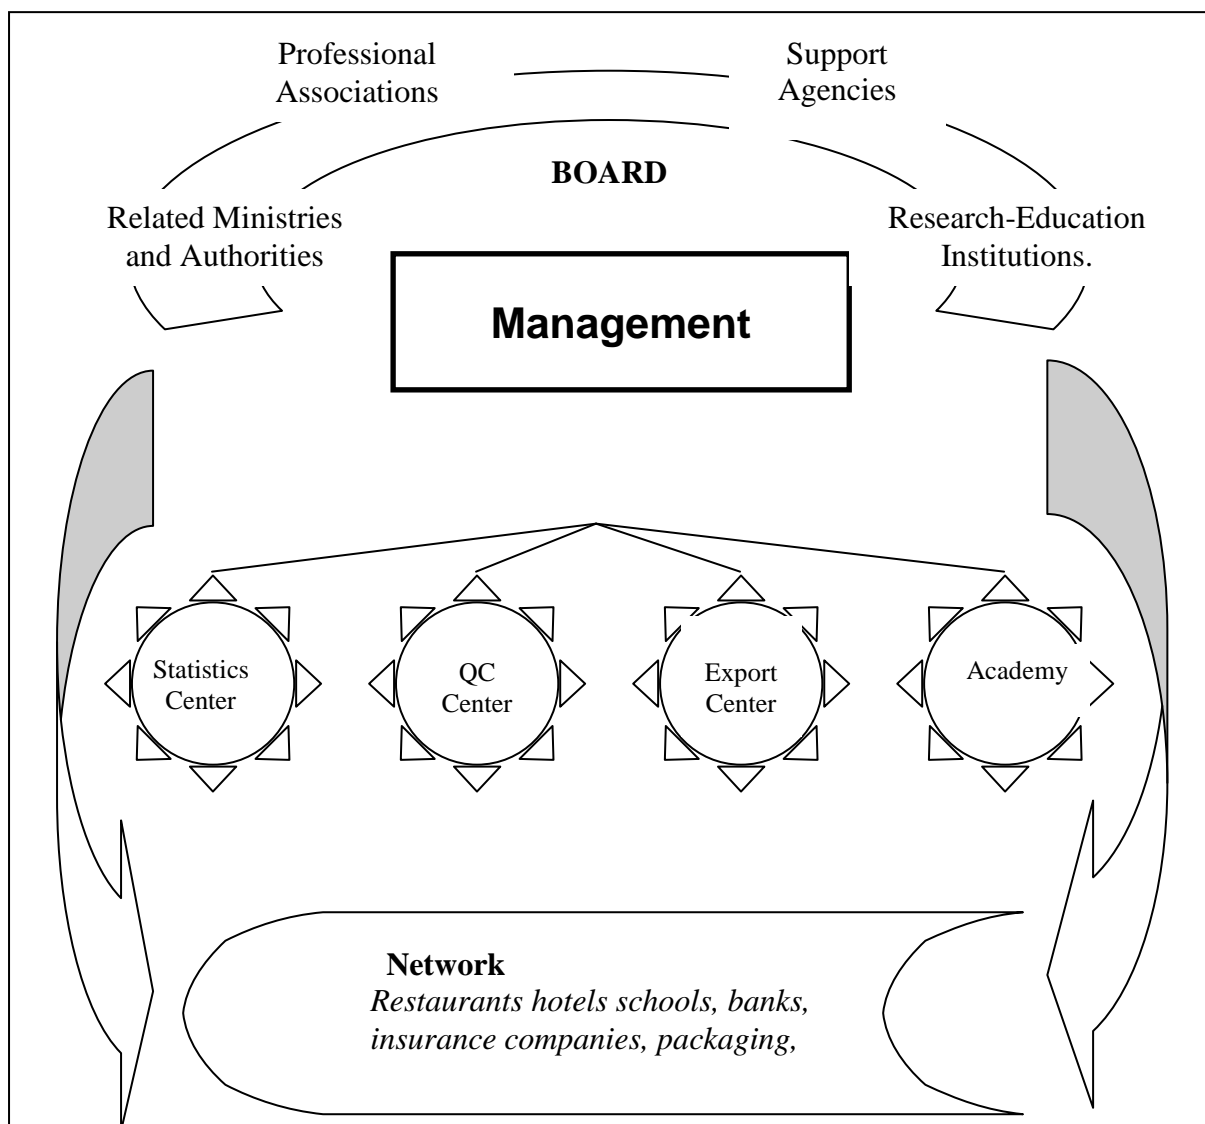

Financial Perspective

Palestinian SMEs have the lowest rank in the financial perspective. As a result of the limited market size, old machinery and production methods, and employees' low productivity, the cost per unit is high. That leads to a reduction in the revenue, profit growth, and exportation.

Food Processing Cluster at National Level

Below is a proposed Food Processing Cluster Model (FPCM) where the board is led by the related ministries and authorities, in a consensus framework with involved organizations (professional associations, educational-training, technical and financial support organizations and related ministries). The Food Processing Cluster should be an independent, non-profit and private membership based organization.

Figure. The Food Processing Cluster Model (FPCM)

In order to achieve the targeted objectives of the proposed cluster, the following four centers are recommended:

Statistics Center

The main aim of this center is to strengthen the relation with the members. The center will help in building the nucleus base for any study about the food processing industry in Palestine through analyzing the collected data.

Academy

The academy provides education, research and training for the food processing sector in Palestine. It works on the development of the industry through establishing a study center to be specialized in food processing studies. It will also conduct a series of educational and training programs. These programs facilitate entrepreneurs from all over the country to work together in an environment of sharing, and to expand their common interests in food processing.

Quality Control Center

Food processing industry addresses quality. The proposed center includes a laboratory equipped with all the necessary tools to conduct various quality tests. It will provide training, consultations and counseling to the food processing firms' owners and workers. The main purpose of this center is to improve and maintain the quality of the food products in order to a better presentation of the sector in local and international markets.

Internationalization and Export Promotion Center

This center is aimed to remain physical and on-line, exhibitions and fairs of locally manufactured products. This facility will provide an environment where wholesalers and customers from Palestine and other countries can visit, thus allowing for more efficient exchange of information on market demand. This approach is one of the tools to ease the sales efforts of the local producers by helping cut costs. It helps in the understanding of the needs for improved packaging and branding policies, as they see and experience a more efficient and transparent marketplace.

Food Processing Cluster at Regional Level

The results of the research show that the Jordanian, Israeli and Palestinian food producers have a weak trade relationship between them, but they expect that by building a regional cluster will have a strong impact on their competitiveness. The required institutions, universities, professional schools, research centers, professional associations, and relevant regional authorities already exist, but the networking is weak in training, education, and research and development.

Cooperation between the food processing sectors in Palestine, Jordan and Israel is an essentially important in building the competitiveness of the Palestinian SMEs. Palestinian SMEs could benefit from the Israeli and Jordanian SMEs new ways of productions, and exportations. It might be expected that the growth in quantity of high quality products, on one hand, and the wider activities of the research centers, on the other, will generate a bottom-up clustering process, i.e., the development of new industries with a high added value.

Conclusion and Recommendations

Based on the data analysis, below are the main conclusions of the research:

- Palestine has a weak clustering in the food processing sector in comparison with Jordan and Israel. As a result, Palestinian SMEs working in this sector have the lowest performance.
- There is a weak relationship between firms working in the food processing sectors in Palestine, Jordan, and Israel due to the obstacles in products' movement and standard's requirements.

The main recommendations are:

In order to enhance the competitiveness of SMEs working in the food processing sector in Palestine:

- There is a need to build a formal dynamic cluster. The research presents a suggested model to build such a cluster. The cluster can promote productivity, innovation and competition in a number of ways, e.g., the reduced cost of sharing resources, the critical mass created by having a pool of specialized skills, expertise and value-added products. The cluster enhances economic foundations such as a skilled workforce, research and development capacity and infrastructure, and thus creates assets such as trust, synergy, collaboration and cooperation, which are all essential for competitiveness.
- There is a need to strengthen the relationship between the food processing clusters in Palestine, Jordan and Israel. This regional clustering will assist in enhancing the competitiveness of the Palestinian SMEs through economies of scale, research and technology transfer, sharing the production of inputs, production processes, transportation processes and warehousing of products.
- The governments in the three countries can encourage clustering by offering an improved infrastructure and other incentives to producers and related service providers. The government can facilitate cluster development by providing an institutional framework that allows cluster participants to form, grow and discuss mutual needs and interests. The private sector and business associations can

identify barriers and opportunities, propose legislative and policy changes, and collaborate with research and educational institutions to translate research and development and technological advances into commercial applications.

KNOWLEDGE, INOVATION AND NEW TECHNOLOGIES FOR SUSTAINBLE DEVELOPMENT: THE CASE OF THE OCCUPIED PALESTINIAN TERRITORY

Sultan, Suhail Sami¹

¹Palestine Polytechnic University. E-mail: sultan@ppu.edu

Abstract

Palestine is pa3ssing through a transition period. Palestinians are in a need to build their national systems based on innovative basis. Palestine's innovation system is still underdeveloped and not working efficiently. The innovation system still suffers from weak components and a lack of coordination and managed links between its components. In order to build a national innovation system in Palestine, there is a need to be opened up to global knowledge, imported massively capital goods and components, reform of universities and R&D organizations, establishing an incubation system at universities, induced FDI to set up large domestic research facilities, encourage expatriate scientists set up high tech industries, focus on premier universities as key knowledge institutions, learn from past policies/ review reports, consult with private sector, scientists, government officials and economists, develop human resource, up-grad R&D Infrastructure, and restructuring of R&D Institutions, promote ICT, and build knowledge network.

Keyword: National Innovation System, Science and Technology, Palestine

Introduction

Sustainable development has different meanings and implications in different parts of the world. Sustainable development is for all countries, not just for developing ones. While developed countries need to find alternative sources of energy and other technologies that reduce their own impact on the environment, developing countries need to develop their own innovation capacity, in order to address their own particular needs (Niosi 2002).

Invention is defined as a focused application of the human mind to the world that yields an original creation with practical use. Invention requires a lot of knowledge, thus there is a need to pay careful attention to education. Invention is not a linear process, from idea to product to economic impact. Rather, invention is a complex interaction between human creativity, technology and the marketplace, and iteration must typically happen between all three realms before an invention has a significant economic impact. Invention stimulates entrepreneurship and overall economic activity (MIT 2003).

Innovation is the practice of bringing inventions into widespread usage, through creative thinking, investment, and marketing. That's why basic invention is typically needed to drive innovative activity. Innovation is seen as an essential tool to alleviate poverty; poverty is nothing else then a situation with a high level of constraints which can only be overcome by smart, innovative solutions (Smith 2003). An important reason why so much is expected from the private sector in terms of

fulfilling the needs of the poor is exactly because of the importance of innovation: it is assumed that firms are generally more innovative than other organizations such as public agencies and aid organizations (Prahalad and Hart 2002).

Innovation is a broad term that encompasses any new development in firms (OECD 2000). It can involve creating or reengineering products or services to meet new market demand, introducing new processes to improve productivity, developing or applying new marketing techniques to expand sales opportunities, and incorporate new forms of management systems and techniques to improve operational efficiency (Porter and Stern 2001). In his research paper "Innovation: Location Matters" Porter (2001) showed that innovation is a process rather than a single event and the internal factors that drive innovation are undeniable, but the external environment for innovation, at least, has the same importance.

In the developing world, however, innovations are typically planned and funded by governments or international organizations. As a result, local inhabitants sometimes fall into the trap of thinking that innovation is provided to them rather than something they create on their own. That's why it's so important for invention and creativity to be nurtured on the local level (MIT 2003). Economists often focus on helping poor countries become richer by improving primary education and infrastructure such as roads and telephones. Unfortunately, it is only a small part of the problem and only explains the gap between developed and developing countries. More important, why can't the poor country seem to do anything about it? Couldn't improve its schools, factories, license technology, and seek foreign partners? The problem of twisted rules and institutions explains part of the gap while the corruption destroys every effort to improve the infrastructure, attract investment, and raise educational standards (De Soto 2000).

According to Freeman (1987) a national system of innovation has been defined as "the network of institutions in the public and private sectors whose activities and interactions initiate, import, modify and diffuse new technologies"⁵. Niosi defined national innovation system as "A national system of innovation is the system of interacting private and public firms (either large or small), universities, and government agencies aiming at the production of science and technology within national borders. Interaction among these units may be technical, commercial, legal, social, and financial, in as much as the goal of the interaction is the development, protection, financing or regulation of new science and technology".

The unique situation of the Palestinian economy, as a result of occupation, makes it impossible to understand the Palestinian economy and the challenges facing it without first understanding the impact of the political and security situation on the economy as a whole and also on the Palestinian private sector. As a result, isolated from the regional and the global economy, leading to a limited degree of economic, social, and technological development as well as the lack of policy-making capacities and underdeveloped institutions.

The Palestinian Context

The location of the Occupied Palestinian Territory (OPT) consists of two parts. West Bank (5860 square kilometre) including East- Jerusalem, and Gaza Strip (360 square kilometres). In 2009 population was estimated at 4.4 million (63% in the West Bank and 37% in Gaza Strip). The macroeconomic situation continued to improve in the West Bank, but in Gaza conditions remain difficult due to the blockade. Real Gross Domestic Product (GDP) in the West Bank and Gaza (WBG) is estimated at 6.8%, consisting of an estimated 8.5% growth in the West Bank and 1% in Gaza (IMF 2010). The GDP composition by sectors is as follows: agriculture (5%), industry (14%), and services (81%).

The West Bank economy is growing and for the first time in years, it experienced positive real growth, estimated at seven percent in 2009. This should be placed in the context of an economy recovering from years of protracted conflict during which per capita GDP fell by nearly a third since 1999. According the Palestinian Central Bureau of Statistics (PCBS 2010), in the early part of 2009 most of the growth took place in two sectors: real estate, renting, and business services; and community, social, and personal services, both of which grew by more than 24%. Public administration grew by nearly 9% and construction by over 10%. Meanwhile, mining and manufacturing grew by only 2% and agriculture fell by more than 17%. This suggests that higher output was based on donor-funded sectors such as health, education, and public administration rather than private investment in productive sectors such as manufacturing, agriculture, and tourism.

Method

A side of the Academic-Government-Industry Partnership (AGIP) Conference that was held on May 12th 2010 in Palestine Polytechnic University in Hebron-Palestine, the researcher organized a workshop for 20 senior experts representing different sectors: government; private sector; educational institutes and donors. The main goal of the brain-storming workshop was to discuss the drivers of the national innovation system. The participants were asked to grade each driver based on a five-point likert scale (1 to 5): 1 means very poor; 2 poor; 3 average; 4 good while 5 means very good. The average was calculated for each factor.

The researcher focused the analysis on the following factors:

- Educational system
- Business
- Research and Development (R&D) System
- Business incubation and Information and Communication Technology (ICT)
- Institutions (Government, educational, and private)
- Capital for Innovation
- Culture for Innovation

Palestine's Innovation System

This section discusses each of the abovementioned drivers.

Educational System

With a high 91% adult literacy rate, Palestinians are the most educated population in the Middle East and North Africa (MENA) region (WB 2006). Tertiary education consists of universities that provide bachelor and master degrees and colleges that provide 2 or 4 years of education for a diploma. In West Bank and Gaza there are 11 traditional universities, 1 Open University, 12 university colleges, and 18 community colleges.

Today, there are more than 200 institutions in the West Bank and Gaza providing short and long term training programs. These include vocational secondary schools, vocational training centres, cultural centres, societies and charitable organizations, and agricultural and economic development centres. In addition to these institutions, come the 18 community colleges providing postsecondary educations, 5 of them are technical colleges. These institutions are run by several bodies that include: the Ministry of Education and Higher Education (MoEHE), the Ministry of Labor (MoL), the Ministry of Social Affairs, UNRWA, several Philanthropic associations, and large number of religious and profit organizations, in addition to private and public organizations. There are five streams in school-based vocational training: industrial, agricultural, commercial, hotel and home economics.

Palestine's primary and secondary education systems do not promote innovations. The system is built on memorizing textbook facts instead of creative learning systems or explorative research. In this sense, the academic system up to the BA grade is an extension of the rigid school system. Only in master courses, students are exposed to independent learning and are applying creative learning concepts. Interests in innovations are thereby stimulated far too late in the educational system. Only a few dedicated courses to innovation management and entrepreneurship can be found in public universities while private academic institutions seem to be slightly more advanced in this field.

At the educational institution level, there are insufficient flexibility, innovation and responsiveness; weak institutional autonomy; overly bureaucratic and centralized management, administrative and human resources practices; inadequate gender sensitive policies and practices; inadequate recognition of and connection to workplace experience; and little consideration of Life Long Learning strategies. OPT is not productive when it comes to the generation of knowledge.

At the educational program level, business participation in program planning, curriculum design review and delivery is weak; there is insufficient use of flexible models for program delivery such as student centered approach; educational programs focus continues to be on the academic rather than the applied knowledge; insufficient gender sensitive measures in recruitment and program delivery mainly in the technical and vocational education and training (TVET); instructors/trainers lack relevant, current and recurrent workplace experience; and weak guidance and student support, job counseling and placement with weak consideration to gender-based differences. The comparatively low levels of entrepreneurship call into question OPT's ability to foster growth and jobs. The challenge

for education is to provide learning environments that stimulate independence, creativity and an entrepreneurial approach to harnessing knowledge.

The participants ranked the innovation in educational system as "average" emphasizing that educational institutes are providing standards specializations and programs focusing on the supply rather than the demand driven approach.

(17%), industry (15%) and services (68%). Female employment is heavily concentrated in just two sectors: agriculture and services. In contrast, the male labor force is more evenly distributed across the main sectors. The two main changes during the last five years are the relative decline in agriculture, manufacturing and construction and the quite marked increase in the share of the services sector (WB 2006). The unemployment rate recorded as 16.3% and the inflation as 2%. The industrial sector includes: stone and marble, textiles and garments, food processing, engineering and metallurgical industries, chemical industries, pharmaceuticals and veterinary, construction industries, handicrafts, paper and printing, furniture, leather and shoes, and plastics. The services sector include: domestic trade, tourism, transport and communications, engineering design, communications, financial services, software services and others. In the OPT, enterprises employing less than 20 employees constitute 98 % of the total number of registered companies that operate in the local Palestinian economy in 2009

The participants ranked the innovation in business as "average" emphasizing that Palestinian businesses are mainly family-owned traditional SMEs producing standard products and services and competing each based on prices.

R&D System

The OPT's heterogeneous R&D framework consists of public and private universities as well as national research centers. Apart from general research, these institutions focus their work on the areas such as: water, environment, energy, biotechnology, and ICT. Though a clear need for new technologies and R&D results exist by Palestine's industrial sector, dedicated and effective technology transfer processes are still under development and current processes work less efficiently. State initiatives to stimulate cross fertilization between industry and the academic institutions are little accepted and not very effective. Table below presents the main indicators for R&D in the West Bank (PCBS 2010).

Main Indicators for (R&D) in the West Bank, 2008-2009

	2008	2009
<i>Number of Enterprises Engaged in R&D</i>	38	40
<i>Number of R&D Personnel</i>	1,555	1,542
<i>Number of R&D Personnel with Full – Time Equivalent FTE</i>	566	669
<i>Number of Researchers in R&D</i>	981	992
<i>Number of Researchers (Males) in R&D</i>	744	765
<i>Number of Researchers (Females) in R&D</i>	237	227

<i>Number of Researchers in R&D with FTE</i>	280	363
<i>Number of Researchers in R&D with FTE Per Million inhabitants</i>	120	150
<i>Total Expenditure on R&D (million\$)</i>	11.5	10.9
<i>Percentage of External Funds for R&D</i>	50.4	40.3
<i>Expenditure on R&D Per Researcher with FTE (Thousands \$)</i>	41	30

Source: PCBS 2010

Data showed that the number of employees in research and development reached 1,542 workers representing 669 workers in Full-Time Equivalent in 2008 (Full-Time Equivalent defined as 90.0% of the total number of working hours in the year on research and development) compared with 1,555 workers representing 566 workers in full time equivalent in 2007. The number of researchers was 992 of whom 363 researchers in full time equivalent in 2008 compared with 981 researchers of whom 280 researchers in full time equivalent in 2007.

The participants ranked the R&D as "poor" emphasizing that there are no publications to speak of and no enough budgets allocated for R&D.

Business Incubations and ICT

Business incubation as an important tool to unleash human ingenuity, enable competitive enterprises and create sustainable jobs. Business incubators can also be instrumental in developing new economic sectors, and expose entrepreneurs to information and communication technologies (ICTs) that in turn help increase the productivity and market reach of enterprises across sectors. Business incubators are initiatives which stimulate the commercialization of innovations by supporting entrepreneurial ventures by a wide array of business support services.

The deployment of ICT in Palestine started relatively late in comparison with developed countries and some countries in the Third World. Palestinian companies began their work in providing ICT in the West Bank and Gaza only in the early 1980's with services that were mostly focused on retail and some wholesale of computers and electronics. All of the Palestinian companies were mostly sub-agents to the Israeli dealers and had limited experience in after-sale services and programming software. The few companies that offered software and programming services focused on accounting-related packages to serve the local market. The Palestinian ICT market during the Israeli occupation years was severely constrained by the total Israeli control over the ICT products. The growth in the Palestinian ICT sector was induced by increased demand for ICT products and services by the Palestinian private sector, universities and the public sector, as well as the establishment of the first Palestinian Internet Service Provider (ISP), which made the Internet commercially accessible to all.

The Palestinian ICT sector started to show significant growth by the end of 1995. The biggest end-user of technology products and services was the PA, followed closely by Local Government (Municipalities) and then by the larger companies. By 1997, the Palestinian telecommunication sector was 100% privatized with the creation of PALTEL, the Palestine Telecommunications Company,

which was licensed to be the exclusive telecommunication operator in Palestine. PALTEL installed a digital network connecting the West Bank and Gaza and currently offers a wide range of services such as fixed telephone lines, leased lines, ISDN connections, ADSL.

The software industry produced a wide range of solutions and packages in areas such as human resources management, projects and sales management, Finance and accounting, education related solutions, management information systems, children education and entertainment. Many new companies were also established and specialized in web development, e-business solutions, web portals development, ICT consultancy, training, and office automations.

The percentage of households having a computer in the OPT reached 49.2%, in 2009 compared with 26.4% in 2004. With regard to internet connectivity, 28.5% of households in the OPT have Internet connection in 2009 compared with 9.2% in 2004, while the percentage of households that own TV dish was 92.0% in 2009 compared with 74.4% in 2004. The data also indicated that 92.4% of the Palestinian households (at least one member) possess a mobile phone in 2009 compared with 72.8% in 2004 (PCBS 2010).

The data below showed that 57.1% of persons (aged 10 years and above) use computer in the OPT in 2009 compared with 35.7% in 2004. Data revealed that 32.3% of persons (10 years and above) use Internet in 2009 compared with 11.9% in 2004. Almost 21% of economic enterprises used computers in the year 2007; while 12.7% of the total number of enterprises accessed the internet. Also 2.3% of the enterprises were using electronic transactions and the percentage of enterprises that have website was 2.6%.

ICT Access Among Economic Enterprises in the Palestinian Territory, 2009

<i>Percentage of Enterprises Using Computer</i>	21.3
<i>Percentage of Enterprises Using Internet</i>	12.7
<i>Percentage of Enterprises Practiced Electronic transactions</i>	2.3
<i>Percentage of Enterprises having Website</i>	2.6
<i>Percentage of Enterprises Engaged in Research and Development in (IT)</i>	1.2
<i>Number of Computers in Enterprises Per 100 Employees</i>	24.0
<i>Percentage of Employees Who Are Using Computer</i>	22.0
<i>Percentage of Employees Who Are Using the Internet</i>	15.0
<i>Percentage of (IT) Specialist</i>	3.5

Source: PCBS 2010

The Palestine Information and Communications Technology Incubator (PICTI) aims to develop the Palestinian Micro, Small and Medium Organizations (MSME) sector, as a means to generate new jobs, attract investments and improve the economic situation in the target areas. The PICTI work program aims to revitalize entrepreneurial culture in youth by encouraging new business development and entrepreneurs, and provides technical training and capacity building for PICTI staff to benefit its clients.

The participants ranked the Business Incubation in the OPT as "poor" emphasizing that the financial support of early phase entrepreneurial ventures is quite low, while the participants ranked the ICT as "average".

Institutions

The OPT has in place a higher education law that provides the legal framework for organizing the relationship between education and business. The main problem is that the law has not been implemented as was intended, and in many respects the governance bodies are not functioning optimally. The Council for Higher Education (CHE) is the most and its creation predates the establishment of the MoEHE. As part of the implementation plan of the national strategy for technical and vocational education and training, the Higher Council of TVET was formed in 2005. The council is composed of 16 members with equal representation of public, private, and other relevant bodies. Although the Council for Higher Education and the Higher Council for TVET composed of representatives from educational and business institutions covering all over the West Bank, these two councils are not well functioning and the economic sectors are not sufficiently covered.

In 2002, the MOEHE established an Accreditation and Quality Assurance Commission (AQAC) headed by a chair who is appointed by the Minister, and has a board of 12 professionals whose mandate is to take final decisions about licensing and accreditation – which get ratified by the Minister. The MoEHE has established the Council for Scientific Research (CSR) at the Ministry. It is a body that was established and operates within a draft by-law set out by the Ministry that has not yet been ratified.

The private sector is represented by many institutes such as: Palestinian Federations of Industries, Palestinian Federations of Chambers of Commerce, Industry and Agriculture, Palestinian Trade Centre among others. Although these institutes are overseen by the Ministry of National Economy, they are not active and competing each other rather than complementing each other.

Consultancy contracts can be useful as an indicator of how know-how is oriented toward various economic activities, and this information can help in identifying areas for building endogenous science and technology (S&T) institutions that may target the transfer of know-how from contracting bodies to enhance national strategic plans. In reality, the transfer of S&T depends largely on how these contracts are managed and what sort of a relationship is established between local teams and the consultants in terms of training, bridging and capacity building.

Although, there are many initiatives called for public private partnership in the OPT, the participants ranked the governmental, private, and educational institutions as "poor" emphasizing that these institutes are not active, and competing each other.

Capital

The OPT's financial support system of innovative entrepreneurial ventures is still underdeveloped. While seed capital generally exists, grants for capital intensive entrepreneurial ventures are very small. Business angel networks are only rudimentary existing and banks are very conservative and risk averse in their investment behavior even with a third party coverage up to 75%. The venture

capital instrument is still underdeveloped due to current legislation. Moreover, most initiatives regarding educational development or private sector development are mostly from donors such as the World Bank, EU, USAID, GTZ, Belgium, Dutch, and French in addition to Arab and Islamic Funds.

The Palestinian firms are facing difficulties in acquiring capital. Family businesses, most of the times, prefer to stay small and prefer not to bring in any external partner to their firms. As well, many banks might lack the knowledge and experience of dealing with small loans. However, in terms of capital assets, the lower investment rate in the OPT is consistent with the Palestine's low capital productivity and the Palestinian's history of relatively high macroeconomic volatility and the bureaucratic rules and regulations.

The participants ranked the financial support system of innovation as "poor" showing that grants and loans supporting innovative entrepreneurial ventures are very small.

Cultural Framework

“National culture is a system of socially constructed meanings and values that members of a nation develop and pass on to others; these values have resulted from the culture’s successful dealings with problems of the environment and the complexities of ordering social relations and integrating people (Hofstede, 2001; Schein, 1985)” Thereby the cultural framework becomes also influential for creativity and innovation. The OPT’s culture does not seem to promote individualism as prerequisite for innovations and entrepreneurship. The traditional trading orientation of the culture seems to be less geared towards innovation than a culture with is more manufacturing oriented. This might be one reason for the undeveloped innovation and entrepreneurial system.

Education-business cooperation is still limited. However, the culture of education-business cooperation started to significantly grow up after 1994, after the Palestinian Authority (PA) took over, a state attributed to many reasons: before 1994, education sector was governed by the Israeli occupation through military laws; TVET strategy and Higher Council for TVET were only created after 1994; and the Council of Higher Education, under which all universities and colleges were operating, was activated after the establishment of the PA.

Some of drivers that have influenced the tradition are: the political effects: like uncertainty and mobility restrictions; the structure of the business community, where most of the business establishments are SMEs and the culture which is still in the stage of having family owned industries, usually limited to employing relatives and close friends, and reluctant or constrained toward approaching the schemes and programs of cooperation.

The participants ranked the culture of innovation as "average" showing that Palestinians manage to find out innovative solutions against many Israeli restrictions.

Conclusion

OPT's innovation system is still underdeveloped and not working efficiently. It suffers from weak components and a lack of coordination and managed links between its components. The main challenges facing sustainable development in the OPT are: political turmoil; weak educational, private, and governmental institutes; weak linkages between educational and business institutes; low R&D expenditure; few scientists and engineers; non competitive industry and knowledge; low usage of information and communication technology; limited private sector R&D and Innovation activities; and brain drain.

Education and labor force lack an overarching vision at the highest level of government that would serve to guide and coordinate reform initiatives. There exist many persistent national systemic barriers to the creation of an educational system that is demand driven, competency-based, flexible and responsive. Main general obstacles are: the pervasiveness of the academic model, bureaucratic processes, and the lack of performance management systems. In addition, there is an absence of a vehicle for creating a vision for education and leading and coordinating the growth and development, and the absence of strategic planning for the educational and business sub-sectors. In addition, labor market and institutional performance information is not being utilized for program planning.

At the business level, it is obvious that more than 90% of industries are classified as small family administered businesses. This implies that efforts have to be devoted to enrich the family business administration tools and mechanisms and tackle small scale related problems in financing, promotion, technical assistance, raw materials and other business essentials. Productivity across all industrial sectors does not exceed 50% on average, and only few industrial investments were evident in the West Bank in the last decade, most of these were in the form of development to existing enterprises. It worth mentioning that there is a lack of coordination efforts between different private institutes, and inter-sector relations and inter-industry relations are weak. There is no unified reference for the private sector (i.e. unions, chambers, associations) to reinforce capacity to help SMEs to address their needs for skills, lack of information accuracy and the government is not able to control and regulate the internal market and eliminate unfair competition with local producers.

Recommendations to Move Forward Drivers of Innovation

Cultural development plays an important role in political, economic and social development. In the OPT, however, the cultural sector is witnessing many challenges that threaten to compromise cultural and artistic outputs and constrain innovation, mainly, due to the lack of clear national policies and strategies required to coordinate efforts and provide funding. To build an innovation national system, the OPT should be opened up to the global knowledge, reform of universities and R&D organizations, promote incubation system, attracted Foreign Direct Investment (FDI) for both domestic and export markets, wide consultation with private sector, scientists, government officials and economists, and promoting ICT. There should be legislation governing the relationship between education, business, Capital, R&D, and ICT sectors endorsed by the Ministerial Cabinet and Palestinian Legislative Council.

REVISITING ORGANIZATIONAL INTERPRETATION AND THREE TYPES OF UNCERTAINTY

Sund, Kristian J.¹

¹Middlesex University Business School, The Burroughs, London, NW4 4BT, United Kingdom. Email: k.sund@mdx.ac.uk

Abstract

Interpretive theory and the concept of perceived environmental uncertainty have received great attention in the literature. Yet, despite the link between interpretation and uncertainty, little work has focused on integrating the dominant constructs into one framework or model and the empirical evidence is highly scattered. The aim of this paper is to move towards such a framework and to make a series of conceptual propositions regarding the impact of perceived uncertainty on interpretation processes.

This conceptual paper extends existing conceptual work on perceived environmental uncertainty by linking the interpretation process to three different types of uncertainty: state, effect and response uncertainty.

In this paper I propose that environmental scanning leads to lower state uncertainty, i.e. less uncertainty regarding the estimation of probabilities of events occurring in the external environment of the organization. I also propose that scanning leads to higher levels of perceived control over events and that the actual interpretation of event, in opportunity/threat terms, drives organizational reactions to these events.

This paper proposes a coherent view of the organizational interpretation process and links to three types of perceived uncertainty. It suggests a way to test these links that might help explain and untangle some of the conflicting empirical results found in the extant literature.

For practitioners this paper emphasizes the importance of environmental scanning and how scanning practices can lead to general alertness, to more positive event interpretations, and finally to responses to opportunities in the environment.

I extend on existing work by linking the interpretation process to three different types of uncertainty (state, effect and response uncertainty) with specific testable propositions. This paper provides a unifying view, piecing together in one picture elements that have so far been dispersed in the literature.

Keywords: Perceived environmental uncertainty; scanning; interpretation

Introduction

Management scholars have long been interested in the alignment between organization and environment. The environment is the source of both opportunity and threat for the organization (Dutton & Jackson, 1987; Jackson & Dutton, 1988) and organizations, by perceiving the environment

and acting in response to what they perceive, at least to a certain extent can enact, create and choose the environment with which they deal (Bluedorn, 1993; Weick, 1979). However, this is typically done under conditions of relative uncertainty with which executives must cope (Lawrence & Lorsch, 1967).

The study of managerial and organizational cognition and its constructs has proliferated in the management literature over the past two decades, with management scholars discovering and building on the earlier work of psychologists and cognitive psychology. The rise in general of the organizational learning and knowledge-based view of the firm (Nonaka, 1994), have contributed to the popularity of this area, and started to shed light on the role of sensemaking in reducing uncertainty (Pandza & Thorpe, 2009). A handful of early scholars thus paved the way in the 1960s and 1970s for what has become a generation of organization scholars within the fields of management, who have taken the lead in examining knowledge structures within organizations (Walsh, 1995). Such structures represent a mental map of organized knowledge about an information environment, which enables some form of interpretation of that environment and subsequent action in that environment. The individual manager has thus been referred to as an information worker (McCall & Kaplan, 1985) and organizations as information processing, or interpretation systems (Daft & Weick, 1984; Galbraith, 1974). In fact, organization and sensemaking are so intimately linked that it may be said that organization actually emerges through sensemaking, as people organize to make sense of equivocal information and join to act on that information (Weick, Sutcliffe, & Obstfeld, 2005).

The three step interpretation process proposed by Daft and Weick (1984) suggests that organizations scan the environment and collect data (phase 1), which is later analyzed and interpreted, thereby giving meaning to the data (phase 2). Finally, actions are taken which result in organizational learning (phase 3). Whilst it has long been acknowledged that the environment is both complex and ambiguous (Starbuck & Milliken, 1988), as well a source of uncertainty (Dill, 1958; Duncan, 1972; Lawrence & Lorsch, 1967; Thompson, 1967), the relationship between this uncertainty and the sensemaking or interpretation process remains underexplored and deserves further exploration (Ashill & Jobber, 2009). If uncertainty is in fact omnipresent when organizations attempt to interpret signals from the environment, ignoring its effects on this interpretation seems a serious omission. Rather than simply acting as a form of background noise, as much of the literature on perceived environmental uncertainty seems to suggest, perceived uncertainty is more likely to accompany and influence every step of the interpretation process.

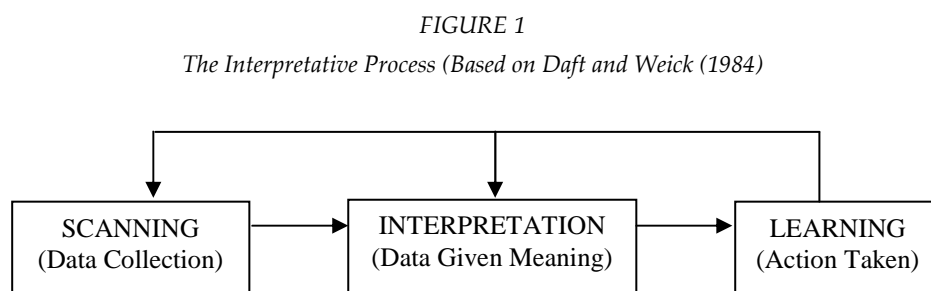

A particularly salient contribution to our understanding of the role of uncertainty in the interpretive process of organizations was made by Milliken (1987), who proposed that perceived environmental uncertainty could be broken down into three types: state, effect and response uncertainty. This concept of three types of perceived environmental uncertainty was related to the interpretation process in a later paper by Milliken (1990), when she suggested how the three types of uncertainty may reflect the three phases of the interpretation process outlined earlier. Unfortunately, despite much attention having been given to both the interpretation process and the three types of perceived uncertainty individually little has been done to extend the idea of bringing the two together conceptually.

Two problems therefore face the scholar interested in the interpretation-uncertainty link. One is that both conceptualizations and empirical evidence for the link is highly fragmented, with no single study painting a complete picture of the process of organizational interpretation and the links with multiple types of uncertainty. The second is that existing studies of the link between, for instance, scanning and uncertainty, are far from unanimous in their conclusions (Weick, 2002). Specifically, relatively little and sometimes contradictory evidence exists concerning the links between scanning, interpretation and the three types of uncertainty and little is known about the specifics of how these types of uncertainty affect actions. It is this lack of theory development that I will attempt to remedy in the present paper.

This paper therefore integrates and extends on existing theoretical and empirical contributions in the field, to give us a fuller view of how three types of issue-specific perceived environmental uncertainty are linked to the process of organizational interpretation. The paper is structured as follows: first I will review the interpretative process, then the literature on perceived environmental uncertainty, before making a series of conceptual propositions for the links between these various concepts, based on various contributions found in the literature.

The Interpretation Process

Although human beings carry out the actual interpretation of individual events, organizations build systems and memories based on past processed information. Organizations learn from their actions, as these actions are in turn analyzed and their effects interpreted (Weick et al., 2005). Individual employees may come and go, but certain norms, cognitive maps and organizational knowledge are standardized, stored and preserved over time (Daft & Weick, 1984). Thus, the organization is capable of interpreting as a system. Daft and Weick (1984) drew together various views on how organizations interpret the environment into a simple three-stage process of scanning, interpretation and learning, as illustrated in Figure 1. In this paper I will follow this particular stylized view given its success in the literature.

Scanning

Scanning is defined as the deliberate act of seeking information about events and relationships in the outside environment (Aguilar, 1967; Daft & Weick, 1984; Fahey & King, 1977). Scanning aims to recognize environmental changes (Sutcliffe, 1994), to improve the match between the objective

environment and the manager's or organization's perception of that environment (Bourgeois, 1985), as well as to correctly assign probabilities to the occurrence of potential changes or events (Milliken, 1990).

Due to scarcity of time, scanning is done selectively across sub-sectors of the environment (Boyd & Fulk, 1996; Daft, Sormunen, & Parks, 1988; Garg, Walters, & Priem, 2003; Hambrick, 1981), such that the focus of scanning differs from one organization to another (Hambrick, 1982). Furthermore, organizations exhibit varying levels of scanning and use various methods of scanning (Beal, 2000; Fahey & King, 1977; Lang, Calantone, & Gudmundson, 1997; Sutcliffe, 1994). Scanning can be both regular and irregular (Fahey & King, 1977; Huber, 1991). If knowledge structures are used to interpret change, then scanning serves to add to and enrich the knowledge structure content, whether at the individual, group or organization level. When measured, scanning is frequently divided into scanning scope and scanning frequency, the former referring to the areas of the environment scanned and the latter to the frequency of use of various scanning mechanisms.

Interpretation

Organizational interpretation can be defined as the process of giving data meaning, or of translating external events into a shared understanding amongst organizational members (Daft & Weick, 1984). It is during this crucial phase that cognitive or mental maps play an important role. Managers use their collective knowledge and mental maps to label and categorize events (Thomas, Clark, & Gioia, 1993; Weick et al., 2005). How a given event is categorized by the organization is a part of, and will obviously affect, the interpretation itself (Dutton & Jackson, 1987).

The categorization the most commonly mentioned and investigated in the literature is the categorization of an event as a potential threat or opportunity to the organization. It has been suggested that there are three dimensions to this threat/opportunity categorization: (1) an evaluation of the event by managers in negative or positive terms, (2) an estimation by managers of potential losses or gains as a result of the event, and (3) a consideration of the controllability by the organization (Barr, 1998; Jackson & Dutton, 1988; Thomas et al., 1993; Thomas & McDaniel, 1990). Although individual members of the top management tend to have a large influence over the labeling of strategic issues, these categorizations are shared with the organization and ultimately influence the organizational actions taken in response to the issue (Julian & Ofori-Dankwa, 2008; Thomas et al., 1993).

Action

The final stage of the interpretative process involves organizational actions. It was labeled "learning" by Daft and Weick (1984), but the learning involves a new response or action based on the interpretation. The learning effect refers to the discovering and interpretation of new action-outcome relationships. Thus, the action phase leads to the accumulation of new knowledge and information which is in turn interpreted by the organization, leading to the feedback loops in Figure 1. Organizational actions can be changes of a strategic nature, of a competitive nature or of a structural

nature (Dutton & Duncan, 1987; Ginsberg, 1988; Thomas et al., 1993). As previously mentioned, the particular organizational action is intimately linked to the interpretation given to the environmental change (Barr, 1998). Thus, the particular interpretation given to an event will determine what actions will be taken, as will past experiences, given that these past experiences, and past learning, to some extent constrain the organization's repertoire of actions. Finally it may be worth pointing out again that the actions taken will ultimately influence and to a certain extent form the environment (Bluedorn, 1993; Weick, 1979).

Perceived Environmental Uncertainty

Environmental uncertainty has for a long time been a central concept and variable in the study of organizations (Dill, 1958; Duncan, 1972; Lawrence & Lorsch, 1967; Thompson, 1967). This uncertainty has been considered by some an objective property of the environment, by others a perceptual phenomenon, such that the uncertainty is in the eye of the beholder (Milliken, 1987). As a result, estimation of environmental uncertainty has been carried out either using objective archival measures, or subjective perceptual measures (Boyd, Dess, & Rasheed, 1993). When the environmental uncertainty is viewed as an objective property of the environment, it is typically measured using constructs that deal with particular attributes of the environment such as instability or rate of change, munificence, and complexity (Bourgeois, 1985). These objective measures involve archival time series data, which will help to eliminate survey problems like non-response bias. Perceptual measures, on the other hand, generally depend on survey-based self-reported data, which many researchers have argued are more relevant (Downey & Slocum, 1975). A manager's perception of environmental uncertainty may change quite rapidly (Buchko, 1994), something objective measures may not pick up. It is no wonder then that studies trying to compare objective and perceptual measures have yielded mixed results (Buchko, 1994; Downey, Hellriegel, & Slocum, 1975; Tosi, Aldag, & Storey, 1973). Objective environmental uncertainty and perceived environmental uncertainty are two very different constructs (Doty, Bhattacharya, Wheatley, & Sutcliffe, 2006).

The measurement of perceived environmental uncertainty has been carried out using many different instruments. These usually divide the environment into sectors, such as suppliers, competitors, customers, government and so forth. Managers are then asked to rate the predictability of changes in each sector. It has been found that these operationalizations, including the most commonly used ones, are not necessarily correlated (Downey et al., 1975), owing probably to the fact that they are not necessarily measuring the same underlying construct (Milliken, 1987). Furthermore, there have been demonstrated problems of validity and reliability for many of these instruments. Thus, both the Lawrence and Lorsch (1967) scale, and the Duncan (1972) scale have been found to lack reliability (Downey & Slocum, 1975; Tosi et al., 1973). Miles and Snow (1978) proposed an instrument with 22 items across six external environmental components: suppliers, competitors, customers, financial markets, government and unions. They suggested a link between the strategic type of an organization, scanning behavior and perceived environmental uncertainty (Miles & Snow, 1978). The various environmental components were equally weighted in their instrument, a fact which has been criticized, since for any particular organization, at any particular point in time, the strategic

importance of the various components are likely to be unequal (Daft et al., 1988). One risk with this instrument is therefore that the researcher underestimates the environmental uncertainty.

Milliken (1987) was innovative in proposing that not only may environmental uncertainty arise from any of the various sub-sectors of the environment, but it may in fact arise in three distinct forms. The first she referred to as state uncertainty, which is the lack of predictability concerning environmental change. She suggested that this type of uncertainty is conceptually closest to the common conception of perceived environmental uncertainty. The manager is uncertain as to the probability of particular events or changes taking place. Thus, he or she finds the environment or portions of it to be unpredictable. An example of this kind of uncertainty would be the uncertainty associated with a potential competitor entering the market or not.

The second type of uncertainty is effect uncertainty, which refers to the inability of managers to assess what the effects of a future state of the environment will be on their organization. This type of uncertainty therefore concerns cause-effect relationships and understanding whether an event will affect the organization and how deeply. An example would be the uncertainty linked to the effects that a new market entrant would have on the organization. The third type of uncertainty is response uncertainty, or a lack of knowledge of response alternatives and the effectiveness of these responses (Milliken, 1987). In our example, this would be the uncertainty of how to respond to the new entrant.

In later work, Milliken (1990) measured these three dimensions of uncertainty in a survey of college administrators and found evidence for their existence as separate constructs. A number of later studies have picked up on the notion of three separate types of perceived uncertainty. Gerloff, Muir, and Bodensteiner (1991), who used factor analysis on Duncan's (1972) instrument of perceived environmental uncertainty in the case of a survey of 118 Navy project managers, found that this instrument reflected the three types of uncertainty, although there were some issues of reliability on the measure of effect uncertainty (Doty et al., 2006; Gerloff, Muir, & Bodensteiner, 1991). Based on a questionnaire answered by 204 New Zealand firms, Ashill and Jobber (2009) presented evidence that the three types of uncertainty are conceptually distinct, although empirically linked. In a previous study the same authors used qualitative measures (Ashill & Jobber, 2001), and I have identified at least one study that interestingly used time series data to confirm the existence of the three uncertainty dimensions (Miller & Shamsie, 1999). However, despite the apparent and justified popularity of Milliken's (1987, 1990) work, relatively little has been done to further examine the possible relationship between the three types of uncertainty and the actual process of organizational interpretation. Although Milliken (1990) herself linked the three types of uncertainty to Daft and Weick's (1984) interpretative process, the details of this link remain largely unexplored.

Studies of cognition and the interpretation process have examined the likely factors affecting this process, and the possible origins of the underlying knowledge structures, including strategy (Thomas & McDaniel, 1990) and strategic type (Citrin, Lee, & McCullough, 2007), market orientation (Qiu, 2008), degree of diversification (A. Ginsberg, 1989), organization culture (Harris, 1994), industry velocity (Nadkarni & Barr, 2008), dynamism (Garg et al., 2003), cognitive motivation (Anderson, 2008)

and a host of other organizational, team or individual level factors. Milliken (1990) herself examined the role of perceived probability of change in the interpretation process, but not of scanning as an activity and a tool for improving the accuracy of perception and for lowering uncertainty. A number of more recent studies have examined particular relationships within the process itself, such as the link between information gathering and interpretation (Anderson & Nichols, 2007). Others have examined how uncertainty may hinder responsiveness or actions (Becker & Knudsen, 2005), but common to all of these studies is that they typically don't distinguish between different types of uncertainty, nor do they paint a very complete picture of how uncertainty can affect organizational cognition at each of the different stages of the interpretation process. Thus there is a need for further conceptual and empirical work on perceived environmental uncertainty and its links with the process of identifying, interpreting and responding to environmental change (Ashill & Jobber, 2009).

An Integrated Model of Interpretation and Uncertainty

It is my intention in this section to make a series of propositions, outlined in figure 2, about the three types of uncertainty and how they may relate to a process of organizational interpretation. I seek here to integrate existing knowledge into a somewhat more complete model of uncertainty and organizational cognition than has been done in the literature thus far. In this model I will differentiate between several types of uncertainty, and in keeping with Milliken's (1987; 1990) intentions, I link these to the interpretative process as outlined by Daft and Weick (1984).

The first proposition concerns state uncertainty, as it relates to organizational scanning. The link between scanning and perceived environmental uncertainty has been extensively debated and studied, mostly with the hypothesis being that high levels of environmental uncertainty prompt executives to have higher levels of scanning (Daft & Weick, 1984; Ebrahimi, 2000; Lang et al., 1997; Miles & Snow, 1978; Yasai-Ardekani & Nystrom, 1996). As previously noted, no particular distinction has been made between different types of perceived uncertainty in general (Becker & Knudsen, 2005), and the three types of environmental uncertainty identified by Milliken (1987) in particular. Daft, Sormunen and Parks (1988) found evidence for a link between perceived strategic uncertainty, measured as a combination of the perceived rate of change, complexity and strategic importance of sub-sectors of the environment, and top executive scanning frequency for that sector, and hypothesized that it is the strategic uncertainty which leads to scanning. The "strategic" element of their uncertainty measure was introduced because they posited that uncertainty by itself will not lead to scanning behavior (Richard L. Daft et al., 1988). Subsequent studies trying to replicate their results have produced mixed results (Elenkov, 1997). In a recent study, authors posited that perceived market turbulence triggers efforts at sensemaking (Neill, McKee, & Rose, 2007). Finally, Nadkarni and Barr (2008) hypothesized that industry velocity will influence attention focus. Thus it remains unclear whether environmental factors by themselves prompt scanning, whether perceptions alone lead to scanning, or whether it has to be a combination of uncertainty and strategic relevance. Critically, existing studies have not provided unanimous results to support either of these views. One reason for this is that the exact definition and measurement of perceived uncertainty has varied from study to study. This uncertainty has in most studies not been broken down into its separate components

(despite the mounting evidence pointing to the existence of such components). Interestingly too, the cause-effect relationships reported in these studies often hinge purely on the strength of the lines of argument. In this paper, I will focus on the issue-specific uncertainty, breaking this uncertainty down into the three types originally proposed by Milliken (1987, 1990). I will therefore not theorize directly about the links between environmental dynamism or complexity and scanning, nor about perceived environmental uncertainty in the traditional sense.

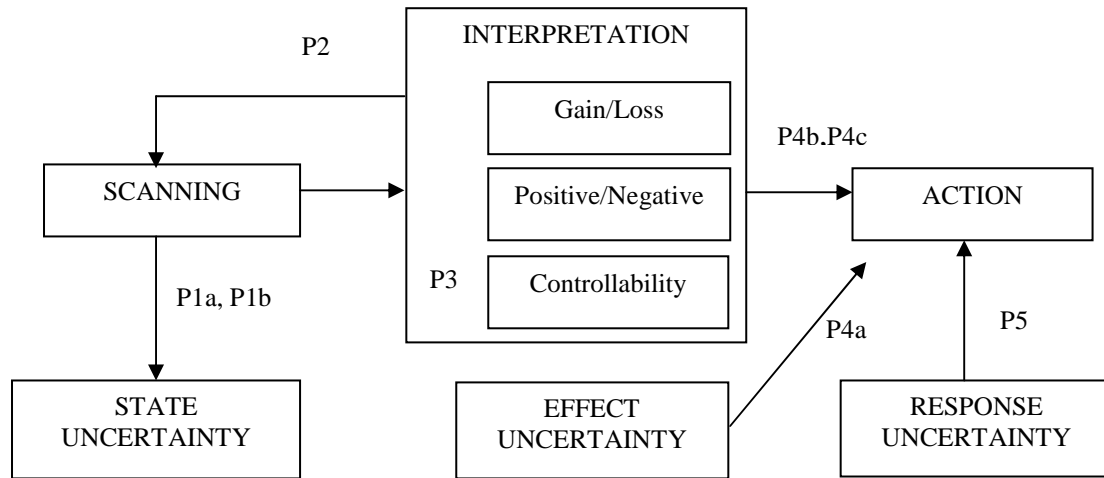

It has been suggested that environmental scanning absorbs uncertainty when it advances beyond the mere collection of data and begins to provide interpretations (Boulton, Lindsay, Franklin, & Rue, 1982; Yasai-Ardekani & Nystrom, 1996). Starting from Milliken's (1987) definition of state uncertainty as being uncertainty about the probability of general changes in state in the environment, it therefore seems logical that scanning the environment for information about a specific issue or trend will tend to lower the state uncertainty related to that issue. In addition to this, and as an indirect effect, the more scanning activities a given organization entertains in general, the lower I would expect the state uncertainty related to any given environmental change to be. In other words, organizational scanning leads to more certainty concerning predictions of the likelihood of particular events taking place. This is firstly because higher general scanning will increase the chance that a given event has been recognized by the organization (Kathleen M. Sutcliffe, 1994), secondly because it will improve the basis for estimation of subjective probabilities and their accuracy (Becker & Knudsen, 2005). In short, if state uncertainty is defined by the absence of information about the environment (Downey & Slocum, 1975; Milliken, 1987), collecting more information should help lower uncertainty.

A second element to this first proposition concerns the particular sectors of the environment that are scanned. The more an organization scans a particular sector of the environment, the lower the state uncertainty concerning changes within that sector.

Proposition 1a: The more an organization scans its external environment, the lower will be the perceived state uncertainty related to environmental changes.

Proposition 1b: The more an organization scans a particular sector of its external environment, the lower will be the perceived state uncertainty related to environmental changes taking place in that sector.

FIGURE 2
Propositions

The second proposition concerns the feedback loop reported by Daft & Weick (1984) and illustrated in Figure 1. They suggested that learning might lead to further scanning in order to monitor the effects of organizational actions. If this is the case, then one could conjecture that the interpretation given to a particular event upon first identifying the event might influence subsequent scanning related to that particular event. Daft, Sormunen, and Parks (1988) noted that uncertainty by itself will not lead to scanning behavior since managers may not be interested in events unless these are perceived as strategically important. Hence the perceived importance of an event may prompt further organizational scanning (Boyd & Fulk, 1996). This scanning is of an irregular type, being a direct reaction to the given event or "crises" (Fahey & King, 1977). The environment is scanned for specific data concerning the event. The bigger the predicted impact of that event, whether negative or positive, the more likely that the organization will engage in more scanning to help form or perfect the interpretation. Any significant threat or opportunity is likely to act as a trigger for scanning.

Proposition 2: The higher the predicted impact of a given event and regardless of the uncertainty related to that prediction, the higher will be the interest in the event and the more likely will it be that scanning activity will be undertaken in the related area of the environment.

The third proposition concerns how scanning affects interpretation. As a reminder I consider here the previously discussed three dimensions of the traditional threat/opportunity categorization: (1) an evaluation of the event in negative or positive terms, (2) an estimation of potential losses or gains as a result of the event, and (3) a consideration of the controllability by the organization. Starting with controllability, the greater the amount and the completeness of information available to decision makers, the greater the likelihood that they will sense that they master the situation and thus perceive any changes as controllable (Eisenhardt, 1989; J. B. Thomas et al., 1993). The fact that scanning

enhances the early detection of events before threat interpretations can emerge should further contribute to increasing the sense of control (Jackson & Dutton, 1988).

Proposition 3: Organizations that engage in more general external scanning will tend to feel a given event to be more controllable.

The fourth proposition concerns the links between the actual interpretation of an event, the effect uncertainty relative to the event, and organizational response. Effect uncertainty measures on the one hand uncertainty related to whether a given event will affect the organization and on the other hand uncertainty linked to the predicted magnitude of this impact (Milliken, 1987). This uncertainty accompanies the actual interpretation and categorization of an event. It is not clear at all that this type of uncertainty influences the actual interpretation or threat/opportunity categorization itself, nor that it is a consequence of that interpretation, but rather it influences the time spent interpreting. As Milliken (1987) noted:

"It seems likely that if administrators are uncertain about the effect of an environmental change or changes, they may spend a lot more time (and use many resources) in the "environmental threat and opportunity analysis phase" of strategic planning... Uncertainty could paralyze the strategic planning process as administrators argue about whether and how significantly their organization is likely to be affected by various environmental changes."

Milliken (1987: 140)

This would suggest that if effect uncertainty has an effect on the interpretation process other than extending the time spent analyzing, this effect might be on the response rather than actual interpretation. It has been shown in the literature that effect uncertainty may arise from the inability to assess how customers, competitors and other actors might influence the organization (Miller & Shamsie, 1996). This can be because the organization may be lacking the necessary skills, information and resources to correctly understand the effects of environmental changes (Miller & Shamsie, 1999). The only paper I have identified dealing directly with the influence of effect uncertainty on the interpretation process is that of Miller and Shamsie (1999), who found that firms experiencing high effect uncertainty will tend to have less varied product lines. Their argument was that the uncertainty would discourage managers from straying into expensive product variations. Product variation and new product launch is clearly one type of decision or action open to organizations facing changing environments. As a result of the above analysis I therefore suggest that higher effect uncertainty will make it more difficult for an organization to determine whether a response is warranted. Therefore, higher effect uncertainty will be associated with less organizational action, at least in the short term.

It has been shown that issue interpretation plays an important role in shaping strategic responses (Ginsberg & Venkatraman, 1995). Within the knowledge-based view, for example, it has been shown that various interpretation mechanisms may benefit the subsequent level of knowledge application (Song, van der Bij, & Weggeman, 2005). Unfortunately few studies have fully explored the effects of the popular threat/opportunity interpretation on response (Julian & Ofori-Dankwa, 2008). Thomas, Clark and Gioia (1993) found that the positive and gain items are indistinguishable and hypothesized

that an interpretation in high positive-gain terms will lead to a greater response, although they did not find empirical support for this hypothesis. Julian and Ofori-Dankwa labeled the positive/gain item "favorability" but we prefer here to keep the original label to avoid confusion. A number of studies have proposed to measure threat and opportunity separately, since these labels have separate connotations (Denison, Dutton, Kahn, & Hart, 1996; Jackson & Dutton, 1988; Julian & Ofori-Dankwa, 2008). Julian and Ofori-Dankwa (2008) thus separated threat and opportunity and found both of these constructs to be positively correlated to intended responses in the case of external environmental change. In summary, it seems reasonable to assume that the interpretation given to a certain event, regardless of the uncertainty linked to that interpretation, will affect the magnitude of the organizational response to this event. We thus posit that an interpretation in high positive-gain terms or in high negative/loss terms is likely to result in higher levels of response.

Controllability can be defined as the extent to which the correct strategic response and the outcome of this response have to be guessed, or escape the control of the manager (Milliken, 1990). The effect of controllability on response has been examined in several studies, with somewhat conflicting results. Julian and Ofori-Dankwa (2008) found a marginal, but non-significant, positive relationship between influence and external response, whilst reporting a strong positive relationship between manageability and response in a separate study (Julian, Ofori-Dankwa, & Justis, 2008). Given the evidence, I posit that controllability, when defined as whether the organization has the capabilities act, and a choice over whether or not to act (Jackson & Dutton, 1988; Thomas et al., 1993; Thomas & McDaniel, 1990), will lead the organization to adopt larger responses.

Proposition 4a: A higher effect uncertainty will lead to a delay in actions being taken.

Proposition 4b: The interpretation of a given event in high positive-gain or negative-loss terms will lead to more actions being taken.

Proposition 4c: The interpretation of a given event as controllable will lead to more actions being taken.

Finally proposition five concerns the effect of response uncertainty on organizational action. This relationship has not benefited from much analysis beyond the simple identification and validation of the response uncertainty construct (Milliken, 1990). Milliken (1987) suggested that high levels of response uncertainty may have the effect of delaying strategy implementation as response alternatives are developed and analyzed. Thus our last proposition concerning the links between the interpretation process and the three types of uncertainty is simply that in the short term at least, the more uncertain the organization feels about the potential effectiveness of a set of organizational actions, the less likely it will be to adopt those actions, preferring to continue scanning and interpreting the event until a suitable course of action can be found for which the corresponding uncertainty is sufficiently low. Although this is a re-statement of Milliken's original proposition it is included here for completeness.

Proposition 5: Greater response uncertainty will lead to less responsive actions being taken in the short term.

Conclusions

The field of managerial and organizational cognition continues to be one of the most promising fields in terms of opening some of the black boxes of organizational behavior, and thus of enhancing the theory of the firm (Walsh, 1995). Interpretive theory and the closely associated concept of perceived environmental uncertainty remains highly popular in the management literature in general, but the field continues to suffer from a multiplication of constructs, labels and measurement instruments (Walsh, 1995), that often make the thorough verification and validation of existing constructs and models through repeated studies difficult, if not impossible. Some of the more salient theoretical contributions have been Daft and Weick's (1984) interpretation process and Milliken's (1987) identification of three separate types of perceived environmental uncertainty. These contributions sought to bring some structure to a growing body of literature and perhaps to explain some of the failures of scholars to reproduce results, particularly with the concept of uncertainty. Although various stages and labels of interpretation have been empirically linked between themselves and with various definitions of uncertainty, the evidence is scattered across the literature and is sometimes incomplete. When brought together these contributions strengthen our understanding of organizational cognition and may help explain some of the empirical evidence on interpretation and uncertainty amassed over the past decades. No study has focused on further developing and integrating existing findings so far and in this paper I have tried precisely that, proposing a fuller account of the interactions between organizational interpretation and three types of issue-specific uncertainty.

Empirical research is needed to continue validating the various constructs and measures discussed, as well as the relationships between these, as outlined in this paper. Furthermore, boundary conditions, contingencies and moderators of the theorized relationships need to be studied, as these may shed more light on the sometimes contradictory empirical evidence found in the literature. The interpretation process and perceived uncertainties constructs continue to be explored within fields as diverse as information systems, human resource management, strategy, marketing and organizational behavior, and all of these fields can validly gain from applying these constructs within their own domains and can further add to our understanding of cognition and uncertainty.

DEVELOPING LOGISTICS MODEL TO DISPOSE TRANSFERABLE HAZARDOUS WASTE IN TURKEY

Taser, Atıl¹; Erdogan, B. Zafer²

¹Assistant Professor, Bilecik University, Turkey. Email: taseratil@yahoo.com

²Professor, Anadolu University, Turkey. Email: bzerdogan@yahoo.co.uk

Abstract

During last the century, rapidly increasing industrial growth have created a significant hazardous waste problem in the world. Although authorities in the public and private sectors try to minimize the production of hazardous waste in all steps of the production process, large amounts of hazardous waste are still being produced and hence there is an urgent need for hazardous waste management. Hazardous waste management involves the collection, transportation, treatment and disposal of hazardous wastes. In this study, a new multi objective location-routing model is proposed for the transferable hazardous waste. The aim of the proposed model is to identify where to locate disposal facilities within Turkey. The model has the objective of minimizing the total cost and the transportation risk by choosing the shortest way and also it aims to minimize the risk of encountering transferable hazardous waste and the people. The large scale of implementation of the model in Turkey is presented from the data obtained from the Turkish Statistical Institute.

Keywords: Hazardous Waste, Location-Routing Problem, Logistics

Introduction

Wastes have been generated by many type of business. To characterize these wastes as hazardous, one of the following four characters must be possessed: ignitability, corrosiveness, reactivity or toxicity (2872 environmental law). These types of wastes usually generated by industrial manufacturing process and presents risks to humans, animals, plants or in other words to all environment. Although wastes of many different types of organizations even household wastes can be characterized as hazardous, only manufacturing industry's hazardous waste amounts used as data in this study.

In the last five decades industrial and technological developments have created a significant hazardous waste problem in Turkey. Even though to the trend in the world is to minimize the production of hazardous waste at the beginning of the process, large amounts of hazardous waste production still continue and need to be taken care of (Basel Convention).

Everyone accepts that the increasing amount of hazardous wastes cause ecological problems, furthermore these wastes also cause problems for the local economy. Most of these wastes still have economical value but can not be integrated to the economy. They can be either reused or recycled to return to the economy.

To solve hazardous waste problem, many different disciplines study together to develop a risk free and cost effective solution (Nema, 1999), but every perspective comes with its point of view. For example for a manufacturing company, some other companies' wastes can be raw material or source of energy. Either way by taking enough precautions the risk factor and by protecting the economical value by re-using the wastes as source of energy will provide the wanted solution. For a licensed carrier firm waste means lots of goods to transfer for a fat charge as the firm has to maintain risk free operation. For a disposal facility hazardous waste means source of wealth and chance for social responsibility. For a NGO hazardous waste means cause of cancer, risk of death.

As the economical value can not underestimated, an important amount of hazardous waste merge back in to economy as raw material or source of energy if possible (Pilar and Et.al., 2006). According to Turkish laws the possibility of using hazardous waste as raw material or source of energy has limited. The inefficient measures of facilities are the main reasons of these limitations (Yılmaz, 2006).

There is not much chance to develop a solution in Turkey for hazardous waste management problems. The increasing amount of generated hazardous waste, the limitations on reusing and recycling and inefficient facilities magnify the problem. According to the academic studies yearly at least 2.118.370 tons/year hazardous waste generated all over the country (Yılmaz, 2006). The official amount is a little bit lower than this amount as official numbers are usually conservative. In the recycling industry there are only a few small size companies which specialized on specific hazardous materials. Only recycling paper, metal and glass could not be count as a datum point in this problem. The only possibility to turn the economic value back in to real economy seems re-using to generate energy. There are some cement and lime factories which use these hazardous wastes as source of energy but as the legislations put a limit on using hazardous waste as refuse-derived fuel. There is only one possible and quick solution left for Turkey to solve hazardous waste problem sending all the obsolescent hazardous wastes to disposal centers as many other countries all over the world do (Tchobanoglous, 1997).

Transferring these wastes to disposal centre seems the only solution of this problem, but this solution could generate new problems. In year 2011 there is only one disposal centre in Turkey which only can dispose the 1/27 of the all hazardous waste generated by manufacturing companies known from official documents. The real amount of hazardous waste generated from all types of business and households could be ten times bigger than this percentage. The insufficient number of disposal centers might be solved by building new centers but another problem appears at this point: NGO's not letting local authorities to build new centers. Not in my back yard (NIMBY) approach developed by NGO's to stop or delay new disposal centre projects (Erkut and Neuman, 1989). Although by using right technology and taking the right precautions the risk of influencing the environment and humans can be minimized, still all environmental NGO's work to stop all governmental efforts to solve this problem by building new facilities (Alamur, 2003).

Efficiency of disposal centers also generates other problems for many businesses. Environmental local laws and Basel convention forces the waste generating business' to take care of all the wastes

they generate. All the responsibilities about hazardous waste belong to them. Storing the hazardous waste on the plant area with enough precautions will never be enough; indeed at the beginning generating hazardous waste must be minimized so there must be no need to build a storage facility on plant area. Anyway the amount of hazardous waste generated and stored at the plant area upon all adjustments also must be transferred to recycling centers or disposal centers by qualified carriers. All this process from generating to disposing is under the responsibility of waste generating business.

Disposing seems the most preferable solution to manage hazardous waste problem, but this must be cleared at this point that, the disposal procedures most businesses prefer are neither right nor risk free. Burying the hazardous waste or throwing over to deserted areas do not mean disposing. The one and only way to dispose hazardous waste is burning them at sufficient facilities.

According to the existing pyramid the least importance given to prevention and minimizing hazardous waste generation. Turkish businesses mostly prefer manufacturing without thinking the hazardous waste generation. Indeed BASEL Convention claims that best way to solve a problem is not generating at the start.

According to proposed agreement all businesses must firstly prevent generating hazardous waste. To manage this, required technology and qualified employees must be provided. The main aspect at this point is to minimize the amount of hazardous wastes which need to be sent to disposal centers (Emek and Kara, 2007).

After working to minimize hazardous waste, there could still be some hazardous waste generation. This waste must be stored at the business plant until its transfer. This storage process also needs some requirements to be done safely. These requirements standardized and applied by local laws. Because of the inadequate technology some hazardous wastes which still have economic value also left for storing and then to disposing. In fact, this kind of hazardous wastes can be recycled as raw materials for another manufacturing process or can be reused to generate energy. By doing this, the resources spend for manufacturing can be recoverable.

The main problem about hazardous waste management is the cost and health risks. If the dangers of hazardous waste wanted to be minimized, somehow a cost effective and risk free method must be developed. Developing a prevention method can be seemed costly but it must be understood that it can never be as expensive as recovering. Minimizing the risk and stopping the negative effects of waste to nature will save money as the liable parties will not need to pay for damages (Hu and Huang, 2002). For all countries the motto is the same: "whoever contaminates has to take care of it".

After describing the up-to-date situation, it must be emphasized again that the best solution for hazardous waste problem is building new disposal facilities. Developing a new concept for hazardous waste management is a must, but there are still with huge amount of hazardous waste all over the country which has to be taken care of.

In this paper, a new model for hazardous waste management will be presented. This model will answer the following:

- How many disposal center will be needed?
- Where to open disposal centers?
- How to route hazardous wastes generated by the manufacturing business grouped by the city borders?

With this model the urgent need of disposal centers would be discovered and the placement and the number of these centers could be planned more realistically.

Literature Review

Although it is a hot topic all around the world, hazardous waste management problem has not been studied extensively. Before being so popular by all disciplines, mostly chemists studied on hazardous wastes to analyze the nature of the substances. The generation, handling, disposing of all these kinds of wastes mostly just studied to analyze and understand the nature of texture. In fact the main point is beyond all these.

The important part of hazardous waste management problem is first handled in location decision literature for disposal facilities. The main reason academia prefers to study hazardous waste problem just for locating facilities could be totally psychological. Most of the people and NGO's prefer to ignore the real problem, but focused on the location of these types of facilities. The general name for this kind of facilities called undesirable facilities. There is an important amount of studies about these undesirable facilities. Most of these studies focused on to avoid locating these kinds of facilities around the human population (Erkut and Neuman, 1989). A new term also entered the literature "Not In My Back Yard" (NIMBY), which means this type of undesirable facilities location, should be outside the center of population (Sheu, 2008).

The first effort to model the location-routing problem simultaneously was by Zografos and Samara (1990). They propose a goal-programming model for one type of hazardous waste, which minimizes travel time, transportation risk, and disposal risk.

Later Reville et al.(1991) presented a model that minimized a convex combination of cost and risk. The cost measure is taken as the distance traveled, and the risk measure is taken as the population exposure. Their model aims to find the location of disposal sites, the assignment of sources to disposal sites, and the routes between sources and destinations.

Jacobs and Warmerdam (1994) model the hazardous waste location-routing problem as a continuous network flow problem. Their model locates the storage and disposal facilities and determines the routing strategies while minimizing the linear combination of cost and risk in time. They define risk as the total probability of a release-causing accident during transportation, storage or disposal. Later, Current and Ratick (1995) presented a model with the addition of equity considerations. In addition to minimizing cost and risk, they maximize equity by analyzing the transportation and facility location components of risk and equity separately. Risk is measured by population exposure (Erkut and Verter, 1995) or by the risk of transportation (Verter and Kara, 2001).

The first location-routing model to consider multiple hazardous waste types is by List and Mirchandani (1991). The model has three objectives: minimization of risk, minimization of cost, and maximization of equity. In addition to locating treatment facilities, the model also locates storage and disposal facilities.

Based on the current literature, we may say that the minimization of cost and the minimization of risk are the most commonly employed objectives.

Most of the studies dealt with one type of hazardous waste, which is a significant simplification, only a few papers add the types of hazardous wastes to build a complex model (Alamur and Kara, 2007). Different risk measures are used in the papers. The most popular of these is population exposure. Another shortcoming of the literature is that it lacks large-scale application. Most of the papers present applications with small instances, such as 10- or 15-node networks and 3 or 4 candidate sites.

Mathematical Model

After recycling and reusing the generated hazardous waste the left over part of all generated amount must be disposed to protect the environment. The disposal of generated hazardous waste at certain sites requires a transportation network. The nodes of this transportation network will be generation nodes and potential disposal facility. We propose a mathematical model with an aim to treat all of the generated hazardous waste and to dispose all of the generated waste residues in a safe and cost-effective manner. It is assumed in the model that the potential sites for disposal facilities have already been identified.

The hazardous waste location-routing problem can be stated as follows: given transportation network and the set of potential nodes for disposal facilities, find the location of disposal centers and the amount of shipped hazardous waste, so as to minimize the total cost and the transportation risk. There are some limitations in this study caused by the nature of waste and the environmental acts. The environmental acts all over the countries who signed BASEL Convention agreed that not more than 6 tons of hazardous wastes can be stored at the generation facility. This means all transfers from generation node to disposal facility must be at six tons limit up most. In addition to this because of chemical nature of waste two different types of wastes can not be stored or transferred together.

As mentioned above most of the previous studies had a shortage to select area and the nodes. Nearly all of them chose a small district to develop network. In this study a whole country had been chosen as the district and all cities had been specified as alternative disposal facility nodes. To choose generation nodes again all cities has been selected, according to the data gathered from the state institute of statistics. Because of the business confidence institute let to use only the hazardous waste amounts by city.

The distances between cities' data taken from Turkish General Directorate of Highways's office have been used in the model.

After gathering the information about the amount of hazardous waste generated by the city, the possible nodes which minimize the risk of exposure and the distances between generation nodes and possible disposal nodes, other important information must be found. The capacity of disposal facilities must be known. At this point İZAYDAŞ's capacity, the one and only disposal facility in Turkey, could be an example. As can be found from their websites, the disposal facility could dispose annually 35.000 tons of hazardous waste (www.izaydas.com.tr). Although this capacity could drop down because of many reasons, we prefer to use this capacity to be optimistic. According to their marketing department the real capacity usually stroll % 20 down.

The proposed model is formulated as a multi objective mixed integer programming model with two objectives: (1) minimizing total cost and (2) minimizing exposure risk.

The following indices, parameters and decision variables are used in the mathematical model:

Given;

i: generation nodes

j: potential disposal nodes

Data:

a_j : Hazardous waste amounts by cities

b_j : Capacity of facilities

d_{ij} : Distances between generation nodes and disposal nodes

c_{ij} : Cost of transfer between generation nodes and disposal nodes

$c_{ij} = F * d_{ij}$

F: cost of transfer per km /145/

Decision variables:

x_{ij} : The amount of waste transferred between generation node to disposal node ($x_{ij} \geq 0$)

Limitations:

Amount of waste at i: $\sum_j x_{ij} \geq a_i$ for all i;

Amount of disposed waste at j: $\sum_i x_{ij} \leq b_j$ for all j;

Objective:

Decrease the cost $\sum_i \sum_j c_{ij} x_{ij}$

Application in Turkey

At this point as mentioned before there are two main criteria in this study. One of them, cost reduction, will be obtained by the P-median mathematical analyze given above, but the other, minimizing the exposure risk, will be obtained by heuristically. The needed population data gathered from Turkish Statistical Institute give a chance to classify all cities by population

After specifying the deserted cities the possible nodes for disposal facilities selected heuristically. After choosing the possible nodes for facility locating, the number of needed facility must be clarified. To do this, the amount of hazardous waste need to be disposed must be known. Again form the data gathered from Turkish Statistical Institute all 81 cities hazardous waste amounts could be listed

Coding the data to analyze program for solving the mathematical model, all cities must be changed to codes. At this point it must be understood that only the cities which can not reuse, recycle or dispose the hazardous waste they generate added to the model. These cities coded with “i” and add to the model as generation nodes.

The possible disposal cities selected as nodes and they coded with “j” to be added to the model. Number of both “i” and “j” cities incidentally are 45, but the cities are not the same.

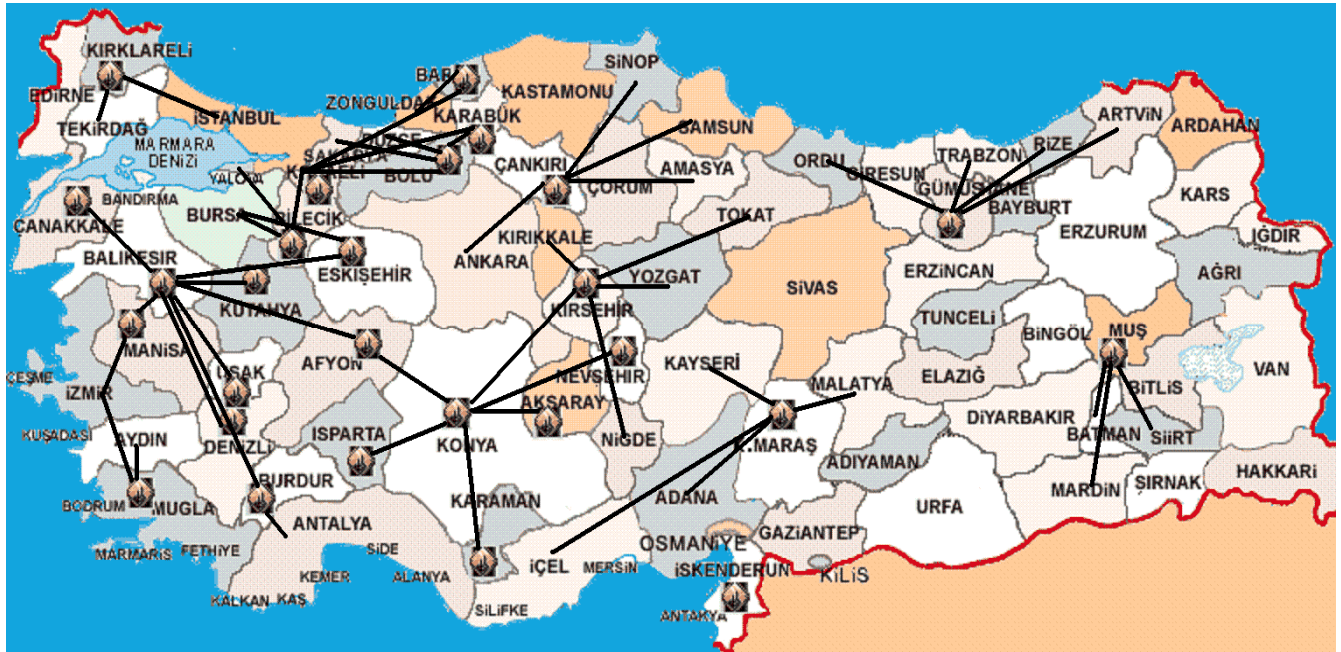

By using GAMS multi objective analyzing program, we coded the formula and the “i” and “j” cities to solve the model. After coding all needed data and running the program, the worksheet become like the table at appendix A.

When we carry all these numbers and codes to the map used the select nodes the locations of the disposal facilities can be seen more clearly. The number of possible nodes was 45 as the selection made, after analyzing this number dropped to 27. By using basic math the total amount of hazardous waste generated among the whole country was 876.768 tons/year. The maximum capacity of model disposal facility was 35.000 tons/year. The exact number of needed facility must be 25.05. At this point one of the main objectives must be remembered again. Minimizing the cost of transfer at this point caused to locate 2 more facilities. On the other hand the extra 2 facilities are also mandatory because they cover the east side of Turkey.

Just locating the facilities will not be enough to reach the objectives. The risk of exposure decreased by choosing deserted cities as disposal facility nodes. Also other objective, cost reduction, must be clear. Again from the work sheet of analyze, the transfers from generation nodes to disposal facilities

can be seen. According to this data, the new map will be formed like below. The lines show the flow to disposal facilities. The amounts of this flow can be checked from the worksheet.

Figure 1: Flow of Hazardous Waste to Disposal Facilities

Conclusion and Future Research Directions

We proposed a mixed integrated programming model in which we combined the applicable aspect from heuristic model in the literature. Our model includes some constraints that were observed in the literature. Our aim was to answer the following questions: where to open disposal centers by paying attention to minimizing exposure risk, how to route hazardous wastes to these disposal centers and indeed how many centers could solve the problem.

We considered real-life aspects of the hazardous waste management problem and realistically implemented these aspects into the model. Especially the most prohibitive problem, “not in my back yard” approach as we believe may be resolved by choosing the deserted cities. Indeed with the boom technology the risks of exposure will not be a problem technically, but still people may believe risk is still and great. The limited number of people living around the selected nodes could minimize these inhibitive actions.

Other objective we considered was total transfer cost. Total transfer cost will carry on to minimum level by choosing the closest ranges between generation points and disposal facilities. At this point it must be understood that distances are used as a measure of cost.

The most important but the easiest objective considered as the last objective was the number of needed disposal facilities. With elementary level math's, everybody could find the solution. At this point we indeed tried to expose the current situation to alert the locals and authorities.

When we review the literature found the special issue of the journal “Computers And Operations Research” (Erkut, 2007), and believed that the only missing link could be this study at that special issue. We demonstrated that our model is manageable for a realistic and important problem of Turkey. The number of possible nodes and the range of the district may improve the value of this paper. Most of the papers studied nearly on the same topics prefer to deal with the local districts with a few nodes. The mathematical model could be much more complex for these kinds of proper studies; however when the study has to deal with the real situation, mathematical models must be simple and working. The suggested model carries both.

During the study, we noticed that these acts not only protects the nature but also generates new professions. The only facility we used as capacity model is an employer of nearly 100 skilled employees. With the new facilities, 100 times the number of facilities of people will have a job. Also with new facilities, transportation companies will need new routes, new vehicles and new skilled drivers. These disposal facilities will create noticeable skilled jobs for the economy.

While disposing the hazardous wastes, facilities also generate energy. This energy costs nothing as obtained from incineration. The waste itself has high calorie and generates high temperature which turns in to usable energy (www.epa.gov). This energy will also be a gain for the economy of the country.

For the future studies the origin of the hazardous waste may be diverted. We only covered hazardous wastes generated by the manufacturing industry. The origin of hazardous waste could be expanding. Even wastes come from our homes could contain hazardous materials. Studying on other industries' hazardous wastes will attract attention on the problem which my cause to find a way to deal with it.

Abstract

Keywords: Entrepreneurship, Entrepreneurial Failing, Entrepreneurial Characteristics, Success Factors, Sustainability

Introduction

While worldwide organisations try to get through markets various innovations (technical, organisational, concerning utilisation systems, institutional or social) by innovation management which they contribute „to the preservation of critical natural goods and to worldwide and in the long term transferable economic styles and consumption styles and levels“ (Fichter 2005: 138), their potential does not suffice on solving the urgent questions regarding climate change and distributive justice. Thus, there is again and again a demand for a "new mindset" (Oppenheim et al. 2007). Intrapreneurs are counting to this new mind set as well as entrepreneurs.

Wagner (2010) states that a profit-maximising enterprise mutually weighs the social and private use (consumer or producer pension) of innovation alternatives: Hence, a higher private use of alternative A compensates a possibly much higher social use of alternative B, so that it comes to a displacement of innovation alternative B. Intrapreneurs have to follow the strategically alignment of their enterprise; hence, it is to be supposed that they also (must) decide in a profit-maximising way which runs counter to a potential social welfare. The question arises to which extent entrepreneurs act as profit-maximising as enterprises do and if they are defeated therefore by these displacement laws by the decision. If there are clues that open the possibility that entrepreneurs do not or do less decide and act in a profit-maximising way, a big potential lies in entrepreneurship for sustainable innovations with high social use.

When entrepreneurs are the key persons to make sustainability come true, a distinction has to be made between invention and innovation. Innovations possess market potential and imply success. That is the reason why entrepreneurs have to transform their ideas into implementable innovations to meet market potentials. Thus, sustainability can be socially, ecologically and economically profitable and realizable. The economic advantage generates a long-term approach for sustainability management in organizations as well.

To supply a market potential and generate market success through innovation it is important to know which factors make an entrepreneur successful in his business. There is a

huge amount of literature that already covers this topic and gives advice for starting a successful business or organisation. In entrepreneurial society, whereas, it is common knowledge that most start-ups fail in their first years. Most ideas are not 'innovative', hence not realizable, and let high failing rate of start-ups grow. Some experts are even saying that about 80% of enterprises fail in their first ten years (Faltin, 2009). In Germany, on which our study about failing entrepreneurs focused, enterprise failure in 2009 increased up to 11.6% (Statistisches Bundesamt, 2010) in comparison to the year before, which might be, in part, due to the financial crisis but still shows a tendency for the huge failure rate of business foundations.

These huge numbers lead us to the question why so many entrepreneurs are failing and if it was not more helpful to find possible factors of failure in addition to already depicted factors of success. Keeping factors of failure in mind and avoiding them could help entrepreneurs to successfully drive their ideas regarding sustainable business to innovation, which is realizable (regarding the definition that innovation is defined by the existence of a realized market potential).

Definition of Entrepreneurship

We see the entrepreneur as a person who comes to a new idea by a creatively constructive force (Schumpeter). The entrepreneur draws his energy and power by his immense intrinsic motivation and a nearly addiction to his job. Nevertheless, the entrepreneur also realizes this idea within his economic environment by a well-elaborated concept. Besides, one has to differ the entrepreneur's characteristics from a technician or from a manager by his tasks (Gerber 1995). An entrepreneur works *on* his enterprise and on his ideas in a forward-looking way (Faltin 2009, Merath 2009), seeing the strategy and purpose of his business and its actions in a broader way. While a technician acts on demand on the businesses' tasks (e.g. baking bread if you run a bakery) and a manager's responsibilities are more by administrative means. In total, all characteristics that we find to be part of the entrepreneur's person are mentioned in figure 1.

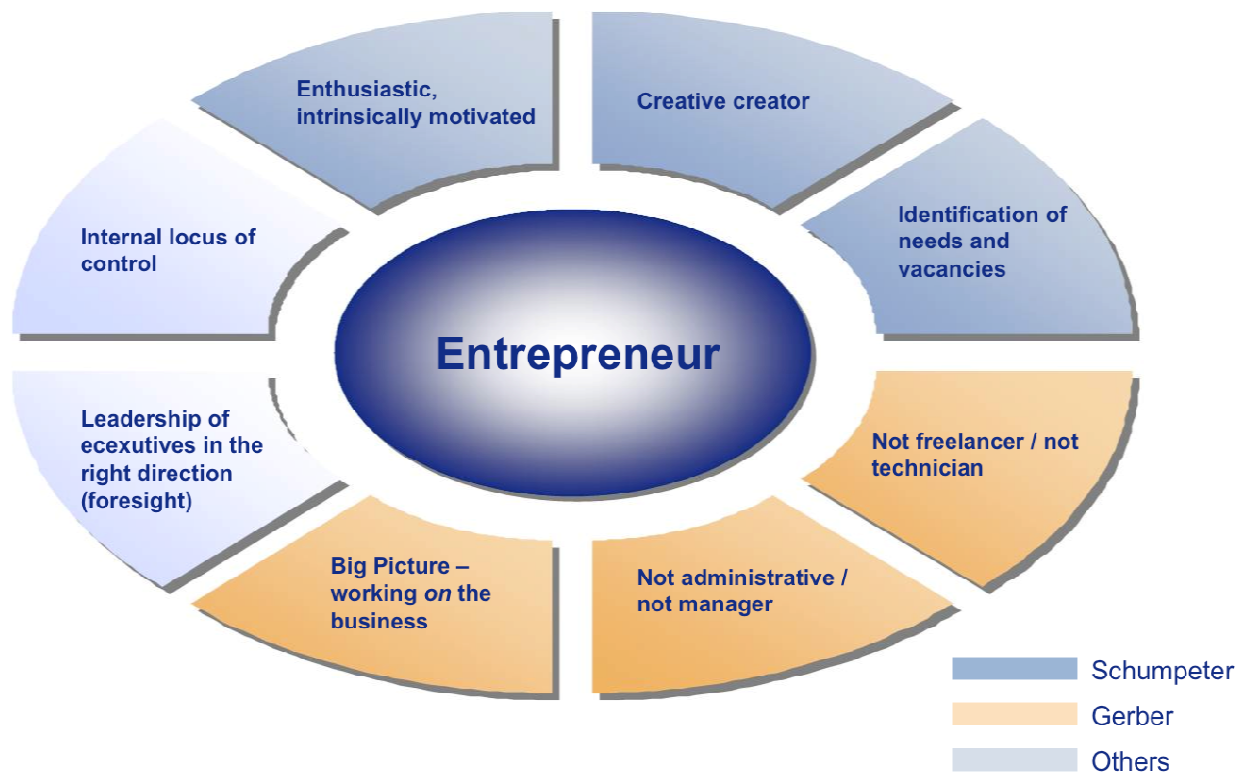

Figure 1: Characteristics of an entrepreneur

Possible Factors of Entrepreneurial Failing

In our study 'Failure of Entrepreneurs – An analysis of possible factors for the breakdown of start-up enterprises by means of biographical-narrative interviews' we analysed the qualitative interviews of two failed entrepreneurs. As a working method, the biographic-narrative interview after Fritz Schütze was chosen. This interview method is based on the linguistic-sociological analysis of the inner mechanisms of action, in particular ad hock narration (Küsters 2009: 17) and provided us a profound insight into the personal affairs and problems the interviewees had with their enterprises. In the analysis of these interviews we differentiated between possible internal and external factors for failure that were taken into consideration with each other. In the following, the main results of this analysis will be pictured:

As one of the main external factors for failure the interviewees depicted the enterprises' cash-out due to the decline of customer demand, the missing of customer receivables and small or even no reserves held. Besides, the complicated bank systems and high account interest lead to overextension that increased the desperation and insecurity of the interviewees. In addition, the external, social pressure as well as the loss of the backing fall of family and friends increased the feeling of having failed personally. Georg Simmel describes this as the 'tragedy of culture', where culture and society requires constant objectivity and perfection in every action. This compulsory leads individuals into failure, as they will never

be able to satisfy the requirements of objectivity (Simmel 1987: 234). Thus, the requirements of society and culture enhance the feeling of having personally failed.

In total, several external factors of failure could be viewed in terms of environmental change to which the failed entrepreneurs could not adapt. Such as for instance, the German reunion and its change in the whole German economy, which affected one of the interviewees. As well as the impact of a new business partner whose interests and ideas did not fit into the whole culture of the enterprise and hence changed it dramatically, with respect of the second interviewee. Hence, regarding the external factors, it could be seen that there is a huge variety and we can just name some of many examples.

More interesting, whereas, is the fact that although the external factors are quite distinct, a huge coherence between the internal factors could be faced. In addition, most of the external factors can be interpreted as being caused from internal factors, which is why the focus of the study was given predominantly to the internal ones.

As one of the main internal factors it could worked out, that both interviewees were too occupied with the technical work of their business itself and did not have any time left to work on its future development. After Michael E. Gerber, who differentiated between 'Technician', 'Manager' and 'Entrepreneur', both interviewees were too much of a 'Technician' or 'Manager' than 'Entrepreneur'. Mentally, the 'Entrepreneur' should focus on his business regarding its look in 20 or even 50 years, working on its values and goals and maintaining an overview about it (Gerber 1995: 19 – 32 and Merath 2009: 32 - 37). Nevertheless, both interviewees only focused on the present, obvious situation. Instead of going into new, interesting markets or opening some (pull-situation), they were pushed by the market situation, to which they – finally – could not adapt.

In addition, the inability to give up responsibility to the employees, as well as the anxiety to take responsibility through leadership, could be seen as two main factors contributing to failed ventures. As a *causa cosa* it appears that without the ability to give up responsibility and daily business tasks the entrepreneur will never have the time to prepare and develop the business for the future. In accordance to this, the ideas of most start-ups are fairly developed and elaborated, which is also a cause to the huge failure rate.

Beside the inability to lead employees and develop a realizable idea and business strategy, the lack of financial knowledge was also a fundamental cause for the failure of the interviewee's business.

Further problems the interviewees had to face – and it is very likely that this issue is faced by a lot of entrepreneurs - was their ego and their 'Internal Locus of Control', after the psychologist Julian B. Rotter (Rotter/Hochreich 1979: 185). According to Rotter, a person with an Internal Locus of Control believes that he is in total control of all his actions. Hence, he believes in the image: the more I work the more I gain - and likewise. He develops a strong

internal understanding of control. On the one hand this seems to be a necessary characteristic for an entrepreneur to build up a business, as it seems quite unlikely that a person with an External Locus of Control - regarding everything that appears to him as forced by the exterior, which he cannot control - can start a business. On the other hand, an internal understanding of control makes it even harder for the entrepreneur to accept, that there are also a lot of external factors that he cannot influence. As there will be always changes of the environment and external factors that he cannot influence (as for instance a financial crisis, recession, war etc.) he only can fail by regarding everything as depending on his own will and ability.

Likewise, the ego of the entrepreneur comprises a lot of values, ideas and conceptions and thus defines his character. Nuttin defines this as 'das Ziel, das der Mensch sich setzt, [...] in der seine Persönlichkeit sich entfaltet.'⁷⁹ (Nuttin 1987: 274). Vice versa, that means that the entrepreneur's ego is defined by his values and experienced patterns of conception, which he is rarely able to abandon. With these patterns of conception he might be successful for a certain period of time. Nevertheless, our environment is constantly changing (as mentioned above) and conceptions and/or innovative ideas that could supply a market before suddenly do not satisfy the customer demand anymore. The entrepreneur must get off his fix ideas but that also includes that he has to abandon a part of the ego he created. That requires a lot of self-reflection and sometimes can be painful. Besides, reflecting the own actions, values and conceptions constantly is also a necessary part of 'maintaining an overview', as mentioned above.

Taking the external factors in consideration with the internal ones, we can see that those could explain them quite clearly.

For instance, the enterprise of one of the interviewees mainly failed because of the influence of an external consultant who became a new member of the team. His influence changes the enterprise culture and separated the founder team. His influence can be definitively regarded as an external influence or factor but the reason how he could influence the team lies mainly in the ability to lead and to overview the future development of the entrepreneur. If he had defined the culture and had communicated the company's goals for the future to his team, he could have avoided the uncertainty and separation of the team. Instead, he was far too occupied with day-to-day work and rather needed advice himself than to lead others.

One other example gives the external influence the German reunion had on the development of the business of the other interviewee (private bankruptcy). For sure nobody could foreseen the reunion but nevertheless the interviewee tried to continue his business with his experienced methods although the whole economical situation had changed. He was convinces about having everything under control and was not able to adapt his patterns of

⁷⁹ Translation by the authors: 'the goal, set by men, [...] in which his personality is developed.'

conceptions to the new situation. Especially in this case, the interviewee showed a good example for the mean of an Internal Locus of Control (Interviewee: 'Also mein Motto war ja wie gesagt, wenn ich fleißig bin muss es mir gut gehen, wenn ich fleißig bin krieg' ich alles hin.'⁸⁰). Hence, the German reunion and its change of the whole economical situation was the effect on which the failure was based but its real cause was the inflexibility of the interviewee's conceptions. His adherence to his business idea, the disregarding of new impacts from economy or customer needs and his inability to adapt to the new situation, finally lead to business failure.

Conclusion

In our study we worked out possible factors why so many enterprises are failing in their first years. Besides a variety of external factors, we could see an interesting coherence between the internal factors, concerning the character of the Entrepreneur. Thus, we draw as conclusion that by avoiding these characteristics or at least keeping them in mind, the possibility for entrepreneurial failure might not be as high. On the contrary, what kind of characteristics can an entrepreneur develop to avoid these kinds of failure characteristics? Looking at our definition of Entrepreneurs there has to exist an internal motivation by Schumpeter, but without Gerber's foresight we see a thread that the entrepreneurial idea is not fitting to sustainability and its capability to satisfy an innovative market potential. Furthermore, certain flexibility is essential to rethink an idea, to shape it marketable and to convert it into a "real innovation".

Hence, for the development of a sustainable business idea that can more constantly lead to success, the continuous work and enhancement on the business idea could be recommendable. So, we can bear in mind that these factors of failure might as well be factors to success on the contrary. They could help entrepreneurs to develop their personality and characteristics and enhance their ability for a better development of sustainable business ideas and – even more relevant for us - their implementation into real innovation that can satisfy and supply customer needs, hence market potential.

Abstract

In an attempt to remain effective, flexible and competitive in today's rapidly developing technological environment, banks increasingly recognize the benefits of the Internet to meet the needs of the modern consumer. Bank management aim and develop their customer base by implementing strategies that achieves an equilibrium between physical and virtual presence. While online banking (e-banking, mobile banking, ATM's) has increased immensely in Greece there is insufficient evidence concerning its acceptance by consumers.

The purpose of the present study is to examine the impact of the implementation of innovative electronic communication strategies to attract new customers and to satisfy the existing ones. Another objective of this paper is to investigate the impact on quality of online banking services on customer's e-loyalty and overall satisfaction. The research sample is consisted of 153 customers of various banks in the region of Central and Eastern Macedonia in Greece. The formulated questionnaire was administered personally and through the Internet between February and April of 2011.

The results of this study indicate that there is a statistically significant relationship between implementation of innovative technological applications, trust and the dedication to online banking. On the other hand, the research provides insufficient evidence about the relationship among the quality of service, the overall satisfaction and the adoption of online banking.

Keywords: innovation, strategies, internet banking, customer behavior

Introduction

Information technology (IT) is extensively used in the global economic competitive environment, to deliver banking services to the demanding consumers (Ganguli and Roy, 2011). The continuing widespread technologies have encouraged many financial organizations to offer more convenient methods of banking, in order to retain their competitive advantage, to lower costs, to enhance their customers overall satisfaction and keep them loyal (Peevers et al., 2011). As Calisir and Gumussoy (2008) support, developing

alternative e-banking channels (SST-self-service technology) in order to retain the existing customers as well as attract new ones is a key element for financial organizations. In reality, rise of information technologies have changed the consumption process of retail banking as human to human interactions in service delivery is becoming increasingly redundant (Bitner et al., 2000). The existing literature has suggested that technological innovations particularly those that involve learning efforts and require of customers willingness to learn and that inadequate provision of relevant information or possible misinformation will discourage innovation adoption (Laukkanen, 2009). Moreover, there is proof of growing customer frustration while interacting with the new technologies (Parasuraman, 2000).

On the other hand e-loyalty enhancement is crucial for an effective and dynamic on-line presence of a bank in order to make profits and succeed (Casalo et al., 2008; French and Springett, 2007). In order to investigate the importance of e-loyalty, the identification of variables influencing repetition in purchasing and recommendation is a crucial area of research (Floh and Treiblmaier, 2006; Bhattacharjee, 2001). The perceived quality and security of alternative banking e-channels, the usability, the ease of use and the perceived pleasure, the previous technology and banking experience, the willingness to use or not the Internet, the personal skills, the trust and the overall satisfaction are some of the most important factors which demonstrate user's intention to remain loyal (French and Springett, 2007).

Furthermore in order for e-banking to be successful in Greece, users should be willing to adopt the innovative technologies that banks apply. Therefore while there have been a lot of investigations of how new e-banking technologies can influence the perceived customer behaviors, preferences, satisfaction and purchase intention, to our knowledge, few studies have examined in Greece the effect that have trust, overall satisfaction, quality of banking service and alternative e-banking networks to e-loyalty. Hence, in an attempt to fill this gap, this study following as a reference model the one that has been developed by Floh, A. and Treiblmaier, H. (2006) seeks to determine whether the findings of this investigation are valid in Greece and particularly in the region of Central and Eastern Macedonia.

The aims of this study include:

- Examining the impact of the implementation of innovative electronic communication strategies to attract new customers and to satisfy the existing ones.
- Investigating the impact on quality of online banking services on customer's e-loyalty and overall satisfaction.

The remainder of the paper is organized as follows: first we review the existing literature on the constructs of alternative e-banking channels, service quality, overall customer satisfaction trust and customer e-loyalty, and the impact of overall satisfaction and trust on e-loyalty. Additional variables, such as gender, age, are hypothesized to have an influence on e-loyalty. Next, the article discusses the research methodology used in the paper as well as the

survey instrument used in data collection. Finally, we present the results of our analysis followed by a discussion of the findings and managerial implications.

Conceptual Development & Hypotheses

Alternative e-banking channels

Internet evolution is changing the way people communicate with others. Therefore, financial services in order to meet customer's expectations are pursuing alternative channels to increase customer convenience, and maintain profitable. Phone banking and ATMs' are already widely used by financial institutions (Püschel et al., 2010). It is notable that in Greece where this study was carried out, the use of alternative distribution channels of banking products is tremendous. The increase in the number of ATM's over the last decade reached 120%, while according to the U.G.B. (Union of Greek Banks) in the first half of 2010, more than 1,929,800 individuals and legal persons were registered users of electronic banking services, an annual increase of 12%. Moreover, at approximately 1500 APS who have installed banks, are carried out yearly payments of 500million € (Lidorikis, 2011). Furthermore mobile banking follows on the success of internet banking and it became an alternative to other traditional bank channels such as ATMs, internet banking and physical branches (Brown et al., 2003). M-banking (mobile banking), can be applied to a number of methods for enabling customers to use their mobile device to perform banking transactions (Peevers et al., 20011). The mobile phone can be used by banks as an alternative channel because of their ubiquity, the accessibility no matter what the location or time, its efficiency and also can help financial organizations to retain existing technology-savvy customers by providing innovative services whilst at the same time attracting new customers (Tiwari et al., 2007). On the other hand the perceived complexity of m-banking, the perceived cost, the security of the service, is argued to be causes of low usage levels and furthermore that trust is the factor that most impacts the level of adoption (Lee and Chung, 2009). Although the current offline branch remains the most common method for conducting banking transactions, internet banking has changed the way personal financial services are delivered to customers (Wang et al., 2003). For those customers who have access on the Internet, e-banking provides incomparable convenience, speed, efficiency, services and products specificity, charges reduction, transactions security, while at the same time, it is available and accessible on a 24-hour basis in any part of the world (Yousafzai et al., 2005, Hertzum et al., 2004). Past studies on technology adoption have showed that perceived usefulness has a strong impact on users' intention to adopt the technology (Jeyaraj et al., 2006, Chong et al., 2010). And moreover, many researchers support that, perceived usefulness is one of the most significant influence on the intention to use e-banking among the consumers (Pikkarainen et al., 2004: Gounaris and Koritos, 2008: Celik,2008). Perceived ease of use has also been validated as important determinant in adoption of an online banking service (Wang et al., 2003). Last but not least, trust is an important factor that affects consumer's behavior and influences the adoption of e-banking.

Many researchers assert that, security and privacy increase the level of consumers' trust also (Yousafzai et al.,2003:Grabner-krauter and Faullant, 2008: Jahangir and Begum, 2008:Koenig-Lewis et al.,2010).

Consequently, we hypothesize that the quality of alternative e-banking channels can positively influence the perceived overall satisfaction and trust, whereas alternative e-banking channels are antecedents of service quality. Thus the following hypotheses are formulated:

H1. Quality of alternative e- banking channels positively influences overall satisfaction.

H2. Quality of alternative e-banking channels has a positively effect on trust.

H3. Quality of alternative e-banking channels can be seen as an antecedent of service quality

Service quality & customer overall satisfaction

The perception of customers regarding service quality of technology banking has gained importance because service quality has been shown to be a strong predictor of customer satisfaction and trust (Dabholkar et al., 2000, Zeithaml et al., 1996). So, there is a need to identify the service quality dimensions, as perceived by customers, in case of technology based banking irrespective of technology being used and how these dimensions affect customer satisfaction and trust (Canguli & Roy, 2011). Perceived service quality is believed to be resulting from comparison between customer's prior expectations about the service and their perceptions after actual experience of service performance (Parasuraman et al., 1985). E-service quality can also be measured by other dimensions such as, website appearance, ease of use, linkage, layout and content, reliability, efficiency, support, security, feature, serviceability, ATM quality, telephone banking, customer perception of price and services, customer satisfaction, trust, responsiveness, reputation, assurance and web store policies (Johnson et al.,2001:Madu and Madu, 2002, Yang et al.,2004:Al-Hawari et al. 2005:Gupta and Zeithaml, 2006). Service quality is found to be a strong predictor of customer satisfaction (Cronin et al., 2000) Hence, this research provides a significant contribution for service quality and observing its hypothesized positively impact on customer satisfaction and trust. Thus, the following hypotheses are formulated:

H4. Service quality positively influences overall satisfaction.

H5. Service quality has a positive effect on trust.

Concept of trust

Many researchers define trust as a belief in a persons' competence to perform a specific task or as a willingness to rely on or to depend on an exchange partner in whom one has confidence (Morgan and Hunt, 1994: Kim and Prabhakar, 2002: Dimitriadis, 2011) The belief-sense of trust is the most important factor that influences a user to use e-banking, while a

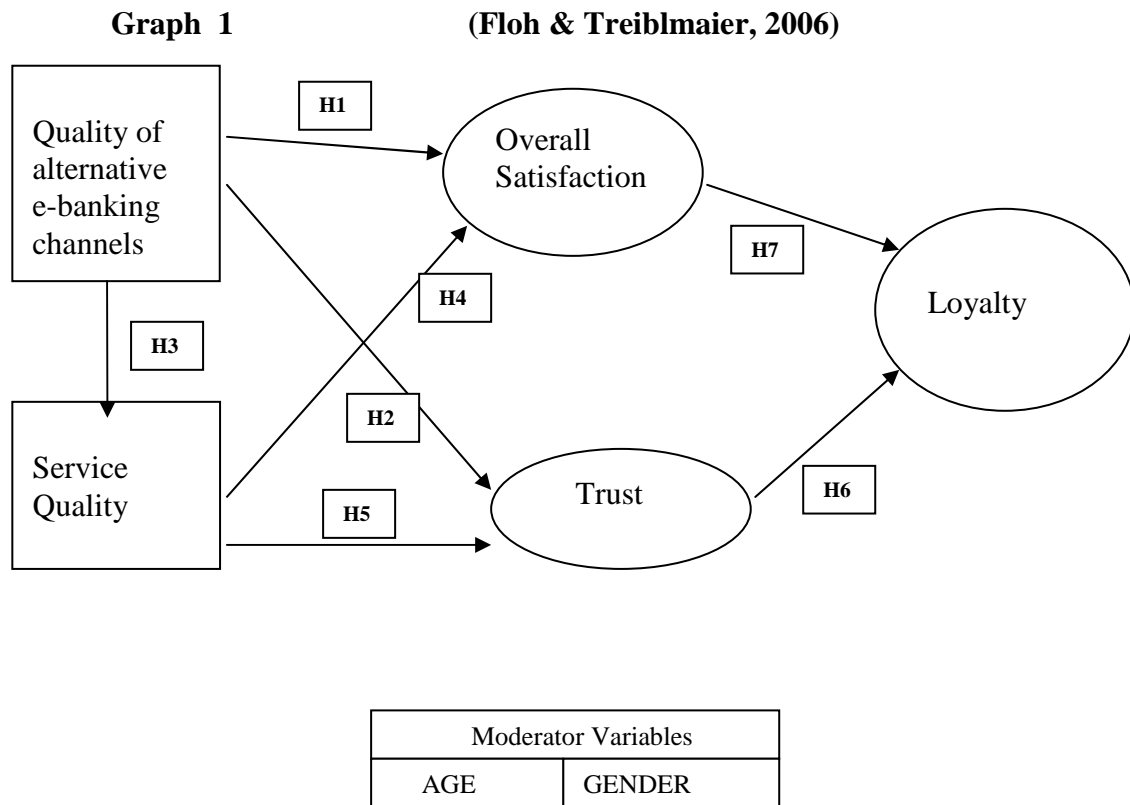

second factor is the quality of overall service that a bank offers. In addition, a constant service and infrastructure delivery assurance (Structural assurance/situational normality) as well as friendliness and reputation positively affect the sense of trust (Mols, 1998; Pavlou, 2002). Finally, Law (2007) reports additional factors such as corporate identity, marketing strategies and means of communication underlying the security and communication speed features. For many practitioners trust is a key variable shaping attitudes, behavioral intentions and tendency for recurring purchases towards e-banking services and specifically SST (Self-Service Technology) bank channels (Yang et al. 2006; Dimitriadis et al., 2011). Lowering perceived risks associated with online transactions as well as strengthening the trust of customers' that the transactions are secure and safe is the key components to attract and retain customers loyal (Floh and Treiblmaier, 2006). Based on this background and following Floh and Treiblmaier, the present study poses the following research hypothesis:

H6. Trust has a positive impact on customer e-loyalty

E-loyalty

Oliver (1999) refers to customer loyalty as "a deeply held commitment to re-buy or re-patronize a preferred product or service consistently in the future, despite situational influences and marketing efforts having the potential to cause switching behavior". In addition e-loyalty is defined by Chang and Chen, 2008 as a favorable customer's attitude toward the e-store that predisposes the customer to repeat buying behavior. A number of practitioners support that internet firms have a growing ability to tailor their services to specific customers' needs through personalization technologies with the expectation that these technologies will lock the customer and remain loyal to them (Srinivasan et al., 2002; Chang and Chen, 2008). Additionally, the concept of loyalty has been the subject of several investigations, which assert that on the Internet apply the same rules as in the offline market. Specifically, early losses, which are caused by expenses for acquiring new customers, are followed by rising profits, due to the high ratio of repeat sales, and the tendency of loyal customers to recommend their online provider to other customers (Reichheld and Scheffer, 2000; Zeithaml et al., 1996; Gefen, 2000, Floh and Treiblmaier, 2006). Finally, several factors are found to moderate attitude towards intention to adopt e-banking services and remain e-loyal namely age, gender, involvement, technology readiness and social influence (Kleijnen et al., 2004; Floh and Treiblmaier, 2006). Based on the studies referenced above, this study suggests that customer satisfaction affects e-loyalty. Thus, this study hypothesizes that:

H7. Customer satisfaction has a positive impact on customer e-loyalty.

Research Methodology & Data

This study is an empirical investigation using a structured questionnaire that was delivered by email mostly to internet users randomly selected during February and April 2011. The scope of the study was explained in a cover letter and the sample of the research consists of 153 customers of various banks who reside in the region of Eastern and Central Macedonia in Greece. As a whole, the questionnaire consists of 41 questions. The first 10 questions extract information for the characteristics of the people who fill in the questionnaire and the other 31 are used for the measurement of several variables of the research. The measurement of quality of alternative e-banking channels, service quality and overall satisfaction was carried out using a 5-grade Likert scale, from (1) to (5), where (1) stands for strongly disagree and (5) stands for strongly agree, while the measurements of factors such as trust and loyalty were carried out using bisecting questions. Before the conduct of the research, the questionnaire was tested for its content validity, its reliability and internal consistency.

Additionally, a test of the unidimensionality structure of the elements that comprise every factor and a reliability test of every single variable were carried out to determine the construct validity of research variables. An Exploratory Factor Analysis was applied to carry out this specific test. Among 24 determinant variables used for the measurement of quality alternative e-banking channels, quality service, overall satisfaction factor and the trust factor in the Correlation Matrix table, seven items were found inappropriate and were excluded as Sig.(1-

tailed) $>0,05$. Then, the reliability, the relevance and the stability of variables measurements were tested using the Cronbach's α coefficient. The concluded results are shown in the following Table 1:

Table 1: Reliability & Unidimensionality Structure Test

Factors	Cronbach Alpha	Kaiser-Meyer-Olkin	Bartlett's Test of Sphericity	Eigen ValuesS	% of Variance
e-banking channels	0.848	0.799	1.352E3/ p=0.001	5.350	22.84%
Satisfaction	0.790			3.236	18.83%
Trust	0.744			1.672	13.73%
Q.- service	0.701			1.058	11.15%

Furthermore, T- tests used to calculate whether the averages of two sets of observations differ significantly from each other. The difference between two samples is considered statistically significant in T-tests when is such that it can not be due to random sampling factors. Moreover, χ^2 was used to compare the frequency of cases in the sample of participants (men and women of various ages), if they differ significantly from each other. Finally, logit analysis was used in order to construct a prediction model for the adoption and loyalty of e-banking by consumers. Logit analysis is the logistic transformation of the ordinary regression model used for the prediction of the probability π of success (prediction of loyalty) when the dependent variable is a binary variable. The logistic regression model has the following form:

$$\text{logit}(\pi) = \log[\pi / (1-\pi)] = a + b_1x_1 + b_2x_2 + b_3x_3 \dots + b_nx_n = Z$$

where $\pi/(1-\pi)$ is the odds ratio, a represents the intercept, x represents n independent variables and b represents n regression coefficients. The formula expressing the logistic regression model directly in terms of π is

$$\pi = e^z / (1 + e^z) = 1 / (1 + e^{-z})$$

where the probability π of success (prediction of loyalty) falls between zero and one when the value of Z ranges from $-\infty$ to $+\infty$ for all x_n values (Agresti and Finlay, 1997). The relationship between the dependent variable and the independent variables is a non-linear sigmoid relationship.

Results and Discussion

In the following section we report the descriptive statistics of our survey and the results of our survey. First, Table 2 presents the most important variables of the descriptive statistics. Second, the measurement model is evaluated and local fit indices are discussed. Finally, we present the logit analysis to examine the pattern of variables that best distinguish loyal consumers to e-banking from those who are not.

Table 2: Descriptive Statistics

Variables		N	%
Gender	Male	65	42.5%
	Female	88	57.5%
Age (18-54)	25-34	98	64.1%
	35-44	42	27.5%
	45-54	12	7.8%
Education	High School	10	6.5%
	University	74	48.4%
	Master	69	45.1%
Computer Knowledge	Medium	30	19.6%
	Very Good	104	68%
	Excellent	19	12.4%
Frequency of use	3-10 Hours/ Week	46	30.1%
	10-20 Hours/ Week	38	24.8%
	20+ Hours/ Week	60	39.2%
Reasons of use	Ease of Use	115	61.25%
	Accurate Info	26	13.8%
Frequent transactions	Bill Payments	88	34.0%
	Money transfer	69	26.6%
	Question of Balance	38	14.7%

As can be seen in Table 3, it is concluded that there is a statistical significant difference between the mean value of Quality of e-banking channels of those who are overall satisfied and those who are not. In other words, the people who are overall satisfied is due to satisfaction from the provision of simplicity in their transactions, speed, pleasant content, ease of use, immediacy and time saving from the use of alternative e-banking channels than those who are not willing to use e-banking. Moreover, there is a statistical significant difference between the mean value of Quality of e-banking channels of those who are filling trust and those who are not. Hence, the people who are filling trust consider Quality of e-banking channels far more important than the people who are not filling trust.

Furthermore, there is not a statistical significant difference between the mean value of Quality of e-banking channels and the mean value of service quality. Additionally, there is not a statistical significant difference between the mean value of service quality and the mean value of overall satisfaction. Evidently, those who are overall satisfied and those who are

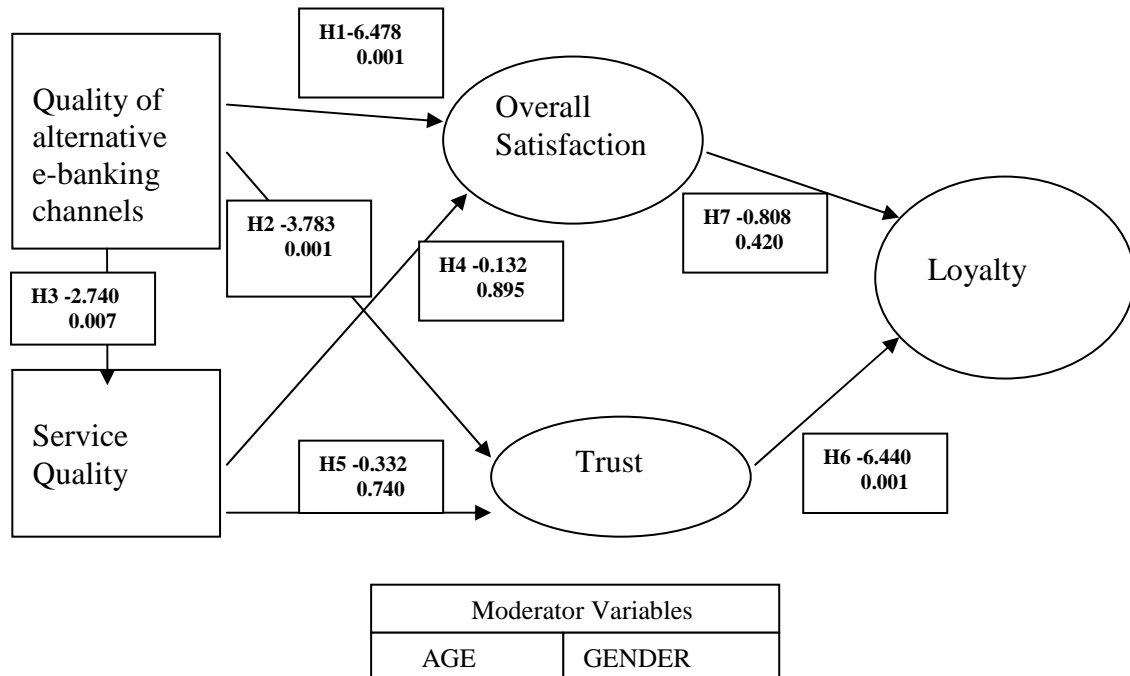

dissatisfied, their opinion do not affect from the quality of service. Moreover, there is not a statistical significant difference between the mean value of service quality and the mean value of trust. Therefore, service quality has no influence over consumers who trust or not, the use of internet banking. Furthermore, there is a statistical significant difference between the mean value of trust of those who are loyal and those who are not. That means, that consumers who are loyal towards a bank, consider trust as an important factor to conduct their banking transactions through its e-banking channels and vice versa. Finally, there is not a statistical significant difference between the mean value of overall satisfaction of those who are loyal and those who are not. In other words, overall satisfaction has no effect on those who are loyal or not towards a bank organization.

Table 3: Results of Independent Samples T Test

		<i>t</i>	<i>DF</i>	<i>Sig.(2-Tailed)</i>	<i>Mean Diff.</i>	<i>Std.Error Diff.</i>	
<i>Dependent</i>	<i>Independent</i>						
<i>H1</i>	<i>Overall satisfaction</i>	<i>Quality of e-banking channels</i>	-6.478	151	<i>p=0.001</i>	-0.395	0.061
<i>H2</i>	<i>Trust</i>	<i>Quality of e-banking channels</i>	-3.783	151	<i>p=0.001</i>	-0.368	0.097
<i>H3</i>	<i>Service Quality</i>	<i>Quality of e-banking channels</i>	-2.740	151	<i>p=0.007</i>	-0.791	0.288
<i>H4</i>	<i>Overall satisfaction</i>	<i>Service Quality</i>	-0.132	151	<i>p=0.895</i>	-0.009	0.071

<i>H6</i>	<i>Loyalty</i>	<i>Trust</i>	-6.440	42.60	<i>p=0.001</i>	-0.279	0.043
<i>H7</i>	<i>Loyalty</i>	<i>Overall satisfaction</i>	-0.081	151	<i>p=0.420</i>	-0.118	0.146

Graph 2

(Floh & Treiblmaier, 2006)

In Table 4, there was a significant dependence on gender and preference for using or not the internet banking ($X^2 = 10,88$, $df=1$, $p=0.001$). While on the other hand, there was not found a significant difference between observed and expected frequencies of ages in their preference to use or not internet banking

	Male	Female	X^2	DF	Sig.(2-Tailed)
Use I. B	56	56	10.882	1	0.001
Non-Use I.B.	8	32			

Vis-à-vis model construction, the independent variables of trust, quality of alternative e-banking channels and gender are statistically significant for the prediction of e-loyalty. The preceding independent variables of the logit model predict 97,3% of the loyal customers and 75,6% of the customers who are not loyal leading to a weighted average of 91,5% accuracy ratio. Accordingly, the probability to classify a disloyal customer as a loyal one (Type I error)

is 24,4% while the probability to classify a loyal customer as a disloyal one (Type II error) decreases to 2,7%. The robustness of the logit model can be perceived as adequate since the Nagelkerke R² is 60,7%. Nagelkerke R² is a pseudo R² statistic which is an approximation of R² for the linear models when the dependent variable (consumer's e-loyalty) is categorical. A summary of the preceding analysis is embedded in Table 5.

<i>Table 5</i>	<i>Logit model</i>	
<i>Variables</i>	<i>Coefficients</i>	<i>Significance</i>
<i>Intercept</i>	-19,351	0,000

Managerial Implications and Conclusions

The goal of this study was to examine the impact of the implementation of innovative electronic communication strategies to attract new customers and to satisfy the existing ones and to investigate the impact on quality of online banking services on customer's e-loyalty and overall satisfaction.

Toward that goal, the research model of Floh and Treiblmaier, was adapted, in order to assess its parameters and investigate how they change and if they are applicable on the Greek banking sector. Data collected by email mostly to internet users provided empirical support for this aim. The evidence obtained showed that, the model was partially confirmed, the researchers asserted that "loyalty of e-banking customers is directly affected by satisfaction and trust in an online bank, which in turn are determined by Web site quality and service quality. Moderating variables such as gender, age, involvement, variety seeking behavior and technophobia exert a significant influence on some relationships".

Comparing the results of this study, with the empirical findings of Floh and Treiblmaier, we similarly concluded that, trust is a critical key factor on the establishment of e-loyalty of e-banking customers while not confirmed the correlation of overall satisfaction with e-loyalty. Researchers support that, determinants such as security and privacy policy of the e-banking include, personal data being transferred to others without permission, unprotected transactions and personal information being stolen by hackers have a negative effect on trust and the intention to conduct transactions (Pavlou, 2003; Lee, 2009; Lu et al., 2011). Therefore to

create e-loyalty, bank organizations must meet the potential needs of customers and increase their confidence to discourage their switching to competitors. Moreover, the results indicate that trust is affected by quality of alternative e-banking channels whereas service quality has no influence on overall satisfaction. Some customers seem to perceive no relative satisfaction in switching from offline banking to online alternative banking channels. Many prefer the old habits or consider mobile banking, web-banking, ATM's, inconvenient, complex, difficult in use and most important unsafe and sometimes costly. Despite the advantages of the web channel, some customers exhibit resistance due to both psychological and functional reasons, to high purchasing costs of a computer and internet connection and also to learning requirements of the new channel, (Ram and Sheth, 1989). Understanding the nature of lack of satisfaction and of resisting to internet banking service, is of value to banks and it is imperative for them to take this into account early enough when they create tactics to implement new internet banking service channels (Kuisma et al., 2007).

Additionally, effects of quality of alternative e-banking channels on overall satisfaction were observed. The acceptance of alternative e-banking channels depend on user performance whether they accomplish their operations or not, and the characteristics of online banking concerning, ease of use, access, validity, immediacy, accuracy, pleasant content, easy navigation, timely and comprehensive information, high technology infrastructure, time savings and simplicity in processing transactions. On the other hand, quality of alternative e-banking channels had no influence on service quality which in turn had no effect on trust. The existing literature has suggested that, for adoption of internet banking, customers should be aware of the availability of quality services. Moreover, banks should, actively offer guidance education and free access to a trial, related to online banking services and explain how they add value relative to other ways of conducting offline transactions through different communication strategies such as active one-to-one marketing actions (e.x., word-of-mouth advertisements, opinion leadership, incentive programmes) or mass media actions (publicity releases, media reports and other) (Laukkanen et al., 2009). In addition, as more and more customers trust to conduct their banking transactions through alternative e-banking channels, and internet banking becomes popular and has diffused to a large proportion of the population even the sceptical non users will differentiate their views and converge to this of the users. Finally, the moderating variable of gender had a significant influence over the use or not of internet banking whereas age had no effect. In particular males have different preferences from females; therefore banks in order to attract customers should offer more alternative services through e-banking channel and highlight the benefits that affect the intention to use for its sex, using customized marketing communication strategies.

A number of issues remain to be addressed. The discussed findings were obtained from one study that targeted a specific group, thus continued research is needed to generalize our findings. Further investigation is needed for additional variables that can predict more

accurately the intention of e-loyalty. Additional research is a necessary next step to evaluate the validity of our findings and enhance our understanding of the correlations between variables that are important for consumer's loyalty towards internet banking

The adoption of innovations accepts resistance thus it requires the bank organizations to continue provide the existing services to customers. Regardless the ease of use, the lower costs and the financial benefits of adopting the internet banking, banks still have to offer traditional payment services in order to meet the needs of those customers that are not ready to accept the new channels. Finally, future research can explore additional antecedents and factors shaping customer attitudes, behaviors and intentions to use e-banking different services.

Abstract

This article responds to the identified considerations and gaps in existing research on the way a new idea is transformed into a market-accepted new product. Utilizing the findings of an extensive theoretical analysis and empirical investigation on the subject, this research studies new product development within a wider strategic marketing context. The research interrelates three different perspectives: the 'process-defining' perspective, that identifies and refines the managerial implications and theoretical considerations; the 'value-defining' perspective, which investigates the various types and stakeholders of value; and the 'context-defining' (contemporary consumer behavior and strategic marketing) perspective, which positions the entire innovation process within the comprehensive set of environmental and organizational processes and factors. The paper concludes with the development of a preliminary 'Contemporary Strategic Framework for New Product Development'. The framework answers the various theoretical considerations on the subject, incorporating the various processes' stages and interrelationships within a single descriptive system. Additionally, it provides constructive functional managerial value through potential practical implementation and prescriptive interpretation.

Keywords: New Product Development, Strategy, Marketing, Value, Framework, Innovation, Idea, Creativity, Exploration

Introduction

The first part of this research (Yahiaoui et al., 2011) has undertaken theoretical and empirical research that improved our understanding of the process, through which new market-accepted products are developed; identifying in parallel its theoretical underpinnings and managerial implications.

The research's findings have expanded our knowledge on the subject, and made the various aspects of the process more distinct. As it often occurs in such cases though, the findings also gave rise to the need for substantial considerations in the overall manner that organizations practically deal with the wider process of new product development (NPD). Further to these managerial implications, considerations of a scholarly/scientific nature were

also identified. Considerations, which become the focus of this paper; and which constitute the first exploratory step towards the construction of a comprehensive Contemporary Strategic Marketing Framework for New Product Development.

Perhaps, more importantly than any other issue on the subject though, is the realization that the epicenter of innovation is 'value' and that this also has a context. A context shaped by consumer behavior and all the macro- and micro-environmental factors affecting it (Thrassou, 2007; Vrontis and Thrassou, 2007; Thrassou and Vrontis, 2009). Instead of, therefore, continuing to focus on the various NPD processes and sub-processes, this paper follows a 'zoom-out' path. This reverse direction allows the understanding and definition of the factors that create the value offered to value stakeholders (Vrontis and Thrassou, 2010) and thus, ultimately, 'add value to value itself' (Yahiaoui et al., 2011).

The aim of this research is to examine the new product development process through different perspectives, and to resynthesize it within a wider strategic marketing context.

Towards this aim, five objectives have been set:

- To present an extensive literature review, that will set the research's theoretical foundations and will help define and interrelate the various product development process concepts and sub-processes.
- To identify and refine the 'process-defining' perspective managerial implications and theoretical considerations (gaps).
- To describe the 'context-defining' (contemporary consumer behavior and strategic marketing) perspective, that will position the entire innovation process within a comprehensive set of organizational processes and forces.
- To examine and define the 'value-defining' perspective, that will identify and interrelate the various types and stakeholders of innovation value.
- To develop a comprehensive preliminary 'Contemporary Strategic Framework for New Product Development', that will answer the various theoretical considerations on the subject, and provide constructive functional managerial value.

The Process-Defining Perspective (Objectives 1 and 2)

Introduction

Reviewing existing research on creativity and innovation, depicts that these two fields are often studied separately and that their understanding and definition among researchers, are frequently ambiguous. Indeed, the innovation process has, for a long time, been described as sequential and linear since it creates value through the implementation and use of one or several ideas (Van de Ven et al., 1989). Criticized by evolutionists (Nelson and Winter, 1982; Dosi, 1982) and neo-Schumpeterians (Kline and Rosenberg, 1986), innovation became a part of an interactive process based on learning (Roozenburg and Eekels, 1995; Hatchuel and Weil,

2003). Thus, we can consider innovation as a process of value creation, through the implementation and setting of one or several ideas. Certainly, this evolution bestows a central role to the conception and birth of ideas, but it does not integrate creativity into the innovation process. Several researchers who studied the characteristics of individual and collective creativity (Pelz and Andrew, 1966; Amabile, 1997; Woodman et al., 1993; Majaro, 1992; Styhre and Sundgren, 2005) consider creativity to be a process in itself, independent of the innovation process. The first part of this research though (Yahiaoui et al., 2011), concluded that this does not necessarily relate to the existing, practically implemented, innovation process in organisations; and that very little research has studied the path from creativity to innovation (Staw, 1990, Flynn et al, 2003, Hatchuel et al. 2003).

Creativity

The researchers in the fields of individual and organizational creativity endeavor to answer the question, "How are ideas born?" This question is linked with the genesis of novelty, as introduced by Lecoivre and Verstraete (1998). The generation of ideas is a matter of creativity, and several authors have accentuated the confusing border between it and innovation (Woodman et al., 1993; West and Farr, 1989; Ford, 1996; Hauch, 2002). Creativity has been studied at the individual level (Pelz and Andrew, 1966; Amabile, 1997) or the collective and organizational level (Woodman et al., 1993) in connection with the management of innovation. These authors define organizational creativity as the creation of new products, services, ideas or useful processes on behalf of individuals working together in a complex social system (Woodman and Sawyer, 1993).

Creativity can be different according to the situation (Majaro, 1992). As Flynn et al. (2003) underlined, creativity can be reactive and answer to a specific need. Also, it can be exploratory and proactive, generating a large spectrum of ideas, not necessarily bound to demands or previous situations. In general, researchers converge to underline that creativity leads to the collection of information (preparation) and analysis (Incubation/Illumination) before being tested in the real world (Verification). Researchers have also studied the factors that encourage creativity (McFadzean, 1988) such as wishful thinking, unrelated stimuli and mind mapping.

Some researchers tried to link creativity with innovation. Amabile (1997), for example, suggested that creativity permits the production of new products, ideas, and services that could be implemented through an innovation. It was also suggested that creativity is connected to socio-cultural validation or even to acceptance by the social environment (Cromptley, 1999). However, this research found that it is important to think about the modes that can be used to structure ideas and identify the axes of values, before moving on to the development. To make this possible, an intermediate phase seems necessary to study the path from creativity to innovation.

From creativity to the innovation

To think about the uphill phases of the innovation process, we have to study the generation, selection and assessment of ideas. Thus, creativity and the transition to innovation can take on a truly strategic character for all innovating firms. Some authors have attempted to integrate creativity into the process of innovation. Staw (1990), for example, proposed a model that considers innovation as the result of developing ideas in a specific context. Getz (2002) suggests that research and development (R&D) activity is removed from the reality of the market. That is why it should be included in what he called “the execution of the idea”. Creativity can even be considered as the first step toward “intrapreneurship” (Carrier, 1997) by making innovation more dynamic. Another important work has been presented by Flynn et al. (2003), who distinguish two main ‘innovation funnels’: one concerning the creative process and another transforming creative ideas into real innovations.

In spite all, the first part of this is research underlined the lack of operationalisation of the ideas’ transformation steps. According to Stoycheva and Lubart (2001), this transient phase is strategic because it can be included within a “pre-conception” logic: selecting projects, reducing risks and time to market (TTM). This research’s extensive review has encountered only one work (Hatchuel and Weil, 2003) that really covers this phenomenon. They showed that each enterprise must think about new creative tracks, without cutting down on planned objectives. Thus, they developed the R-I-D (Research-Innovation-Development) model. Embedded in collective action theory, this model marks the passage of the reflections dealing with innovation to those studying the innovating organizations. Their so-named “I” function consists of managing the “fields of innovation, which are conducive to new programs of product developments and new questions for research”. It creates value and manages the process of the emergence and structuring of new knowledge.

However, two remarks deserve to be looked at in more detail. Firstly, the authors evoke the “I” function (innovation) between the research and development stages. Secondly, they present this phase as a supplementary organizational system to establish innovation in less structured situations. Certainly the “I” function is important, but it focuses only on one dimension of this strategic activity. Thus, it is necessary to develop a deeper study of the modes of the transition from idea to product. It is in this setting that the first part of this research (Yahiaoui et al., 2011) undertook its empirical study.

**The Gaps – Managerial Implications and Theoretical Considerations
(Objective 2)**

The findings of this research concluded that the concepts of ‘idea’, ‘creativity’, ‘innovation’ and others, are relatively extensively researched. At the same time there appear to be a number of matters that demand further research into these subjects.

As Yahiaoui et al. (2011) note, 'firstly, the various concepts are not defined, nor utilized in the same manner by the researchers. Secondly, a gap appears to exist in terms of the way that these concepts are transformed from the one into the other, especially the leap from 'new idea' to 'market-accepted product', or essentially, 'creativity' to 'innovation'. Thirdly, these concepts are not adequately intra-related i.e. their linkage within a defined process is still not distinct. Finally, these concepts are not adequately inter-related i.e. their relationship with other critical organizational functions, such as market/consumer research and R&D, within the wider strategic/marketing contexts, is also still not distinct'.

Through their empirical exploration into the creativity-to-innovation process, they found that the development of an idea into a real innovation (accepted by the market) must take place in the setting of a structured and organized process (also, Le Masson et al., 2006). The potential paths of innovation though, do not emerge in a spontaneous way. The ideas are studied in a pre-conceived way within the business test (market opportunity) phase. Customers play a very important role in testing the commercial feasibility of new ideas. This role recalls the notion of "lead user" introduced by Von Hippel (1978, 1986). In this setting, a distinction is made between the customers who think and conceive new products, from the "early adopters" or precocious purchasers.

The exploration of new tracks of innovation requires the mobilization of customers, as well as partners from different fields: research, development, marketing and design. Based on this finding, it is indicated that for the best results from this intermediate step, works must better be project-based (also, Midler, 1993; Azan and Mayrhofer, 2003; Garel et al., 2004). Finally, the ideas become "pre-concepts" that are better refined and enriched with potential business value. This approach can be called piloting by learning (also, Hatchuel and Weil, 2003). Adjacent to the project mode, a second organizational feature characterizes exploration: the creation of a structure exclusively dedicated to this activity. Its importance deserves to be emphasized, noting also the thin and obscure line that divides technological and organizational innovation (also, Damanpour, 1991).

The main features of the exploration process are summarized in the table 1.

<i>The exploration criteria</i>	<i>New concepts with business potential: risks of use, business case (target, business model, positioning), design, technology</i>
<i>The actors (participants)</i>	<i>Customers (creative users and ambassadors), designers, ergonomists, marketing managers, partners, R&D engineers...</i>
<i>Structure and organization of the activity</i>	<i>New structure : The explocenter Projects and co-localized teams (Core team & Circle 2) Trial-and-error process Coordination through the exploration file (DEX)</i>
<i>Governance</i>	<i>Method of governance «venture capital» Sponsor from the technocenter (development)</i>
<i>Added value to the innovation process</i>	<i>Accelerating the transformation of ideas (more mature concepts) Improved view of the relationship between projects and the strategy of the company Better selection of concepts with great business potential</i>
<i>Results and concepts</i>	<i>Swarmed concepts Capitalized concepts Transformed concepts</i>

Table 1: Synthesis of the characteristics of the exploration activity (Source: Yahiaoui et al., 2011)

The research underlines the importance of interconnecting creativity and conception within the innovation process. It further proposes an operationalization of this strategic step for firms. On the theoretical level, it links two fields of research that have been disconnected until now.

For managers, this research highlights the necessity of creating exploration activity in order to bring to maturity the ideas and concepts for organisations. This “pre-conception” step can be organized at several levels: the axes of exploration (technology, business), the participants (customers, managers), the organizational pattern (new structure, standardization of the procedures, project) and the mode of governance.

Most importantly though, the research has pointed out the the need for substantial considerations in the overall manner that organizations practically deal with the wider process of new product development. Regarding these managerial implications, Yahiaoui et al. (2011) state that: ‘irrespective of the theoretical taxonomy, classification ad categorization of the components and steps comprising the ‘idea to innovation’ and wider NPD processes; individual organizations need to redefine and reorganize their processes based on their individual characteristics, resources and strategic aims. The refinement of the processes at a scholarly level is a useful knowledge foundation; on which nonetheless, organizations need to build their own practical implementation’.

This, second part of the research, has combined the theoretical and managerial gaps, implications and considerations developed by Yahiaoui et al. (2011); and reorganized them into three categories of research perspective requirements regarding the wider NPD process:

the 'Value-defining' ones, the 'Process-defining' ones, and the 'Context-defining' ones (table 2).

	<i>Research Perspective Category</i>	<i>Requirement</i>
	<i>Value-Defining</i>	<i>Breakdown the concept of 'value' in relation to each of the value stakeholders, both within and outside the organization e.g. value to existing customers, potential customers, employees, associates, departments, the public, society, the industry etc</i>
		<i>Breakdown the concept of 'value' in terms of value type e.g. financial, time, effort, psychological, image, social/ethical, functional, technological, infrastructural, knowledge etc.</i>
		<i>'Evaluate value' i.e. develop a way to decide on the absolute and relative importance of each value type and for each value stakeholder.</i>
		<i>'Transcribe value' into a single currency i.e. develop a way to objectively and if possible quantitatively measure each value type in a manner that allows direct comparison between benefits/options.</i>
	<i>Process-Defining</i>	<i>Focus even more greatly on the NPD process and its potential constituent components, such as innovation, creativity, exploration, R&D etc.</i>
		<i>Understand these components, place them within a single, unified and comprehensive process, and define the role and function for each, specifically for each organization at hand.</i>
		<i>Organize the practical implementation of the whole transition process, in a manner that makes both practical and economic sense.</i>
		<i>Theoretically position and test the 'idea to innovation' sub-process, within the more specific NPD process.</i>
		<i>Investigate the features of the 'exploration activity' presented earlier (Criteria, Actors, Governance etc), separately and adjacent to economic factors</i>
	<i>Context-Defining</i>	<i>Interrelate and 'synergise' the whole 'idea to innovation' sub-process with (and if needed incorporate into) the marketing research, R&D and consumer analysis processes.</i>
		<i>Position and test the 'idea to innovation' process, within the wider strategic marketing context.</i>
		<i>Interrelate and 'synergise' the 'idea to innovation' process with the management and human resource contexts, as the value stakeholders of innovations / new products are often internal ones</i>
		<i>Answer the ultimately defining strategic-level question, adjacent to organizational culture: whether innovation / NPD are more consequent of abstract human qualities (creativity, vision, imagination, inspiration, ingenuity, inventiveness, resourcefulness), or methodical and mechanistic processes (market research, consumer profiling and analysis, idea filtering systems, etc).</i>

Table 2: The New Product Development Process-defining gaps (Developed Based on Yahiaoui et al., 2011)

The Context-Defining Perspective (Objectives 1 and 3)

The Contemporary Markets' Consumer Behaviour

The significance of consumer behaviour knowledge rests on the foundation of modern marketing philosophy which recognises the consumer as being the focus of marketing activity. In contemporary markets, consumers' influence on business has been steadily increasing over the past few decades, empowering and crowning them sovereigns among the forces shaping business environments (Schiffman and Kanuk, 2004; Kotler et al., 2005; Blackwell et al., 2006). The contemporary markets bear a number of characteristics that facilitate this phenomenon: high economic productivity and prosperity, the freedom that largely characterises business activity, high education and administration levels, technological superiority, the comparative importance of knowledge and information versus other economic factors, and a socio-cultural environment that supports personal and collective development and expression (Steiner and Steiner, 2000; Keegan and Schlegelmilch, 2001; Chan and Chui, 2004; Thrassou, 2007).

Furthermore, the usual cultural diversity of their population, the high per-capita-income and low inflation, the high labour costs and quality, the organisation of labour into powerful groups and the increased regulation of working conditions, the strengthening role of services (Keegan and Schlegelmilch, 2001; Fitzsimmons and Fitzsimmons, 2001; Paladino, 2005), the excellent infrastructure, the comparatively low/stable inflation and their stability and law supremacy are other characteristics that should be highlighted. The effect of these on behaviour is profound in every step of the consumer decision process, which distinguishes itself from the reciprocal ones in other countries on a number of factors (Laroche et al., 2003; Teng et al., 2007).

Additionally, contemporary developed markets differ with regards to personality influence on consumer behaviour chiefly in terms of attitudes and values in relation to social and personal freedom and dignity, respect toward the natural and built environments, the drive for achievement and others (Cronin et al., 2000; Mukherjee and Hoyer, 2001; Laroche, 2002; Maniyiwa and Crawford, 2002; Robbins, 2003; Laroche et al., 2003; McEachern et al., 2007; Thrassou, 2007).

Cultural and social factors are equally important and among developed countries there are commonly shared characteristics. Family influences are diminishing (Kotler et al., 2005; Blackwell et al., 2006; Thrassou, 2007), as are religious influences; though this pattern is neither absolute, nor clear, nor constant (Solomon, 2007). In developed countries, national culture is another factor with diminishing influences; this being a distinctly separate phenomenon to nationalist feelings/tendencies and their observed increase or decrease. On the other hand cultural diversity within developed countries has in fact increased the effect on behaviour of nationality-based subcultures (Schiffman and Kanuk, 2004; Angelis et al., 2005).

Finally, the influence of education on consumers is increasing, not only because of rising standards, but also because of the nature of education in contemporary markets. Education walks hand in hand with empowerment and the perception that citizens self-develop both as individuals and in their capacity as consumers (Vittell, 2003; Henry, 2005; Blackwell et al., 2006; Vrontis and Thrassou, 2007). Finally, reference groups tend to significantly influence an individual's behaviour through socialisation, self-concept, comparison, conformity and role models (Maniyiwa et al., 2002; Laroche et al., 2003; Kotler et al., 2005; Zeithaml et al., 2006).

These differences not only result in different motivators (Rayner and Easthope, 2001), but also in considerably more complex motivational processes; themselves resulting in both quantitative and qualitative upgrades in the consumer decision-making process (CDP) of a developed-country consumer (Yi and Baumgartner, 2004; Esch et al., 2006). The contemporary markets' CDP therefore, is found to differentiate itself in three ways: its complexity, its upgraded significance to marketers, and the fact that the majority of consumption relates to the satisfaction of 'higher' needs (Rayner and Easthope, 2001; Blackwell et al., 2006; Zeithaml et al., 2006).

The findings show that the causal factors of behaviour are embedded in all collective levels and dimensions (social, cultural, economic etc), but that their effect is direct on the beliefs, attitudes, perceptions, feelings, actions and all other components of individual behaviour. For developed markets, with few concerns for immediate needs towards survival, consumerism appears to have become an end in itself, and through it, consumers find a voice of expression, the way to promote their understanding of a better society, an abstract escape from the predetermined, and the means to build an identity for themselves. The choice belongs to the consumer and the consumer alone, but the context and content belongs to the businesses. The above lead to the conclusion that exhibited individual consumer behaviour is moulded by its social context, but also by the reciprocal businesses' behaviour. So although the social context may be similar, businesses' behaviour is in fact a critical factor of individual consumer behavior.

This relationship therefore, between consumers and businesses, is one that must be better understood if the context-defining (as well as the value-defining) perspectives are to be truly understood.

Business Versus Consumers: a Balance-of-Power Relationship Interpretation

Vrontis and Thrassou (2007) found that the highly competitive environment necessitates for businesses, both the understanding of the nature of demand and the ability to satisfy it. Intense competition means that greater value is frequently offered through means such as innovation (Mukherjee and Hoyer, 2001), augmented products/services/ideas, customisation, personal attention, convenience and others (Naumann et al., 2001; Thøgersen and Olander, 2002). Furthermore, simply meeting expectations is often not enough. Organisations have to surpass expectation to meet the prerequisites of quality (Foreman, 2000; Naumann et al., 2001;

Gupta and Lehmann, 2002; Blackwell et al., 2006). An additional option is the ability of organisations to create value through the building of an appropriate brand image that is perceived as transferable to the individual. In a developed world dominated by media and other communication channels, perception often becomes a more critical parameter than reality itself (Naumann et al., 2001; Palmer and Ponsonby, 2002; McCullough, 2004).

Thus, consumers and businesses co-exist in a dynamic equilibrium of influence and interdependence. The question no longer is 'how can organisations utilise marketing knowledge to affect individual behaviour', but rather 'how can organisations understand and predict individual behaviour in order to sustain a two-directional value-adding relationship'.

Vrontis and Thrassou (2007) proposed the 'fundamentals' of the evolving organisation-individual relationship in developed countries as being:

- individuals will be in an even better position to demand what they want, both in terms of quality and customisation
- the incessant change means that strategic marketing will probably rest its construction of the relationship, not so much on foresight as much as on reflex-like adoption to occurring changes
- individual 'Needs' are all the more manifested into 'Wants' which are intangible, of obscure value, affective in nature and of course naturally much more vulnerable to marketing communications and other techniques that shift power back towards the business end
- ethics and social responsibility will continue to become stronger and more integrated into organisational behaviour, but overwhelmingly in the most 'visible' areas of organisational activity
- organisations will strive to add value to products and services through the creation of 'brand personalities' and the building of associations with lifestyles and other anthropomorphic characteristics.
- Differentiation and added value will potentially be partial results of marketing approaches aiming to create perceptions rather than tangible effects.

They schematically portrayed the present (parallel existence) of businesses and consumers and continued to construct a predictive framework that encompasses the two entities into a new co-existence. The latter portrays consumers and businesses acting continuously as equal and opposite forces, resulting in a centrifugal equilibrium whereby 'balance' is the 'spinal column that acts as the prerequisite, the aim and the consequence of the relationship' (figure 1).

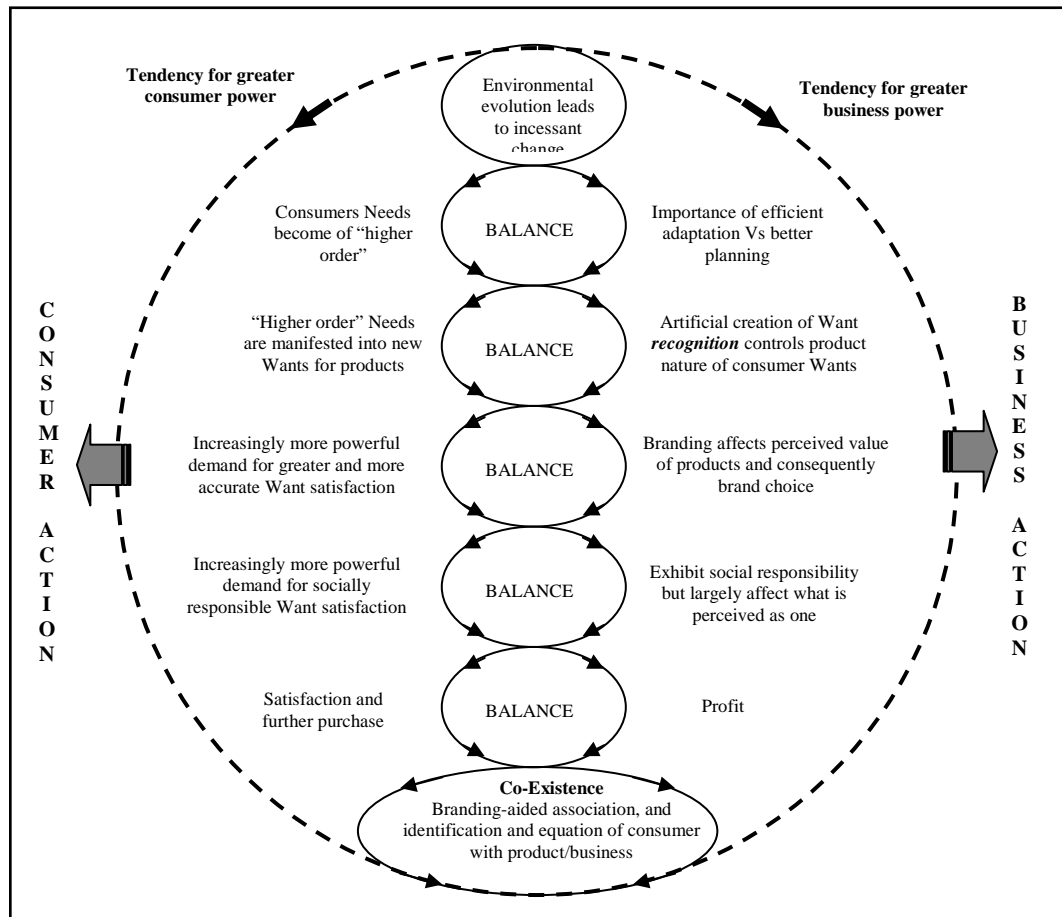

Figure 1: A Framework towards a New Business-Consumer Relationship in developed countries (Source: Vrontis and Thrassou, 2007)

The essential finding of the above is that the dawning organisation-individual relationship is fundamentally more than a co-existing one. It is a symbiotic one. The consequent realization is that this shifts marketing focus 'from the individual's environment to the individual's mind; from the external to the internal; from the tangible to the intangible. 'Reality' is increasingly shadowed by 'perception' with the latter being frequently predominant'. In terms of marketing practice, the profound effect relates to 'a transference of focus from 'function' (awareness, knowledge, information, etc) to 'perception''; with 'perception management' arising as a primary marketing communication process, and 'branding' as its primary vehicle' (Vrontis and Thrassou, 2007). Overall, the findings demand for the concentration of marketing on the dynamic intervention in the processes by which consumers perceive their environment towards shaping not only perceptions, but also expectations.

The Strategic Marketing Context – Services, Small Firms and Communications

This paper avoids the review of the fundamental/classic marketing principles and theories, as these are excessively covered throughout the literature review. As a matter of formality

though, Kotler et al (2005) as well as most other 'principles of marketing' and 'strategic marketing' books provide all the needed material toward the construction of the Contemporary Strategic Framework for New Product Development. Instead, more effectively, this paper is confined to presenting existing theory on services marketing small firm marketing; two subjects which individually or combined relate to the majority of businesses. The consideration of their marketing differentiating attributes therefore, within the proposed framework, should be considered an imperative and not a contingency. Additionally, special emphasis is placed on the marketing communications of these firms as this has been found (above) to be a primary tool towards consumer understanding and perception management.

The review of services marketing theory, as developed by many authors, including Guttman (1987), Lovelock (1996), Lovelock and Wright (2002) and Zeithaml et al. (2006), surfaces a number of important points. The first one is the intense perception of the environment as physical and non-physical with the latter naturally presenting complications both in its definition and analysis. The second point is the internal marketing's upgraded value which is directly related to the emphasis placed on the non-physical environment. The third and most significant point though, is the importance placed on quality, the audiences' perception of quality and the organisation's management perception of target audiences' expectations. One cannot fail to observe that services have a strongly intangible nature, whose quality and essence relates considerably to perceptions; to a degree in fact, that strategic and marketing aspects of an organisation might be concentrated on communication of impressions as much as they should on the service itself. Additionally, McDonald and Payne (2006) support that only a minority of service organisations truly understand their audiences and have a strategic plan based on this understanding. They furthermore call for a dramatic need for improvement in their marketing effectiveness.

Zeithaml et al. (2006) identify the key reasons for service marketing problems as being: inadequate management of promises, inadequate management of customer expectations, inadequate customer education, and inadequate internal marketing. Additionally, the researches by Herrington et al (1996) and McArthur and Griffin (1997) concluded that instead of generically applying idealised planning procedures, the individual managerial attributes and organisational resources need to be considered in the development of strategic marketing planning activities.

Thrassou and Vrontis (2006) find that the complex and specialised nature of professional services' SMEs necessitates a marketing mix that will primarily inform, educate and consult audiences. Furthermore, marketing communications stipulated as the means of both receiving the necessary information and transmitting it successfully, towards controlling consumers' attitudes, beliefs and feelings. Finally, word-of-mouth is found to be relatively more important to small organisations while the reliance on opinion leaders appears to also

be more frequent. Similar conclusions are drawn through the review of work by Schiffman and Kanuk (2004), Hawkins et al (2004) and Solomon (2007).

Longenecker et al (2003) conclude that small businesses are limited in their design of the marketing mix by the limits of their resources and that the higher the value offered by the product to the audience, the greater the importance of personal communication. Said (2000), identifies a number of SME generic marketing characteristics, including: a lack of proper marketing practices; a market competitive situation that is becoming more vulnerable to liberal trends; and a contradiction between the realisation of the need for more, faster and better market (and marketing) knowledge and information on the one hand, and an apparent unwillingness to pursue this on the other.

A review of “classical” theories on small businesses, including the authors Beckhard et al (1987), Burns et al (1989); Stevenson (1991), Sahlman and Stevenson (1992), Barrow (1993), Julien (1993), Dewhurst et al (1993), Ballantine (1993), Fuller,(1994), Storey (1997), Shutt (1998), Wickham (1998) and Longenecker et al (2003), further gave rise to two critical questions. The first relates to the degree to which a small business is able to affect its market, which varies according to the structure of the specific market; and second is whether the business is small as a matter of choice or ability. Additional issues identified include the market size, the concentration of small businesses and the degree and nature of cooperation between businesses.

Finally, Thrassou and Vrontis (2006), relying also on the work of Yisa et al. (1996), McArthur and Griffin (1997), Kitchen (2001), Pickton and Broderick (2001), Smith and Taylor (2002); Fill (2002), Reedy and Schullo (2004), Thrassou (2005), and Thrassou and Lijo (2007) pinpoint a number of attributes that largely define small service businesses marketing communications. Specifically, they note that personal communication tools should bear greater relative weight and elements that can substitute for the intangibility deficiencies should be given greater relative attention. Client education and training should be a primary aim, owing to the audiences’ subjectivity of attitudes and beliefs. Internal communication should be an integral part of the marketing mix, though not necessarily a separate tool. Focus is noted as a primary means to achieving stronger and more effective communication, and electronic communications and word-of-mouth should be at the same time tools, but also targets. In SME-dominated environments, small businesses may undertake competitive roles such as ‘leadership’ which are normally unattainable. Finally, but most importantly, although communications are normally a process within the wider marketing strategy, for small businesses communication capabilities may actually dictate the strategy.

The Value-Defining Perspective – Towards a Preliminary NPD Framework (Objectives 4 and 5)

Having examined the new product development process and its context, this research appears ready to propose a preliminary Contemporary Strategic Framework for New Product

Development. At the same time though, the factor of 'value', which originally figured as just another parameter, keeps emerging as a critical and defining one. The above works and models have consistently revolved around the concept of 'value' as both the cause and effect of new product development, both from the consumers' side and the producers'. Though the evidence is there, this research has not uncovered any taxonomy or categorization of 'value' that incorporates both the 'type' and 'stakeholders' of value regarding the NPD process.

It is therefore an imperative, that before the construction of a preliminary Contemporary Strategic Framework for New Product Development, the research should bring forward the evidence in existing literature regarding 'value'; and attempt its theoretical amalgamation and ultimately its integration into the proposed framework. One observation regarding the subject, is that 'value', while being frequently referred to, is rarely defined. This is understandable since to define value one needs a context; and research concentrating on NPD would not shift focus nor 'de-focus' to define contexts. Thus the value of this specific research which aims exactly for that, thus allowing the definition of value in terms of types and stakeholders, within a wider strategic and macro environmental context.

Drawing from the literature review therefore this research is able to identify seven different main types of value stemming from the NPD process, and seven different main stakeholders (three external and four internal ones). Presenting the former vertically and the latter horizontally, along with the transcription of each interrelationship (table 3):

TYPICAL POTENTIAL VALUE THROUGH		EXTERNAL VALUE STAKEHOLDERS		
		Existing Customers	Targeted Customers	Society
V A L U E T Y P E S	Financial	Lower price; lower running costs; lower replacement costs	Lower price; lower running costs; lower replacement costs	Indirect / ripple effect
	Time	Efficiency; speed; punctuality; multi-tasking; dual time utilisation	Efficiency; speed; punctuality; multi-tasking; dual time utilisation	Indirect / ripple effect
	Physical/ Sensory	Ease; comfort; noise and odors limitation; physical environment improvements	Ease; comfort; noise and odors limitation; physical environment improvements; physical ease of switching / joining	Indirect / ripple effect
	Mental	Simplification in information / selection / usage / support stages	Simplification in information / selection / usage / support stages	Indirect / ripple effect
	Psychological	Comfort; sensory positive stimulation; pressure minimization; safety; security; assurance / guarantees	Comfort; sensory positive stimulation; pressure minimization; safety; security; assurance / guarantees; switching / joining guilt elimination	Indirect / ripple effect
	Image	Status; prestige; self-image	Status; prestige; self-image	Indirect / ripple effect
	Function	Effectiveness; quality; multi- tasking; durability	Effectiveness; quality; multi- tasking; durability	Indirect / ripple effect

Table 3a: Integrated Value Types and External Stakeholders in the New Product Development Process Context
(theory based - research composed)

TYPICAL POTENTIAL VALUE THROUGH		INTERNAL VALUE STAKEHOLDERS			
		Company – the employees	Company – the organizational system	Company – the economic entity	Company – the brand
V A L U E T Y P E S	Financial	Higher income; improved benefits	Improved processes; higher human resource moral	Higher profitability; lower risk	Branding investment
	Time	Efficiency; task simplification	Efficiency; improved planning	Economic efficiency	Indirect branding attribute
	Physical/ Sensory	Improved environment	Improved quality; human resource efficiency / effectiveness / moral	Economic efficiency	Indirect branding attribute
	Mental	Stimulation; knowledge; experience	Improved quality; human resource efficiency / effectiveness	Higher profitability	Indirect branding attribute
	Psychological	High moral; internal social benefits	Improved quality; human resource efficiency / effectiveness	Economic efficiency	Indirect branding attribute
	Image	High moral;	Improved quality; human resource efficiency / effectiveness	Economic efficiency	Indirect branding attribute
	Function	Efficiency; effectiveness; quality	Efficiency; effectiveness; quality	Higher profitability; lower risk	Indirect branding attribute

Table 3b: Integrated Value Types and Internal Stakeholders in the New Product Development Process Context
(theory based - research composed)

With the concept of 'value' more defined within the New Product Development Process context. It is now possible for this research to integrate the three perspectives of 'process', 'context' and 'value' within a single, comprehensive, preliminary Contemporary Strategic Framework for New Product Development

The framework, for practical purposes, avoids the detailed presentation of the steps and factors which are already much researched and are widely considered as orthodox and mainstream. The strategic marketing and planning steps are denoted as single points, although there are of course complex interrelationships between these. Instead, the framework stresses the elements and factors that are more rarely met in literature and of course those interrelationships that have surfaced through this research.

Specifically, 'marketing and consumer research' is slightly differentiated from mainstream literature in the sense that it has a 'cyclical' relationship with the new product development process, being both its starting point and its end result; with the concept of value being the intermediate catalyst of the circular motion.

The new product development process itself has also been presented excluding the standard steps of 'idea generation', 'filtering' etc. to present the critical intermediate elements of 'exploration criteria', 'actors' (participants), 'activity structure & organization', 'governance', 'added value', and 'results and swarmed, capitalized and transformed concepts' (as described earlier). The new product development process is depicted as leading to a single (in reality the most important) critical concept: that of 'value'. Contrary to past models though, this proposed framework breaks down the generic idea of 'value' into seven specific types of value that appear as most dominant in literature of contemporary markets (see above sections): financial, time, physical/sensory, mental, psychological, image and functional value. In parallel to these, this preliminary framework distinguishes also the potential stakeholders of value: the internal ones (the employees, the organizational system, the economic entity and the brand) and the external ones (existing customers, targeted new customers and society).

Further to the above, this proposed framework deviates from classical literature by introducing the matter of 'context' into the system. The context, largely relying on contemporary consumer behaviour analysis, revolves also around the question of 'power' between the consumer and the business. The consequent effect on the framework is noticeable within the 'post-NPD strategic marketing processes', and more specifically through the introduction of marketing communications as crucial in the definition of value in the eyes of stakeholders. Additionally and within the same context, 'perception management' is termed as a primary sub-process of the system, with 'branding' its primary 'vehicle'.

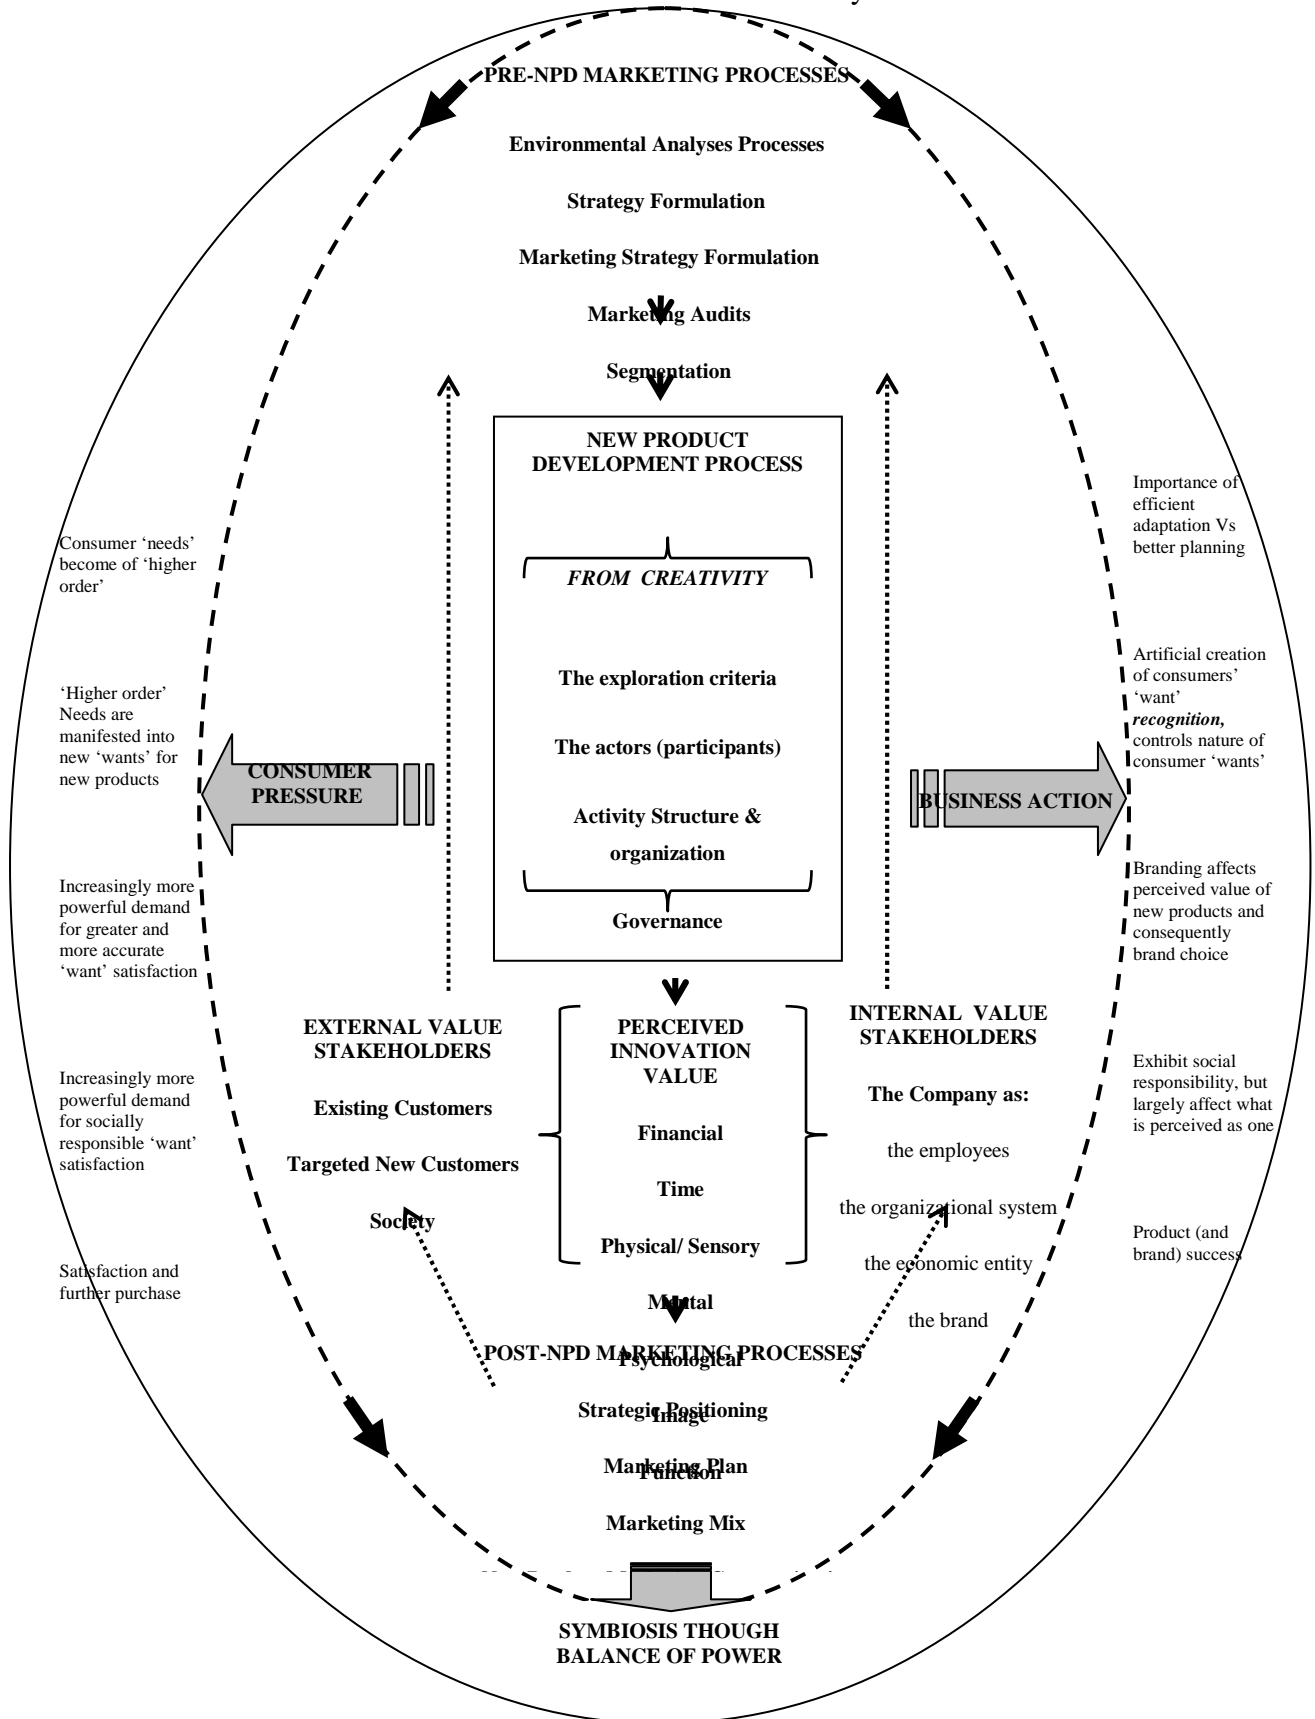

Figure 2: A Preliminary Contemporary Strategic Framework for New Product Development

Catalexis, Limitations and Further Research

This research has reversed the trend in research direction on new product development, to focus out of the various sub-processes. Specifically, the research has investigated the context of new product development, within contemporary developed economies, and through three distinct perspectives: the process itself, the consumer and macro-environmental context, and the concept of value. It has ultimately developed a preliminary framework to descriptively and prescriptively assist both researchers and practitioners in comprehending the multi-dimensionality of the subject.

The findings are largely conceptual and based on theoretical research. The research therefore does not claim that its findings or framework are unquestionable or final. On the contrary, the research calls for further and especially empirical work to take place, on the subject of NPD context and interrelationships. The currently presented work, provides a solid and scientific foundation on which researchers can build. Moreover, the same foundation can be utilized by practitioners in designing their new product development process.

The ultimate challenge though, both for researchers and practitioners, as it surfaces through this research, is not a matter NPD process definition, its sub-processes or functions. It is a matter of interrelating the various components within the wider organizational activities without creating unnecessary inefficiencies and complexities. Moreover, both researchers and practitioners must master two very difficult concepts, in the context of new product development: on the one hand, the interdependencies between the business and the consumer needs, and on the other, the notion of value and its role in the development of new products. There is no magic formula or specific model that fits all organizations; and balancing and utilizing these challenging concepts for the benefit of individual organisations is an art, as much as it is a science. Irrespective of theoretical modeling and past practices, it is, as it often is, a matter of theoretical knowledge, of practical experience, of instinct and trial and error. New product development, as a process, does not 'fit in a box', as rarely do business processes that contain the term 'new'.

Abstract

The objective of this paper is to develop a conceptual framework for measuring the effectiveness of social media marketing communications. Specifically, we study whether the existing marketing communications performance metrics are still valid in the changing communications landscape or whether it is time to rethink them or even to devise entirely new metrics.

The study examines reviews and combines the discourse of social media marketing, social media metrics, and marketing performance measurement. Literature is collected from newest social media books and articles, and marketing performance measurement studies.

This study attempts to contribute to a better understanding of marketing communications measurement in social media era by incorporating marketing performance and social media marketing literatures. Recent advances in information technology marketing bring a need to re-examine measurement models. We combine two important research topics and set directions for potential future research.

The results reveal that metrics to measure marketing communications performance have developed towards a customer orientation. According to this study there is no broadly accepted opinion of a single critical performance indicator. The findings suggest that social media marketing metrics have been classified in three groups: qualitative, quantitative and financial. The shift towards a digitized interactive marketing environment does not necessarily mean that a whole array of new measurement metrics is needed.

Keywords: Marketing Communications, Social Media, Marketing Performance Measurement, Marketing Communication Metrics

Introduction

In recent years social media has gained significant interest among marketing practitioners and academicians. It is increasingly being argued that we are in the midst of a new communication landscape (e.g. Kietzmann et al. 2011) as the roles of customer interaction and user-generated content (UGC) are emphasized in marketing communications (Dennis et al., 2009; Liu et al., 2011). This shift towards interactive communications is transforming the landscape from one-way to two-way communications in which customers are actively

participating, or at least being asked to participate, in the communications loop. Thus, customer engagement has been recently listed as a top research priority for marketing academics (MSI, 2010).

In addition to customer engagement, the changing media landscape has led the Marketing Science Institute to call for research to create new frameworks and methods that link existing marketing metrics and marketing performance measures with new media (MSI, 2010, for research priorities concerning metrics see also MSI, 2000; 2002; 2004; 2008). Thus there is a real need for research related to marketing communications performance measurement in social media context, as researchers and managers pay increasingly attention to social media without a clear understanding of how effective the media is or how to measure it.

In this article we attempt to develop a framework for measuring the effectiveness of social media marketing communications. Specifically, our objective is to discuss whether the existing marketing communications performance metrics are still valid in the changing communications landscape. An interesting research question we ask is whether there is a need to rethink them or even to devise entirely new metrics? In order to answer this question, the study reviews and collates the literature on social media marketing, social media metrics, and marketing performance measurement. Literature is collected from the most recent social media books and articles, and from marketing performance measurement studies. A detailed study of this phenomenon is important insofar as it can throw light on a number of processes involved in scientific activity and the growth of knowledge in this field in general.

This paper is structured as follows. First, we trace the development of the academic marketing discussion related to social media and its main topics. Second, we review the literature on marketing performance measurement and state how increasing use of social media creates a strong need for both marketing performance measurement research and marketing performance measurement implementation in practice. We conclude with a discussion of the implications of our findings and outline possible topics for further research.

Marketing Measurement in Social Media Era

Social media in marketing communications

Companies have taken social media seriously on a strategy level and a large number of companies have begun to set a budget for social media marketing. Organizations sense that social media is a new, but permanent, environment for marketing (Weinberg and Pehlivan, 2011). Social media has changed marketing practices tremendously and constantly. While in the traditional online environment large media budgets were typically targetted at catching the customers' attention, in the new social media age power structures are different as power has shifted increasingly towards the media consumers. Against this backdrop, large media budgets no longer directly and positively correlate with large audiences and effective business in the world of user-generated content and multidimensional interaction. Hanna et

al. (2011) hit the nail on the head when stating that social media has transformed the internet from a platform for information to a platform for influence.

Business is expected to invest \$6 billion in social media in 2011 (Aho Williamson, 2011) and inevitably the academic marketing literature has shown a growing interest in this new media landscape. Marketing journals have published special issues on social media (e.g. *Business Horizons*, 2011) and many top marketing journals (e.g. *Journal of Marketing*; *European Journal of Marketing*; *Journal of Business Research*; *Journal of Advertising Research*) have recently published articles covering social media.

Social media marketing has been investigated in marketing literature from various perspectives, including the viewpoints of viral marketing (Kaplan and Haenlain, 2010; Ho and Dempsey, 2009), word of mouth (Steffes and Burgee, 2009; Cheung and Rabjohn, 2008; Brown et al., 2007), ecosystem (Hanna et al., 2011), customer engagement and participation (Parent et al., 2011; Muñiz and Schau, 2011; Kaplan and Haenlain, 2011), marketing budgeting (Weinberg and Pehlivan, 2011), corporate internal communications (Hearn et al., 2009), organizational knowledge management (van Zyl, 2008), history and development (Boyd and Ellison, 2008; Kambil, 2008; Schibrowsky et al., 2007), conceptual studies (Karakas, 2009; Constantidines and Fountain, 2008), relationship marketing and customer interaction (Quinton and Harridge-March, 2010; Ozuem et al., 2008), and direct marketing (Palmer and Koenig-Lewis, 2009).

Social media is collaboratively produced and shared content published through the internet. The term refers to networked digital platforms, which are used in communication between human beings (Hearn et al., 2009). Parent et al. (2011) suggest that social media platforms differ from traditional Web applications by offering users a place for content creation, content upload, networking, conversing, media sharing and bookmarking. According to Kietzmann et al. (2011) social media is interactive sharing, co-creating, discussing and modifying user-generated content through mobile and web-based technologies. To sum up, compared to the first generation online media or to the offline media, with social media one could equally be a content creator and a content consumer. In social media, neither the customer nor the company is a king. The king is content.

Social media is often used as a synonym for the term "Web 2.0" (Palmer and Koenig-Lewis, 2009; Riegner, 2007; Weinberg and Pehlivan, 2011). According to Constantidines and Fountain (2008) the term "Web 2.0" refers to digital communication platforms, while the term "social media" refers to the social characteristics (participation, openness, conversation, seamless, communal) of those platforms. However, they state that the term "Web 2.0" should be used as an umbrella term to include both technical features and characteristics. Kaplan and Haenlain (2010) suggest that although the term "Web 2.0" was not originally meant to describe a new technical era of the internet, it later acquired that meaning. According to them, because of the later development trend of the term "Web 2.0", the term "social media" should

be preferred. On this basis, it seems that social media is similarly more than just Web 2.0. As Weinberg and Pehlivan (2011) discover, Web 2.0 consists of computer network-based platforms upon which social media applications run.

The two key characteristics of social media are user-generated content and customer interaction (van Zyl, 2009; Riegner, 2007), which should be considered as a goal for marketing communication in social media. Muñiz and Schau (2011) prefer the term consumer-generated content (CGC). The interrelationship between UGC and interaction is quite logical as without any interaction there is no UGC. Thus, content is the result of interaction.

Palmer and Koenig-Lewis (2009) propose that UGC is an opportunity for a new kind of marketing communication, but it also challenges companies to give power to customers and loosen their own control over the discussion. In the same vein, Hennig-Thurau et al. (2010) argue that in traditional media, companies may formulate and control their marketing communication messages in the way they wish, but in social media they may only participate in the conversation and interaction with customers. Weinberg and Pehlivan (2011) state that social media has properties to empower consumers and give them influence, enabling relationship building between organizations and customers. Kietzmann et al. (2011) argue that in the age of social media, corporate communication has been democratized as the power has been taken from companies' marketing and PR by individuals and communities.

Why should an organization encourage customers to create content? First, marketing communication created by customers has been proved to be more credible in customers' eyes than the messages promoted by an organization, and so to have a more powerful impact on decision making (Riegner, 2007). Second, UGC may increase customers' value experience, because of interactive and fluent customer service and better opportunities to participate in product and service creation process (Muñiz and Schau, 2011). Third, active interaction and customer based content creation helps companies to build long-term competitive advantages (Parent et al., 2011).

Marketing communications performance measurement

Marketing performance in its narrow sense refers to gaining calculable and provable results from marketing activities. Ambler et al. (2001) for example state that "performance" refers to the financial results gained from business activities. In this study performance is however seen as not only related to financial results (something to be measured in currency e.g. sales, profits, increase in shareholder value, cash flow), but also inclusive of non-financial (e.g. brand awareness, customer satisfaction, customer loyalty / retention) results from marketing activities.

"Marketing" in turn refers to what the company does to turn prospects into customers and to satisfy customers and so create shareholder value (Ambler and Roberts, 2008). In the marketing literature, marketing performance measurement (or like Morgan et al. 2002 and

Donthu and Yoo 1998 state, marketing performance assessment), has been discussed mainly from two angles: marketing productivity (the efficiency approach) and the marketing audit concept (the effectiveness approach) (Morgan et al., 2002). Although marketing performance measurement has long been a concern in marketing literature, productivity and measurement analyses in marketing have advanced only sporadically in academic research (Morgan et al., 2002). The history of marketing performance literature dates back to the 1940s. According to Sheth and Sisodia (2002) in its early years marketing productivity analysis focused mainly on cost analysis. The same trend continued in the 1950s and 1960s, when marketing performance was still analysed mainly from a cost accounting point of view (Seth and Sisodia, 2002). Later, market-oriented and especially customer-oriented objectives came under the spotlight (Rust et al., 2004). In the 1990s, the marketing measurability discussion exploded (Greenyer, 2006) and after the millennium the same trend has continued.

Companies have long attempted to identify marketing key performance indicators (KPI) in order to measure the impact and success of marketing (Hanna et al., 2011). Sidhu and Roberts (2008) argue that in marketing literature little is known about the need for marketing to work more closely with the reported accounting performance of the firm. According to their research, marketing and accounting should have a morphological relationship and both of them should play an important role in a company's business strategy. There have been several calls for research on how marketing and accounting interrelate in both theory and practice (Inglis, 2008). In future, marketers should gain financial discipline and derive credibility from accountants, while accountants should learn about the nature of the organization's assets from marketers.

Ambler et al. (2004) state that both practitioners and academics have shown an increasing interest in the assessment of marketing performance. The growing interest is understandable, because according to O'Sullivan et al. (2007) and O'Sullivan et al. (2009), the ability to measure marketing performance positively affects firm performance and reporting frequency mediates the relationship. On the other hand, as Seth and Sisodia (2001) state, marketing's fundamental problem is low productivity and especially lack of accountability. So although the strong connection between business strategy, marketing strategy and marketing performance measurement with firm performance is recommended and proven by marketing literature (see e.g. Vorhies and Morgan, 2003), in practice, marketing measurement is quite fragmented and non-systematic (Amler et al., 2004). Vorhies and Morgan (2003) write that organizing marketing activities in ways that fit the business's strategic type is associated with marketing effectiveness and with marketing efficiency.

Lukas et al. (2005) state that marketing literature's failure to incorporate current financial valuation techniques and properly demonstrate its contribution to accounting research, suggest that future research is needed. According to McManus and Guilding (2008) it appears that there is also considerable potential for accountants to draw on points of focus raised in

the marketing literature to further advance marketing-focused accounting measures of performance. So marketing should collaborate with accounting both in academic research and business practice. According to Seth and Sisodia (2002) marketers can learn sophisticated cost accounting methods and the value of having well-defined rules and regulations governing its functions from accounting. They state that this could help marketers to become more productive and more effective. While this is a reasonable assertion, we would suggest that due to marketing being focused on generating future income, as compared to accounting being focused on the past, audit-based practices applying well-defined rules and regulations do not necessarily fit in with future-oriented marketing planning.

Recent advances in technology have created new opportunities for marketing and accounting integration (Phillips and Halliday, 2008). The digitized world has radically altered the ways in which firms can monitor their customers and collect data from their marketing communications. Gleaves et al. (2008) suggest that recent developments in marketing accounting measures, recent technological advancements in database management and increasing pressure on marketers to prove their worth are contributing to a need for more effective marketing / accounting synergy. Also according to O'Sullivan and Abela (2007) there have been several high-profile calls for more research in the area of marketing performance measurement. Modern corporations must adopt new technologies to build competitive advantage.

Hanna et al. (2011) raise an important point in saying that the social media era has changed companies' marketing communication as consumers increasingly adopt active roles in co-creating marketing. On the other hand, companies do not understand what performance indicators they should be measuring and how they should measure the new kind of interactive marketing communications. Even though the benefits of social media communication, UGC and digitized customer-seller interaction are proven and often accepted, practitioners are still insecure of how to measure the effects of the growth in interactive communication. Thus, business managers are uncertain how to allocate marketing effort and budget to social media (Weinberg and Pehlivan, 2011).

Marketing communications metrics

Ambler et al. (2001) propose that "metrics" should be limited to performance measures which are high level, necessary, sufficient, unambiguous, and ideally, predictive. Thus, marketing metrics should be calculable, in quantitative form, and auditable – in other words, reliable and professionally sourced (Ambler, 2002).

When discussing marketing performance measurement metrics, we often realize that marketing inputs (costs) are much easier to track than the outputs of marketing. It is important to note that there is no universally applicable way to measure marketing performance (Seth and Sisodia, 2002). Even if the main metrics were common between companies, the measurement strategy has to be customized to comply with the company's

strategy and marketing tactics. Marketing performance measurement has to be company related.

In general, marketing tactics should be based on objectives arising from marketing strategy. Furthermore, marketing strategy should be strongly based on company-level objectives and on business strategy. Marketing performance measurement has to be seen in the context of the whole company (Phillips and Halliday, 2008). To know whether the marketing objectives or whole company's business objectives are met or not, the company needs regular marketing measurement. As Ambler and Roberts (2008) propose, the first step in marketing performance measurement is to make the company's long and short term objectives explicit.

One challenge related to marketing performance measurement metrics relates to the short and long term effects of marketing actions. Some marketing actions may generate rapid short term outputs, while other actions may have an outcome only seen after a longer time. Ambler et al. (2004) suggest that brand equity could bridge this challenge. On the other hand, they point out that brand equity is often measured but rarely integrated into a formal measurement system.

Seth and Sisodia (2002) raise an essential observation related to continuous change in business environments. They state that in marketing performance measurement, it is important to ensure that metrics do not yield spurious relationships. For example a firm's market share could increase because its competitor lost its customers and not because of an improvement in the firm's marketing communications. That is why it is important for a company to have multiple metrics.

As stated above, better marketing performance measurement means more cooperation with the accounting department. Sidhu and Roberts (2008) notice that because of the lack of shared marketing-accounting language, different objectives, different tools and different metrics, the cooperation demands special care. A major challenge is that the financial accounting domain is dominated by rules and law, unlike the marketing domain that does not even have commonly accepted basics.

Ambler et al. (2004) state that the simplest measurement model includes actions (inputs) and profits (outputs). In the real world however the links between action and results are often difficult to prove. That is why marketing a measurement model also needs intermediate metrics (e.g. awareness, attitudes, satisfaction), behaviours (e.g. purchases, loyalty, word of mouth) and competitive metrics (e.g. market share) (Ambler et al., 2004). Ambler et al. (2001) found 19 primary general metrics: awareness, perceived quality, consumer satisfaction, relevance to consumer, perceived differentiation, brand / product knowledge, number of new customers, loyalty / retention, conversions, (trade) customer satisfaction, perceived quality, number of new products, revenue of new products, margin of new products, sales, gross margins, profitability. These 19 metrics they categorize in 6 groups: consumer attitudes, consumer behaviour, trade customer, relative to competitor, innovation and accounting.

The metrics that best summarize brand equity and market performance are sales information, market share, marketing investment (into the brand), relevant end user satisfaction, relative price, perceived product quality, customer retention, sales to new customers, share of turnover of the previous three years' products launched, product availability/distribution, a glossary of marketing and brand terminology, and relevant measures chosen by directors (Ambler, 2002).

During the 21st century both academics and practitioners have sought the best single financial indicator for marketing performance measurement. Peppers and Rogers (2005) argue that return on customer (ROC) is the best key performance indicator. Reichheld (2003) in turn proposes a new loyalty metric called promoter, which measures the likelihood of a company's customers recommending the company to another person. Other candidates for the single solution or "silver metric" include shareholder value, discounted cash flow (also used as a synonym for net present value, brand valuation, customer lifetime value, and customer equity), or return on marketing investment (Ambler and Roberts, 2008). According to Ambler and Roberts (2008), any single silver metric is inadequate and marketing performance measurement always requires more than one indicator.

Many recent managerial marketing measurement publications are positive about marketing ROI (see e.g. Jeffery, 2010; Sterne, 2010; Lenskold, 2003; Powell et al., 2011; Blanchard, 2011; Thomas and Barlow, 2011; Turner and Shah, 2011; Moeller and Landry, 2009; Arikan, 2008), but Ambler and Roberts (2008) for example criticize the usage of the ROI concept related to marketing measurement. They state that ROI is a good tool for comparing alternative investments and even the American Marketing Association (AMA 2005:8) identifies six ROI measures (incremental sales revenue, ratio of cost to revenue, cost per sale generated, changes of financial value of sales generated, cost of new customer, cost of old customer retention), but, according to Ambler and Roberts, none of those is really an ROI metric. They claim that ROI metrics promote underperformance and short-termism.

In our opinion this depends on how we look at the question of ROI. As ROI is the net return divided by the investment, and if taken literally, Ambler's and Robert's (2008) critique of the AMA's list is apt. On the other hand, if we consider ROI as an umbrella metric or more like a title for a financial metric category to track the performance of marketing actions in currency, ROI is a usable term in marketing performance discussion. In the same way, Rust et al. (2004) support the terms ROI and ROMI (Return on Marketing Investment), when they propose a conceptual marketing measurement model called "return on marketing".

Zahay and Griffin (2010) examine customer based performance metrics (such as customer lifetime value, customer retention and share of wallet) in association with the choice of generic positioning and segmentation strategies, while strategic positioning choices are indirectly associated with business growth performance. They further propose that

companies should focus on long-term customer metrics (for example customer retention and customer lifetime value) to maximize the growth of the company.

Rust et al. (2004) point out that the past 40 years of customer-centred marketing theory and practice also reflects on marketing metrics, by adding the measures of customer satisfaction, market orientation, customer value, and customer lifetime value. They also note that in recent years the concept of brand equity has been challenged by a more customer-oriented concept, that is, customer equity. For example Gleaves et al. (2008) propose customer profitability (CP) as a metric that links accounting and marketing.

In addition, Lukas et al. (2005) emphasize that marketing managers should pay attention to long-term measurement. However they accentuate that instead of customer-oriented metrics, marketers should focus more on shareholder value measurement using metrics like free cash flow, shareholder value added, economic value added, market value added, cash flow, return on investment, and cash value added. Although the shareholder value point of view is important in the marketing performance measurement context, the links between action and results are often difficult to prove and shareholder value difficult to directly quantify and measure. Thus marketing measurement models demand intermediate metrics (c.f. Ambler et al., 2004).

Customer profitability (CP) is one of the keys to effective marketing and it has been a subject of increasing attention in recent years (McManus and Guilding, 2008; Sidhu and Roberts, 2008). CP is associated with the concepts of customer lifetime value and customer equity (Sidhu and Roberts, 2008). Sidhu and Roberts (2008) condenses the link between these three concepts as follows: "If, as is proposed in this paper, CP can be considered, with some adjustments, equivalent to the CLV over a period of one accounting year, it is possible to see the inter-relation of these two terms. Since CE is defined as the sum of all current and future customers' lifetime values, we can clearly link CE with CLV by adding the NPV of future customers to the sum of the individual CLVs of all existing customers."

McManus and Guilding (2008) found in their literature review that increased customer satisfaction will have a beneficial impact on a firm's financial performance especially in a long-term context. In our opinion this is a well-defined reason to measure customer satisfaction and to implement metrics like customer equity, customer profitability, customer lifetime value, and customer retention.

Social media marketing metrics

From the company's point of view listening is even more important in social media than talking. After well-defined objectives and goal setting, which is the first phase of social media marketing (Powel et al., 2011; Thomas and Barlow, 2011; Blanchard, 2011; Turner and Shah, 2011; Sterne, 2010; Delahaye Paine, 2011), listening is the second step towards social media marketing measurement. Social media offers companies a new kind of environment for

listening (Thomas and Barlow, 2011; Blanchard, 2011). Barlow and Thomas (2011) state that companies can listen to social media in five ways: searching (manually used search engines), monitoring (automated methods to search), alerting (automated alert based search), measuring (quantitative manual and automated monitoring), and mining (research based search).

Barlow and Thomas (2011) state that social media analytics is a fresh concept, but it is based on the old principles of business analytics: if you can analyse what is being said about your company, its products and services in its business environment, you can reset your marketing objectives more precisely and plan your marketing actions more carefully.

Social media marketing ROI is a topic much discussed in managerial marketing literature. Blanchard (2011) draws a clear distinction between financial and non-financial outcomes of social media marketing. Financial outcomes are cost reductions or increased revenue, which must be measured in currency. ROI measurement is always a measurement of financial outcomes. Turner and Shah (2001) additionally propose that ROI must be measured in currency, but their opinion is slightly broader. To ease ROI measurement they propose companies use metrics such as customer lifetime value and cost per acquisition (CPA). They argue that by knowing CLV and CPA it is easy to calculate ROI. Arikian (2008) underlines that qualitative and quantitative metrics are intermediary indicators, while ROI metrics are the only truly reliable performance indicators. Delahaye Paine (2011) lists five ways to measure social media marketing ROI: sales or revenue, cost savings, paid versus earned search rankings, cost avoidance, and social capital (cost savings for example through customer service in social media).

Hanna et al. (2011) propose that social media marketers should focus on conversion tracking of downstream metrics such as sales and brand engagement. This means that marketing managers should define the key outcomes of a certain marketing campaign and quantify the relevant metrics (e.g., sales, reach, brand mentions, leads) to measure those outcomes. To avoid the situation where a company measures only the results they are seeking, it is worth remembering that marketing objectives should be considered as a starting point of the measurement process. If the measurement process focuses straight in on conversion tracking, the broader picture might be overlooked.

Barlow and Thomas (2011) present 22 social media marketing metrics in five categories. The categories are based on a five step sales funnel: exposure, influence, engagement, action / conversion, retention. Blanchard (2011) lists 55 metrics and sub-metrics to measure social media marketing and ten metrics (total volume of mentions, sentiment mix for mentions, SMS/text activity data, email activity data, traditional mail response data, retail store traffic, net transacting customers, net number of transactions, net revenue, and other conversion data) as management level key performance indicators. He underlines that all data the company gathers should measure the impact of the company's marketing activities on

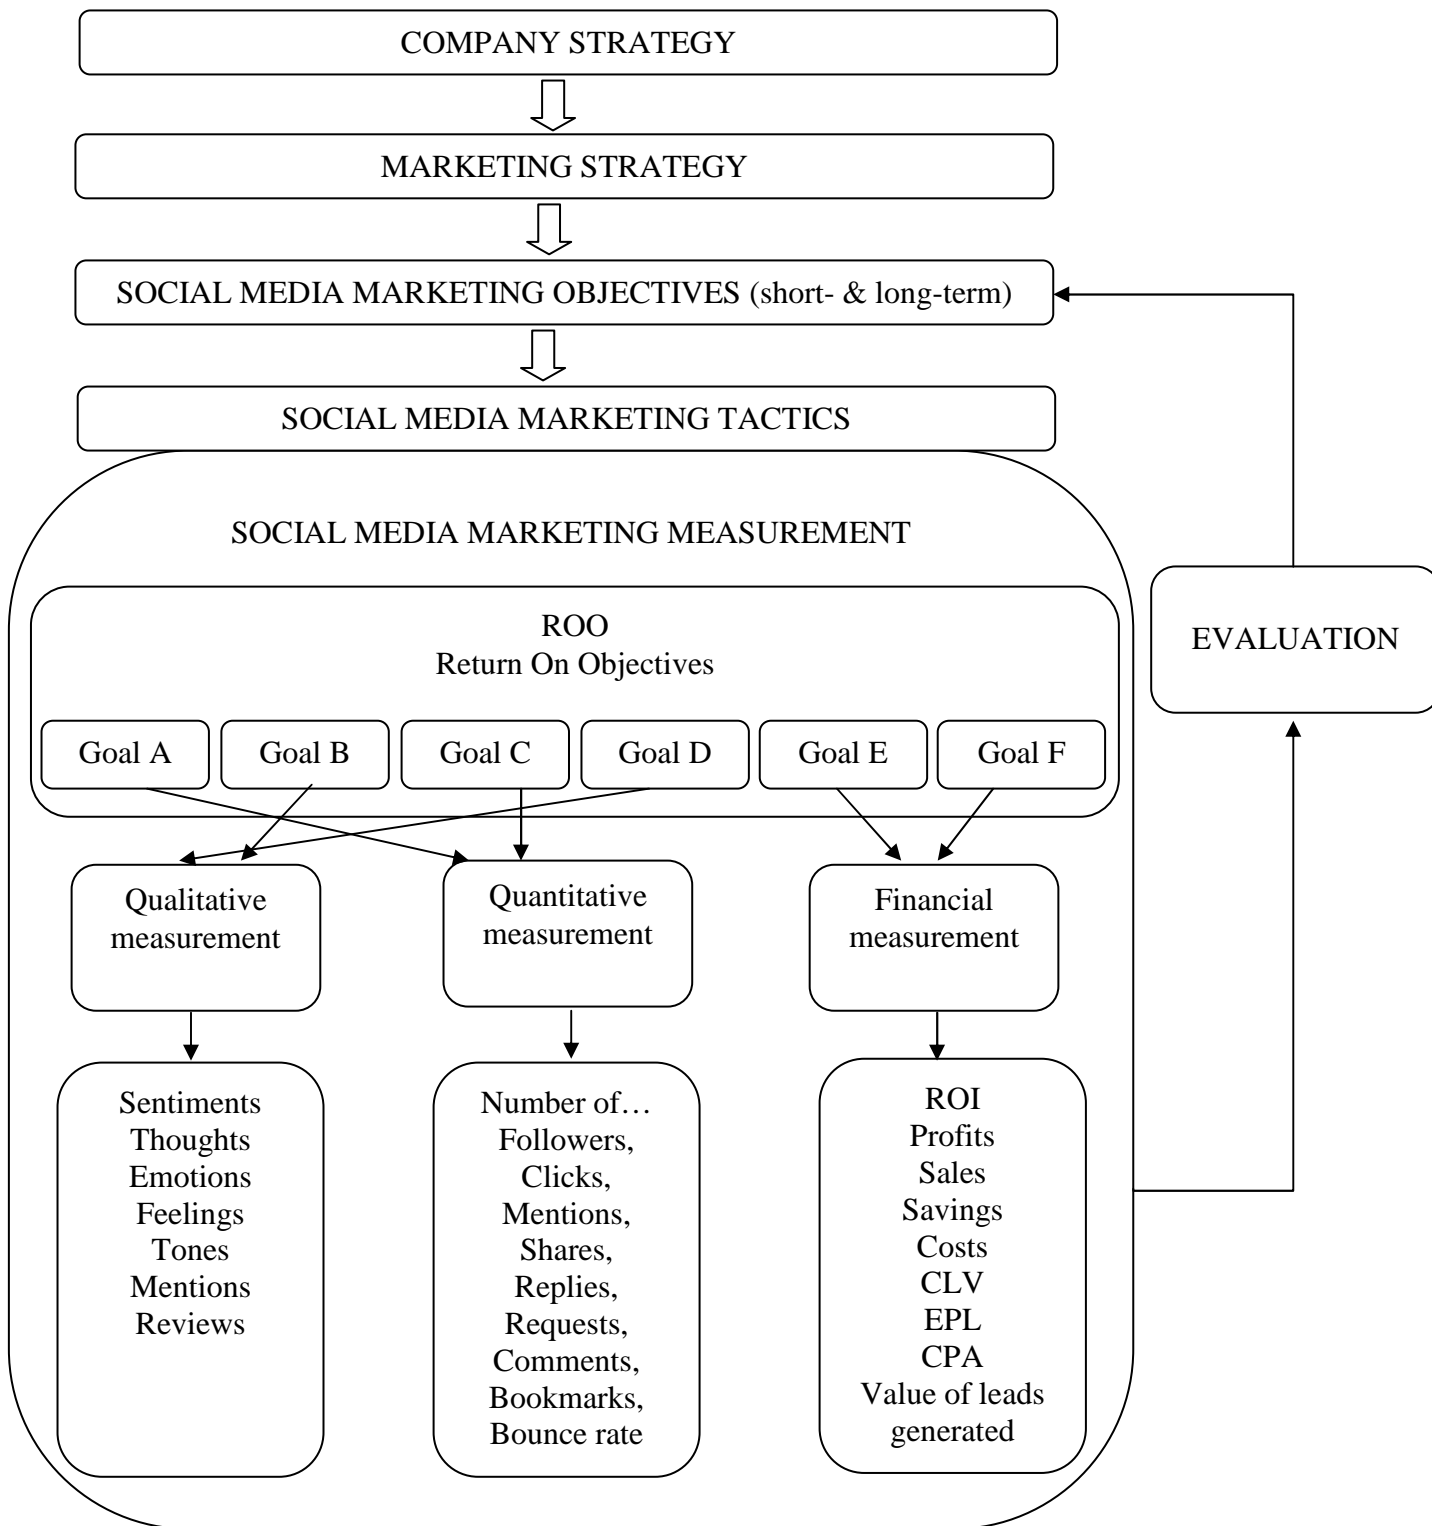

consumer behaviour. Turner and Shah (2011) list 20 metrics for social media marketing, but they note that those are only some of the metrics available. They categorize social media measurement metrics in three groups: measurement of quantity (e.g. number of followers, number of links, click-through rates), measurement of quality (e.g. sentiments, thoughts, emotions, feelings), and measurement of ROI (e.g. leads generated, customers retained, prospects converted, profits generated). Similarly, Arikan (2008) categorizes 17 online marketing metrics in three groups (qualitative, quantitative, ROI). Against this backdrop, we unify the metrics lists of Barlow and Thomas (2011), Blanchard (2011), Turner and Shah (2011), and propose 33 different metric to measure social media marketing (Table 1).

Table 1

<i>Qualitative Metrics</i>	<i>Quantitative Metrics</i>	<i>Financial Metrics</i>
<i>Negative mentions</i>	<i>Number of shares</i>	<i>Average buy</i>
<i>Positive mentions</i>	<i>Number of retweets generated</i>	<i>Average yield per transaction</i>
<i>Recommendations</i>	<i>Number of outbound replies</i>	<i>ROI</i>
<i>Product reviews</i>	<i>Number of click-throughs</i>	<i>EPL = earnings per lead</i>
<i>Geographic distribution of mentions</i>	<i>Number of customer service requests</i>	<i>Customer lifetime value</i>
<i>Consumers thoughts</i>	<i>Number of comments</i>	<i>Cost per acquisition</i>
<i>Consumers feelings</i>	<i>Frequency of transaction</i>	<i>Value of online transactions</i>
	<i>Number of bookmarks</i>	<i>Value of sales</i>
	<i>Number of inbound visits</i>	<i>Value of conversions</i>
	<i>Number of subscribers</i>	<i>CPM</i>
	<i>Number of event attendees</i>	<i>Value of leads generated</i>
	<i>Bounce rate</i>	<i>Value of prospects converted</i>
	<i>Conversions</i>	<i>Value of customer retained</i>
		<i>Costs</i>

Most marketing managers struggle to analyse a large number of metrics on a weekly basis, so a company has to choose the best metrics for each objective and situation. To do that it is important to categorize the metrics in groups. Based on our conceptual discussion, we categorize the different social media marketing performance metrics in Figure 1 in three groups labelled qualitative, quantitative and financial (ROI).

Figure 1 Conceptual model of social media marketing measurement

Conclusion

The objective of this study was to create a framework for measuring the effectiveness of social media marketing communications. We asked whether the existing marketing communications performance metrics are still valid measures of the effectiveness of social media marketing. By drawing upon literature on marketing performance metrics, social media marketing, and social media metrics we proposed a framework (Figure 1) for assessing the available social media marketing performance metrics.

Social media has become a popular research topic among marketing academics in a short time (e.g. Kietzman et al., 2011; Dennis et al., 2009; Liu et al., 2011). Although the concept of social media is still in its infancy, during the last ten years the topic has been studied from several standpoints. Our review of the literature reveals that social media marketing is customer-centred – its key elements being UGC and customer interaction (van Zyl, 2009; Riegner, 2007). It seems obvious that social media literature is constantly growing and enhances its popularity among business practitioners and academics in future.

When companies engage with their customers, the focus of their marketing measurement should be on the customer reaction to the tactics employed by their marketers. The digitized environment facilitates reaction tracking and marketing communications measurement. In the light of the findings of the study, we propose that marketing measurement models developed in the past 40 years are still usable, and even more important than ever. The shift towards a digitized interactive marketing environment does not necessarily mean that a whole array of new measurement metrics is needed.

Discussion of marketing performance measurement has deep roots in marketing history. Since the 1940s, writers have searched for the best ways to establish the results and benefits accruing from marketing actions (Seth and Sisodia, 2002). The marketing performance measurement discussion was initially focused on cost analysis and auditing (Seth and Sisodia, 2002), but later shifted to market orientation and especially customer orientation (Rust et al., 2004). The typical metrics employed in cost analysis are profits and savings; with market orientation, they are shareholder value, brand equity and market share; while with customer orientation they are CLV, CP and customer satisfaction.

The digitalization and social media technologies have enlivened the discussion around marketing performance measurement during the last ten years (Gleaves et al., 2008; Phillips and Halliday, 2008). New technologies enable more precise qualitative and quantitative marketing communications measurement and on the other hand executive boards want tangible results from marketing actions. The latter might be also the reason why many marketing authors have asked for more synergy between marketing and accounting (e.g. McManus and Guilding, 2008; Seth and Sisodia, 2002; Lukas et al., 2005; Phillips and Halliday, 2008).

We found that the marketing communications measurement must be company specific (Seth and Sisodia, 2002) and have its roots in the company's business strategy (Phillips and Halliday, 2008). Measurement practices should examine how both long-term objectives and short term objectives are met (Ambler and Roberts, 2008). Especially in the social media context, but also in a broader sense, marketing performance should be measured with several metrics. Metrics should be high level, necessary, sufficient, unambiguous, and ideally, predictive. Thus, marketing metrics should be calculable, in quantitative form, and auditable – that is, reliable and professionally sourced (Ambler, 2002).

According to our research there is no broadly accepted opinion of a single critical performance indicator (CPI). Many authors have classified social media marketing metrics in three groups: qualitative, quantitative and financial (ROI) (see e.g. Arikan, 2008; Turner and Shah, 2011). Based on our literature review this classification could be useful, but more research is needed in the future. In any case, through social media measuring, monitoring and searching, companies can gather both quantitative and qualitative data. The relationship between qualitative metrics and ROI metrics should be investigated carefully.

Because marketing communications in social media is customer-oriented (or even customer driven), marketing measurement metrics should also be customer oriented. In our literature review we noticed that metrics to measure marketing communications performance has developed towards a customer orientation. Metrics like CP, CLV and CE have won favour from many authors (see e.g. McManus and Guilding, 2008; Sidhu and Roberts, 2008; Zahay and Griffin, 2010; Arikan, 2008; Blanchard, 2011).

Limitations and further research

It is necessary to point out that our analysis is not without its limitations. For example, a large share of the literature concerning social media marketing measurement is managerial in nature. Our study can also be considered as a pioneering study attempting to combine traditional marketing performance literature and social media marketing literature. Thus, the results presented are merely indicative rather than conclusive. Given the early stages of the literature concerning the measurement of social media marketing, it was also difficult to draw robust conclusions about the best metrics everyone should use.

In an attempt to mitigate these limitations, we identify several fertile avenues for further research in this domain. As stated above, marketing communications performance measurement in the era of social media is a growing research topic for both academics and practitioners. For example social media monitoring, web analytics, cloud-based customer service and e-commerce might strongly develop marketing performance measurement potential. It would be interesting to study how companies have combined the increased interest both in social media and in marketing performance measurement in practice. How has the movement towards social media changed measurement practices?

In future, empirical research is needed to examine and validate social media marketing performance measurement. Empirical studies could specify and evaluate the most common metrics employed to measure marketing performance in the social media era. Further research could examine how marketers formulate their key performance metrics for social media marketing communications. An interesting question is whether the popularity of marketing accounting will continue to increase or perhaps we are moving towards more qualitative type of measures, or a mix of the two forms.

We believe, in line with Morgan et al. (2002) that marketing practitioners are often unable to prove and support cause and effect relationships between marketing inputs (money), tactics (actions) and outcomes (e.g. growth in profit). On the other hand, the increased research interest, the greater demand for more precise reporting from marketing managers, and especially the recent movement towards a digitized interactive business environment, make possible remarkable changes in marketing communications performance measurement. The theoretical discussion on marketing performance measurement should continue and step by step transform into practice.

**THE INFLUENCE OF MANAGERIAL DISCRETION, INNOVATION AND UNCERTAINTY ON
EXPORT INTENSITY: A REAL OPTIONS PERSPECTIVE**

Trevino, Len¹

¹Loyola University, New Orleans, USA.

Abstract

Geographic sales diversification or exports is a multi-dimensional phenomenon that has been examined primarily using a single theoretical perspective from either the international trade or organizational strategy. We draw on the insights of managerial discretion, innovation and real options literatures and examine the role of managers, context and environment to explain an industry's reliance on exporting. We find that a combination of managerial discretion, innovation and uncertainty leads to increased levels of exports. We contribute to the literature by highlighting that a combination of managerial discretion, the capacity to offer innovative products, and uncertainty in the external environment motivate internationalization.

Keywords: International business strategy, Internationalization, Industry exports, Managerial discretion, Industry innovations

Introduction

Although the diversification of sales markets through exports is a complex strategic decision that is influenced by many factors, this phenomenon has been analyzed primarily using a single theoretical lens from either the international trade or organizational strategy literatures. One such perspective that has been influential in explaining exports as part of the internationalization process is the sequential approach to internationalization (Cavusgil, 1984; Johanson & Wiedersheim-Paul, 1975; Johanson & Vahlne, 1990). The sequential theory of internationalization builds on product life cycle and international trade concepts to explain the process of internationalization (Mudambi & Zahra, 2007). This theory suggests that firms with innovative products will first establish themselves in their respective domestic markets before expanding internationally; usually beginning with exporting to foreign markets (Johanson & Vahlne, 1990; Mudambi & Zahra, 2007).

Organizational strategy literature, conversely, has historically relied on transaction cost economics to explain the process of geographic sales diversification as part of the internationalization strategy (Boisot & Child, 1996; Chi & McGuire, 1996). Transaction cost economics (TCE) highlights the difficulties in writing, executing, and monitoring contractual arrangements with international partners (Oxley, 1999; Williamson, 1985). Transaction cost economics focuses on contractual hazards and opportunistic behavior

that could surface among exchange partners because of uncertainty, information asymmetry and difficulty in enforcing contracts (Verwaal & Donkers, 2002; Zacharakis 1997).

Though each of these perspectives has contributed to explaining the choice of modes for internationalization, a consensus is emerging among scholars that internationalization is a complex, multidimensional phenomenon; and a more complete picture of the phenomenon would emerge by incorporating the role of managerial discretion in the analysis (Chi & McGuire, 1996; Crossland & Hambrick, 2007, 2010; Oviatt & McDougall, 2005; Reuer & Tong, 2005). Indeed, the role of the top management team (TMT) cannot be underscored enough in strategic decisions such as internationalization—managers need high levels of discretion to pursue internationalization (Crossland & Hambrick, 2010; Hambrick & Finkelstein, 1987). Concomitantly, literature is yet to focus its attention on how managers with decision-making latitude leverage contextual factors such as innovation levels in combination with environmental pressures to pursue geographic sales diversification (Leonidou, 1998; Zahra et al., 2000). The role of managerial discretion in combination with contextual and environmental factors remains mostly understudied in the literature (Crossland & Hambrick, 2010; Leonidou & Katsikeas, 1996; Salomon & Shaver, 2005).

In this study, we draw upon managerial discretion, real options and innovations literature to examine the role of managerial discretion, industry context and environment in motivating geographic sales diversification or exports. We develop our theoretical framework around the following overarching theme: Managerial discretion in combination with industry contextual and environmental variables motivates greater reliance on exports as a growth option. As such, we propose that the industries where levels of managerial discretion, innovation and uncertainty are high will display greater geographic sales diversification. By integrating these variables into our theoretical framework, we respond to the calls for a deeper examination of the role of managers and innovation in the internationalization process (Bernard & Jensen, 2004; Leonidou, 2004; Lohrke & Bruton, 1997; Salomon & Shaver, 2005).

We test our hypotheses using a large sample of U.S. manufacturing industries. Industry-level analysis is used because firms in an industry often share attributes that allow for the aggregation of firm effects and the development of a composition model (Klein, Dansereau & Hall 1994). This is particularly valid for various modes of geographic diversification, such as industry exports. Industry exports are a key international trade metric that is reported universally by the national economic agencies (e.g., U.S. Bureau of Economic Analysis or the U.K. Office for National Statistics (ONS)). We use the notion of homogeneity to view firms embedded at the industry level of analysis because key strategies initiated by the firms, for example, exporting innovative products to diverse international markets, often spill over to other firms. Firms within an industry learn about each other's key strategies through business intelligence, industry

conferences, trade publications, forums and shows, and employee mobility (Ahmadjian, 2004; Henderson & Cockburn, 1996). They often mimic one-another's strategies for rent generation in isomorphic manner as industry is a collective, group level entity composed of a number of firms and their managers (Aldrich, 1999; Appleyard, 1996).

We use a sample of U.S. industries because there is a high degree of variance among U.S. industries, both in terms of managerial discretion and innovation (Hambrick & Abrahamson, 1995; Silverman, 1999), and this presents an opportunity to test our theoretical model in this setting. The U.S. business environment is one of the most technologically progressive environments in the global marketplace because U.S. firms have been at the forefront in punctuating equilibrium with cutting-edge innovations (Segal, 2004). In addition to being the largest producer of knowledge-based products, the U.S. is also the largest consumer of innovative products (Cateora & Graham, 2002; Segal, 2004). Indeed, with every industry turning global and value chain integration within industries and across geographical boundaries (Inkpen & Ramaswamy, 2007), U.S. managers continually face the challenge of finding an optimal balance between boundary expansion strategies in large domestic versus international markets (U.S. Department of Commerce, 2000). Thus, we believe that the U.S. industry environment provides an ideal setting for analyzing the role of innovations and managerial discretion in influencing industry exports in the presence of uncertainty.

We contribute to the extant literature by developing an integrated theoretical model that examines the role of managers, context (i.e., innovations) and environmental pressures (i.e., technological change) in explaining variance in the geographical diversification via exports. We begin with a brief review of the real options, managerial discretion and innovations literatures and discuss their relevance in the context of internationalization particularly industry exports. Next, we develop hypotheses and subsequently present the methods, results, discussion, and implications sections.

Literature Review

In the context of geographic sales diversification, the use of real options lens is particularly applicable because exports is generally an entry-level strategy that further provides an option for enhancing commitment using modes such as international joint ventures (IJV), foreign direct investments (FDI), and acquisitions of foreign firms—these modes are fraught with higher levels of uncertainty and complexity than exports (Johnason & Vahlne, 1990; Leonidou & Katsikeas, 1996; Oviatt & McDougall, 2005). However, exporting itself is a complex strategic decision that is influenced by various uncertainties in foreign markets because these often have different social, political, monetary and legal systems (Oxley, 1999; Salomon & Shaver, 2005; Zacharakis, 1997). For the domestic U.S. managers, it is relatively more challenging to weigh trade-offs between risk and expected returns from less familiar and geographically

distant product-markets because the U.S. is not only the largest global producer of most innovative products but also the largest consumer of them (Segal, 2004). For them, another viable alternative to industry exports is an increased focus on the large U.S. home market (Bernard & Jensen, 2004; Salomon & Shaver, 2005). Overall, managers have a number of options for boundary expansion in lieu of exports—for example, use of other modes and a greater focus on domestic U.S. market.

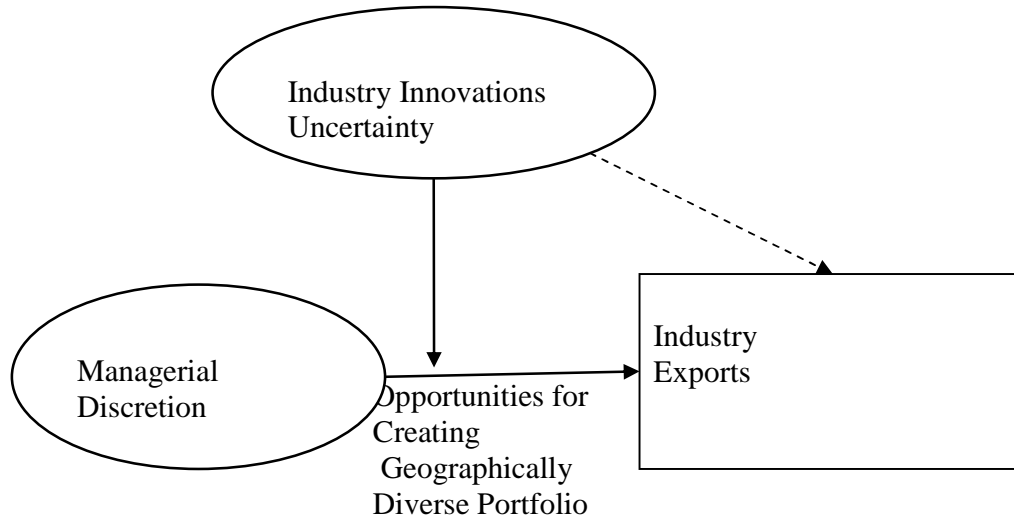

Industry Exports, Uncertainty and Real Options View

Real options⁸¹ represent investment opportunities that allow managerial response in a contingent fashion by conferring managers the right, but not the obligation, to undertake specific actions in the future for claiming upside opportunities (Kogut & Kulatilaka, 2001; McGrath & Nerkar, 2004). In the presence of uncertainties such as those associated with venturing in foreign markets, real options reflect managers' flexibility in adapting their future actions (for example, by enhancing their investment and commitment for international boundary expansion when successful else reducing these if results are not commensurate with efforts) (Bowman & Hurry, 1993; Reuer & Tong, 2005).

Under conditions of uncertainty, managers employ a stepping-stone approach by exercising the option of expanding sequentially into new foreign markets rather than making huge commitments upfront (Chi & McGuire, 1996; Su et al., 2009). They may further weigh strategic positioning in the familiar home market against risks and uncertainties in the distant foreign markets. In essence, we focus exclusively on exports because export-strategies are based on managers' informational and experiential knowledge relevant to exports market as they are often the first stage of the internationalization process (Morgan et.al, 2003). Further, from the lens of real options, exports provide firms with high levels of flexibility and opportunity to limit large losses at early stages of internationalization while simultaneously retaining the option to reap additional rents by committing further if expected payoffs are realized over time. Figure 1 depicts the research model.

81 Su and colleagues (2009) state that the options view has been applied to a diverse set of managerial decisions including global manufacturing coordination, joint venture termination, venture capital investment, technology expenditure, and outsourcing contracting from both the client's and the vendor's perspectives.

Figure 1: Theoretical Framework for Managerial Discretion, Context, Environment and Industry Exports

Managerial Discretion

Though geographical diversification provides options for reaping additional rents with minimal upfront investment as discussed above, it is the managers who must ultimately pursue such opportunities. Managers need high levels of discretion for taking such policy decisions because the development of an exporting strategy and its operationalization involves streamlining export channels, marketing networks, workforce skills, and credit providing ability—these involve not only monetary but long-term social, political, and legal commitments (Nolle, 1991). Consistent with the literature, ‘managers’ in our context are the executives in key hierarchical positions with differential authority. These managers have the potential to influence the actions and outcomes of their firms as they provide direction by making strategic choices from available options.

Managers have latitude of action or discretion when there is a relative absence of constraints and when multiple plausible alternatives are available to influence strategic outcomes. Managerial discretion, or their latitude for action, is an indicator of their relative influence on strategic decision making and consequent organizational outcomes (Hambrick and Finkelstein, 1987; Hambrick and Abrahamson, 1995). Managers differ substantially in the degree of discretion they possess in their industries; indeed, they have greater decision-making freedom in some industries than in others (Adner and Helfat, 2003; Hambrick and Abrahamson, 1995; Finkelstein et al., 2009, pp. 26-28). We develop our theoretical model⁸²

⁸² Finkelstein and Boyd (1998, p.179) state: “Although it is conceivable to study discretion in terms of specific actions of managers, such an approach is problematic because it requires clear knowledge of whether a specific strategic move is managerially driven or externally motivated. Without in-depth, clinical examination of managerial actions and the context surrounding those actions, such an approach to the study of discretion is quite problematic. By focusing on the determinants of discretion, it is possible to assess in a more objective manner the potential

drawing upon the determinants of managerial discretion emanating from the task environment because a number of empirical studies demonstrate that variance in the levels of discretion emanating from task environment is strongly associated with the differences in the top managers' influence on strategic decisions (e.g., Datta & Rajagopalan, 1998; Finkelstein & Boyd, 1998; Finkelstein & Hambrick, 1990; Finkelstein & Hambrick, 1996; Hambrick & Abrahamson, 1995; Rajagopalan & Finkelstein, 1992).

We begin with a premise that a differential in levels of discretion affects managerial choices and strategic decisions, such as pursuing geographical diversification. Both the development and operationalization of geographic sales strategies involve certain risks (e.g., legal, supply-chain, liability of foreignness etc.) and managers need latitude for pursuing such activities outside not only firm boundaries but also geographic boundaries (Hambrick & Finkelstein, 1987; Sanders & Carpenter, 1998). Further, managers need leeway to adapt in the face of environmental pressures and opportunities as they pursue geographic diversification strategies.

Industry Innovations

Innovations motivate boundary expansion as firms tend to enter markets where their innovations could provide both competitive and comparative advantages (Anand, Oriani, and Vassolo, 2010; Sahaym et al., 2007). Industry innovations reflect the application and exploitation of tacit and explicit knowledge and resource bundles for developing outcomes that are both unique and tangible (Afuah, 2003; Hunt, 1997; Kogut & Zander, 1993; Martin & Salomon, 2003). Prior studies have found that greater the similarity of firms' pre-entry technological products to the requirements of other markets, the greater is the likelihood of firms' entry in those markets (Anand 2004, Silverman 1999). Managers with innovative product offerings based on superior knowledge have more leeway to pursue internationalization because such products have the potential to deliver competitive and comparative advantages in world-wide markets (Hitt, Hoskisson & Kim, 1997; Porter, 1998). Such products often create their own niche, and if radical, such innovative offerings have the potential to create new segments in the global marketplace (Conner & Prahalad, 1996; Porter, 1998; Tushman & Anderson, 1986). Managers with innovations also venture into international markets to redeploy their innovative products to the demands of the foreign markets in an effort to obtain economies of scope (Anand, Oriani, and Vassolo, 2010). Further, such products meet the demands of 'technology-savvy' market segments worldwide. In essence, innovative product offerings motivate geographic sales diversification.

latitude of action facing a manager, an approach that also enables larger-sample studies of discretion and its consequences...(e.g., Finkelstein & Hambrick, 1990; Hambrick, Geletkanycz, & Fredrickson, 1993)."

Summarizing, we build on the insights of real options, managerial discretion and innovations literatures because ultimately, we examine whether managerial discretion in combination with industry contextual and environmental variables motivates geographic diversification via exports. Real options view highlights the value of flexibility and adaptability for managers as they gain the right to reaping additional rents with minimal upfront investment in their pursuit of internationalization, whereas managerial discretion underscores the latitude that managers have in pursuing internationalization strategies while bearing risks and uncertainties associated with these. We begin with a premise that a combination of higher levels of discretion, innovativeness and environmental pressures motivates geographic sales diversification using exports.

Hypotheses and development

Managerial Discretion and Industry Exports

Managerial discretion, as discussed above, is managers' latitude for action and reflects their influence on strategic decision making and consequent organizational outcomes (Hambrick and Finkelstein, 1987; Hambrick and Abrahamson, 1995). Managerial decisions regarding geographic sales diversification are complex and uncertain requiring managerial risk-taking and concrete decision making. Such decisions involve commitment of resources and risk-bearing associated with the process (Hunt, 1997; Sanders & Carpenter, 1998). Further, geographic sales diversification demands streamlining of export channels, creation of marketing networks, developing workforce skills, and credit providing ability—each of these involve uncertainty, complexity and not only monetary but long-term social, political, and legal commitments (Nolle, 1991; Sanders & Carpenter, 1998). However, a key premise is that in the face of globalization, expansion outside geographic boundaries and developing geographically diverse options are critical for long-term growth (Crossland and Hambrick, 2010; Hambrick & Finkelstein, 1987; Ramamurti, 2009; Sanders & Carpenter, 1998).

Though internationalization provides geographically diverse options for long-term growth in global markets, it also exposes managers to numerous hazards due to unpredictability stemming from differences in legal, political and social systems, property rights, differing languages, norms and religions, monetary policies and fluctuating exchange rates (Hymer, 1976; Williamson, 1985). In essence, global expansion increases opportunities, risks and complexity simultaneously; and to contend with such challenges, managers must have significant latitude, authority and control for benefitting from opportunities while bearing risks and managing complexity (Sanders & Carpenter, 1998; Hunt, 1997). Firms need to develop various competitive assets to become successful exporters, including extensive export channels, marketing networks, workforce skills, and the ability to provide credits to buyers (Nolle, 1991). Strategic relationships for dealing with different legal, political and social systems, social norms,

property rights and monetary policies need to be established to overcome the inherent liabilities of operating in an unfamiliar setting (Hymer, 1976). Managers require high levels of freedom to simultaneously manage multiple product-markets involving different regulatory systems and market needs.

Managerial discretion view proposes that industries differ substantially in terms of managerial freedom to make key strategic decisions such as internationalization (Finkelstein & Hambrick, 1990; Shimizu & Hitt, 2004). In some industries, managers have high levels of discretion in taking such strategic initiatives, due to the presence of strategic alternatives and the relative absence of decision-making constraints (Hambrick & Abrahamson, 1995); in other industries, managers are relatively constrained to pursue internationalization. In industries where managerial discretion is high, managers have greater authority and control over organizational resources, structure, and performance. In these situations, they can assert more direct influence over important organizational decisions, such as internationalization (Finkelstein & Hambrick, 1990). Constraints in the task environment are generally less severe and managers have resource alternatives (Hambrick & Finkelstein, 1987). Boards in such industries are generally more receptive to bold managerial decisions, such as the decision to internationalize operations. Thus, managers are able to assert their decision choices on boards relatively easily (Finkelstein & Hambrick, 1990). In sum, managers have the latitude to pursue industry exports for organizational growth and to earn additional revenues in global markets in industries where levels of discretion are high. As such, our base hypothesis is:

Hypothesis 1. High levels of managerial discretion in an industry will be positively associated with industry exports.

Managerial Discretion and Innovation

In the presence of managerial discretion, innovative product offerings facilitate the process of geographic sales diversification. Innovation requires the integration and application of tacit and explicit dimensions of knowledge for the creation of unique product offerings (Afuah, 2003; Hunt, 1997; Kogut & Zander, 1993; Martin & Salomon, 2003). Further, firms within industries engage in continual reconfiguration, recombination and exploitation of unique bundles of resources for generating valuable product offerings; and certain industries are more knowledge intensive and generate more innovations than others (Afuah, 2003; Grant, 1996; Utterback & Afuah, 1998). Both competitive and comparative advantages result from differences in the nature of knowledge that firms possess (e.g., patents) and their ability to exploit that knowledge in relevant foreign markets (Morgan et.al, 2003; Steensma & Lyles, 2000; Tallman & Phene, 2007). Indeed, managers with unique product offerings based on superior knowledge and competencies have more leeway to pursue internationalization because such products have the

potential to deliver competitive and comparative advantages in the global marketplace (Hitt, Hoskisson & Kim, 1997; Porter, 1998).

Managers with high levels of discretion particularly benefit from innovative product offerings because such products often create their own niche, and if radical, such innovative offerings have the potential to create new segments in the global marketplace (Conner & Prahalad, 1996; Porter, 1998; Tushman & Anderson, 1986). Moreover, innovative product offerings diffuse quickly in worldwide markets because there is homogeneity for innovative products in major export markets and knowledge swiftly flows across geographic boundaries (Ohmae, 2005; Tallman & Phene, 2007). Firms with cutting-edge innovations find markets not only in developed countries but also in 'technology-savvy' market segments worldwide.

Managerial decision making for internationalization with such products becomes less challenging as the uncertainties associated with introducing such products in the global market attenuate. With innovations showing promise in the global market, stakeholders are generally more amenable to following managerial decisions for geographic sales diversification—they provide greater authority to the managers for asserting their decisions on the firm despite the risks and uncertainties associated with them. This is crucial for the managers because geographic sales diversification involves myriad uncertainties associated with macroeconomic, global, legal, socio-cultural and political environment (Gupta, Smith and Shally, 2006; Porter, 1998).

In essence, managers with high levels of discretion are further motivated to develop export markets in the presence of innovative product offerings based on superior knowledge and technological competencies as these have high potential to deliver competitive and comparative advantages in the global marketplace (Afuah, 2003; Autio et al., 2000; Kotabe, 1990; Miller & Friesen, 1984; Zahra et al., 2000).

Hypothesis 2. The relationship between managerial discretion and industry exports will be stronger when levels of innovations are high.

Uncertainty and Real Options Perspective

Uncertainty is the difficulty in predicting or foreseeing future events and advances—uncertainty arises when a decision maker cannot reliably forecast events based on available information (Anderson & Tushman, 2001). It has been argued that the less foreseeable the future state of the environment, and the higher its level of uncertainty, the more difficult strategic decisions will be (Steensma & Corley, 2001; Tushman & Anderson, 1986). Industries vary in the extent to which predictions can be made regarding the future, with some being closer to equilibrium than others. A primary source of environmental

uncertainty is technological change (Schilling & Steensma, 2001; Teece, 1986; Tushman & Anderson, 1986). In fact, technological change has been found to create high levels of uncertainty in the overall market environment (Anderson & Tushman, 2001). Technological change and uncertainty disrupt the underlying equilibrium of an industry (Schumpeter, 1942). Firms may lose both competitive and comparative advantage in the face of uncertainty because uncertainty has the potential to render the existing resources of a firm obsolete (Leonard-Barton, 1992).

Conversely, technological uncertainty provides an impetus for both the product and geographic diversification (Anderson & Tushman, 2001; Schumpeter, 1942). On one hand, firms may focus on the use of internal modes for developing new technologies; on the other hand, they may diversify geographically to exploit their existing products and technologies (Anderson & Tushman, 2001; Tushman & Rosenkopf, 1992). Firms may also venture into international markets for the creation of a portfolio of 'geographic' growth options—geographic diversification provides benefits such as resource sharing and risk distribution in geographically diverse markets while allowing for a stepping-stone approach in terms of future investments (McGrath & Nerkar, 2004; Reuer & Tong, 2005). A stepping-stone approach makes managers' investments flexible for deploying as opportunities arise in various locations—they avoid any huge commitment outright thereby limiting large losses at any step while retaining the option to reap positive gains by committing further in select locations if the expected payoffs are delivered. They can increase involvement in select geographic markets as the markets evolve, information asymmetries attenuate, and uncertainty resolves over time (McGrath & Nerkar, 2004; Reuer & Tong, 2005).

Uncertainty, Managerial Discretion and Industry Exports

Managers require considerable freedom and authority over organizational resources, structure, and performance to adequately influence and implement strategic decisions (Hambrick & Abrahamson, 1995). When managerial discretion is high, managers have significant authority and control over their firms and this leverage enables them to pursue industry exports for worldwide growth (Bettis & Hitt, 1995; Finkelstein & Hambrick, 1990).

In the presence of uncertainty in the domestic market, managers may seek opportunities for sharing investments and distributing risks outside geographic boundaries. They require high levels of discretion to create growth options by entering into diverse international markets for hedging against uncertainty in the domestic market (Kogut & Kulatilaka, 2001). In the industries with high levels of managerial discretion, managers possess the freedom to build a geographically diverse portfolio of growth options—they can call for the option to grow and expand internationally rather than remaining constrained and tied only to the domestic market. Uncertainty pressures managers to exercise their discretion, authority and control to diversify into potentially profitable international markets to maximize rents. In essence,

under conditions of uncertainty, managers with high levels of discretion will face pressures to use their latitude and power to distribute risk by diversifying into international markets. Pressures applied by uncertainty, on one hand, drive managers to explore international markets for creating a portfolio of growth options. High levels of managerial discretion, on the other hand, provide managers with the authority, control and power to distribute risk by creating a portfolio of growth options by entering into diverse international markets. The presence of both uncertainty and managerial discretion in the industry context serves as an impetus for internationalization in general, and exports in particular.

In contrast, when uncertainty is low, despite having high levels of discretion, managers operating exclusively in domestic markets do not face significant pressure for distributing risks and hedging uncertainty by creating geographically diverse growth options. Under this scenario, managers may not feel enough pressure to explore international markets for building a geographically diverse portfolio of growth options. As such, they will continue to allocate resources domestically to satisfy local managerial hubris and agency by focusing on home market rather than exploring new international markets that involve search costs and risks (Christensen & Bower, 1996; Zahra, 1996).

In summary, managers with high levels of discretion feel greater pressures to pursue international markets in the face of uncertainty, thereby distributing risk and sharing resources.

Hypothesis 3. The relationship between managerial discretion and industry exports will be stronger when the levels of uncertainty are high.

Innovations, Discretion, Uncertainty and Industry Exports

In the presence of managerial discretion, conditions will be particularly ripe for internationalization via exporting when both the levels of innovations and uncertainty are high. Managers with high levels of discretion particularly benefit from innovative product offerings because such product offerings are based on superior knowledge and competencies and provide opportunities for entering new markets. When the levels of managerial discretion are high, managers will have the latitude to build a geographically diverse portfolio of options with innovative products for entering into international markets for growth purposes in lieu of facing uncertainty in the domestic market (Kogut & Kulatilaka, 2001; Tong, Reuer & Peng, 2007). Further, uncertainty in the domestic market develops pressure on the managers for hedging through geographic sales diversification, especially because levels of technological change and uncertainty vary in different nations (Kogut & Kulatilaka, 2001; Tong, Reuer & Peng, 2007). Managers may also explore international markets for enriching their portfolio of 'geographic' growth options. In sum, when the levels of both the innovations and uncertainty are high, managers with high levels of discretion are induced to use their latitude for diversifying into potentially

profitable international markets with their innovations for maximizing rents and for hedging against risks and uncertainty.

In spite of the presence of managerial discretion, conditions will be especially detrimental for geographic sales diversification when levels of innovations as well as uncertainty are low. In the absence of innovative product offerings, managers will be highly constrained due to the lack of novel, cutting-edge technology that could help them in penetrating international markets. They would hardly reap any benefits of differentiation that generally provides competitive and comparative advantage to foreign firms in the global markets (Hitt, Hoskisson & Kim, 1997; Porter, 1998). The stakeholders would not have as much faith in the managerial decision to expand internationally and it is plausible that they may resist such move. International markets have certain hunger for innovative products and reaching those markets with relatively obsolete, unexciting product offerings may be detrimental in the long run (Afuah, 2003; Hitt, Hoskisson & Kim, 1997). Further, when levels of uncertainty are low, such managers face neither significant pressure for growth by exploring international markets nor the need to distribute risks and hedge uncertainty by creating geographically diverse growth options. In the absence of innovative products, they do not have anything substantial to offer to global markets—as such, inertia would likely set in with regard to geographic expansion. Overall, managers would limit themselves to continue with routine and typical products to generate more rent in familiar home markets to satisfy local managerial hubris and agency rather than exploring international markets (Christensen & Bower, 1998; Zahra, 1996).

When the levels of innovation are high but uncertainty is low, managerial discretion may not necessarily motivate managers to create a geographically diverse portfolio of growth options. In relatively stable environments, firms will face limited pressure to venture outside of their boundaries regardless of the levels of innovation. Under such conditions, managers may not feel the pressure to venture into international markets—they may continue to pursue more familiar domestic markets that generate expected returns (Aldrich, 1999). In the absence of pressures, managers may not prefer bringing on and facing uncertainties associated with international markets and would rather reap the rents of their innovations in domestic settings. Under these conditions, the potential for innovations to facilitate the creation of a portfolio of geographically diverse growth options remains underutilized.

In contrast, when the levels of uncertainty are high but levels of innovation are low, managers with discretion will be under pressure to venture in the international markets, however, they will not have unique products that they could offer to the international markets. In the absence of differentiated products, it would be difficult to penetrate international markets for any competitive and comparative advantage (Hitt, Hoskisson & Kim, 1997; Porter, 1998). Managers may not want to commit resources and take risks associated with geographic sales diversification unless they have compelling product offerings

(Afuah, 1998; Hitt, Hoskisson & Kim, 1997). In addition, such an environment will shift managerial attention toward mastering threats in the fast changing environment, survival, resource acquisition and competition rather than focusing on internationalization for growth (Aldrich, 1999). Managers will pursue routine domestic growth with relatively typical product offerings in familiar domestic markets because pre-existing markets already have a pipeline for such products rather than trying to venture internationally.

Summarizing the above, in the presence of managerial discretion, the “ideal” conditions for motivating geographic sales diversification develop when the levels of both uncertainty and innovation are high. In the mixed environments, that is, in the presence of high uncertainty and low levels of innovation and low uncertainty and high levels of innovation, conditions are moderately favorable for industry exports. However, conditions are particularly detrimental for geographic sales diversification when both the technological uncertainty and innovation are minimal. In essence,

Hypothesis 4a. The relationship between managerial discretion and industry exports will be particularly strong when the levels of innovations and uncertainty are high.

Hypothesis 4b. The relationship between managerial discretion and industry exports will be particularly weak when the levels of innovations and uncertainty are low.

Methods

We gathered data on every U.S. manufacturing industry at the four-digit SIC level. Our sample consists of those industries that fall under the Manufacturer Standard Industrial Classification (SIC) Codes—2000 through 3999. According to U.S. Census bureau, firms in these industries must be primarily engaged in the chemical or mechanical transformation of raw materials or processed substances into new products. There are 459 industries in the manufacturing sector (i.e., between SIC codes 2000 to 3999) (e.g., Bartelsman, Becker, and Gray, 2000). As per our database, there were 357,984 firms in the 459 SIC industries in 1997 with about 778 firms on average per industry.

After eliminating those industries for which data were not available for every variable, we were left with 203 industries. The resulting database contains information on financial and industry-level data from U.S. Census Bureau, U.S. Bureau of Economic Analysis, Carnegie-Mellon Survey (CMS) of industrial R&D, Schonfeld and Associates, and Standard and Poor’s Compustat.

Dependent Measure

Industry exports measured as Export Intensity. To measure industry exports via export intensity, we use the U.S. Bureau of Economic Analysis data. Arithmetic averages of financial data attenuate annual fluctuations and have been used for this reason in prior research (Rothaermel, 2001; Rothaermel, Kotha & Business Research Challenges in a Turbulent Era

Steensma, 2005). Export intensity is defined as the total value of industry exports expressed as a percentage of net sales averaged for the years 1996-1998 for each industry.

Independent Measures

Managerial discretion. Consistent with past operationalizations of managerial discretion, we conceptualize managerial discretion as an aggregate construct comprised of the following dimensions emanating from the task environment (Hambrick & Abrahamson, 1995; Finkelstein & Hambrick, 1990):

Industry munificence. Industry growth results in greater decision-making freedom for managers (Hambrick & Finkelstein, 1987), providing them greater latitude for geographic sales diversification by enhancing growth prospects and minimizing constraints. We measure industry munificence in terms of growth in sales (Li & Mahoney, 2009). Following the methodology employed by Keats and Hitt (1988), we acquired industry sales for the years 1990 to 1994 from the U.S. Census Bureau's Annual Survey of Manufactures. The natural logarithms of these sales figures were entered into quasi-time series regressions with time serving as the independent variable. The antilogs of the resulting regression slope capture industry growth.

Industry product differentiation. In highly differentiated industries, managers have more freedom to develop innovative product offerings and to meet global, heterogeneous demand with different product recombinations (Schilling & Steensma, 2001). Managers develop innovative product offerings that stand out in the international product-markets based on their features, quality, and design among others. They also have the opportunity to explore myriad ways to meet demands based on worldwide customer preferences. Thus, industries with higher levels of differentiation provide more avenues for using discretion because means-end linkages are relatively ambiguous (Finkelstein & Boyd, 1998; Hambrick & Abrahamson, 1995). We assess product differentiability using advertising intensity of an industry. Advertising intensity reflects firms' attempts to differentiate themselves and gain market attention (Balasubramanian & Lieberman, 2010; Erickson & Jacobson, 1992) and according to Finkelstein and Boyd (1998, p.183), "advertising intensity (Rajagopalan & Prescott, 1990)...(is a) standard indicator of product differentiability." Advertising intensity is measured as the advertising budget as a percentage of net sales and averaged for the period 1990 to 1994. We get this data from Schonfeld and Associates (1990-1994).

Capital intensity. Firms in capital intensive industries are generally committed to a course of action due to the high investment in fixed assets. This leads to a high degree of continuity of past practices and decisions in the present that are often constrained by past resource commitments. Capital intensity creates strategic rigidity. Due to high fixed costs, any deviations from existing routines could prove very expensive (Datta & Rajagopalan, 1998). Managers follow past routines as safe bets for avoiding costly mistakes. They focus on cost and efficiency considerations. Managers face limitations in their pursuit of

geographic sales diversification because of the presence of strategic rigidity and relatively high constraints in exploring international markets (Hambrick and Finkelstein, 1987). Capital intensity is associated with lower incentives for experimentation in decision-making and innovation, and higher needs for following routines. Thus, we use the inverse of capital intensity as an indicator of industry-level discretion that facilitates venturing into international markets. Capital intensity is measured as the ratio of the industry's gross book value of assets to value of annual shipments. We use the arithmetic average of 1990 to 1994 data that were obtained from the U.S. Census Bureau's Annual Survey of Manufactures.

Industry structure. In highly competitive or fragmented industries, managers generally experiment with diverse strategies for reaping rents to counter their competitors. They try to beat the competition by exploring international markets in order to gain first-mover advantage. This stands in contrast to the strategies deployed by oligopolists who are constrained by their responsiveness and reaction to the behavior of rivals (Hambrick & Finkelstein, 1987). We used a comprehensive and widely used measure to capture competitive intensity: the inverse of the Herfindahl-Hirschmann opportunities index of market share (Curry & George, 1983; Morgan & Rego, 2006; Palmer & Wiseman, 1999). This index addresses both the number of firms in an industry and relative inequalities in the market share of firms in an industry. The 'H index' is the sum of the squared market shares of all the firms in an industry. This index ranges between 0 to 1, with 0 being perfect competition and 1 monopoly. Score of 0 represents infinite number of firms with equally infinitesimal market shares. A score of 1 represents perfect monopoly, single firm controls whole market. Any entry of additional firms moves the score towards 0, and any disproportionate possession of market shares moves the score towards 1 (Boyd 1990). The U.S. Census Bureau releases this data every five years. These measures were obtained from the data released for the 1990 to 1994 timeframe in the 1992 Economic Census by the U.S. Census Bureau.

Overall Managerial Discretion. Consistent with the conceptualization of 'Managerial Discretion' as an aggregate of the above variables (e.g., Hambrick & Abrahamson, 1995; Hambrick & Finkelstein, 1987; Law, Wong & Mobley, 1998), we standardize each of these variables and combine them to develop a composite measure to capture the levels of discretion managers have in their industry. Moreover, we used updated data for each of the above variables to conduct robustness checks and analysis.

Industry innovations. Industry innovations reflect the application and exploitation of tacit and explicit knowledge and resource bundles for developing outcomes that are both unique and tangible. Industry innovations are measured as the origination of patents in each SIC industry between 1990-1994 (Silverman, 1996; Silverman, 1999). This measure is based on the probabilistic distribution of patenting activity in the SIC of origin during this timeframe (Silverman, 1996; Silverman, 1999). Silverman (1996, 1999) developed an algorithm for associating patents in different U.S. patent classes with industry SICs.

He adapted a Canadian patent office concordance system that assigns Canadian patents to the appropriate 4-digit Canadian SIC of use. Silverman then calculated a probability distribution derived from the Canadian data, and associated each patent issued in the U.S. to its corresponding probability-weighted U.S. SIC. This is the most robust data available on the assignment of U.S. patent distributions for innovations by each SIC category. This patent-industry concordance has been used in a number of studies that require linkages between U.S. patent classes and four-digit SIC classifications of U.S. industries (McGahan & Silverman, 2001; Silverman, 1996, 1999).

Technological change and uncertainty. We use a version of the Solow residual, namely total factor productivity growth (TFP), to measure industry-level rates of technological change and uncertainty (Solow, 1957). A series of studies of economic growth conducted by the National Bureau of Economic Research showed that the historic rate of economic growth in GDP could not be explained entirely by growth in labor and capital inputs (Jorgenson, 1984; Schilling & Steensma, 2001). A consensus has emerged that the residual largely captured technological change and uncertainty (Crafts, 1996; Terleckyj, 1980; Schilling & Steensma, 2001; Siegel & Griliches, 1991). A number of researchers have used TFP growth at the industry level (e.g., Griliches & Lichtenberg, 1983; Jorgenson, 1984; Schilling & Steensma, 2001; Siegel & Griliches, 1991). The Bartelsman-Gray manufacturing productivity database tracks TFP growth for every four-digit manufacturing SIC code from 1958-2005. This measure is based on a five-factor production function: capital, production worker hours, non-production workers, non-energy materials and energy. The TFP growth index is calculated as the growth rate of output (real shipments) minus the revenue-share-weighted average of the growth rates of each of the five inputs (Bartelsman, Becker & Gray, 2000; <http://www.nber.org/nberces/>). The measure used in the present study is the five year average TFP growth rate: 1990 through 1994.

Table 1
Key Measures with Description

<i>Variable Name</i>	<i>Brief Description</i>	<i>Time-Period and Source</i>
<i>Dependent Variable</i>		
<i>Industry exports</i>	<i>Total value of industry exports expressed as a percentage of net sales averaged for each industry</i>	1996-1998
<i>Independent Variables</i>		
<i>Managerial discretion</i>	<i>Aggregate construct of the following variables that were standardized and combined to create a composite measure (e.g., Hambrick & Abrahamson, 1995; Hambrick & Finkelstein, 1987; Law, Wong & Mobley, 1998).</i>	<i>See below</i>
<i>Industry munificence</i>	<i>Natural logarithms of sales figures entered into quasi-time series regressions</i>	<i>1990 to 1994 from the U.S. Census Bureau's Annual Survey of Manufactures.</i>
<i>Industry product differentiation</i>	<i>Captured by advertising intensity is measured as the advertising budget as a percentage of net sales</i>	<i>1990 to 1994 from the directory by Schonfeld and Associates</i>
<i>Capital intensity</i>	<i>Ratio of the industry's gross book value of assets to value of annual shipments</i>	<i>1990 to 1994 from the U.S. Census Bureau's Annual Survey of Manufactures.</i>
<i>Industry structure</i>	<i>Inverse of the Herfindahl-Hirschmann opportunities index of market share or H-index</i>	<i>1992 and 1997 Economic Census by the U.S. Census Bureau — largely time invariant nature of data published every five years (http://www.census.gov/mcd/historic/mc92cr.txt)</i>
<i>Industry innovations</i>	<i>Probabilistic distribution of patenting activity in the SIC of origin during this timeframe</i>	<i>1990-1994 by Silverman (1996) and Silverman (1999).</i>
<i>Technological change and uncertainty</i>	<i>The TFP growth index is calculated as the growth rate of output (real shipments) minus the revenue-share-weighted average of the growth rates of each of the five inputs</i>	<i>1990-1994: Five year average TFP growth rate as discussed by Bartelsman, Becker & Gray, (2005) and http://www.nber.org/nberces/</i>

Control Variables

Diversity of demand. The nature of certain industries is such that customers demand products of greater variety as well as products with greater features. In such industries, under pressures of diverse demand from global customers, managers have greater latitude to develop such products using different

recombinations and to reach a diverse set of customers worldwide (Porter, 1998). The benchmark input-output data which are measured every five years captures, at a detailed level, how each industry uses the outputs of other industries. It is the most carefully and consistently measured data on the outputs used by each industry (Schilling & Steensma, 2001). To measure diversity of demand for each industry, we use the 1997 Benchmark Input Output data which covers heterogeneity during 1993-1997 periods because this timeframe is most applicable to our sample. First, all commodity categories produced by each industry were identified. Then, for each of those commodity categories, all purchasing industries of the commodity were identified. Thus, the resulting count measure includes every industry customer of every commodity category produced by each industry. Our measure explicitly accounts for variety of products by industry by tracking every product-to-industry sales relationship.

Diversity of inputs. Industries that use a variety of inputs are capable of developing a number of valuable recombinations and reconfigurations that could potentially serve various niches in different international markets. To measure input diversity for each industry, we used the 1997 Benchmark Input Output data. We used counts of every commodity category used by a given industry to measure diversity of inputs.

We control for the diversity of demand and inputs by standardizing both measures and aggregating them to create a multidimensional construct (Law, Wong & Mobley, 1998).

Slack. Slack is an important determinant of industry exports. Slack serves as a cushion of excess resources that can be used in a discretionary manner for the creation of export channels (Bourgeois, 1981). We operationalize slack as the current ratio, or the ability of firms within industries to meet current obligations averaged for the 1990-1994 data (current assets/current liabilities).

Industry standards. The development of technology standards within an industry further facilitates internationalization. Standards mitigate fear and confusion regarding new technological trajectories, reduce barriers to entry and develop common platforms for collaborative partnerships worldwide (Sahaym, Steensma & Schilling, 2007). We used a database of organization standards provided by the American National Standards Institute (ANSI) to capture whether standards are available in the industry. A dummy variable (0, 1) was employed to indicate whether the industry has a registered member of the ANSI for 1994 that develops and administers standards.

Industry appropriability. We control for industry appropriability because we measure industry innovations based on industry-level patenting, and industries vary in their propensity for using different appropriability mechanisms, such as patents and secrecy. We measure strength of the appropriability regime in an industry as the percentage of process and product innovations in the industry that patents effectively protect from imitation (e.g., Basu et al, 2006; Sakakibara, 2002; Cockburn & Griliches, 1988).

We obtained these data from the Carnegie-Mellon Survey (CMS) of industrial R&D (Cohen et al., 2002). In the CMS, 1,478 R&D managers estimated the effectiveness of different intellectual property protection mechanisms in protecting product and process innovations in their industry. The CMS was administered in 1994.

Average firm size. We control for average firm size of the industry measured as average assets held by firms in each industry for 1994. This measure parses out the amount of variance in exporting that could be present due to a firm's scope and scale. Average firm size in terms of assets is based on data from NBER-US Census Bureau.

Industry size. We control for industry size in terms of the number of firms in each industry for 1994. We acquire these data from the U.S. Census Bureau's CenStats databases.

Model Specification

We used Hierarchical Moderated Regression model with the following specification (e.g., Hair et al. 1995; Arnold, 1982; Sharma et al. 1981; Schoonhoven 1981):

$$Y = a + b_1X_1 + \dots + b_8 X_8 + b_{10} X_7X_9 + \dots + b_{13}X_7X_8 X_9 + e$$

where Y denotes the dependent variable: Geographic Sales Diversification; X1 through X6 correspond to control variables, while X7, X8 and X9 correspond to main effects of Discretion, Innovations and Uncertainty. In addition, X7* X9, X7* X8, and X8* X9 are the two-way multiplicative interaction terms (the cross product of the predictor and the moderator variables), and, X7* X8*X9 is the three-way interaction term. In essence,

$$\text{Geographic Sales Diversification} = \alpha + \beta_1 \text{Firm assets} + \beta_2 \text{Industry size} + \beta_3 \text{Standard} + \beta_4 \text{Appropriability} + \beta_5 \text{Diversity} + \beta_6 \text{Slack} + \beta_7 \text{Managerial discretion} + \beta_8 \text{Innovations} + \beta_9 \text{Uncertainty} + \beta_{10} \text{Discretion*Uncertainty} + \beta_{11} \text{Discretion* Innovations} + \beta_{12} \text{Innovations*Uncertainty} + \beta_{13} \text{Discretion* Innovations* Uncertainty} + \epsilon$$

We entered the variables in the following order. First, we entered the control variables and the key independent variables. Our overall model with these variables was significant ($p < .001$). Next, in the Model 2 of table 2, we added interaction terms associated with managerial discretion, innovations and industry exports. The model was significant ($p < .01$, Table 2, Model 2). Last, we added the three way interaction term of managerial discretion, innovations and technological uncertainty and found that this model was significant as well ($p < .05$, Table 2, Model 3).

Results

Table 2 reports the means, standard deviations, and correlation coefficients between the dependent, independent, and control variables. We use hierarchical moderated regression using ordinary least squares to estimate our models. To avoid multicollinearity between the predictors and the interaction terms and to enhance the interpretation of the main effects, we center all variables involved in the interaction terms (Aiken & West, 1991). Table 3 presents the results of this analysis.

In Model 1 of Table 3, we entered the control variables and main effects of our independent variables. Our overall model with these variables is significant ($p < .001$). In general, for our sample of industries, both innovation and managerial discretion have a positive relationship with industry exports.

Hypothesis 1 proposes that the presence of higher levels of managerial discretion in an industry will lead to greater industry exports. The coefficient associated with managerial discretion in our model is significant (Model 1, Table 3, $p < .001$). Hence, hypothesis 1 is supported.

Hypothesis 2 argues that managerial discretion will more strongly motivate geographic sales diversification when the levels of innovations are high as compared to when they are not high. The interaction term associated with managerial discretion, innovations and industry exports is positive and significant ($p < .05$, Table 3, Model 2). Hypothesis 2 is supported.

Hypothesis 3 argues that managerial discretion will more strongly motivate geographic sales diversification when the levels of technological change are high as compared to when they are not high. The interaction term associated with managerial discretion, technological change and industry exports is positive and significant ($p < .01$, Table 3, Model 2). Hypothesis 3 is supported.

Figure 2: Discretion, Uncertainty and Exports

Figure 3: Discretion, Uncertainty, Innovation and Exports

Hypotheses 4a and 4b contend that the relationship between managerial discretion and industry exports depends in part on the joint effect of the levels of innovations and technological uncertainty. Model 3 (Table 3) adds the associated three-way interaction term hypothesized. The coefficient associated with the three-way interaction term of managerial discretion, innovations and technological uncertainty is positive and significant ($p < .05$); indicating that in the industries with high levels of managerial discretion, the presence of innovations and technological change motivates geographic sales diversification. To gain further insight into the nature of the three-way interaction, we plotted this significant three-way interaction in Figure 3 following the procedure suggested by Aiken and West (1991). As predicted in hypothesis 4a, the relationship between managerial discretion and industry exports is most strongly positive when the levels of innovation and technological uncertainty are high.

In contrast, the relationship between managerial discretion and geographic sales diversification is the weakest when levels of innovations and technological change are low. This is consistent with hypothesis 4b, which predicts that the relationship between managerial discretion and geographic sales diversification will be weakest for those industries where levels of innovations and technological change are low.

Robustness tests and further analyses

To check for the robustness of our results with more current data, we collected additional data till 2005 for the dependent variable and till 2001 for the independent variables. Though we found the levels of fluctuation in the independent as well as dependent variables unusual for 1999 through 2003 because of the market recession and recovery during these years (e.g., <http://www.census.gov/foreign-trade/statistics/historical/>), we conducted the analysis in the following ways.

First, we averaged the data for 1990 through 1999 for the independent variables, and 2002 to 2004 for the dependent variable. We again used hierarchical moderated regression for estimation. There were no material changes in the results relative to the reported results though minor differences were found in the regression coefficients and levels of significance (e.g., slack was now significant at .05 level whereas earlier it was significant at .001 level).

Second, we performed the analysis using the data beginning 1998 through 2001 for the independent variables, and 2003 to 2005 for the dependent variables. Though we found support for our key hypotheses, a few results were different. First, the control variable, appropriability regime, was now significant at .05 level whereas earlier it was not significant. Second, the control variable, slack, was now significant at .05 level whereas earlier it was significant at .001 level. Third, industry innovations variable

was now significant at .01 level whereas earlier it was significant at .001 level. Fourth, we observed minor changes in regression coefficients though signs remained consistent.

Overall, we did not find any material difference in the outcome relative to the reported results.

Discussion

Industry exports are vital for growth, expansion and competitive advantage in the global marketplace. In this study, we systematically identified and examined the joint effects of managerial discretion, industry context and environment in motivating internationalization via industry exports. We introduce the notion that managerial discretion in combination with industry contextual and environmental variables motivates geographic sales diversification. The context of U.S. manufacturing industries during the mid-1990s, when the U.S. was the largest producer and consumer of most of the world's innovative products, makes this framework more generalizable to emerging markets that are on the path of becoming large producers as well as large consumers of such products (e.g., BRICS countries—Brazil, Russia, India, China and South Africa).

Our results demonstrate that a significant relationship exists between managerial discretion and industry exports, implying that managers exercise considerable influence on exporting when they have greater latitude, authority and control. Moreover, we found that the relationship between managerial discretion and industry exports is enhanced when levels of innovation are high. Managers are better able to use their latitude to leverage innovations for creating a portfolio of product recombinations that facilitates venturing into international markets. Our results also show that the relationship between managerial discretion and exports is enhanced when levels of technological uncertainty are high. Under these conditions, managers use their latitude to create a portfolio of geographically diverse growth options for hedging against uncertainty in the domestic environment.

We considered a more complex model by exploring how the combination of industry environment (i.e., technological uncertainty) and context (i.e., innovations) alters the influence of managerial discretion on industry exports. Our results show that the conditions are particularly ripe for industry exports when levels of technological uncertainty and innovations are high. Under this scenario, managers with the latitude to make internationalization decisions are armed with innovative product offering for penetrating worldwide markets and technological uncertainty at home provides them an opportunity to take such products to the international markets. As such, managerial discretion has the strongest positive relationship with industry exports under these conditions, whereas an absence of these factors makes the conditions particularly detrimental for industry exports.

Overall, with this research, we respond to the calls by a number of scholars to examine the role of managerial discretion in the internationalization process under contingencies (e.g., Crossland & Hambrick, 2010; Leonidou, 1998; Lohrke & Bruton, 1997; Salomon & Shaver, 2005)—according to these scholars, a reliable relationship between managerial variables and exports is yet to be found particularly in the presence of environmental and contextual factors.

Implications

Theoretical implications

In the context of international business and global strategy, our findings have a number of theoretical implications. We believe that this is one of the first studies to use managerial discretion view to integrate the insights of scholars having polar views on strategic choice versus environmental determinism. We provide a foundation for future research with our empirical finding that internationalization process is influenced by a combination of managerial discretion, uncertainty, and an ability to offer innovative products to worldwide markets.

We also contribute to the literature at the intersection of upper echelon, international trade and strategy literatures with our results that managers require considerable freedom and authority over firm resources and structure for making key decisions. This is one of the few studies to extend managerial discretion view in the realm of geographic sales diversification (exceptions include Crossland and Hambrick, 2010, 2007).

Similar to Tong, Reuer and Peng (2008), this study contributes to both the real options and internationalization literatures by extending real options view to examine issues related to international business. Further, its findings highlight the role of environmental and contextual factors in affecting the relationship between managerial discretion and geographic sales diversification.

Our empirical findings also underscore the importance of innovations in the geographic sales diversification. In addition, this study highlights the role of environmental and contextual contingencies in the domestic market and their influence the relationship between managerial discretion and strategic decisions. These findings are consistent with the conceptual insights of scholars such as Burgelman and Grove (2004) who propose that, "...company's strategy resides in its strategic actions... (p. 13)...top management's beliefs...are the most important drivers of a company's strategy....leaders' strategic actions respond to external and internal selection pressures...rapid technological change may alter the industry structure. (pp. 14-15)...strategic action interacts with the environment (p.30)... technological platform ...give(s) rise to the emergence and growth of ecosystems (p. 42)."

Our findings also have implications for related streams such as international entrepreneurship that examine phenomenon such as role of MNCs top managers in promoting international corporate venturing. Scholars in these streams can fruitfully use our findings on the role of managerial discretion, innovations and environment in potentially motivating international corporate venturing between MNCs from the developed countries (e.g., G-8 nations) and start-ups in emerging markets (e.g., BRICS countries—Brazil, Russia, India, China and South Africa).

Managerial relevance

In addition to the above theoretical implications, our findings have a number of important implications for managers. First, managers with high levels of discretion may want to leverage their latitude for action and assert their authority for pursuing internationalization if they are armed with innovative offerings and face environmental pressures at home. Such managers should confidently develop internationalization strategies for the markets that hold potential for growth because their firms are well positioned for pursuing geographic sales diversification.

Second, superior value will be generated for both the primary and secondary stakeholders when the managers with high levels of discretion are armed with innovative offerings and face pressures to shed inertia. In the words of Finkelstein and colleagues (2009, pp. 27-29), such managers must take strategic actions to match the environment—in our context, the actions of such managers will be matching the pressures and opportunities for internationalization.

Third, from a public policy perspective, such managers can proactively contribute to both their nation's GDP and GNP by pursuing internationalization. On one hand, geographic sales diversification benefits domestic firms by providing them opportunities for developing new markets worldwide. On the other hand, venturing in the international markets provides new revenue streams as well as worldwide legitimacy to the domestic brands and firms while hedging for uncertainty in the domestic markets. As such, from a policy perspective, managerial initiatives for geographic sales diversification have implications for the growth of domestic economy, businesses and the human capital.

Limitations, future research and extensions

Our research framework regarding industry contextual and environmental factors is by no means exhaustive. We acknowledge that our analysis has certain limitations because it was conducted at a relatively macro (i.e., industry) level assuming homogeneity among firms (Klein, Dansereau and Hall, 1994). Though the implications of studies with 'managerial discretion' at the industry level permeate across-levels (e.g., Rajagopalan and Datta (1996) and Rajagopalan and Finkelstein (1992) study this phenomenon at mesa-level; whereas Carpenter and Golden (1997) study the same at micro-level), some

potential biases may have been introduced due to the level of study. For example, it is plausible that the firms within each SIC code are not involved in similar activities to the extent assumed by the U.S. Census Bureau. Indeed, shortcomings of the SIC classification led to the development of finer North American Industry Classification System (NAICS), which provides a greater level of detail about a firm's activity than SIC codes. Further, this would affect the assumption that firms within industry are homogeneous, resulting in certain bias in the managerial discretion scores of the industries. A systemic longitudinal analysis at the firm level but in different industries with CEOs as respondents could bring new insights into the role of managers in motivating geographic sales diversification under firm-specific contingencies.

Future research could explore how firm-level differences in TMT members' attributes (e.g., education, hierarchical position, background etc.) influence the choice of certain modes of internationalization over others (e.g. international joint ventures, FDI, greenfields). Organizational and international business researchers may also examine the role of managerial discretion, innovation and environment in mergers and acquisitions (M&A) and alliance decisions, particularly those involving MNCs and young firms from different countries.

Researchers may also strive to establish unequivocal causality between the constructs proposed in the study. Though we performed Univariate Analysis of Variance⁸³ to further test for the relationships, we acknowledge that our research design does not allow us to claim causality unequivocally. However, we can make an inference about causality with some confidence as the results of Univariate analysis are consistent with that our findings. We hope future research can use longitudinal data and pursue a lag structure building on the theoretical foundation developed in this study. Researches can then use Granger causality test or panel data regression analysis or time series analysis to establish causality.

Other studies might examine how managerial discretion in combination with firms' technological and operational capabilities influences their strategic choice on the use of different modes (e.g., alliances vs. acquisitions vs. greenfields vs. joint ventures) for international market entry. For instance, firms' information technology (IT) and supply-chain related capabilities may promote the use of one mode of internationalization over other depending on the levels of discretion managers have in different industries.

Scholars interested in macro-economic and cross-cultural approaches might attempt to distinguish between export destinations, analyzing how country variables such as risk preferences and power distances, among others, influence managerial decisions.

⁸³ We thank an anonymous reviewer for this suggestion.

Though this study is limited to the context of U.S. manufacturing industries, this research has implications for firms from emerging economies that aspire to become both large producers of goods and consumer markets (e.g. BRICS countries). These countries are poised to become the dominant suppliers of manufactured goods and services as well as have large domestic markets between 2025 and 2050 (Ohmae, 2005). Drawing on the theories of international trade and organizational strategy, we believe that firms from emerging economies would also face similar challenges and opportunities in the future. U.S. firms' rich experiences in dealing with these issues have normative implications for firms from emerging markets. In light of our results, managers worldwide may engage actively in the development of innovative capabilities and respond effectively to environmental pressures for reaping benefits from industry exports.

WHAT MOTIVATES PEOPLE TO PURCHASE CHOCOLATE BRANDS: ITALY VERSUS RUSSIA

Trevisan, Italo¹; Neganova, Irina²

¹University of Trento, Italy. Email: italo.trevisan@unitn.it

²Ural State University of Economics, Russia. Email: irina-neganova@yandex.ru

Abstract

Today highly competitive business environment and more exigent customers call for using all available company's resources especially a company's brand for providing better consumer satisfaction. We argue that customers are more loyal to a product brand that corresponds to their needs better (H1). While buying a chocolate, consumers want to satisfy firstly their physical and then their psychological needs (H2).

The findings indicate that the respondents prefer to buy chocolate brands that present the characteristics they like most. However, a positive evaluation does not translate into strong brand loyalty. In general consumers purchase multiple chocolate brands. The second hypothesis was disproved. It appears that the needs that are primarily satisfied by buying chocolate are psychological rather than physical.

Keywords: chocolate brands, motivation, consumer loyalty

Conceptual background/hypothesis development

According to Kotler and Keller (2005) customer needs are the basis of all modern marketing. The key to a company's survival, profitability, and growth in a highly competitive marketplace is its ability to identify and satisfy unfulfilled consumer needs better and sooner than the competition. Keller (2007) proposes that brands make a client's choices easier since they signal quality. The brand is important for maintaining a client's loyalty with all the advantages that loyalty brings with it (competitive safety, expected cash flow, entrance barriers to other brands). Thus,

Hypothesis 1. Customers are more loyal to a product brand which corresponds to their needs better.

There are many classifications of consumer needs (Solomon, 2004). Innate needs are physical. Acquired needs are needs that are learnt in response to a culture or environment. These may include needs for self-esteem, prestige, affection, power and learning.

Hypothesis 2. While buying a chocolate, consumers want to satisfy firstly their physical and then their psychological needs.

Methodology

The data were collected during November-December 2009 in Trento (Italy) and in Yekaterinburg (Russia) by personal interviews outside different types of outlets (supermarkets, discounts, specialty stores, etc.). The respondents were asked about three

internationally known (Ferrero, Cadbury and Ritter Sport) and two national chocolate brands regards to the general evaluation, length of purchase, frequency of purchase, important characteristics, reasons for buying chocolate, attitudes towards national and foreign chocolate brands. The collected responses were analysed using the SPSS-software. Corresponding figures were provided.

Hypothesis 1 is tested by comparing the reported length and frequency of purchase with the evaluation of the brands by the respondents and their satisfaction with them.

Hypothesis 2 is tested by analysing the motivations for buying chocolate expressed by the respondents.

Sample

The Italian sample is made up of 240 questionnaires. They were collected through a non-probability convenience sampling. The questionnaires were collected in equal number (60) outside shops of four different types, i.e., supermarkets, discounts, small shops (independent individual owner), small shops (linked to a cooperative).

The interviewees were exactly two thirds females (66,7%) and one third males (33,4%).

They were fairly split between the various age groups (excluding the younger one, less than 18 years old, 2,1%, and the elder one, more than 60 years old, 9,2%), with the largest concentration in the groups between 46 and 60 years old (30%) and between 18 and 25 years old (24,2%). In the group between 26 and 35 years old there were 14,2% of respondents; in the group between 36 and 45 years old there were 20,4% of respondents.

The majority of respondents was married with children (50,8%) and a large group was of those who are single without children (37,1%).

The most widespread occupations were clerk (in private enterprise) - 16,6%; civil servant - 11,7%; housewife - 11,7%, professional - 8,3%, skilled worker - 7,1%, entrepreneur - 5,4%. However the largest group answered other occupation (32,5%): most of them were students.

The Russian sample consists of 200 questionnaires. They were collected in the same way as the Italian sample.

Also in this sample the proportion between females and males was two thirds and one third (slightly more males than in the Italian sample)

The largest concentration was in the group between 18 and 25 years old (60%). Other respondents were split evenly between groups of 26-35 years old (14,5%), 36-45 years old (10,5%), 46-60 (11%).

Most of the respondents were single without children (56%), the next largest group was those of them who were married with children (31,5%).

In terms of occupation more than a half of the Russian respondents were students (50,5%), while 33,5% of them were managers, 8,5% were engineers, etc.

Limitations

Only 540 questionnaires were collected in two countries. Respondents were citizens of chosen two cities. The sampling methodology adopted (non-probability convenience sample) makes it impossible to generalize any of the findings and caused some macroscopic skewing of the sample, in particular the high proportion of students and the predominance of women (if in both countries apparently the task of shopping for groceries still falls mostly on the ladies, the consumption of chocolate indubitably sees a stronger sharing by the gentlemen). An additional limitation is due to the fact that only three “international” and two “national” chocolate brands were chosen in every country limiting the scope of the findings.

In view of the limitations of the samples, the analysis presented in this paper will be mainly descriptive and each of the hypotheses will be tested for both the samples, in order to ascertain possible different attitudes between the people interviewed in Russia and in Italy.

Results

In relation to the general evaluation of the various brands, the respondents tend to be rather satisfied with two of the international brands mentioned (Ferrero and Ritter Sport) and to a less extent with the others (see Table 1). The first national brand is evaluated well enough (although not as well as the two international brands) while the second national brand and the remaining international brand (Cadbury) are clearly less appreciated (although being still above the neutral point – save for Cadbury in Italy).

The sub-samples differ in the average score of the evaluation of each brand, but the difference, albeit significant at the 99% level, might easily be attributed to slightly different perception of the scale used, rather than to an actual difference in evaluation (except for Cadbury, where the difference is so great that it certainly shows that the Italian sample is less impressed by this brand than the Russian one). Remarkable is that the ranking of the brands is basically the same (Ferrero and Ritter Sport swap the first place but the difference between them is barely discernible).

Table 1. General evaluation of the brand (1 not satisfied at all to 5 fully satisfied)

Brand (% of answers for the brand)	Full sample		Italy		Russia	
	average	median	average	median	average	median
Ferrero (100)	4,10	4	4,01	4	4,20	5
National brand 1 (99,8)	3,84	4	3,88	4	3,79	4
Cadbury (57,7)	3,29	3	2,78	3	3,43	4
National brand 2 (98,9)	3,56	4	3,69	4	3,40	4
Ritter Sport (97,5)	4,09	4	4,02	4	4,18	5

Besides the general evaluation of the brand, the interviewees were asked to evaluate their satisfaction in relation to the price and the quality of the selected brands. In relation to price (see table 2) both sub-samples show less satisfaction (the median in most cases being 3, the mid-point value and the average going in two cases below it). Despite this common trend to a limited satisfaction for the price of the product, the sub-samples differ significantly (always at the 99% level) in their evaluation for each brand and in their attitude to different types of brand. In detail, the Italian sub-sample shows a better acceptance (average 3,4 to 3,6; median 4) of the prices of the two international brands that received the highest marks in the general evaluation, while the Russian sub-sample shows that as far as price is concerned, the national brands have a much better evaluation. This undoubtedly is because of the price differential between national and international chocolate brands on the Russian market and high price-sensitivity of Russian people towards foodstuffs.

Table 2. Satisfaction about price (1 not satisfied at all to 5 fully satisfied)

Brand (% of answers for the brand)	Full sample		Italy		Russia	
	average	median	average	median	average	median
Ferrero (100)	3,21	3	3,41	4	2,97	3
National brand 1 (99,5)	3,70	4	3,33	3	4,14	5
Cadbury (59,1)	3,09	3	2,50	3	3,27	3
National brand 2 (97,5)	3,65	4	3,27	3	4,09	5
Ritter Sport (97,0)	3,43	4	3,64	4	3,20	3

Rather different is the satisfaction about quality (see Table 3). Both sub-samples are satisfied (sometimes extremely satisfied) with the quality of the brands. For the Italian sub-sample the most satisfying brands are Ferrero and Ritter Sport, that have an average evaluation slightly above 4; however, for all the brands excluding Cadbury the median is 4. The Russian sample is even more satisfied, with three brands with an average evaluation above 4 and a median of 5 and the remaining two – although with a lower average evaluation – having a median of 4. The most satisfying brand for this sub-sample is Ferrero, closely followed by the first national brand and then by Ritter Sport.

Table 3. Satisfaction about quality (1 not satisfied at all to 5 fully satisfied)

Brand (% of answers for the brand)	Full sample		Italy		Russia	
	average	median	average	median	average	median
Ferrero (99,3)	4,16	5	4,05	4	4,28	5
National brand 1 (99,1)	4,06	4	3,89	4	4,26	5
Cadbury (58,9)	3,42	3	2,76	3	3,62	4
National brand 2 (98,2)	3,71	4	3,59	4	3,85	4
Ritter Sport (96,8)	4,07	4	4,02	4	4,13	5

How do these perceptions translate into buying behaviour? The two factors chosen to evaluate buyer behaviour and, indirectly, brand loyalty are the frequency of the purchase of a given brand and the persistence in time of the purchase of that brand (length of the time since the brand was first bought).

In terms of frequency of purchase, the difference between the two sub-samples is quite big (see Table 4). The Italian one shows that the two brands are bought regularly or often by more than one quarter of the respondents are the two international brands (but one of them is actually Italian) that have received the best overall evaluation and are highly appreciated for their quality, although their price is considered rather high. The two National brands are frequently bought by about one fifth of the respondents, while Cadbury is basically inexistent in the local market. Indeed more than nine tenth of the respondents have never bought this brand and a few more buy it very seldom. A number of respondents never or seldom buys one or more of these brands. The brand that the respondents in the lowest proportion never or seldom buy is Ferrero, closely followed by Ritter Sport and the first National brand (Perugina). The second National brand (Novi) shows a marked polarisation in the buying behaviour: it is bought regularly or often by slightly more respondents than the first National brand, but many more say that they seldom or never buy it.

Table 4. How often brands are bought

Brand (% of answers for the brand)	Full sample			Italy			Russia		
	1	2	3	1	2	3	1	2	3
Ferrero (99,8)	48,1	33,0	18,9	32,2	38,9	28,8	67,0	26,0	7,0
National brand 1 (99,1)	36,7	31,2	32,1	38,7	31,8	19,5	22,5	30,5	47,0
Cadbury (87,3)	84,2	11,7	4,0	96,2	3,3	0,5	73,0	19,5	7,5
National brand 2 (99,5)	47,7	25,6	26,7	56,3	22,7	21,0	37,5	29,0	33,5
Ritter Sport (99,1)	48,6	31,9	19,5	37,3	34,7	27,9	62,0	28,5	9,5

1 = never or rarely 2 = from time to time 3 = regularly or often

The Russian sub-sample shows a markedly different buying behaviour. There is a clear difference in the purchase of National and international brands. Close to two thirds of the

respondents (almost three quarters for Cadbury) never or seldom buy the international brands, while a much lower proportion never or seldom buys the National brands. Even more marked is the difference when looking at the brands that are regularly or often bought. The National brands are regularly bought by a rather high proportion of the sample (the first National brand by almost half of them) while less than one out of ten of them does so with the international brands. The explanation for this could be either a strong patriotic preference for the National brands or the high price of foreign brands. Considering that in terms of satisfaction for the quality of the product two international brands score very high, the most likely reason is the relatively high price of these brands. The huge difference in the satisfaction with the price of the product, discussed above, confirms this conclusion. These brands are then bought mostly for special occasions (particularly Ferrero), while the National brands are for “everyday” consumption.

Also in terms of constancy of purchase of a given brand the two sub-samples clearly differ (see Table 5). The Italian one shows a low proportion of respondents who have never bought the brand (excluding Cadbury that has never been bought by 94% of the sub-sample); only the second National brand has never been bought by a largish proportion (slightly more than one fifth). The strong persistence in buying a specific brand, however, does not mean unquestioned brand loyalty: 85% of the sub-sample has been buying Ferrero and 80% Perugina for one year or more (78% and 72% respectively for more than three years), which means that most of them are regular buyers of more than one brand. The Italian sub-sample shows a buying behaviour typical of “expert” consumers in a mature market, attracted by brands but not captive.

Table 5. Since when the brands have been bought

Brand (% of answers for the brand)	Full sample			Italy			Russia		
	1	2	3	1	2	3	1	2	3
Ferrero (99,5)	16,4	11,4	72,2	7,1	7,1	85,2	27,5	16,4	56,0
National brand 1 (99,8)	11,8	11,6	76,5	10,9	8,3	80,7	13,0	15,5	71,5
Cadbury (85,5)	61,2	8,3	30,6	94,3	1,7	3,9	32,0	14,0	54,0
National brand 2 (100)	20,0	15,7	64,4	22,1	14,2	63,7	17,5	17,5	65,0
Ritter Sport (98,9)	16,3	14,0	69,6	11,5	10,6	77,9	22,0	18,0	60,0

1 = not bought 2 = up to few months ago 3 = more than one year ago

The Russian sub-sample shows a higher proportion of respondents who have never bought a certain brand, particularly foreign ones (up to one third of respondents). Correspondingly lower is the proportion of those who have been buying the brand for more than one year. Very few of them, in particular, are consolidated buyers (more than three years): only for the first National brand this last group reaches beyond 10% of the total and for the foreign brands it never reaches 3%. However, considering that – also for foreign brands that are basically

bought from time to time for special occasions – those who have been buying them for more than one year are always more than half of the respondents, this sub-sample gives a picture of a rapidly changing market and an evolution of buying behaviour. Chocolate is now becoming a more commonly and frequently acquired foodstuff. Foreign brands, despite their higher price, are consolidating their presence in the market and the consumers are increasingly willing to keep purchasing them. From the answers given, it appears that the penetration of foreign brands in the Russian market (at least in Yekaterinburg) is happening right now: more than three quarters of the respondents are now buying them, more than half have been doing so regularly (albeit not often) for more than one year; three years ago almost the totality of the respondents had never bought a foreign chocolate. This fact is not surprising because the mentioned international chocolate brands in general are considered expensive by Russian consumers; moreover they were not very well-informed about these brands some years ago, hence they trusted more the national chocolate brands. All in all the shift in the last three years is significant and indicates, besides the influence of global crisis on people's income and so their consumer behaviour, the consolidation of the presence of foreign brands of chocolate in this market.

The difference between the two sub-samples appears very clearly when the buying behaviour is referred to the brand(s) the respondents have evaluated positively (being satisfied or fully satisfied with the brand). In the Russian sub-sample, more than half of those who consider favourably the first national brand buy it regularly or even often and the same applies for more than one third of those who have a favourable opinion of the second national brand (see Table 6). For international brands, however, the very favourable general opinion expressed by the respondents does not materialise in frequent purchases of the brand: they are bought regularly by less than 10% of those who are satisfied by them. The Italian sub-sample shows a different attitude: a lower proportion of those who have a favourable opinion of a given brand actually buy it often or regularly (the most bought is Ritter Sport, 38%, the least is the National brand 1, 21,5%).

Table 6. Frequency of purchase of respondents evaluating positively the brand

Brand	Buys regularly or often this brand		Never buys this brand		Regularly or often National brand		Regularly or often international brand	
	Italy	Russia	Italy	Russia	Italy	Russia	Italy	Russia
Ferrero	29,1	7,5	4,4	13,1	20,1	45,6	26,0	9,4
National brand 1	21,5	54,1	10,2	2,2	29,4	40,0	27,0	8,9
Cadbury	n.a.	9,1	n.a.	12,8	n.a.	45,9	n.a.	9,1
National brand 2	33,8	35,4	10,1	3,5	30,9	52,2	31,6	7,1
Ritter Sport	38,2	9,1	4,2	11,9	28,5	45,9	28,5	9,1

Rather unexpectedly, a certain proportion – albeit small – of those who evaluate positively a brand never buy it. One tenth of the Italians never buy the national brand which evaluate positively and a much smaller proportion has the same attitude towards the two most appreciated brands (Ferrero and Ritter Sport). Among the Russians, only few people do not buy the national brand that they consider favourably and a bit more than one tenth do not buy the international brand.

Confirming a finding previously reported, the respondents showed a limited loyalty to the brands. Between 20% and 30% of the Italians who expressed a favourable opinion for a given brand say that they buy regularly or often another National brand and in similar proportion say that they regularly buy another international brand. Similar promiscuity is expressed also by the Russian sub-sample. Russians, however, show a strong preference for Russian brands: between 40% and 50% of them regularly buys another National brand besides the brand(s) they evaluated positively, while less than 10% does the same with international brands. Clearly, for this sub-sample the price of the international brands is often a discriminating factor in their decision of which brand to buy.

This behaviour points to a flexible attitude of the consumers of the sample towards the brands: they have clear opinions on them and on their quality. However a general positive evaluation does not translate into strong brand loyalty. Brand loyalty appears to be stronger for the Russians who have good opinion of their National brands, but also a large proportion of them tend to buy with regularity other brands. A larger proportion of Russians of the older age groups tend to buy their preferred National brand, while younger age groups tend to buy more than one brand. In any case, regular purchase of multiple brands seems to be the rule not only for the Italian sub-sample but also for a large part of the Russian one.

In relation to Hypothesis 1, in the end, it is possible to say that the sample prefers to buy chocolate brands that present the characteristics they like most, but apparently more than one brand has those characteristics and the decision of which brand to buy depends on various factors and can change from occasion to occasion.

The respondents were asked to state the most important reason(s) for buying chocolate. The answers are summarised in Table 7. Both sub-samples give the two main reasons *I like it* and *deliciousness* (the two reasons are mentioned by 64% of the Italian sub-sample and 61% of the Russian one). The next two are also the same for both samples, although in different order: *pleasure* and *cheering up* (with 20% and 10,5% of the Italian sample and 10,5% and 11% of the Russian one respectively). In the fifth position *healthy* comes for the Russian sub-sample (mentioned by 7,5% of the respondents) and *nutritious/snack* for the Italian one (8,3%, most often mentioned by mountaineers, who find chocolate a handy – and pleasant – store of energy when trekking or climbing). Next reason in order of mentions is to give *a gift*, and other reasons are mentioned but altogether by less than 10% of the respondents in both sub-samples.

Table 7. Main reasons for buying chocolate

	ITALY			RUSSIA		
	<i>n</i>	%	<i>rank</i>	<i>n</i>	%	<i>rank</i>
1 <i>Healthy</i>	4	1,7	9	15	7,5	5
2 <i>Deliciousness</i>	76	31,7	2	49	24,5	2
3 <i>Cheering up</i>	26	10,8	4	22	11,0	3
4 <i>Children</i>	9	3,8	7	1	0,5	8
5 <i>I like it</i>	78	32,5	1	73	36,5	1
6 <i>Pleasure</i>	47	19,6	3	21	10,5	4
7 <i>Nutritious/Snack</i>	20	8,3	5	9	4,5	7
8 <i>Gift</i>	12	5	6	12	6,0	6
9 <i>Other</i>	8	3,3	8	1	0,5	8
<i>Total respondents</i>	236			197		
<i>q.nnaires</i>	240			200		

Also when looking at how important some characteristics of chocolate brands are considered it appears clear that functional characteristics as being nutritious are much less important than those related to personal satisfaction (see table 8). Among the characteristics mentioned, two are considered of the highest importance by both sub-samples and a third one is quite important, while the remaining ones are relatively unimportant. The two most important characteristics (with an average close to 4,9 for the Russians and 4,8 for the Italians, both with a median of 5) are *quality* (overall evaluation, including many aspects) and *deliciousness* (taste). It is evident that these are the characteristics that the respondents, Italian and Russian alike, are looking for in chocolate and are at the basis of the decision of buying it and of the choice of brand. The next important aspect, slightly more important for Russians than for Italians, both in both cases with a median of 4, is price.

From this it can be surmised that in buying chocolate the level of price might become a factor deciding the choice of brand according to the occasion of purchase, but seldom would be an obstacle to a purchase.

Table 8. Importance of characteristics of chocolate brands

	<i>Total sample</i>		<i>Italian sample</i>		<i>Russian sample</i>	
	<i>average</i>	<i>median</i>	<i>average</i>	<i>median</i>	<i>average</i>	<i>median</i>
<i>Price</i>	3,66	4	3,5	4	3,85	4
<i>Quality</i>	4,77	5	4,67	5	4,89	5
<i>Deliciousness</i>	4,79	5	4,72	5	4,88	5
<i>Nutrition</i>	2,66	3	2,92	3	2,35	2
<i>Prestige</i>	2,34	2	2,49	2	2,17	2
<i>Assortment</i>	3,19	3	3,2	3	3,17	3
<i>Packaging</i>	2,63	3	2,49	2	2,81	3

From the answers given by the respondents, it appears that the needs that are primarily satisfied by buying chocolate are psychological rather than physical. Hypothesis 2, then, is disproved.

General discussion

Although no company wants to lose its competitive advantages, it is perhaps inevitable in the face of growing competition in the global markets. Companies may focus on strengthening their financial position, developing organisational structure, reengineering business processes, using different product strategies and technologies. Our research highlights the importance of understanding the exact customer needs that they want to satisfy when they buy chocolate and then transforming these needs into a product brand characteristics.

Managerial implications

We believe that these conclusions lead to some significant implications for national and international companies producing chocolate. What is most important is that they should be well-informed about their customers' needs and recognise the importance of their satisfaction by a particular brand in order to increase the brand loyalty. Concerning chocolate it appears that functional characteristics as being nutritious satisfying physical needs are much less important than those related to personal satisfaction (psychological needs).

However, the companies should take into consideration the fact that even a general positive evaluation very often does not translate into strong brand loyalty. Regular purchase of multiple brands seems to be the rule for the respondents. And the decision of which brand to buy depends on various factors (for example, the price of the international brands for Russian consumers) and can change from occasion to occasion.

Future research directions

In no way do we suggest that our paper is the final word on this topic but we hope that it can act as a way to open a dialogue on the interdependence between consumers' perception

of brand characteristics and their loyalty to the brand. We consider that there is a number of very interesting questions that remain to be answered relative to our research. For example, in our study we only looked at three “international” and two “national” chocolate brands in two cities in Russia and Italy. It might be the subject of the future research if our findings are generalisable to other cities and brands.

Abstract

Internet has been available as a competitive advantage tool to SMEs for years now. Several e-business models have been developed as well as, system architectures such as C2C, B2C, B2B, G2C and G2B. This paper discusses challenges and opportunities encountered by SMEs in the Internet era and finally describes the development of an innovative B2B e-business platform combining country and regional business information, a business directory and a 3D virtual exhibition.

Keywords: SME, challenges, opportunities, e-Business, B2B, 3D Virtual Exhibition, platform,

Introduction

The diffusion of internet and ICT has substantially changed the nature of international business over the past recent decades, transforming the ways of doing business in unprecedented ways. Supporting the emergence of virtual communities and commercial arrangements that disregard the traditional boundaries between firms and consumers, it created a dynamic setting that, transforming the rules of competition, had the potential of generating great new wealth (Amit and Zott, 2001). In fact, the economic integration and interdependence foreseen with the emergence of internet expected the “end of geography”^{vi}, made many believe that time and space would have ceased to represent limits in business transactions, and suppliers, firms and customers would have finally been linked in a seamless web that would have covered the entire world (de la Torre, 2001). Others even envisaged that the internet had the potential of bringing the economy closer to the theoretical model of perfect competition (Unctad, 2001).

This paper is organized as follows: Section 2 provides some related background research while Section 3 discusses challenges and opportunities for small and medium enterprises (SMEs) in the Internet era. Section 4 explains the architecture and advantages of ExpoGlobaOnline, an innovative global B2B Internet model. Finally, Section 5 draws the concluding remarks and provides recommendations for future work.

Background Research

Internet has the potential to cut procurement costs, help employees work together more efficiently, improve customer service and reach more customers and enter new markets (Unctad, 2001). E-commerce could create new and cheaper opportunities, especially

advantageous for SMEs to participate in international trade. But in order to fully benefit from this opportunity, SMEs need to develop new capabilities that would enable them to use technology intensive resources in a way that boosts their comparative advantage and maximizes value. Simply put, opening to the global market through a website does not substitute a full export strategy (Unctad, 2001). Thus, entrepreneurs and managers need to consider internet not as simple promotional tools that merely increases the visibility of their company but grasp the underlying strategic importance behind online operations. Only so, will e-commerce become an important tool for development.

As SMEs begin their operations worldwide, they must consider that they are expanding the frequency, depth and breadth of their operations abroad (Rhee, 2005). Therefore, firms that launch the process of international expansion must attune to the new way of doing business in order to be capable of endure in the global context and come to terms with the fact that firm performance depends on its capability of modifying its organization capabilities and its strategic processes to appropriately exploit information technology as a business resource (Sambamurthy et al., 2003). Essentially, if retailers decide to adopt the internet as a sales channel, then a response of greater magnitude will be required of them, since they must develop online order-taking capabilities and build logistic capabilities to ensure the timely delivery of products (Lee and Grewal, 2004).

While each type of firm may have a different strategic concerns, it is important to understand the general impact of information technology on firm performance, especially considering that the internet revolution has affected the whole organization of economic life of most sectors of the economy (Unctad, 2001). It is unquestionable that information is a central element of this new digital economy. To conduct business over the internet, firms have to deal with a substantial amount of information, so much so that some researchers have even considered as the “currency” of the New Economy based on Internet.^{vii} As it flows more quickly and in more directions, the amount of information exchanged has exponentially increased. Firms are thus required to possess an information-processing capacity or else they run the risk of being exposed to so much information that consequently can increase their perception of the uncertainties that stem from operating in an unfamiliar environment, and stall their overall process of international expansion (Rhee, 2005). To be able to reap the greatest benefits and gain and sustain competitive advantage, it is fundamental that firms learn to leverage information and recognize the value of new information, assimilate it and apply it to commercial ends (Rhee, 2005).

Regarding knowledge as an important strategic factor Rhee (2005) makes a couple of interesting considerations and sustains that: “the importance of knowledge, coupled with the difficulty of handling knowledge, makes the management of knowledge one of the most important strategic issues.”^{viii} According to Rhee (2005) a firm’s ability to acquire the adequate knowledge to be able to survive international expansion relies on both objective

knowledge and experiential knowledge. At first, firms must be able to understand their possibility of conducting successful business transactions by acquiring objective knowledge of the host foreign country and so, they must be inform themselves of the tariff barriers, investment regulations, supplier practices, labor laws and so on. In concrete terms, the efforts of developing countries to adopt e-commerce and e-business will be futile if supplies spend weeks in a warehouse waiting for customs clearance. (Unctad, 2001) Subsequently, firms will acquire learning-by-doing knowledge, i.e. experiential knowledge, as it operates in its host country—a type of experience can help a firm accumulate tacit knowledge that can become a source of competitive advantage (Rhee, 2005).

With its unprecedented reach, connectivity and low-cost information and processing power, as the internet era unfolds it challenged the conventional theories of value creation (Amit and Zott, 2001). In sharp contrast to the axiom inherited from the industrial age, which views the relative scarcity of a factor as the determinant of competitive advantage, in the internet economy, abundance becomes the major determinant of value (Rhee, 2005). Consequently, information becomes increasingly perceived as something to share, rather than protect, in order to maximize its value. This new approach challenges the traditional way of doing business as enterprises are now expected to rethink the ways in which they interact with their stakeholders and learn to share information with other enterprises to ensure compatibility of technical standards and business models. According to Unctad's 2001 E-Commerce and Development Report, this alteration of approach represents a viable threat to the SMEs in developing countries, since this type of decentralized decision-making process, which requires workers to feel empowered and to perform a wider range of tasks, greatly challenges the firms' traditional notion of authority and hierarchy.

Challenges and Opportunities

Challenges

A major challenge that has developed together with the advent of internet is the technological disparity that has increased between developed and developing countries. This digital gap seems to be a consequence inherent to the socio-political trends of a country, that according to some^{ix} especially corresponds to the differences in political systems, in the levels of education and in the industrial development, even though there is no real agreement in the literature as to its causes (Guillén and Suárez, 2005). In recent years, this technological inconsistency has inevitably affected the overall performance of international business in general, as firms considering international expansion from within a low infrastructure level country have been equally deterred as foreign firms that want to penetrate the markets of such a deficient host country (Rhee, 2005). In light of this reasoning, the 2001 Unctad Report suggests that it would seem more strategic for firms in developing countries to on reduce their business to consumers (B2C) e-commerce that point on activities of businesses serving end consumers with products and/or services and maximize and enhance their business-to-

business (B2B) approach by making goods or delivers services for the productive process of other enterprises, especially since the price of computing power, and PCs remain unaffordable for the vast majority of the population of the world.

In fact, B2B e-commerce is expected to play a pivotal role in the future of e-commerce, especially since the liberalization of the economic processes through the various mechanisms of e-business can strengthen the ability of the business enterprises to participate in the economic arena without depending too much on the various traditional, and sometimes restricting, bilateral or regional trading agreements.

Opportunities

The internet also creates new opportunities for innovative inter-firm cooperative arrangements and the formation and consolidation of strategic alliances (Unctad, 2001). In the face of ongoing intense competition, firms will be obliged to adopt new strategies or business models in order to survive and inter-organizational linkages seem to provide the private sector with the necessary flexibility to achieve multiple objectives in the face of mounting international competition (Miner et al., 1990). Yet, as alliances are expected to consolidate as the best business strategies to acquire new technology, resource dependence theorists argue that the irregular resource distribution between partners can lead to adverse performance outcomes, since research has demonstrated that firms generally receive a smaller share of the “alliance pie” when they rely on partners for technological know-how (Unctad, 2001; Lee and Grewal, 2004). Furthermore, literature on strategic alliances also cautions on alliances that are formed primarily to meet legitimacy needs and not to attain efficiency, for these mechanism usually affects firm performance negatively (Lee and Grewal, 2004). The personal involvement of entrepreneurs and managers in networks allows them to bypass the political tensions that generally arise in formal project structures, and grant them access to new markets or to different sources of financial resources that are usually required to guarantee the survival of the company.

To be able to benefit from inter-organizational linkages, entrepreneurs and managers thus need to consider them not as simple promotional tools that merely increases the visibility of their company on the web, but rather as an instrument that permits them to implement a strategic communication plan in B2B commercial operations, that will consequently encourage, joint research and development (R&D), regional technology exchanges, co-marketing agreements and strengthen and proliferate market and manufacturing rights throughout the region. Ultimately, the consequences of giving entrepreneurs the opportunity to proceed autonomously can certainly foster a wider range of deeper political and social integration through professional relationships that go beyond any type of bilateral trade agreement.

In light of the predominant opportunities and threats Internet poses in context of e-business and global economy that are mentioned in the above analysis, IMC Business

Global, in cooperation with Euro-Med TDS, are proposing two distinct and innovative B2B platforms, in order to encourage SMEs to enter the global arena, without being intimidated by the various threats and challenges that they may foresee in the virtual world, and participate more prominently in international business. The overall goal of these platforms is to enhance local and regional trade in ways that will strengthen the region's economic development.

Expoglobalonline.com

Platform Architecture

The platform is an innovative B2B 3D Virtual exhibition system to enhance local and regional trade. It is structured under one single database with hundreds of tables and complex relationships. It includes more than 200 regional and country specific domain websites. The platform is integrated with a Customer Relationship Management (CRM) system used by the sales executives of the company, a Content Management System (CMS) used by the Web administrator and a Business Intelligence System (BIS) used by the Web Marketing team to measure traffic and analyze user behavior. Finally, the platform is integrated with ExpoPark, a 3D virtual exhibition environment (Figure 1). Future work includes the transformation of the platform to a multilingual one with the inclusion of 29 languages. Future research will also investigate the possibility of implementing a live business forum where executives and decision makers around the world can discuss latest business trends and opportunities from the comfort of their office.

Currently the platform provides three primary components (Figure 2):

- Country information – Each country domain (e.g. GreeceExpoOnline.com) or regional domain (e.g. EuroMedExpoOnline.com) provides useful information for business executives such as country (or regional) economy and business environment information, access to public sector, NGOs, chambers and trade associations and a Showcase where countries can promote their key industries with the use of videos.
- Business Directory & Marketplace – The database includes more than a million companies that are organized into three types of memberships: Platinum, Gold and Silver. In addition, the platform has a marketplace where companies have the opportunity to promote their latest and most innovative products.
- 3D Virtual Exhibition – Each Platinum member has a personalized 3D virtual pavilion. The system is so sophisticated that with a touch of a button the Web Administrator can create parallel exhibitions based on country or region or even based on category (e.g. Furniture Exhibition) that all related pavilions will be included. Each exhibition simulates the experience and feeling of a physical exhibition with added advantages explained in the next section.

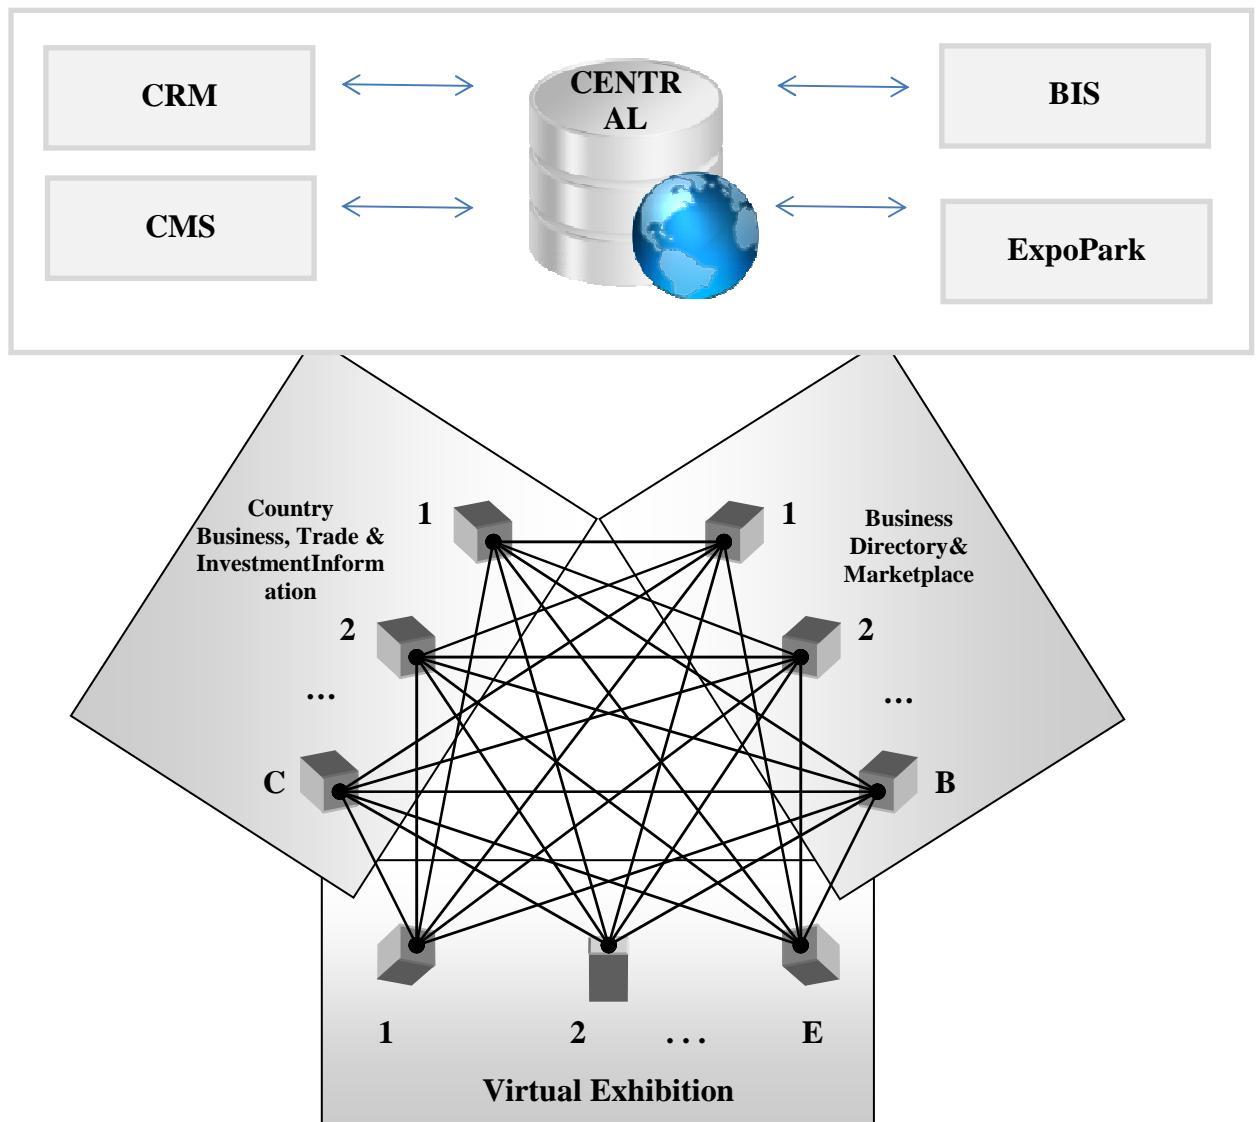

Figure 2: The 3 Primary Components of EGO

Platform Advantages

The platform offers several advantages with the most significant ones are briefly described below:

- Promotion of a country's business, trade and investment opportunities internationally
- Ability for a company to be enlisted not only in a specific country but also regional and international
- Ability to engage in a virtual exhibition that simulates a physical exhibition with functions such as, product display, video presentation, online catalog, business card exchange, notes facility, and chat (text, voice, video)

- Ability to participate in parallel exhibitions. For example, a company may have a pavilion in a Furniture exhibition and at the same time participating in a EuroMed Exhibition
- Identify the number, type and location of visitors contacting each pavilion
- Ability for a company to include its profile information in other languages therefore offering a multi-language business environment
- Ability for companies to provide keywords related to their business. These are used for smart optimization to improve their ranking and appearance within the platform

While the ExpoGlobalOnline platform is recent, the success of the site is evident from the number of monthly visitors to the site. The site receives more than 1 million visitors per month with an increase of approximately 12% every month.

Emed b2b.biz

A global platform of supply and demand of goods and services between businesses in the agro-food sector. Currently, it consists of the fifteen members of Euro-Med TDS (all the national Unions of Chambers of Commerce and business confederations of European and Mediterranean countries, such as Italy, Spain, Algeria, Palestinian Authority, Egypt, Greece, Israel, Jordan, Malta, Morocco, Portugal, Syria, Tunisia, Turkey) and covers a total of nearly 8 million companies.

Platform Architecture

The platform consists of two interdependent applications:

- Local access points (Pal): currently with 15 partners and 1 point for international access (Pai). The number of Pal can be extended indefinitely through the sale of rights to new countries;
- Operating System Node (NOS), which performs the following functions:
 - Output the specific identification Pal codes;
 - Allows interconnection;
 - Promotes dialogue and stores the transaction;
 - Stores all the proposals for the supply and demand;
 - Make simple and advanced searches;
 - It stores, manages, and search the business directory and knowledge base;
 - Make statistical analysis on the traffic system.

Platform Advantages

The multiplicity of actions that companies can accomplish through the platform enables firms to offer their goods or services, or request goods or services, in the global market. Companies

who purchase User Id and Password, and enter the system to sell or buy goods or services will conduct business in a professional but personalized, flexible, and cost efficient manner. Any private person acting on the platform, has his own "site" to manage. Firms accept a code of ethics, and recognize that all business transactions completed or communications held on the platform is recorded in the main memory and can be produced in court as legal documentation by any aggrieved party.

The small and medium enterprises find additional advantages:

- The creation of business partnerships that allow small operators to join forces and respond to large scale requests.
- Assistance and advice by the various associated Chambers of Commerce and/or Confederations.

It can be argued that no other global market environment, material or immaterial, can offer companies greater safety, faster times, lower costs for trades initiated by the relationship between demand and supply of goods and services, and concluded with an agreement commercial details with legal validity.

Conclusions

Not all threats that SMEs face or encounter can be resolved through a B2B platform, especially since most of these threats and/or challenges concern their 'internal' capacity to cope with ITC technology. Yet, we sustain that these two platforms provide benefits that entrepreneurs and managers, and to some extent even employees, can use to generate new value for the firm. Being platforms that enables the interconnection of more business firms, they do have the potential to link suppliers, firms and customers in a seamless web that covers a vast coverage of the entire world as it was anticipated at the advent of internet. The variety of services incorporated in these platforms, such as live chat features, in-platform e-mail service, exchange of virtual business cards and efficient B2B search engines, are intended to go beyond merely increasing company visibility but rather to offer two dynamic settings that stimulate an increase in business interaction. Last but not least, in view of the number of nodes that prevail in both networks it is clear that the abundance of flow of information can easily be translated in knowledge that strengthen business firms capacity to endure in the global market and provides them with the opportunity to create new, perhaps personalized, forms of value.

**CAUSALITY OF RELATIONSHIPS BETWEEN THE DIMENSIONS OF CUSTOMER
LOYALTY IN SERVICES MARKETS: EVIDENCE FROM BANKING**

Abstract

This study examines the causality of relationships between the dimensions of customer Loyalty in service industries, sheds light on the effects of customer Satisfaction on individual Loyalty dimensions and explores the mediating impact of interrelations between Loyalty dimensions on these effects.

In the frames of a wider research project, also involving service quality metrics' assessment, this study examines between variables relationships under a structural equations modelling analytical perspective. To this end, a specially designed research instrument is used for evidence collection. Data is analyzed through SPSS and LISREL.

The causality of relationships between the dimensions of Customer Loyalty was found to run along the path: "word-of-mouth" → "customer retention intentions" → "business extension intentions". The direct effects of customer Satisfaction on customers' "affectionate" and "behavioural" commitment were found to vary. Between the statistically significant direct effects the strongest was that on "word-of-mouth" followed by that on "customer retention intentions". On the other hand, the direct effect on "business extension intentions" was found statistically insignificant. The indirect effects of customer Satisfaction on "customer retention intentions" and "business extension intentions", via "word-of-mouth" were found to be threefold and fourfold stronger respectively than the direct ones.

The study adds to the existing Customer Satisfaction – Customer Loyalty literature. While up to date published research mostly examines between constructs effects at the aggregate level, new light is now shed by examining the effects at the level of dimensions. Support is provided to the idea that not only the dimensions of Loyalty are interrelated but the causality of the relationship between them runs from "affectionate" to "continuance" Loyalty.

In managerial terms, customer Satisfaction campaigns, in services industries, would yield more if primarily targeted at enhancing customers' "affectionate" rather than "continuance" commitment.

Rests upon its design of examining relationships between constructs at the level of dimensions, rather than at the aggregate. To the best of the authors' knowledge no such study has been reported in the banking services literature.

Keywords: Customer Satisfaction, Customer Loyalty, Greece, Banking

Introduction

Unanimity in considering Satisfaction as a key driver of Customer Loyalty seems to have been reached, among management practitioners and academics. With very few distinct exceptions (e.g. Bloemer et al., 1998; Shankar et al., 2003; Tsoukatos and Rand, 2006), however, research over the years has mostly investigated the Satisfaction – Loyalty relationship at the aggregate rather than at the level of specific dimensions (e.g. Cronin and Taylor, 1992; Anderson and Fornell 1994; Rust and Zahorik 1993; Lam et al., 2004; Chandrashekar et al., 2007). This investigative perspective, though, largely overlooks the well documented in the literature multidimensionality of Customer Loyalty (e.g. Zeithaml et al., 1996; Gremler and Brown, 1996; Oliver, 1999) as well as previous research findings proving that the construct's elements are causally interrelated with the direction of causality running from emotional to behavioural Loyalty (Oliver, 1999; DeWitt et al., 2008; Garnefeld et al., 2011). As a consequence, literature gaps related to variations of Satisfaction effects on specific Loyalty dimensions are left wide open. This paper reports research findings contributing towards overcoming these gaps.

As part of a wider study, also involving service quality metrics' assessment, the interrelations between the dimensions of Loyalty are examined under a structural equations modelling perspective. Under the same analytical perspective, the study goes on to explore the effects of Satisfaction on specific Loyalty dimensions as well as the mediating impact of interrelations between Loyalty dimensions on these effects.

Reported findings are expected to be important to both academia and practice. In scholarly terms, enhancing current understanding on managerial issues is always beneficial as piled-up theoretical knowledge eventually finds its way towards practical application. In this respect the debates over the Satisfaction-Loyalty interactions at the level of construct dimensions and the interrelations between these dimensions are re-opened. In managerial terms, to the extent that customer Loyalty is a key organizational asset leading to improved economic performance and profits (Gronroos; 2000; Reicheld et al., 2000), the better firms are equipped to understand the dynamics of the relationships between the dimensions of Loyalty as well as the Satisfaction-Loyalty links the more capable they become of leveraging their Satisfaction campaigns towards achieving best possible outcomes. Valuable evidence is provided that Customer Satisfaction campaigns, in banking and services industries in general, should be targeted at attitudinal rather than behavioural Loyalty.

The remainder of this paper is organized in six sections as follows: After this introductory section, there follows section 2 containing a literature review on the main constructs and issues related to this study. Section 3 is devoted to describing the study's methodology and discussing its results. Section 4 offers a comprehensive review of the study's implications while limitations and directions for further research are discussed in section 5. The study's general conclusions are, finally, presented in section 6.

Literature Review

Discussion of Customer Loyalty

Academics and practitioners agree that customer Loyalty can be beneficial to a firm through increasing sales, lowering customer costs, generating predictable income and profit patterns etc. (Jones and Taylor, 2007; Gronroos; 2000). In service industries, especially, building customer Loyalty is key to the survival and growth of firms (Reichheld, 1996). Despite agreement on Loyalty's positive consequences, unanimity seems to exist when it comes to the concept's conceptualization and measurement. In this regard, a great extent of variation is observed across studies (Jones and Taylor, 2007).

Early marketing studies perceived Customer Loyalty as a strictly behavioural phenomenon (Oliver, 1999; Bodet, 2008) that is evaluated in terms of repeat purchasing frequency (Newman and Werbel, 1973; Tellis, 1988), considering only a single brand/service, not seeking information on other brands/services etc. (Newman and Werbel, 1973). The core strength of this approach was that it offered objective means of evaluating Loyalty in terms of specific and quantifiable net present worth (Reichheld, 1996). Early enough, however, severe criticism was addressed to this one-dimensional perspective (e.g. Day, 1969; Monroe and Gultinan, 1975; Jain et al., 1987) on a number of accounts: offering an outcome-based only view of what really is a dynamic process (Bloemer et al., 1999), recording only what consumers do or have done and not what they think, disregarding the psychological component of Loyalty (Oliver, 1999) etc. As such, this strictly behavioural approach of addressing Loyalty was considered as incapable of distinguishing between true and spurious Loyalty (Storbacka et al., 1994; Liljander and Strandvik, 1995; Bodet, 2008).

To deal with this criticism and the particularities of the growing services sector, where the human contact element of transactions facilitates the development of interpersonal relationships (Iacobucci and Ostrom, 1996; Macintosh and Lockshin, 1998; Jones and Taylor, 2007), behavioural-oriented conceptualizations of Loyalty were soon complemented with attitudinal-affectionate components. In this respect, Zeithaml et al., (1996) measured attitudinal customers' Loyalty to a service provider in terms of customers' affective commitment and behavioural intentions. The former was measured along three items: a) saying positive things about the company to other people, b) recommending the company to people seeking advice, c) encouraging friends and relatives to do business with the specific company. Behavioural intentions were measured across the items: d) considering the specific

company as first choice for doing business with in the future and e) doing more business with the specific provider in the future. Gremler and Brown (1996) viewed service Loyalty across a behavioural, an attitudinal and a cognitive dimension while Oliver (1999) defined attitudinal Loyalty as the consumer's "... deeply held commitment to rebuy or repatronize a preferred product/service consistently in the future, thereby causing repetitive same-brand or same brand-set purchasing, despite situational influences and marketing efforts". Moreover, Oliver (1999) thought of attitudinal Loyalty as being integrated in four consecutive phases. In the initial "*cognitive*" phase, the consumer gets experience-based information indicating that a product/service is preferable to its alternatives. On the grounds of a cumulative positive experience, the consumer moves-on to the "*affective*" phase where a commitment to the product/service is developed. After recurring positive incidents, Loyalty goes on to the "*conative*" (behavioural intentions) phase reflecting the consumer's desire to keep purchasing the same product/service in the future. Depending on the obstacles, however, this desire may become unrealized. Finally, "*action loyalty*" is related to the consumer's true commitment to not only rebuying the product/service but to also "*overcome obstacles that might prevent the act*".

A review of current literature suggests that unanimity is finally reached regarding the dual behavioural - affectionate nature of Customer Loyalty (e.g. Tsoukatos and Rand, 2006; Oliver, 1999; Garnefeld et al., 2011 etc.). It also reveals, though, that a great deal of confusion exists over the true meaning of Behavioural Loyalty. A closer look into the growing body of studies pertaining to Attitudinal and Behavioural Loyalty exposes that most often behavioural intentions are mistakenly assumed as synonymous to actual behaviour (e.g. DeWitt et al., 2008; Garnefeld et al., 2011 among many others). As Oliver (1999) has very clearly put it, however, conative (reflecting intentions) Loyalty is at a lower step of the ladder than behavioural (reflecting real action) Loyalty, very simply because intentions do not always turn into actions.

In view of the above, much is still to be learned about the true relationships between Attitudinal and Behavioural Loyalty as opposed to the state of existing knowledge on Attitudinal Loyalty, which is more advanced. Although Ajzen and Fishbein (1977) have argued that attitude is a strong predictor of behaviour, in the majority of published studies the two manifestations of Loyalty are most often examined as independent and non related (Durvasula et al., 2004).

As regards Attitudinal Loyalty, the consensus is that it is operationalized across two sub-dimensions: "*continuance commitment*" and "*affective commitment*". The former reflects customers' intentions to preserve a relationship with a specific product/service and/or provider while the latter reveals a psychological disposition, very similar to "*love*", towards a product/service and/or its provider (Garnefeld et al., 2011). Customers' affective commitment is primarily articulated by word-of-mouth communication (Garnefeld et al., 2011). That is, talking favourably to others about specific products/services and/or their providers

(O'Mitchell, 2005). Because this is done at no cost to the firm, word-of-mouth can be highly efficient in attracting new business (McConnell and Huba 2007), competing with and/or enhancing traditional advertising. *“For many service brands, word of mouth—and, especially, personal recommendations—has long been more powerful than media advertising in driving both trial and repeat purchase behaviour”* (Ostrom et al. 2010, p. 23). This is especially true in financial services where high stake decisions are often taken. Prospective customers are more likely to trust word-of-mouth than other promotional forms because the communicator is considered as having no connection with the service provider. (O'Mitchell, 2005). Evidence exists, that word-of-mouth goes further than simply attracting new business to being the main antecedent of customers' behavioural intentions (Oliver, 1999; Tsoukatos and Rand, 2006; DeWitt et al., 2008) and even beyond that, to enhancing the communicator's own Loyalty. In the latter respect, Garnefeld et al. (2011) propose that word-of-mouth should be considered as a Loyalty enhancing instrument and that customers, from the very early stages of their relationship with a firm, should be encouraged to recommend the product/service and/or provider.

Discussion of Satisfaction

In the literature, Satisfaction is generally conferred upon as the main driver of Customers' Loyalty and Behaviour towards a firm (Bloemer et al., 2002), which in turn affect profitability and corporate economic performance (Jones and Sasser, 1995; Mittal and Kamakura, 2001; Chumpitaz and Paparoidamis, 2004). Support is provided to the argument that repeated instances of transaction-specific Satisfaction lead to overall Satisfaction (Oliver, 1999; Bodet, 2008), which mediates between transaction-specific Satisfaction and Loyalty (Parasuraman et al., 1994; Jones and Suh, 2000).

Although the role of Satisfaction as the main driver of customer Loyalty is theoretically very well documented (Tsoukatos, 2007), relationships between the two constructs are found to vary between products/services, industries, and settings (Fornell, 1992; Cronin et al., 2000; Johnson et al., 2001; Olsen, 2007) with observed correlations often below 0.30 (Johnson et al., 2001). Moderate to low relationships have been found by several studies (e.g. Bloemer and de Ruyter, 1998; Mittal and Kamakura, 2001; Szymanski and Henard, 2001). Quite a lot of research on trying to shed more light on these issues is reported, mostly targeted at examining the effects of additional drivers and/or moderators between the two constructs (Olsen, 2007).

Not much is known, however, about the effects of Satisfaction on specific customer Loyalty dimensions and even less on whether these effects may be influenced by existing interrelations between Customer Loyalty dimensions. Empirical findings providing evidence that Customer Satisfaction positively affects both Behavioural and Attitudinal Loyalty do exist (e.g. Woodside et al., 1989; Nelson et al., 1992; Heskett et al., 1994; Zeithaml et al., 1996; Athanassopoulos, 2000; Van der Wiele et al., 2002; Durvasula et al., 2004; Lee and Hwan, 2005

etc.). With a few very distinct exceptions (e.g. Tsoukatos and Rand; 2006), however, strength differences among Satisfaction's effects on Behavioural and Attitudinal Loyalty or the mediating impact on these effects of relationships between Customer Loyalty dimensions are not researched. This study is designed to shed new light on these issues.

Methodology

Research Setting

Evidence for the study is drawn from Greek banking with special focus on face-to-face service interactions. Currently (2009 data), the industry encompasses 65 banks either established or having at least one branch in the Country, operating through 4,304 "bricks and mortar" service/sales outlets and employing 66,969 employees in total (HBA, 2011). During the past decade two parallel trends have been observed regarding banking services' delivery. On the one hand, the number of ATMs doubled from 3,605 to 7,624 (HBA, 2011) in combination with heavy investments in various e-banking forms. On the other, the number of face-to-face service/sales outlets increased by 28%, a rate almost double from its EU-27 (15%) counterpart (HBA, 2011). The latter is believed to reflect customers' preference towards face-to-face banking, stemming from technological illiteracy, low internet penetration and security concerns (Observatory for the Greek IS, 2007; Marinakis and Karanikolas, 2007).

Research Instrument and Data Collection

Data was collected through a specially designed for the study research instrument. The survey consisted of five sections: respondents' demographics, respondents' quality expectations across four service quality metrics, respondents' performance perceptions across the same metrics, respondents' overall Satisfaction with their bank's services and respondents' Loyalty to their bank. Overall Satisfaction, in section four of the questionnaire, was measured as a single item construct (Meyer and Westerbarkey, 1996), while Loyalty, in section five, was measured across three distinct dimensions: word-of-mouth (WOM), customers' retention intentions and customers' extension of business intentions. The former was meant to reflect respondents' "affective commitment" (O'Mitchell, 2005; Garnefeld et al., 2011) towards their bank, while the second and third would reflect their "continuance commitment" (Garnefeld et al., 2011). All items in sections two to five were measured on 7-point Likert scales, anchored at 1= "not at all"/"absolutely not"/"not important at all" and 7= "extremely"/"absolutely"/"most important".

The survey was executed during the period from February 1st to June 30th of the year 2010 in a banking industry setting in Crete, Greece. A total of 1,000 questionnaires were administered, at a rate of four via the internet to one through personal interviews. Internet respondents were recruited among specific mailing lists of bank customers, whereas personal interviews were conducted among customers of specific bank branches. Eligible for the sample were adult individuals, users of face-to-face services of both retail and/or corporate banking, who had at least one face-to-face banking transaction during the prior month. All

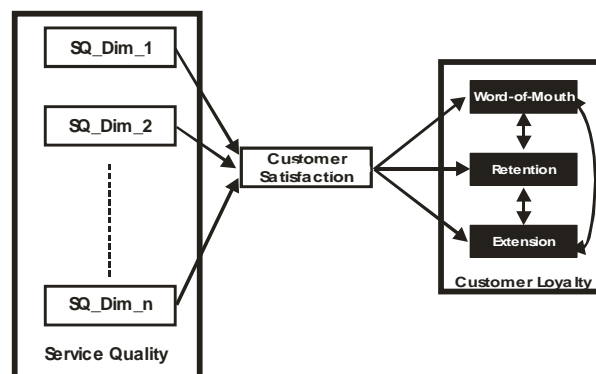

questionnaires were anonymous and no record of specific banks, which customers were doing business with, was taken. In view of this study's design to explore between variables relationships, the above described convenience sampling strategy is considered adequate. In study designs where generalisation is not the primary goal random sampling is not paramount (Calder et al., 1981). Overall, the survey yielded a sample of $n=458$ usable questionnaires after 78% and 38% response rates for personal interviews and internet administration of questionnaires respectively. Careful checking of filled questionnaires revealed no systematic bias that could be attributed to the two diverse modes of questionnaire administration.

Data Analysis and Results' Discussion

As already mentioned in the introductory section of this paper the design of the wider study involved: a) the assessment of alternative, banking specific and generic, service quality metrics, b) the interrelations of Loyalty dimensions, c) the examination of effects of overall Satisfaction on specific customer Loyalty dimensions and d) the examination of the mediating impact of interrelations between Loyalty dimensions on these effects. Herein, while we'll describe the entire modelling and analytical design of the wider study we'll then proceed with focusing our results' discussion on parts b to d of the study.

A Structural Equations Modelling (SEM) analytical pattern was chosen for data processing and most specifically the Path Analysis (PA) variation of SEM, appropriate when observed variables only are involved. The software package LISREL 8.72 was used in this respect. Based on the grounds of existing literature (e.g. Parasuraman et al., 1988; Cronin and Taylor, 1992; Luarn and Lin, 2003; Tsoukatos and Rand, 2006; Bandyopadhyay and Martell, 2007) all possible variations of the general model depicted in Figure 1 were examined.

Figure 1. – General Model

The exogenous variables of the model variations represented the dimensions of the SQ metric under evaluation each time. The right hand side of all variations under assessment, however, identically reflected possible relationships between customer Satisfaction and customer Loyalty dimensions as well as interrelations between the latter. Variables **CUSAT**, **WOM**, **RETEN** and **EXTEN**, measured in identical 7-point Likert scales, reflected respondents': **Overall Satisfaction** with their bank, willingness to engage in **Word-of-Mouth** communication in favour of their bank and its products/services, intention to **Keep on Doing Business** and intention to **Extend their Business Relation** with their bank respectively.

Model parameters were estimated by Maximum Likelihood (MLE) and model variations were evaluated on the account of Overall Fit and Structural Assessment (Diamantopoulos and Siguaw, 2000). To allow for non-normality the Sattora-Bentler statistic was used (Sattora and Bentler, 1994) for overall fit appraisal. Structural Assessment was based on the grounds of estimated parameters and R² values (Diamantopoulos and Siguaw, 2000). For a full account of overall fit and structural assessment of all model variations please see Tsoukatos and Koulentaki (2011).

Presentation and Discussion of Results

As stated already, this section will only discuss analytical results related to interrelations between Loyalty dimensions, the effects of Satisfaction, and the mediating impact on the latter of revealed interrelations between the former. In this respect, Figure 2 below depicts the produced model together with path estimates of direct effects from/to variables.

Figure 2. The Customer Satisfaction-Customer Loyalty model ^(a, b)

A Arrows represent direct effects

B Pairs of numbers indicate direct effects' estimates (numbers on top) and t-values (numbers below).

R² values of structural equations associated with the model (below) are high, thus, exhibiting strong predictive power of estimated equations.

$$WOM = 0.98 * CUSAT \quad R^2 = 0.54$$

$$t\text{-values} \quad 23.07$$

$$RETEN = 0.23 * CUSAT + 0.69 * WOM \quad R^2 = 0.69$$

$$t\text{-values} \quad 4.59 \quad 18.03$$

$$EXTEN = 0.10 * CUSAT + 0.45 * WOM + 0.44 * RETEN \quad R^2 = 0.63$$

$$t\text{-values} \quad 1.56 \quad 7.20 \quad 7.52$$

Direct Effects of Satisfaction on Dimensions of Loyalty

As indicated in Figure 2 above between the direct effects of Customer Satisfaction (CUSAT) on the three dimensions of Loyalty under consideration, the strongest (0.98, t-value: 23.07) was that on Word-of-Mouth (WOM), reflecting customers' "affective commitment" to their bank (O'Mitchell, 2005; Garnefeld et al., 2011). Satisfaction's direct effects on dimensions associated with customers' "continuance commitment" (Garnefeld et al., 2011) intentions, i.e. Keep on Doing Business (RETEN) and Extend Business Relation (EXTEN), are of much lower magnitude. The CUSAT→RETEN effect of 0.23 is statistically significant (t-value: 4.59) whereas the CUSAT→EXTEN effect of 0.10 is not (t-value: 1.56). These results offer support to Tsoukatos and Rand (2006) who, in a Greek insurance setting, reported that the effect of customers' Overall Satisfaction on their willingness to engage in favourable for their insurer WOM communication was statistically significant whereas the effect on customers' intention to extend their business with their insurer was not.

Causality of Relationships between Loyalty Dimensions

The model, in Figure 2, also depicts significant relationships between the dimensions of Loyalty, the causality of which runs from "affective" to "continuance" commitment related dimensions. Direct effect estimates of WOM on both RETEN and EXTEN are statistically significant; 0.69 (t-value: 18.03) and 0.45 (t-value: 7.20) respectively. The direct effect estimate of RETEN on EXTEN is also significant; 0.44 (t-value: 7.20). These results offer support to previous research findings proposing word-of-mouth as antecedent of behavioural intentions

related dimensions of Loyalty (Oliver, 1999; Tsoukatos and Rand, 2006; DeWitt et al., 2008; Garnefeld et al., 2011).

The Mediating Impact of Interrelations between Loyalty Dimensions on the Effects of Satisfaction

The model, in Figure 2, further depicts the enhancing impact of word-of-mouth on Loyalty dimensions related to “*continuance commitment*”. The indirect CUSAT → WOM → RETEN effect estimate ($0.98 \times 0.69 = 0.68$) is almost threefold higher than the direct CUSAT → RETEN estimate of 0.23. Furthermore, both the CUSAT → WOM → EXTEN ($0.98 \times 0.45 = 0.43$) and CUSAT → WOM → RETEN → EXTEN ($0.98 \times 0.69 \times 0.45 = 0.31$) indirect effect estimates are fourfold and threefold higher, respectively, as compared to the direct CUSAT → EXTEN effect estimate of 0.10. These results support similar findings reported from (among others) Oliver, (1999); Tsoukatos and Rand, (2006) and DeWitt et al., (2008). Moreover, Garnefeld et al.’s (2011) proposed notion that word-of-mouth is enhancing the communicator’s own behavioural Loyalty is fully supported.

Implications of the Study

The above discussed results yield important implications. First, the long-established in the literature notion that overall customer Satisfaction is an immediate antecedent and strong driver of customer Loyalty (Cronin and Taylor, 1992), is once again confirmed. However, examining the relationship between the two constructs at the aggregate level is wrong, as it fails to expose the impact of Satisfaction on individual Loyalty dimensions. Findings of previous research reporting varied effects of Satisfaction between Loyalty dimensions (Tsoukatos and Rand, 2006) are confirmed. Hence, examination of Satisfaction-Loyalty relationships at the aggregate should be avoided as it may lead to systematic error.

Second, Loyalty dimensions are not independent constructs and should not be treated as such. Previous research findings on existing relationships, of specific causality, between Customer Loyalty dimensions (Luarn and Lin, 2003; Tsoukatos and Rand, 2006; Bandyopadhyay and Martell, 2007) have been confirmed. As expected, the causality was found to run from “*affectionate commitment*” to “*continuance commitment*” (Garnefeld et al., 2011). Most specifically, it followed the trail “willingness to engage in word-of-mouth communications in favour of the service firm and its products/services” → “intention to preserve current business relationship with the service provider” → “intention to extend current business relationship”. Garnefeld et al.’s (2011) notion that word-of-mouth enhances the communicator’s own Behavioural Loyalty is fully supported by the findings of this study.

Third, between significant direct effects of Satisfaction on Loyalty dimensions, under consideration, the strongest is the one on customers’ willingness to engage in word-of-mouth communication, followed by the one on their intentions to preserve current business relationship with their service provider. The direct effect on customers’ intentions to expand current business levels was found to be non-significant. Moreover, word-of-mouth is proven

to have a mediating impact on Satisfaction's effects on other Loyalty dimensions. Indirect effects of Satisfaction, through word-of-mouth, on customers' intentions to preserve and extend relationship were found to be threefold and fourfold stronger, respectively, than the direct ones. These findings not only support previous research reports (e.g. Tsoukatos and Rand, 2006) but also give additional meaning to Garnefeld et al.'s (2011) notion about word-of-mouth's role in enhancing communicators' own Loyalty.

The implications of these study's findings are of critical importance to managerial decision making. It is now proven that word-of-mouth communication, besides its well established in the literature effectiveness in attracting business from new customers (Trusov et al., 2009), is also capable of promoting communicators' retention and attracting new business stemming from it. Managers should be innovative in exploiting word-of-mouth communication in all these respects. Furthermore, they should be aware of possible differential effects of Satisfaction on specific Loyalty dimensions in view of better exploiting their Satisfaction campaigns' potential. Directly targeting such campaigns towards building customers' retention and/or cross-buying intentions might prove inefficient. Aiming such campaigns primarily at creating and/or reinforcing their customers' affectionate bonds with their firm will be much more beneficial. New business will be attracted customers through positive word-of-mouth communication of devoted customers (Trusov et al., 2009) and at the same time stronger motivation of existing customers to keep-on doing and extend their business with the firm will be achieved.

Study Limitations and Further Research Directions

The main limitation of this study is that it drew evidence from a single service industry, i.e. Greek banking. Further research should be undertaken to confirm this study's reported findings in other service industries and settings. Convenience sampling is certainly an additional limitation, especially in view of that questionnaires were to a great extent administered via the Internet. However, this type of sampling is considered adequate when between constructs relationships are examined (Calder et al., 1981). As such is very common in the management literature (e.g. Brady et al., 2002; Chang et al., 2002; Wang et al., 2004; Semeijn et al., 2005). Despite these limitations, the methodology of this study provides future researchers a solid basis for their work.

Conclusions

The findings reported in this paper build upon previous research on the Customer Satisfaction - Customer Loyalty link as well as on research about the internal relationships between customer Loyalty dimensions. Valuable insights to managers are provided indicating that their firms' customer Satisfaction campaigns should be primarily targeted at increasing the "*affectionate*" rather than the "*continuance*" commitment of their customers. Garnefeld et al.'s (2011) notion that word-of-mouth is enhancing communicators' own behavioural intentions is confirmed. Hence, targeting at positively affecting customers'

"affectionate commitment" will eventually result in enhanced behavioural Loyalty. Although the situational variables in the Greek banking industry may differ from those in other industries, the study's methodological framework can be adapted to apply to every research setting.

Abstract

In this paper we examine which type of alliance experience matters most for developing an alliance management capability. Although experience is deemed to be an important antecedent of a firm's capability to manage collaborations, we argue that only some types of alliances are likely to foster the development of such a capability, thus representing the valuable alliance experience. Starting from the identification of the constitutive skills of an alliance management capability, we develop a theoretical framework which proposes that only alliances resembling the nature of the so-called embedded ties provide firms with these specific skills. We refer to the collection of such alliances as a firm's repertory of embedded alliances. Moreover, we argue that, in order to affect the capability building process, such a repertory needs to be not only extensive but also heterogeneous in terms of alliance goals, contents, governance forms and partners. Finally, we assume a stronger effect of the valuable alliance experience when leveraged through the use of deliberate learning mechanisms.

Keywords: alliance management capability, alliance experience, embedded alliances, deliberate learning mechanisms.

Introduction

During the years, there has been an explosion of interest in knowledge, which today is considered to be one of the most important resources for people, firms and countries. The economic role played by knowledge assets has changed since the industrial revolution, as it led to the adoption of artificial energetic sources, making human work mainly cognitive (Rullani, 2004: 249). In the field of strategic management, this has conducted to the knowledge-based view of the firm (KBV), asserting that firms are knowledge-based activity systems deriving competitive advantage from their cognitive structures (Nonaka and Takeuchi, 1995; Conner and Prahalad, 1996; Grant, 1996; Spender, 1996; Tsoukas, 1996; Boisot, 1998; Davenport and Prusak, 1998; Rullani, 2004). In today's complex economic scenario firms are unable to produce internally all the knowledge necessary not only for the achievement of a sustainable competitive advantage but also for their survival. At the same time, they cannot rely on mere market transactions to sustain the continuous process of knowledge creation. Therefore, firms often opt for the specialization of their activity and cognitive work division, engaging in strategic alliances.

However, despite their relevance, interorganizational collaborations often fail to reach their goals because of managerial difficulties (Simonin, 1997; Anand and Khanna, 2000; Ireland *et al.*, 2002). In this context, firms' ability to manage interorganizational alliances - defined *alliance management capability*^[1] (Schreiner *et al.*, 2009) - appears to be one of the most important organizational knowledge assets.

In the last decade, several scholars have addressed the question of how firms can develop such a capability. Building on organizational learning and evolutionary economics, most of these studies assume that a relevant antecedent of a firm's ability in managing collaborations, and therefore of alliance success, is previous alliance experience (Anand and Khanna, 2000; Kale *et al.*, 2002; Zollo *et al.*, 2002; Sampson, 2005; Heimericks and Duysters, 2007).

However, empirical studies on the effect of previous experience on alliance performance have led to mixed results. Some scholars (Anand and Khanna, 2000) found a strong positive effect just for a specific type of collaboration (R&D joint ventures). Others studies, which distinguish between general collaborative experience and partner-specific collaborative experience, have provided different findings about their association with performance (Zollo *et al.*, 2002; Hoang and Rothaermel, 2005).

Despite in these studies scholars have highlighted the importance of experience in managing collaborations and have stressed the need to take account of differences in the types of alliance experience, we still lack a more comprehensive understanding of the linkage between the characteristics of previous experience and the alliance management skills which are fostered by such an experience.

The aim of the paper is to make a contribution towards the understanding of which part of experience can be considered valuable for the generation and development of a firm-level capability enabling firms to successfully manage interorganizational collaborations.

To get to the point, we first identify the constitutive elements of an alliance management capability following Schreiner *et al.* (2009) who conceptualize it as a multidimensional construct made of *coordination*, *communication* and *bonding* skills. Then, on the basis of such a conceptualization, we delimit the type of experience which is more likely to stimulate the development of such skills and refer to it as *valuable alliance experience*. In fact, we believe that previous alliance experience matters only to the extent that it provides the firm with those specific skills required to manage collaborations, i.e. with the elements that constitute an alliance management capability. In other words, the identification of the main components of such a capability is a necessary prerequisite to detecting the part of experience which contributes to its development.

We offer a framework which focuses on the alliance management capability building process. More specifically, in the proposed model, after breaking the alliance capability down into its constituent skills, we identify the part of experience which contributes to foster them thus affecting such a capability. Moreover, since experience is deemed to be a necessary but not sufficient condition in the capability building process (Simonin, 1997; Zollo and Winter, 2002; Heimericks and Duysters, 2007), we also recognize the role played by the adoption of deliberate learning mechanisms in such a process.

The paper is therefore organized as follows. Next section presents the theoretical background on the issue of alliance management capability. The following section describes the theoretical framework analyzing the dimensions supposed to affect the development of such a capability. Finally, we discuss some main implications and provide concluding remarks.

The Alliance Management Capability

Entering an alliance is widely recognized as a necessary strategy for firms aiming at filling their knowledge gaps and keeping pace with rapid environmental changes (Doz and Hamel, 1998). However, the complexity of interorganizational relationships makes alliance success difficult to achieve, as confirmed by their high failure rate. Several challenges in the pre-alliance phase (selection of the partner, choice of the governance structure of the alliance, etc.), as well as in the ongoing management of the alliance (building of trust, management of interfirm knowledge sharing, etc.) make the outcome of a partnership extremely uncertain. Hence, given the role of partnerships in today's competitive environment and the asymmetric distribution of alliance managerial skills (Anand and Khanna, 2000: 296; Ireland *et al.*, 2002: 435), the capability to manage alliances has been identified as an important source of competitive advantage (Dyer and Singh, 1998; Ireland *et al.*, 2002). Following Schreiner *et al.* (2009), we term such a capability *alliance management capability*.

So far, one main stream of research on this subject has emerged focusing on the process behind the development of a firm's capability in managing alliances. More specifically, this body of literature mainly stressed the role played by experience in such a process by analysing its effect on performance.

For instance, Annand and Khanna (2000) found a positive association between collaborative experience and alliance performance by measuring the value created for each firm in the alliance in terms of stock market returns. Such a positive relationship is supposed to be due to the learning effects triggered by the accumulation of alliance experience. Other studies, which distinguish between general alliance experience (meant as the total number of previous agreements) and partner-specific alliance experience (meant as the number of previous ties with the same partner), gathered mixed findings (Zollo *et al.*, 2002; Hoang and Rothaermel, 2005). For instance, in studies on the same industry (biotechnology), Zollo *et al.* (2002) found a positive effect of partner-specific experience on alliance performance while Hoang and Rothaermel (2005) found that only biotech firms' general alliance experience was positively associated with joint project performance.

Other studies, although recognizing the importance of previous alliances, assume that collaborative experience alone is not enough (Simonin, 1997; Kale *et al.*, 2001; Heimeriks and Duysters, 2007; Kale and Singh, 2007). Simonin (1997: 1167) suggests that the lessons of experience have to be internalized by the firm and drawn into specific know-how in order to achieve benefits from future partnerships. Moreover, Sampson's findings (2005) about the decreasing marginal returns of alliance experience on a firm's innovative performance suggest the possibility of a depreciation of the value of experience over time and consequently the need to institutionalize and diffuse best practices within the organization (Sampson, 2005: 1027).

Building on organizational learning, evolutionary economics and dynamic capability studies, many scholars have proposed that firms need to invest in *deliberate learning mechanisms* (Zollo and Winter, 2002) in order to leverage previous alliance experience and therefore improve alliance performance (Kale and Singh, 1999; Kale *et al.*, 2002; Draulans *et al.*, 2003; Heimeriks and Duysters, 2007; Kale and Singh, 2007). These studies assume that the use of deliberate learning mechanisms helps the firm to derive lessons from previous collaborative experience and diffuse alliance management knowledge within the organization. In other words, by purposefully designing the organization for accumulation, storing, integration and diffusion of organizational knowledge acquired through experience, firms will make capability building more effective (Kale *et al.*, 2002: 749.).

Although these studies have offered considerable insight into the alliance management capability building process, they have given less attention to what actually constitutes a capability in managing alliances (Shreiner *et al.*, 2009; Schilke and Goerzen, 2010). Schreiner *et al.* (2009), in the attempt to extend a second stream of research on which elements constitute

an alliance capability, identify it as a multidimensional construct based on three skills - *coordination*, *communication* and *bonding* - required to manage the post-formation phase of an alliance. *Coordination* refers to the capability of managing and coordinating the interdependence between partners; *communication* entails the ability of fostering information sharing within the alliance; *bonding* refers to the firm's ability to enhance strong personal relationships among individuals involved in the collaboration.

We believe that the two research streams on alliance management capability – how it develops and which elements constitute it – are strictly related. Indeed, an attempt to deepen our understanding of a capability building process needs to be based on the analysis of the constitutive elements of the focal capability. In fact, in this study we aim to combine the two research streams on alliance management capability. Particularly, starting from Schreiner *et al.*'s (2009) conceptualization of such a capability as composed of coordination, communication and bonding skills, we attempt to shed more light on the linkage between alliance experience and alliance management capability. Indeed, Schreiner *et al.*'s (2009) conceptualization calls for a careful analysis of what kind of experience can actually foster the development of the aforementioned skills within the firm. Actually, we believe that merely referring to *alliance experience* as the basis for capability building without taking into account the type of experience accumulated by the focal firm, could be misleading. Following this logic, we isolate the part of alliance experience which is likely to foster the development of coordination, communication and bonding skills from that part which can hardly contribute to increase a firm's alliance management capability. In the following section we present in detail the proposed theoretical model, generating a set of propositions.

Theoretical Framework

As shown in figure 1, we propose a multidimensional framework for the investigation of the relationship between the part of experience identified as valuable alliance experience and alliance management capability. Moreover, we suggest that the adoption of deliberate learning mechanisms is likely to affect such a relationship.

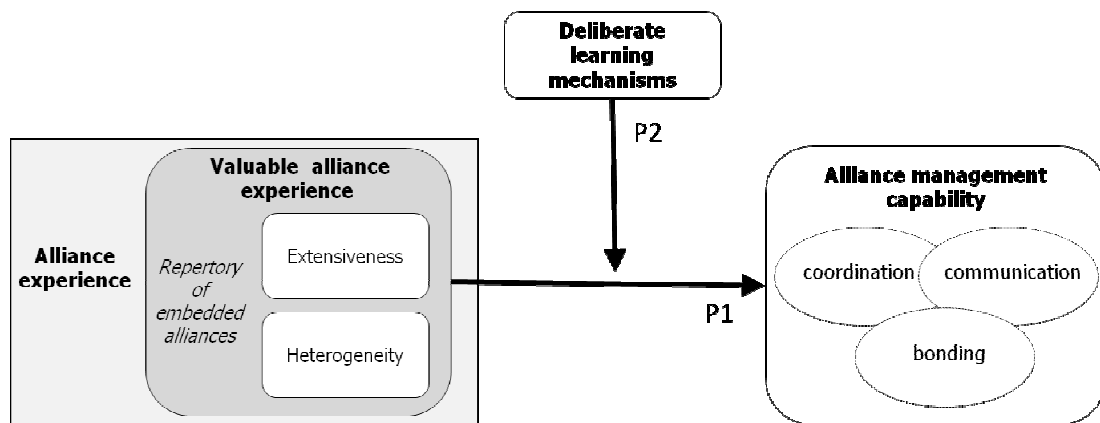

FIGURE 1

A theoretical model of alliance management capability building

In what follows we provide explanations for each of the assumed relationships.

Valuable alliance experience and alliance management capability

Many research suggest that previous experience in managing alliances might be a critical antecedent of alliance or firm success (Powell *et al.*, 1996; Lorenzoni and Lipparini, 1999; Anand and Khanna, 2000; Kale *et al.*, 2000; Hoang and Rothaermel, 2005; Sampson, 2005; Heimeriks and Duysters, 2007). Such a positive association between experience and performance is supposed to be due to capability development (Simonin, 1997; Zollo and Winter, 2002; Heimeriks and Duysters, 2007).

Overall, studies which stress the role of experience are built on the assumption that a firm's accumulation of experience in a focal activity makes it possible to repeat the action in a similar way. Such an assumption derives from the experience curve literature, which suggests that repeated engagements in an activity produce benefits through learning by doing (drawing inferences, encoding, storing and saving experience) (Levitt and March, 1988). As individuals remember skills by practising them, in the same way organizations remember activities by doing them. That is to say that the skills of an organization reside in their routines and in the operational knowledge which derives from the routinization of an activity (Nelson and Winter, 1982: 99).

In such a process of experiential learning, organizations develop a capability adopting those routines and strategies that are likely to lead to the desired outcome, and refining the routines by learning within them.

With reference to the specific process of alliance management, previous alliance experience might help firms to store and develop a repertory of practices which facilitates the interpretation, anticipation and response to unforeseeable contingencies and to the unpredictable nature of the interaction between alliance partners (Anand and Khanna, 2000:

298). Such an experience seems to assume a more critical role under some circumstances. For instance, Sampson (2005) states that alliance experience produces collaborative benefits when alliance activities are characterized by high levels of ambiguity and uncertainty and managerial decisions cannot be based on observable criteria.

Apart from facilitating decision-making, alliance experience might also help firms to further develop their internal capabilities in terms of strategic and network assets (Powell *et al.*, 1996: 119). The model of learning proposed by Powell *et al.* (1996) assumes that a more extensive experience at managing R&D alliances leads to a more diverse firm's portfolio of alliances and, in this way, increases the firm's ability to become more centrally connected and so to gain information and reputation benefits.

Generally, these studies suggest that the extensiveness of a firm's repertory of alliances (alliance experience) is positively related to a firm's alliance management capability.

However, we put this statement one step further by arguing that alliance volume does not necessarily imply learning from alliances: the effect of experience may differ according to the type of previous ties a firm has been involved in. In fact, the logic that firms learn how to manage alliances as their overall experience increases, neglects that only some types of experience are actually likely to foster managerial learning.

Indeed, following the perspective that experience produces benefits thank to the development of routines derived from repeated engagements in the same activity, we believe that the alliance experience which matters is only the one allowing firms to practice and routinize the specific skills required to manage collaborations.

Therefore, the starting point in understanding which type of alliance experience might be really valuable is a clear identification of the constitutive skills of alliance management capability. As mentioned above, we use Schreiner *et al.*'s conceptualization (2009) of a collaborative capability as composed of *coordination*, *communication* and *bonding* skills^[2]. Coordination refers to the ability to understand and match the interdependence among partners; communication entails the ability to share relevant and accurate knowledge with partners, as well as the ability to choose adequate communication modes according to the context; bonding refers to the firm's ability to strengthen interpersonal relationships among individuals involved in the collaboration (Schreiner *et al.*, 2009: 1401-1402).

The focus on what actually constitutes an alliance management capability helps us to delimit the experience which matters most. In fact, assuming that alliance management capability is made of coordination, communication and social bonding skills, as stated, we need to ask which kind of experience could matter for developing these skills, excluding that part which does not contribute to this process. Therefore, we need to focus on the nature of the relationship in order to understand which type of previous ties might be influential in facilitating alliance management learning. In other words, which ties have the features that

can provide firms with communication, coordination and bonding expertise? We advance the hypothesis that alliance management learning is more likely generated as previous relationships resemble the nature of the so-called *embedded ties*, characterized by a unique combination of personal, social and economic factors and defined by three main components: *trust*, *fine-grained information transfer* and *joint problem-solving arrangements* (Uzzi, 1997).

Trust – meant as the mutual confidence that no parties involved in the relation will exploit another's vulnerability – is a unique governance mechanism based on voluntary, non-obligating exchanges of assets and resources by norms of generalized reciprocity.

Trust seems to operate on the basis of a heuristic process characterized by subtle control of interdependence and self-regulation, instead of a calculative risk-based decision focused on monitoring devices (Uzzi, 1997: 43).

Such a process speeds up decision making and economizes cognitive resources such as time and attention, not damaging information quality. In this way, it provides alliances with an *open architecture* to transfer and exchange *fine-grained information* (Uzzi, 1996: 678), which is proprietary, sticky, strategic and tacit knowledge, hard to codify and acquired through learning by doing. Knowledge sharing develops through the establishing of shared norms, codes, languages and representations which provides the normative background for communication. By generating “a common conceptual apparatus”, this alignment offers the opportunity of creating a common base which avoids that misunderstanding deriving from speaking different languages (Nahapiet and Ghoshal, 1998: 253).

As a result, by taking for granted the integrity of partners, embedded ties help partners to develop *joint problem-solving arrangements*, in this way making partners able to coordinate their interdependence, to work through problems, learn by them and accelerate problem correction.

Synthesizing, the features of embedded ties (trust, fine-grained information transfer and joint problem solving arrangements) allow for greater transparency between partners thus facilitating the formation of strong social bonds, foster the activation of a communication-intensive process of relationship management and support the joint resolution of problems and the mutual coordination (Kale *et al.*, 2000: 223). For this reason, embedded ties are likely to provide firms with coordination, communication and bonding experience and, therefore, seem to correspond to the part of experience which really counts for developing the capability of managing alliances as previously defined.

Stated the importance of previous embedded ties in the alliance capability building process, we suppose that it is not the number of all previous alliances to matter but the extensiveness of the collection of embedded alliances a firm has accumulated over time. We refer to such a collection as the firm's *repertory of embedded alliances* (Figure 1).

So far, the analysis has allowed us to delimit the repertory of relevant experience. As a further step, we need to ask which features of such a repertory as a whole may enhance managerial learning, avoiding the paralyzing effect which transforms experience into a *core rigidity* (Leonard-Barton, 1992). In fact, a firm's repertory of embedded alliances can be characterized by heterogeneous or homogeneous ties in terms of alliance goals, contents, governance forms and partners.

We recognize the existence of two main experiential risks in alliances which resemble embedded ties:

- the tendency to choose similar partnerships in terms of alliance goals, contents and governance forms;
- the over-repetition of the alliance with the same partner.

This may lock firms in a specific experience which sets up idiosyncratic routines inapplicable to different types of alliances. Paradoxically, the same embedded ties which can stimulate managerial learning might turn into a liability restricting firm's experience outside a specific relationship.

On the contrary, a heterogeneous repertory of embedded alliances - in terms of goals, contents, governance forms and partners - makes firms able to experience different alliance management practices. A diverse and broader range of collaborative experience provides greater opportunity to refine interaction routines and procedures for cooperating making them more versatile and generally applicable. Thus, the diversity of ties might result in a more general managerial capability.

Therefore, in our framework, the extensiveness of the repertory of embedded alliances is a necessary but not sufficient condition for learning from experience: the more a repertory is formed by heterogeneous partnerships, the less the risk that experience transforms into a rigidity.

We refer to the experience provided by an extensive and heterogeneous repertory of embedded alliances as *valuable alliance experience*.

Summarizing, we suppose that it is not the extensiveness of all types of alliance experience to matter but the extensiveness and heterogeneity of a firm's repertory of embedded alliances.

By this argument, we elaborate the following proposition (Figure 1):

Proposition 1: the extensiveness and heterogeneity of a firm's repertory of embedded alliances (valuable alliance experience) will be positively related to alliance management capability.

Deliberate learning mechanisms and alliance management capability

Our analysis thus far has assumed that firms with an extensive and heterogeneous repertory of embedded alliances are more likely to develop an alliance management

capability. However, in line with previous studies, we believe it is necessary to look also at those intra-firm dynamics which foster such a capability building process.

In fact, there are limitations that constrain learning by doing and, therefore, the process leading from valuable alliance experience to alliance management capability cannot be taken for granted. As Levinthal and March (1993: 96-97) remarked, experience is often a *poor teacher* and learning entails many of the same cognitive limits that constrain rationality. Organizational limitations, such as problems of memory, conflict and turnover, accentuate the cognitive limitations of individuals, thus making learning from experience extremely difficult. More specifically, firms have to foster knowledge sharing within the organization, otherwise critical knowledge would reside only in those who have learned the lessons (Heimeriks and Duysters, 2007: 42).

As regards alliance management, learning from prior experience is likely to be even more challenging as compared to other tasks for which experience effects have been documented, since alliances are usually less frequent, more heterogeneous and more causally ambiguous than other processes (Zollo *et al.*, 2002: 703).

As a result, scholars that investigated alliance management capability building assume that, although important, alliance experience is a necessary but not sufficient condition for improving alliance performance (Simonin, 1997; Kale and Singh, 1999; Kale *et al.*, 2002; Heimeriks and Duysters, 2007).

In line with these scholars, we believe that what really matters is the way prior experience translates into a capability. Zollo and Winter (2002) argue that the ability of a firm to derive lessons from previous alliance experiences and develop a process to manage partnerships in a systematic and relatively predictable fashion is an example of a dynamic capability whose development requires deliberate learning processes of explicit *knowledge articulation* and *knowledge codification* going beyond semi-automatic stimulus response and tacit accumulation of experience. Similarly, Kale and Singh (2007) highlight the importance of enhancing an *alliance learning process* so that firms can learn, accumulate and leverage alliance management knowledge gathered in previous partnerships. They argue that experience is a *crude approximation* of the mechanisms that lie at the foundation of an alliance capability, which, instead, would develop from proactive efforts to accumulate and leverage alliance know-how associated with prior experience. In particular, apart from the above-mentioned processes of knowledge articulation and knowledge codification, they address the role of *knowledge sharing* and *knowledge internalization* mechanisms as a way to diffuse best practices within the firm.

Heimeriks and Duysters (2007) found that a firm's alliance capability resulting from learning mechanisms for capturing, disseminating and applying alliance management knowledge, mediates between a firm's alliance experience and alliance performance. Similarly, Draulans *et al.* (2003: 160) argue that companies need to develop processes directed at learning from alliances and spreading alliance management knowledge within the

company in order to achieve alliance success. They found that organizations that institutionalize and structure learning from experience are able to achieve superior alliance performance.

More in general, several scholars stressed the importance of investing in deliberate learning mechanisms in order to leverage and disperse alliance knowledge within the organization, such as: codified tools (databases containing firm's alliance history, manuals, checklists and guidelines), formal and informal debriefings of alliance managers, alliance training systems, problem-tracking and problem-solving procedures, rotation across different partnerships of experienced alliance managers, alliance committees and task forces, dedicated alliance functions (Simonin, 1997; Kale *et al.*, 2001, 2002; Zollo and Winter, 2002; Draulans *et al.*, 2003; Heimeriks and Duysters, 2007; Kale and Singh, 2007).

Building on these studies, we assume that valuable alliance experience will have a stronger effect on the development of alliance management capability when alliance management knowledge accumulated in previous partnerships is leveraged through the use of some deliberate learning mechanisms.

On the basis of these arguments, we offer the following proposition (Figure 1):

Proposition 2: the more a firm invests in deliberate learning mechanisms, the stronger the positive relationship between valuable alliance experience and alliance management capability.

Discussion

In this study, building on Schreiner *et al.*'s (2009) conceptualization of an alliance management capability as made of coordination, communication and bonding skills, we have introduced the concept of *valuable alliance experience*, that is the type of experience which is more likely to contribute to the development of such a capability. Contrary to other studies which highlighted the role of the firm overall collaborative experience, we propose that only alliances which resemble the features of embedded ties might represent an antecedent of an alliance management capability. In fact, these ties, being characterized by features such as trust, fine-grained information transfer and joint problem-solving arrangements, provide firms with an experience of the specific skills required to manage interorganizational relationships. We refer to this part of experience as the firm's *repertory of embedded alliances*. Moreover, we suggest that the more such a repertory is heterogeneous in terms of alliance goals, contents, governance forms and partners, thus providing firm with an experience of different alliance management practices, the more likely previous experience will transform into a general applicable alliance management capability. In addition, we focus on the need to design internal organization in order to foster the development of an alliance management capability. We emphasize the centrality of adopting organizational mechanisms, managerial practices and routines - *deliberate learning mechanisms* - suitable to interorganizational alliance management and consequently to knowledge transfer processes.

Theoretical implications

From a theoretical point of view, our framework makes a contribution to existing literature in several ways. First, it extends alliance management capability studies by bridging two research streams usually treated in isolation: what alliance management capability is and how it develops. Previous studies have focused either on the process leading to an alliance management capability, highlighting the role of alliance experience and deliberate learning mechanisms (Kale *et al.*, 2001; 2002; Draulans *et al.*, 2003; Heimeriks and Duysters, 2007; Kale and Singh, 2007), or on the elements which constitute such a capability (Shreiner *et al.*, 2009). In this paper we have showed how an enhanced understanding of the issue of alliance management capability can be reached by bridging these two streams of research. More specifically, by focusing on the constitutive elements of an alliance management capability, we question the assumption that all previous alliances lead to an improvement in the firm's capability to manage relationships and advance the hypothesis that only some of them can actually contribute to this process. Although some other scholars have distinguished among different types of alliance experience and empirically tested their effect on performance (Zollo *et al.*, 2002; Hoang and Rothaermel, 2005), they did not link the characteristics of such experience to the specific skills required to manage collaborations. Second, our model contributes to theory by stressing the need of focusing on different levels of analysis when dealing with the issue of alliance management capability. Specifically, our framework explores the role played in the capability building process by interorganizational elements - both at the alliance level (embeddedness of ties) and at the entire collection of previous ties level (heterogeneity of the repertory of embedded alliances) - as well as intraorganizational elements (deliberate learning mechanisms). Thus, alliances are likely to enhance managerial learning when firms, at an interorganizational level of analysis, have been involved into several and diverse embedded relationships and, at a firm-level, adopt suitable internal organizational mechanisms, managerial practices and routines to leverage such an experience. In addition, our framework might be useful for the analysis of other organizational capabilities (such as the capability to manage mergers and acquisitions). Generally, our argument suggests that breaking capabilities down into their constituent skills might be central in order to identify, among previous experience, what might represent a valuable one.

Managerial implications

From a managerial perspective, the framework suggests some point of intervention for alliance management. First, by highlighting the role of embedded ties in the alliance capability building process, it stresses the importance of managing relationships through personal involvements and close bonds. Second, it recognizes the role of a differentiated repertory of alliances as a means of preventing inertia. Although we admit that the heterogeneity of the collection of embedded alliances a firm accumulates over time is often contingent on concrete opportunities and environmental factors, we think that to some extent

it can be strategically designed. Third, it stresses the role of the adoption of organizational mechanisms to turn experience into a capability. In this case, the role of management becomes more crucial. In fact, some of the deliberate learning mechanisms (for instance a dedicated alliance function) may lead to an excess of bureaucracy and others (e.g., codified tools such as guidelines and manuals) may limit the dynamic evolution and revision of firm's routines and procedures. Therefore, the mere adoption of these mechanisms is not enough since the leverage of previous alliance experience through such mechanisms is a process that needs to be dynamically managed in order to avoid organizational inertia and the generation of core rigidities.

Indeed, though we have argued that valuable alliance experience is likely to be an antecedent of an alliance management capability, we need to consider that such a process might actually develop in a cyclical way. If, according to our framework, an extensive and heterogeneous repertory of embedded alliances may provide the firm with specific communication, coordination and bonding skills, these skills are actually likely to lead the firm to experience further embedded and heterogeneous relationships, which will lead to an additional improvement in the firm's alliance management capability and so on. In other words, we need to consider the likelihood of a virtuous cycle enhanced by such a capability building process.

Endnotes

[1] Other scholars refer to such a capability as *collaborative know-how* (Simonin, 1997) or *alliance capability* (Anand, and Khanna, 2000).

[2] Following this perspective, we believe that alliance management capability is the ability of favorably and successfully managing and coordinating an individual alliance during the post-formation phase. In so doing, we exclude from alliance management capability the skills related to pre-formation and formation phases of alliances (such as, for example, the selection of partner and the choice of governance structure), as they only indirectly affect the relationship.

**THE EVALUATION OF THE STRATEGIC BUSINESS UNITS OF DERIVATIVES
WITHIN GERMAN SAVINGS BANKS AGAINST THE BACKGROUND OF THE
CURRENT ECONOMIC CRISIS: SYSTEMATIC LITERATURE REVIEW & INITIAL
APPROACH**

van Bracht, Jan Hendrik¹; Kaufmann, Hans Ruediger²

¹University of Gloucestershire

²University of Nicosia

Abstract

This paper provides a systematic literature review on the critical success factor (CSF) approach within the banking industry. This is done in order to create a theoretical basis for further research regarding the question if there are CSFs which have to be considered implementing a meaningful and sustainable business strategy for the business segment 'derivative sales' within German saving banks against the background of the current financial and economic crisis. In detail it presents a wide list of success factors, success factor categories and their developments in order to build up an appropriate platform for further bank-specific research regarding this approach. It could be observed that a generally accepted holistic concept is still outstanding and no research regarding critical success factors has taken place within the banking industry since the year 2005.

In addition to this, research objectives are formulated and an initial outlook is given how the identified scientific gap will be addressed within further research using grounded theory as overall methodology within a constructivism worldview.

Keywords: Systematic Literature Review, (Critical) Success Factors, Predictive Factors, Competitive Factors, Financial Crisis, Bank, Banking, Derivatives.

Introduction

The impacts of the global economic and financial crisis are still very much in evidence, especially in relation to the market of OTC-derivatives. This has suffered from many regulatory and legal changes. Within the business segment of selling derivatives to hedge client's interest rate exposure, German savings banks have just started to position themselves during the last years, making use of different strategies to enter, stay in and leave the competitive environment.

While smaller institutions do not actively engage within this business segment, medium and larger savings banks make use of different forms of co-operation, either horizontally with other savings banks (e.g. within special purpose vehicles) or vertically with their mother institutions. Furthermore the set up of own business units within their institutions as well as the involvement of external consultants (hired as outsourced sales units) can be observed.

Against the background of the global economic and financial crisis, the available resources within savings banks as well as the up-coming changes within the landesbanks'⁸⁴ sector, the question that arises is: What are the critical success factors which have to be considered in implementing a meaningful and sustainable business strategy for the business segment 'derivative sales' within German savings banks.

Global Economic and Financial Crisis

For critically discussing the approach's results the economic and financial crisis of 2007 has to be reviewed shortly. Due to the different perspectives and variety of research the issue shall only be addressed briefly on a descriptive level illustrating the central causes, the development economy has taken and the outcomes.

Since August 2007 catastrophic developments hit the national economies, financial institutions and financial markets all over the world (Hellwig, 2009). Even though it is hard to determine the exact origins the results became visible to the "general public on the global level" in 2007 (Radun, 2009, p. 348). As central element of this crisis the US housing bubble, especially regarding subprime mortgages, is seen (Baker, 2008; Singh & Bruning, 2010). The origins of this bubble can be referred to the stock bubble in the mid-90s. The increased stock-wealth had led to more consumption and people tended to invest their money in housing. As the supply of houses is relatively fixed in the short-run the prices began to rise and people were able to sell their houses on higher prices than they have paid in order to buy better homes (Baker, 2008; Singh & Bruning, 2010).

The consumption motivation was accomplished through extraordinarily low interest rates due to the slowly recovering economy, which still suffered from the 2001-recession and the arising threat of deflation (Baker, 2008). Accelerating low levels of lending standards combined with wrong stimulates regarding the housing-market (e.g. "teaser-rates" and "negatively amortizing loans") had additionally led to a strong increase of subprime-mortgages since the years 2001 (Sanders, 2008; Radun, 2009). At the beginning of 2007 nearly 13% of all mortgages had the purpose of private house financing. Regarding this volume of more than half a trillion US-Dollar nearly 700 billion were securitized and had become tradable. Doing this, the loan-giving institutes could pass on their default risks to the capital market and could relieve their balance sheets (Kofner, 2009). The validity of the securitized papers was assessed by rating agencies, which made use of statistic (historical) databases determining the default probability and the recoverability of the collaterals (Kofner, 2009; Radun 2009).

After a time of decreasing and low interest rates the Federal Reserve Bank changed its interest-rate policy and introduced a period of increasing federal funds rates (Eisenbeis,

84 Landesbanks are central institutions for the savings banks with the intention to be competence centres and to offer links to the financial markets for savings banks.

2010). Due to financing on revolving loans with adjustable interest rates especially debtors with low credit-worthiness could not meet their financial obligations any more (Singh & Bruning, 2010). As a consequence the number of non-performing loans increased and many homeowners had to face foreclosure (Kofner, 2009; Baker, 2008). The increasing number of debt enforcement led to an increasing offer of houses and at the beginning of 2008 the house prices had already fallen over 30 percent in annual rates (Baker, 2008). In 2009 about 1.5 million US-households defaulted and faced foreclosure (Les, 2009).

As the house prices decreased and the number of non-performing loans increased, the financial industry had to depreciate their positions and became more and more restrictive regarding their lending standards as well as to roll over the granted loans. In addition to this the securitization markets had become more and more illiquid (Eisenbeis, 2010). As within the securitization market national as well as international investors were involved, the former national problems of subprime mortgages spilt over to other economies, stock markets and became a global financial crisis (Kofner, 2009; Sing & Bruning, 2010). Many financial institutions had to make value adjustments on their investments resulting in decreasing equity-positions with impacts on their ratings, their refinancing possibilities and their lending opportunities (Kofner, 2009; Eisenbeis, 2010). A general loss of trust against other asset classes and the financial sector itself took place and led to strong problems regarding the refinancing of banks through interbank borrowing (Radun, 2009). As a consequence several banks went bankrupt or needed supported by government or other public institutions. These rescuing programs were accomplished by several economic programs by governments trying to stabilize and stimulate the economy (Kofner, 2009). Regarding the German banking industry it became obvious that several banks were also invested in the US mortgage market through special purpose vehicles. This led to dramatic problems regarding refinancing and solvency and private as well as fully/partly state owned banks needed to be rescued by the state (Hau & Thum, 2009).

Success and its Measurement

Even though the term 'success' is used quite often an appropriate definition is far away from being trivial as it occurs to be an abstract parameter, which cannot be measured directly (Strauss, 2005). In addition to this the terms success and success measurement cannot be discussed separately as at least the performance measurement is determined by the definition of success. Therefore combined explanations of three approaches take place in the following, mentioning the underlying definition of success as well as its measurement, followed by the advantages and disadvantages. A special focus is laid on the practicability of the considerations.

Traditionally the term success is defined to be the difference of an input-parameter to an output-parameter. A positive balance is defined to be success, while a negative difference is characterized to be a loss/failure (Fritz, 1995). As organizations and companies do not only

strive for economic goals, further considerations took place, having the objective to determine the efficiency and therefore performance of a company (Grabatin, 1981).

The **goal approach** assumes that companies are systems serving different purposes. The enterprises' objectives are clear and identifiable. Therefore success is defined to be the achievement level of the set objectives (Buehner, 1977). As this approach is rather practical and easy to use, there are several disadvantages going along with this. A main argument is that only internal stakeholders are taken into account. The environment as well as competitors are completely disregarded and therefore the approach lacks the possibility to compare enterprises with each other (Grabatin, 1981). Finally the approach assumes that each company has a main goal, which is quite problematic regarding the bundle of goals defined by companies (Stahle, 1999).

An extension is made with the **system approach**, which considers – in addition to the internal processes and structure of the organization – the relationship of the entity with its environment. Within this concept, success is defined to be an “abstract, multidimensional construct” (Stahle, 1999, p. 445), which focuses on the survivability of the company. On the one hand the abstract level of definition leads to problems regarding the implementation, but on the other hand it offers the possibility to include external dimensions.

The **stakeholder approach** makes use of a completely different idea. It assumes that each stakeholder (shareholder, employee, customer, etc.) assess the organization/object in a different way, depending on his own motivation and intention (Stahle, 1999). Following this idea success is defined to be the level of agreement within these groups. By widening the perspective the stakeholder-approach considers far more dimensions than the other approaches, but can also be characterized to be more abstract. Therefore a practical implementation seems to be even more difficult.

To sum up it can be said that the more perspectives are included the higher the level of abstraction and the lower the applicability. Hence, many success factor studies make use of the goal approach using its definitions and methods of performance measurement (e.g. Kalka, 1996; Haenecke, 2001).

Theoretical Background of Critical Success Factors

The CSF approach has the aim to identify the general, sustainable factors, which differentiate successful from less successful companies (Hoffmann, 1986; Fritz, 1995; Hildebrandt, 2002; Hesse, 2004). Following the arguments of Riekeberg (2003) critical success factors⁸⁵ can be characterized to be

- definable,

⁸⁵ Within literature the terms 'success factors' and 'critical success factors' are used synonymously (Kube, 1991).

- sustainable in the long-term⁸⁶,
- directly/not influenceable by the company itself,
- company- or industry-specific,
- limited in their amount,
- original influencing variables leading to empirical or analytical assumptions about causal links,
- which help to explain the current or future positive or negative success of a business (unit).

Riekeberg (2003) distinguishes between 'critical success factors' and 'success factor categories'. While their characterization seems to be quite similar the levels of abstraction make the important difference as success factors can be aggregated to success factor categories.

The general goal of the success factor approach can be split into three considerations (Jenner, 1999). These are firstly the identification of the determinants, secondly their characteristics and thirdly the intensity regarding their influences (Fritz, 1995). These pieces of information about the cause-and-effect-relationship shall lead to the ability to make predictions for the future. Therefore the knowledge of the critical success factors helps a company to make transparent and rational decisions regarding their business strategy (Grimm, 1983).

General assumption of this approach is the consideration that only a few factors determine the success or failure of an enterprise, parts of a company or a business unit (Hoffmann, 1986; Leidecker & Bruno, 1984). Disregarding multidimensionality and multi-causality the theory's advocates believe that such critical factors always exist (Riekeberg, 2003). This leads to the argument, that the identification of all influencing factors is not necessary as only some of them have relevance (Daschmann, 1994; Lange, 1982). The identification of these *critical* factors is the aim of the critical success factor approach (Liehr-Gobbers, 2006), offering the company's management a framework for their strategic decisions (Böing, 2001).

First steps to a critical success factor approach were made with the research of Daniel (1961) and Rockart (1979). Researching information systems, Daniel (1961, p. 116) originally states that these systems "[...] should focus on 'success factors'. In most industries there are usually three to six factors that determine success; these key jobs must be done exceedingly well for a company to be successful". Daniel's thesis were followed and developed further by Rockard (1979, p. 85), who comes to the conclusion that "critical success factors thus are, for any

⁸⁶ Regarding further information of this strategic aspect of the critical success factor please refer to Grimm (1983), Fritz (1995) as well as Annacker (2001).

business, the limited number of areas in which results, if they are satisfactory, will ensure successful competitive performance for the organization. They are the few key areas where ‘things must go right’ for the business to flourish”.

Based on this a more professional and more academic examination took place (Woywode, 2004) with the result that the search for success factors also spilt over from single enterprises to whole industries as well as the theoretical organization itself. Beginning in 1980 strategic management research became also interested in the critical success factor approach and several large research projects were introduced, e.g. the Profit Impact of Marketing Strategies-Project (Woywode, 2004). Even though they became quite popular, their results often were low and Ghemawat (1991, p. 11) sums up: “The whole idea of identifying a success factor and then chasing it seems to achieve something common with the ill-considered medieval hunt for the philosopher’s stone, a substance that would transmute everything it touched into gold.”

Research on critical success factors can be roughly distinguished in research which on the one hand concentrates on the success or on the other hand focuses on the failure of economic activity. Studies which focus on failure of a company (‘negative success’) can be accredited to the insolvency or crisis research (Fritz, 1990) and will not be regarded further. In addition to this, research can be often differentiated by studies highlighting only one single factor or in contrast to this on a bundle of variables (Strauss, 2005).

Depending on the method, the identification of critical success factors can result from theoretical or conceptual findings, logical considerations, knowledge (from experts) or empirical analysis (Lange, 1982). Until now, two general directions of scientific approaches regarding success factors have been established: a qualitative and a quantitative approach (Tomczak, 1992). The qualitative approach analyzes a variety of qualitative arguments in order to find similarities and overlaps by using (soft) criteria. These are then defined to be critical factors (Haenecke, 2002). In contrast to the qualitative approach which focuses on qualitative arguments and does not rely on corporate data, the quantitative approach focuses on mathematical and statistical methods to analyze. Its researchers base their analysis on figures, trying to identify coherences by using mathematical methods for analysis (Werries, 2008).

Additionally, studies can be differentiated according to their scientific objective and the type of study (Haenecke, 2002). While explorative studies have the aim to identify patterns for setting up hypotheses, confirmatory studies have the goal to deduct practical suggestions by an assessment of logical causalities or to empirically prove theoretical theses (Werries, 2008). These confirmatory studies try to identify critical success factors by using a logical-deductive method (Werries, 2008). In contrast, explorative studies are usually based on empirical-inductive findings. In the history of critical success-factor research both approaches have had relevance and were used (Gruenig, Hecker & Zeus, 1996). While till the 90s most of

the studies can be seen as explorative analysis, recent studies have moved towards a confirmatory approach (e.g. Evanschitzky, 2003; Riekeberg, 2003; Hesse, 2004).

In summary it becomes obvious that besides the variety of former and present studies also the methodological approaches strongly differ. Deficits regarding comparability and less possibilities to draw hypotheses in order to set up a framework have been the result and a holistic concept of the critical success factors approach, which has been generally accepted and fully empirically examined, is still outstanding and missing (Rehkugler, 1989; Fritz, 1990; Goettgens, 1996). Therefore the critical success factor approach can still be seen at its beginnings and has problems regarding its acceptance (Fritz, 1990; Kube, 1991; Schroeder, 1994; Goettgens, 1996; Kieser & Nicolai, 2002).

Systematic Literature Review on Bank specific CSF

Works on literature reviews, like Tranfield, Denyer and Smart (2003, p. 214), suggest to make use of (iterative) scoping studies for management research in order to “assess the relevance and size of the literature and to delimit the subject area or topic”. This has already been done for presenting the historical, theoretical and methodological developments in the previous sections. As iterative process such scoping studies were rerun focusing on bank-specific research regarding ‘critical success factors’. The online databases EBSCO were searched through on 15.10.2010 using the following search terms: *(Success Factors) and Banks*, *(Critical Success Factors) and Banks*, *(Success Factors) and Derivatives*, *(Critical Success Factors) and Derivatives*.⁸⁷ A hand search of literature using the local library was also carried out.

As a preliminary result indicated by various sources, it becomes obvious, that previous research on success factors has been mainly conducted in the fields of the traditional manufacturing industry as well as on retail market. In contrast to their quantity and variety, the research on success factors in the banking industry seems to be quite limited. Especially focusing on ‘derivatives and CSF’, it becomes apparent that, so far, neither quantitative nor qualitative research has been embarked upon. Therefore, the assumption is drawn that the review has to start on a more generic (bank) level, and the following sections illustrate previous research and empirical findings on CSFs in banking.

Scoping previous studies reveals that Riekeberg (2003) and Strauss (2005) have already carried out literature reviews regarding CSFs in banking some years ago. Riekeberg identified ten studies to match his criteria. From these, he isolated 73 CSFs, which he aggregated into 12 success categories (cf. Appendix 1). Furthermore, Strauss (ibid) covers 20 studies presenting the reader an overview of the factors involved (cf. Appendix 2). In addition to this meta-analysis, an own systematic literature review was carried out using EBSCO, German National Library, Google Scholar incl. Emerald, ZETOC and Ethos (cf. Appendix 3 for

⁸⁷ In addition to this also the German expressions/translations were used, offering even more possibilities to gain pieces of information.

inclusion/exclusion criteria). To sum up, only the already known work by Strauss (which was not covered by previous reviews) matched the inclusion criteria. The lack of new studies confirms the assumption that there is not much empirical work as to CSFs on banks in general and on derivatives in particular in comparison to other industries. This deplorable state might be partially explained by the financial crisis of the recent years preventing further research on banks and their success determinants to be carried out. Analyzing the identified studies it can be concluded that the theory of CSFs regarding the banking industry, especially in recent history, has mainly taken place in the German-speaking areas. On the one hand, this might have been caused by a stronger focus on this approach by German-speaking researchers or, on the other hand, by a certain bias of German speaking academics. The general trend, that newer studies focus on more generic and, therefore, more transferable work instead of on company-specific research is interrupted by Strauss emphasizing corporate banking within the saving banking group. The inconsistent results of the respective literature reviews regarding the characterization as well as categorization of factors mirror the different objectives of the authors as well as the general problems of the scientific approach on CSFs itself. Hence, so far, a generally accepted list of 'the critical success factors' for the banking industry implicit from literature review is currently not existent. Nevertheless, the aggregations of previous literature reviews in combination with an analysis of Strauss' work offer an appropriate overview of possible CSF (categories).

Conclusion and Outlook

It could be observed that a generally accepted holistic concept of a critical success factor approach is still missing – especially within the banking industry. Therefore, the general applicability of the approach against the background of the business segment of derivative sales within regional banks seems questionable or might have to be accomplished by resorting additionally to other theoretical approaches. Nevertheless, the approach might be a useful starting point of a theoretical basis and might help to operationalize it. Summarizing, the literature review has shown that, so far, the aforementioned research issue has not been addressed within previous research.

The aim of up-coming research, therefore, is to identify these critical factors by 'building a bridge' between academic methods and practical knowledge thereby closing the gap between science and practice. Therefore, the research objectives are briefly

- to explore the nature of current business strategies for derivative sales within savings banks,
- to examine the critical success factors differentiating successful from less successful business units,
- to understand the external and internal influences on the implementation of new business strategies for derivative sales and

- to recommend strategies to enable saving banks to deal with this sector.

Relating to the savings bank industry up-coming research will be limited to the field of hedging/optimizing interest rate risk on the customer's liability side. Other derivative classes like foreign exchange- and credit-derivatives as well as derivatives for the asset side shall be excluded by definition. The final outcome shall be the development of a conceptual framework contributing to a better understanding of this business segment by academics and practitioners as well as providing a basis to optimize existing or the setting up of new sustainable business level strategy. For this research, sustainable business strategy shall be defined to answer the questions 'what has to happen to achieve a defined position in relation to other competitors within a market segment and what has to be fulfilled to stay successful in the long term' (Collis & Montgomery, 1998; Grant, 2002). The business strategy shall set up conditions for the effective arrangements of offers, resources and abilities for the business unit and defines conducive 'competitive strategies' (Hofer & Schendel, 1978; Collis & Montgomery, 1997; Gruenig & Kuehn, 2000). Hence, the business strategy sets the guidelines for a certain market segment within an organization.

Therefore, the up-coming research is highly relevant for the banking and consulting industry, offering in-depth - expertise within a market-environment which is swiftly and radically changing but still having high profit potential. The purpose of the up-coming research is exploratory, accepting that only few practitioners will be able and willing to participate and share their experiences and meanings about the research questions and objectives. The aim to construct a framework needs a deep understanding of the business activity accomplished by considerations about regulations and future developments and, therefore, requires complex discussions. Finally, one of the researchers can be seen as a passionate practitioner regarding the topic, working within this area for years. For these reasons it seems to be appropriate to take the position of constructivists to answer the research question.

Choosing grounded theory as an overall methodology, research will be based on the techniques of face-to-face in-depth expert interviews (as well as participant observation). Figure 1 illustrates a rough, initial concept of the research design. The upcoming results will then help to close the identified scientific gap regarding the question, how to make the business segment 'derivative sales' within German saving banks successful against the background of the current economic crisis.

Appendix 2: Success Factors according to Strauss' Literature Review

No.	Author(s)	Date of Publication	Country	Target Group	Research Method	Internal Success Factors	External Success Factors
1	Martin	1967	USA	Private Clients	quantitative, confirmative	Bank: relation 'spendings for marketing' to 'dividends on deposits', accommodativeness of the location	Sociodemographic Factors: population within business area, yearly population growth, share of inhabitants aged over 65, share of minority households, share of houses for rent, share of households with migration background, job Economic Factors: average income / house value, retail space within business area Competitive Situation: relation population/bank institute, number of institutes within (business) area, market penetration
2	Clawson	1974	USA	Private Clients	quantitative, explorative	Branch Characteristics: attractiveness of interior and exterior, age of the office, distance to a shopping center, parking adequacy, promotion activities	Sociodemographic Factors: share of persons aged 45 to 64 or older, income per capita within business area, share of renters next to the branch Economic Factors: median value of owner-occupied homes, retail sales per year within one-half mile radius, savings per capita Competitive Situation: population per saving and loan facility (S&L), amount of competing S&L-facilities, total assets of competing S&L facilities, average net saving gains of competitors
3	Heggestad	1977	USA	Private Clients	quantitative, confirmative	-	Economic Factors: average total deposits, ratio of time and savings deposits to total deposits, growth of retail sales, income per capita Market Structure: market concentration Risk (moderating factor)
4	Doyle et al.	1979	Great Britain	Private & Business Clients	quantitative, explorative	Branch Characteristics: age of the office, existence of night safe	Market Potential of Business Area: age distribution, distribution of occupational groups, characteristics of local environment of branch: number of retail sellers, number of other branches of the same bank within environment Competitive Situation: relation of 'amount of non-financial institutes' and 'amount of competitive branches'
5	Fenwick	1979	Great Britain	Private Clients	quantitative, explorative	age of the office	age distribution within business area, categorization of the population to social-economic groups, houses under constructions, competitive situation (amount of competitors)
6	Olsen & Lord	1979	USA	Private Clients	quantitative, confirmative	-	Variables of Demand: average income per household, placement of retail area, purchasing power of households, amount of employees, inhabitants of rented apartments (in percent) Variables of Supply: external and internal competition (amount of competitors from other/own institutes within business area)

Outcome	Studies which are open to any result and do not focus on one single success factor	Studies which focus on the relevance of one success factor
Miscellaneous	Studies focussing on critical success factors in business units with relevance for derivate sales (e.g. corporate banking)	Studies focusing on critical success factors in non-relevant business units (e.g. Private Banking, M&A) or services (e.g. Transactions Services, e-Banking)

THE BOUNDARIES OF FREEDOM OF THE PRESS IN SOUTH AFRICAN LAW

van der Bank, C. M.¹

¹Vaal University of Technology, South Africa. Email: riana@vut.ac.za

Abstract

Our entire social system is pervaded with a myriad of issues relating to freedom of expression. A free responsible press is one of society's greatest assets. Courts must now ensure that common law is not locked within the limitations of the past and they must re-consider common-law rules within the new context so as to render them congruent with the fundamental values and principles.

Strict liability of the press is now rejected as unconstitutional since it mars the free flow of information – a democratic principle. The press should, however not be placed in a privileged or superior position to that of the individual on the basis that the press constitutes an essential bastion of free expression in a democracy. The onus rests on the media defendant to prove a defense excluding unlawfulness on a preponderance of probabilities rather than a mere evidential burden. The media defendant in a defamation action is often in the best position to know whether reasonable steps were taken to verify the information published and so to establish that its publication was reasonable.

In a system of democracy dedicated to openness and accountability, as ours is the especially important role of the media, both publicly and privately owned, must be recognised. Freedom of expression is therefore a part of the very definition of self-government: the process of free discussion is required no matter whether the process leads to the truth or not.

Keywords: Freedom of expression, unlawfulness, reasonable, democracy and values.

Introduction

Freedom of expression is a method of achieving a more adaptable and hence a more stable society, of maintaining the precarious balance between cleavage and necessary consensus (Baker, 1978).

John Manyarara describes press freedom as: "...Press freedom in the region is like the English weather: bright and sunny when you emerge from the comfort of your home – but if you are initiated, you will carry an umbrella because you are likely to need it on your way back. Therefore, my survey of press freedom in the region will be like a weather forecast: the forecast is always correct, it is the bloody weather which keeps changing" (Duncan and Seleokane, 1998). The barometer by which the extent of press freedom existing in a country can be measured with reasonable accuracy is that country's political climate.

Section 16 of the *Constitution* 1996 states:

- Everyone has the right to freedom of expression, which includes-
 - freedom of the press and other media;
 - freedom to receive and impart information and ideas;
 - freedom of artistic creativity; and
 - academic freedom and freedom of scientific research.
- The right in subsection (1) does not extend to-
 - propaganda for war;
 - incitement of imminent violence; or
 - advocacy of hatred that is based on race, ethnicity, gender or religion, and that constitutes incitement to cause harm (Constitution, 1996).

Freedom of expression is fundamental for democracy to succeed. It does, however, precipitate profound jurisprudential issues and complex problems that require dispassionate examination and a judicious weighing up of competing interests in a democratic body politic (Van der Westhuizen, 1994).

Chapter 2 of the *Constitution* 1996 contains no express hierarchy of rights and is affirmed by the Constitutional Court in *Khumalo and Others v Holomisa* 2002 (5) SA (CC0 (2002 (8) BCLR 771) nevertheless freedom of expression is a cornerstone of an authentic democracy since it is "the indispensable condition of nearly every other form of freedom", without which other freedoms would not long endure and therefore *de facto* it must be ranked as a very important right (Carpenter, 1995) In this regard a distinguished American judge. Mr Justice Cardozo, commented that "freedom of thought and speech is the matrix, the indispensable condition, of nearly every other form of freedom" (*Palko v Connecticut* 1937 302US 319).

The Nature of Freedom of Expression

Section 16(1) protects free expression and not only free speech (De Waal, Curie and Erasmus, 2002). Expression is a wider concept than speech and includes activities such as displaying posters, painting and sculpting, dancing and the publication of photographs. In principle, every act by which a person attempts to express some emotion, belief or grievance should qualify as constitutionally protected expression (De Waal, Curie and Erasmus, 2002).

Our entire social system is pervaded with a myriad of issues relating to freedom of expression. In the past a vast number of restraints inhibiting freedom of expression were adopted and used because of the oppressive nature of our body politic. The fact that South Africa is now functioning under a *Constitution*, which protects freedom of expression, implies that there will have to be changes, also in the area of freedom of the press, where the common law is not in step with the constitutional values of freedom, equality and human dignity.

The Limitation of this Right

Fundamental rights and freedoms are not absolute (Carpenter, 1995). Their boundaries are set by the rights of others and by the legitimate needs of society. In the South African Constitution, a general limitation clause- section 36- sets out specific criteria for the restriction of the fundamental rights in the Bill of Rights. The existence of a general limitation clause does not mean that rights can be limited for any reason. The reason for limiting a right need to be exceptionally strong. The limitation must serve a purpose that most people would regard as particularly important (Meyerson, 1997). But, however important the purpose of the limitation, restrictions on rights will not be justifiable unless there is good reason for thinking that the restriction would achieve the purpose it is designed to achieve, and that there is no other way in which the purpose can be achieved without restricting rights. *“A free responsible press is one of society’s greatest assets. The press is the artery through which a democracy’s lifeblood flows, exposing corruption, dishonesty and maladministration. Thus the press has to be the watchdog, inciting the inert and curbing the over-eager. Effective freedom of press would be frustrated if freedom of expression is limited in such a way as to intimidate the media into not publishing”* (Klopper, 1979).

Strict Liability of the Press

In the past our courts construed defamation in our common law in a very wide manner, thereby restricting press freedom. Strict liability of the press is now rejected as unconstitutional since it mars the free flow of information - a democratic principle (Burchell, 1998). Thus *bona fide* published untruths in the political sphere are defensible if it is of public interest. The press serves public interest by making available information relevant to the community as well as criticism on all aspects of public, political and social activities (Burchell, 1993).

Through freedom of expression, the press helps to establish true democracy. The contentious issues are the extent to which freedom of expression should be permitted and the manner in which the courts ought to balance it against equally fundamental rights and considerations applying in a democratic society such as *inter alia* the right to reputation or dignity, privacy, political activity, fair trial, economic activity and property (Burchell, 1993).

It is not without significance that section 16 of the South African Constitution, after stating that ‘everyone has the right to freedom of expression’, includes ‘freedom of the press and other media’ under the general rubric of freedom of expression, and places these facets of the right on an equal footing with the ‘freedom to impart information and ideas, freedom of artistic creativity, academic freedom and freedom of scientific research.’ *“The press should not be placed in a privilege or superior position to that of the individual on the basis that the press constitutes an essential bastion of free expression in a democracy. They bear an obligation to provide citizens both with information and with a platform for the exchange of ideas which is crucial to the development of a democratic culture... If the media are scrupulous and reliable in the performance of*

their constitutional obligations, they will invigorate and strengthen our fledgling democracy (National Media Ltd v Bogoshi 1998 (4) SA 1195 (SCA)).

Defamation

The common law of delict requires a plaintiff in a defamation action for damages to show that a defamatory statement has been published with intent and knowledge of wrongfulness (*animus iniuriandi*). In the pre-democratic era, the courts alleviated the plaintiff's burden by presuming the presence of both intent and unlawfulness when defamatory material directed at the plaintiff was published to communicate information and comment, while obviously crucial in a modern democracy, should be no greater than that of an ordinary citizen to communicate. This need for substantially equal treatment of all who communicate with others has been recognised (*Pakendorf en andere v De Flamingh 1982 3 SA 146 (A) 156B*).

The Supreme Court of Appeal in *National Media Ltd v Bogoshi 1998 (4) SA 1195 (SCA)* has set broad, realistic standards of reasonableness, or reasonable care, for the media in regard to the publication of matter, which could be defamatory or impair other personality rights of the individual.

Hefer JA's judgment in *Bogoshi* constitutes the watershed decision in the revival of the common-law emphasis on freedom of expression, in particular of the print and electronic media. The court, in rejecting the concept of strict liability for the media, re-emphasised the vital role of media freedom in a democracy, affirmed that there was no closed list of defences excluding unlawfulness, and stressed that although a high degree of care is required of editorial staff, even the publication of some falsity may be in the public interest in special circumstances.

Publication in the press of false defamatory statements of fact will be regarded as lawful if, in all the circumstances of the case, it is found to be reasonable;... protection is only afforded to the publication of material in which the public has an interest (ie which it is in the public interest to make known as distinct from material which is interesting to the public (*Financial Mail (Pty) Ltd and Others v Sage Holdings Ltd and Another 1993 (2) SA 451 (A)*).

The decision in *Bogoshi (National Media Ltd and Others v Bogoshi 1998 (4) SA 1196 (SCA) (1999 (1) BCLR 1)*) relates both to the fault element of the delict of defamation and to the element of unlawfulness. Insofar as fault is concerned, the usual rule is that one will be liable for defamation only if one has *animus iniuriandi*. The focus in *Bogoshi* was thus the question of fault (negligence as opposed to strict liability).

A fault criterion of negligence is necessary not only to address freedom of expression but also to emphasize the imperative that the media should not be treated in a way, which is substantially inferior to other defendants in defamation cases. In other words, fault is required for the liability of both the individual and the media defendant; intention is required for the former and negligence is sufficient for the latter. The distinction is more readily

justifiable as a reasonable one than the now jettisoned distinction between intention-based liability for the individual and strict (no-fault) liability for the mass media. The press will thus not be held liable for the publication of defamatory material where it can show that it has been reasonable in publishing the material. Accordingly, the form of fault in defamation actions against the press is negligence rather than intention to harm.

However, fault need not be in issue at all if in the particular circumstances anterior inquiry shows that the publication is lawful because it is justifiable. *Bogoshi* indicates that the reasonableness of the publication might also *justify* it. In appropriate cases, a defendant should not be held liable where publication is justifiable in the circumstances – when the publisher reasonably believes that the information published is true. The publication in such circumstances is not unlawful. Political speech might, depending on the context, be lawful even when false provided that its publication is reasonable. It determines whether, on grounds of policy, a defamatory statement should be actionable because it is justifiable made in the circumstances.

In *Holomisa v Argus Newspapers Ltd* 1996 (2) SA 588 (W) at 618E-F a judgement presciently foreshadowing *Bogoshi* as regards the availability of a defence based on absence of negligence, Cameron J held that a defamatory statement “*which relates to free and fair political activity*” is constitutionally protected, even false, unless the plaintiff shows that, in all the circumstances of its publication, it was made reasonably made. The Court in *Holomisa* did not, however, consider it correct to import into our law the so-called *Sullivan* principle (*New York Co v Sullivan* (1964) 376 US 254 (1964) 11 L ed 2nd 686) that defendant press members will not be liable for defamatory statements made of public figures unless the plaintiff can show that the statement was made with actual malice. Such a principle would give far too little protection to the right of dignity. The approach that is preferred in both *Holomisa* and *Bogoshi* of reasonable publication.

Jonathen Burchell commenting on *Bogoshi* writes, “*The test of reasonableness or public (legal) policy is a supple criterion which can ensure that the law of delict is able to meet the needs of a changing society... The accommodation of freedom of expression under the unlawfulness inquiry is now firmly acknowledged by the Supreme Court of Appeal*” (Burchell, 1998).

The central reasoning of the Supreme Court of Appeal in *Bogoshi* for confirming that the media defendant bore a full burden of proof on a preponderance of probabilities rather than a mere evidential burden. The media defendant in a defamation action is often in the best position to know whether reasonable steps were taken to verify the information published and so to establish that the publication was reasonable. It would be unrealistic to expect the plaintiff to prove facts that he or she has very little of discovering

It was with great relief that I read the judgment of Hefer JA in *Bogoshi* and I enthusiastically support the conclusions thereof. These conclusions in *Bogoshi* are momentous and signify a profound, beneficial change in direction of the common law. Freedom of expression

(including media freedom) at last received due recognition. A vital function of the press is to make available to the community information and criticism about every aspect of public, political, social and economic activity and thus to contribute to the formation of public opinion (Van der Walt, 1998)

However, without wishing to appear churlish, I want to focus on some blurred edges in the judgment. The central problem is whether a media defendant can rely on absence of knowledge of unlawfulness and negligence, i.e. whether reasonable mistake or ignorance could be a defence. Negligence of the defendant may well be a determinant of the unlawfulness of the publication.

The central issue is not whether a media defendant can rely on a defence of absence of knowledge of unlawfulness due to negligence, but whether such a defendant can rely on a defence of absence of knowledge of unlawfulness not due to negligence. Reasonableness of the publication also includes an inquiry into whether the person detrimentally affected by the publication was given an opportunity to reply, at least after publication. The fact that a media defendant, who has channels of reply available, has not granted the opportunity to a person detrimentally affected by one of its application to reply to the allegations about him or she, after publication, will be a factor to be considered in determining the overall unreasonableness of the publication.

But the reasonableness inquiry is not completely open-ended: it involves the balancing of other rights against freedom of expression, and what is most important, in the context of freedom, equality and dignity. A right to reply (rebuttal) could according to me attractive- it may provide a quick and effective remedy and, in most cases, would not interfere with any editorial discretion because very little editing appears to take place.

The question arises whether special principles should be invoked to protect the press, or for that matter individuals, when they make defamatory statements about a member of Government. The *Reynolds* decision in the Court of Appeal (referred to by Hefer JA in *Bogoshi*) was confirmed by the House of Lords (*Reynolds v Times Newspapers Ltd and Others* [1999] 4 All ER 609 (HL) [2001]2 Ac 127).

The House of Lords declined to recognize a special defence of political speech. It differed in this regard from the Australian High Court decision in *Lange v Australian Broadcasting Corporation* (1997 189 CLR 520 (1997) 145 ALR 1) (a case approved by Hefer JA in *Bogoshi*), finding that the common law should not develop 'political information' as a generic category of information the publication of which attracts a qualified privilege irrespective of the circumstances. In *Lange v Atkinson* (NZ 1997 2 NZLR 22-Eds) Lord Nicholls pointed out: "One feature of all the judgments, New Zealand, Australian and English, stands out with conspicuous clarity: The recognition that striking a balance between freedom of expression and protection of reputation calls for a value judgment which depends upon local political and social conditions. These conditions include matters such as the responsibility and vulnerability of the press".

Right to Dignity and Right to Freedom of Expression

Twenty four years after the decision in *Pakendorf v De Flamingh* 1982 3 SA 146 (A) where strict liability of the press was apply, the *Mthembu-Mahanyele v Mail & Guardian Ltd and Another* 2004 (6) SA 329 agree that strict liability has a negative impact on press freedom. There must be a balance between the right to dignity, including reputation, and the right to freedom of expression. Both rights were now given special protection in the bill of Rights, and the question was whether a class of people (members of Government) had to lose the right to the protection of their dignity and reputation in the interest of public information and debate.

In *Mthembu-Mahanyele* the Cabinet Minister had asserted that words published by a certain weekly newspaper in its annual 'report card' on the performance of Government Ministers were defamatory of her. She pleaded that the respondents had acted recklessly, not caring whether the contents were true; and that they took no reasonable steps to establish whether the statement made was true. The Court had for reasons of convenience referred to Cabinet Ministers, but that could not be taken to mean that other members of Government, or parliamentarians or officials of State had to be treated differently (*Mthembu-Mahanyele v Mail & Guardian Ltd and Another* 2004 (6) SA 332).

Freedom of expression in political discourse was necessary to hold members of Government accountable to public. And that some latitude must be allowed in order to allow robust and frank comment in the interest of keeping of society informed about what Government did. Errors of fact should be tolerated, provided that statements were published justifiably and reasonably. That does not mean that there should be a licence to publish untrue statements about politicians. They too have the right to protect their dignity and their reputations.

As Burchell puts it: "*There are limits to freedom of political comment, especially in regard to aspects of the private lives of politicians that do not impinge on political competence. Politicians or public figures do not simply have to endure every infringement of their personality rights as a price for entering the political or public arena, although they do have to be more resilient to slings and arrows than non-political, private mortals*" (Burchell, 1998).

But where publication is justifiable in the circumstances the defendant will not be held liable. Justifiability is to be determined by having regard to all relevant circumstances, including the interest of the public in being informed; the manner of publication; the tone of the material published; the extent of public concern in the information; the reliability of the source; the steps taken to verify the truth of the information (this factor would play an important role too in considering the distinct question whether there was negligence on the part of the press, assuming that the publication was found to be defamatory); and whether the person defamed has been given the opportunity to comment on the statement before publication (*Mthembu-Mahanyele v Mail & Guardian Ltd and Another* 2004 (6) SA 332). In cases

where information is crucial to the public, and is urgent, it may be justifiable to publish without giving an opportunity to comment.

Conclusion

The *Constitution* 1996 requires the government to respect the principle of democracy when dealing with citizens. Therefore, in a democratic system of government, the relationship between state and the citizen is not simply a power relationship. Rather than state power, the consent of the governed is the defining characteristic of the relationship.

In *Holomisa* Cameron J said: *“Our Constitutional structure seeks to nurture open and accountable democracy. Party to that end, it encourages and protects free speech and expression, including that practised by the media. If the Constitution affords is to have substance, there must in my view be some protection for erroneous statement of defamatory fact, at least in the area of ‘free and fair political activity’ (Holomisa v Argus Newspaper Ltd 1996 2 SA 588 (W)).*

In a system of democracy dedicated to openness and accountability, as ours is the especially important role of the media, both publicly and privately owned, must, in my opinion, be recognised.

Our entire social system is pervaded with a myriad of issues relating to freedom of expression. Courts are obliged to consider the Bill of Rights and the values embodied therein, when assessing whether conduct is wrongful. The Bill of Rights is therefore a medium or prism through which the light of every aspect of the law of delict will eventually be refracted. Limitations on freedom of expression should only be justifiable when it can show that the non-limitation would probably cause specific harm.

Freedom to speak and write about public questions is as important to the life of our government as is the heart of the human body. Freedom of expression is therefore a part of the very definition of self-government; the process of free discussion is required no matter whether the process leads to the truth or not. In fact, this privilege is the heart of our government! If that heart be weakened, the result is debilitation; if it be stilled, the result is death. *It is reporting that puts the needs of society first and everything else; including the need for the media to make profit, last... Responsible reporting is reporting that reflects reality as it is not as journalists and those propping them up would like it to be* (Nel, 1998).

CENTRAL AMERICA MAQUILADORAS AND THEIR IMPACT ON ECONOMIC GROWTH AND EMPLOYMENT

Vargas-Hernández, José G.¹

¹Profesor Investigador miembro del Sistema Nacional de Investigadores, Departamento de Administración, Centro Universitario de Ciencias Económico Administrativas, Universidad de Guadalajara, Periférico Norte 799 Edificio G-202, Núcleo Belenes CUCEA, Zapopan, Jalisco C.P. 45100; México. Email: josevargas@cucea.udg.mx, jgvh0811@yahoo.com, jvargas2006@gmail.com

Abstract

The objective of this paper is to analyze the different perspectives of the roles played by the maquiladora in Central America as a lever of economic growth and social development in the region. Maquiladoras are industries that import materials and equipment, perform assembly or manufacturing processes, then re-export the finished goods to other countries. After a brief historical review of the maquiladoras emergence in the Central America region, the context is analyzed to underline the legal regime of temporal import and legal regime of managerial oriented free zone or fiscal precinct. Afterwards, the impacts that the maquiladoras have had in the regional economic growth and employment generation under the variable of the Asian competence is analyzed. After the discussion, prospective scenarios are analyzed and several strategies are recommended, including the promoting and creation of maquiladoras that go beyond the competitive advantage of cheap human labor. The Central America countries must design and implement strategies of diversification of the maquiladora development process in industrial sectors that require greater added value and technological innovation.

Keywords: Central America, economic growth, employment, in bound industries.

Introduction

The maquila (In bound industry) term etymologically comes from the Arabic term makila as a measurement for capacity used in milling to design the proportional share of grain, flour or oil (AVANCSO, 1994:2). Nowadays, the maquiladora industry is located within the geographical boundaries of a country with facilities in place for international transactions. These territories receive foreign-owned intermediate inputs, carry out some transformation processing, taking advantage of cross-border discontinuities, and later returned the final products to their country of origin. The maquila is a production system based on a form of contract under which, the intermediate inputs and raw materials imported are transformed through processes that add value. Afterwards, the added-value products are outbound and sent back as finished products to the country of origin for marketing. The maquiladora industry activities are possible in those areas that allow process segmentation. Developed countries tend to concentrate on those activities that require technology, innovation and

design for sustained growth. On the other hand, the assembly routine, intensive in terms of manpower, tends to take place in developing countries with lower labor costs as their competitive advantage.

Theoretical framework

Theoretical studies have determined that some of the benefits of Foreign Direct Investments (FDI) are ownership, location and internalization costs (Caves, 1996). Many of these benefits are provided by the Central American countries. Investors choose to invest in certain areas, mainly focusing on the availability of resources and markets. If foreign investment is seeking resources, it arrives to the locations which have abundant natural resources (Lipsey, 2006). Several analyses of the endogenous determinants of maquiladoras consider both the size of the enterprise and the intensity of research and technological development. The analysis of exogenous determinants of foreign direct investment in the maquiladora plants, takes into account the host country localization advantages, market size and labor costs (Campos, 2008).

Campos (2003) investigated classical factors such as market size, infrastructure, macro-economic environment and institutional factors. Campos inquired about whether the government's structural reforms of the host country play an important role in the attraction of foreign investors. A country's commitment to implement structural and financial reforms, as well as efforts to achieve trade liberalization and privatization, may encourage steady long run foreign direct investment (Forbes, 2006).

Regarding the institutional quality variables, the economic growth literature emphasizes the role of economic institutions in promoting investment and achieving better human development indicators. The institutions provide the local conditions for business operations, but they differ in support of physical and infrastructural factors, such as transport and telecommunications infrastructure. Institutional quality is an important factor to be considered for decision making by foreign investors, to enter directly or as outsourcing (Antras, 2003).

Bengoa and Sanchez-Robles (2003) find that economic freedom level, economic stability, and human capital level are important determinants in foreign direct investment. The determinants of location are the origins of the host country's comparative advantages. The maquiladora companies choose investment in locations which not only minimizes the cost of production but also the relative prices of factors such as natural resources, labor costs, human capital and proximity to market.

Countries that have more development in financial markets are capable of operating more efficiently the direct foreign investment. Foreign direct investment can be attracted by an economy that has more and better liberalized financial market, but at the same time, financial liberalization is encouraged by foreign direct investment. Financial reform is the most important of the structural reforms aimed to accelerate financial development. It is necessary

to facilitate financial programs for new productive activities oriented towards exports and to promote business development services.

Foreign investors assess and appreciate the host country's financial institutions and their capabilities to allocate efficiently the economic resources, monitoring the maquiladoras, diversifying and sharing risks, and mobilize the profits. Fewer restrictions to foreign capital imply more foreign capital inflows of FDI. Prasad et al. (2003) argue that absorptive capacity measured by the host country's financial development is a condition for foreign capital inflows to contribute to higher economic growth. The impact of FDI on economic growth is three to six times more efficient than the total investment (De Gregorio, 1992).

The FDI is attracted to countries with stable macroeconomic environment, and better levels of economic development and infrastructure. The risks of investment in terms of political and economic environment also affect the expected return on investment. The economic and political stability of host country attracts more foreign direct investment (Bevan and String, 2000). FDI requires the formulation and implementation of economic policies that promote strategic alliances and joint actions between the foreign direct investors, the domestic private capital and the Nation-State. One strategy implemented to bring down high rates of unemployment and poverty is the attraction of foreign investment by offering tax incentives, along with abundant cheap labor. Another major challenge is the creation of appropriate conditions for attracting investment. The businessmen's sensitivity to political movements limits solid and stable investments.

Maquiladoras as an instrument to achieve economic growth is a diversification dilemma in terms that although they create jobs and contribute to economic growth, however they bring some other side effects harmful to the local economies. To encourage economic growth in Central American countries, the diversification dilemma of maquiladora industry must be resolved and recommendations for improvements integrated into the programs tied to promotional schemes aimed at attracting foreign direct investments. There is a need to renew the instruments of export promotion, to strengthen the competitive advantages created in the region. To this end, it is suggested to design a common strategy of promotional programs to attract foreign direct investment for all Central American countries in order to avoid unfair competition while attracting new maquiladoras.

Coordination of governments' efforts of Central American countries will help to sustain an industrial integration project to boost regional development. In the same way, reforms to the legal framework to extend the scheme to sectors such as agribusiness, services and supply chain, etc., are necessary. Regarding labor laws and regulations, there must be law and order enforcement and compliance, besides agreements and behavior codes adopted by companies.

There is a need for transparency in all sectors: Auditing organizations in maquiladora industry by requiring independent assessments, monitoring of working conditions, as well as verification of enforcement and compliance with labor rights and behavior codes,

conformance with administrative and managerial standards industrial security and accounting, corporate social responsibility, environmental standards, regulations of free trade agreements, governance. There must be greater supervision of human and labor rights by specialists in the field, and greater promotion of social certifications among maquiladoras, particularly SA8000, which assesses the conditions and respect for labor rights and certification of "no sweat" (without holding).

The Central American governments and industry must develop unify criteria, to design strategies and mechanisms to facilitate the negotiation processes, as opposed to relying on the unilateral revision by the United States government of labor rights, management of the environment, expropriation, as well as how to structure and implement programs to coordinate the different economic agents involved in strategic alliances.

A regional economic development strategy must take into consideration growth in employment and production. This can be accomplished by focusing attention on the improvement of the efficient in the maquiladora industrial activities to increase value added in the region. This in turn, requires intermediate inputs to the maquiladora sector in the local regions throughout the Central America countries, subject to supply and demand forces operating in the national and international markets for the factors of production and the final demand for consumer goods and services. Local supply of intermediate inputs to the maquiladoras promotes indirect exports through an open market economy which together with improvements in domestic competitiveness can be transformed into direct exports (Agosin, Gitli and Vargas, 1996). The International Labor Organization (ILO) argues that the maquiladora industry in Central American is moving its full manufacturing processes in a complete package to add economic value. Central American maquiladora industry has to develop and implement horizontal and vertical strategies to compete with the Asian maquiladoras' production; otherwise the Central American maquiladoras will be left lagging behind. A horizontal strategy to broaden the impact on economic growth, and to generating jobs in the maquiladora industry in Central America, is growing and expanding activities of raw material's suppliers, services and inputs, as well as the expanding distribution networks in local markets.

Economic agents involved in the development processes of the maquiladora industry in Central American countries, government authorities and private sectors, are responsible for designing and implementing strategies for developing industrial activities, around comparative and competitive advantages. Among other advantages offered by the Central American region to foreign direct investment, is the territorial proximity to the world's largest market, infrastructure, and a new labor culture. Offering these advantages reveals the new territorial and spatial restructuring of the maquila, with the creation of new regions which are the foundation of the new production strategy for exporting.

The Central American countries have to formulate and implement strategies to diversify the maquiladora industry aimed to create industries involving higher added value and technological innovation processes, such as automotive or aviation industries. For the future success of the maquila, it is important to strengthen technological innovation to create competitive advantages in the industry. Foreign direct investment has been discerned as an important catalyst for technological development, which is a necessary condition to increase the region's competitiveness in international markets.

This diversification of the maquiladora industry requires technological breakthrough to provide employment for more skilled and specialized workforce, and also to lead to the formation of suppliers groups with more complex technological base. Diversification of the maquiladora industry requires the formulation and implementation of a national development strategy aimed towards and centered on the workforce. The strategy of human capital formation should consider training and developing the workforce for better performance in industrial sectors different from that of the traditional maquiladoras, and in accordance to the life cycles of these industries.

Brief History

Historically, the maquiladora industry's tariff scheme in Mexico was initiated with an export orientation, restricting the sale of the products from the maquiladoras inside the country, except paying import taxes. The design of maquila's regimen was conducted in such a way that increments in competitiveness had no impact on the national process of industrialization and development as in the case of apparel and garment industry (Mortimore y Zamora, 1996). Mexico, followed by Central America countries and some Caribbean countries, has experienced an unusual growth of companies which, under the maquiladora industrial development strategy, link national economies of these countries to the world's most powerful economy, the United States. At the middle of the last century, Central American economies began implementing their industrialization plans. As part of their development strategy, they protected their nascent industries, using an import substitution process. The exception was Panama which was more oriented towards the service sector and finance. The maquiladora industry development in these Central American countries operate separate from the established traditional local economic system, most of the times creating enclaves more than hubs. The policy of tax and credit incentives encouraged and favored foreign investment into the creation of assembly industries oriented towards production for domestic consumption. It was the generally believed that foreign direct investment (FDI) is an important channel through which financial globalization would benefit the economy (Prasad, Rogoff, Wei and Kose, 2003). Although, it should be noted that FDI does not necessarily support financial globalization.

Financial globalization involves the differentiation of a set of measurements, ranging from financial development indicators to changes in government policy. Some countries consider

that attracting FDI is an important element of economic development, so the factors that attract such investment form the core issue of their development policy. Increasing foreign direct investment has expanded production activities related to the export of agricultural goods besides different manufacturing sectors to different industrialized countries

The maquila represents a form of trans-nationalization of production factors, which are widespread in industry sectors such as textiles and apparel, electronics and automotive. Since the seventies, all Central American countries have had legal systems/frameworks for sustaining and promoting the maquiladora industry. Since that time the maquiladora industry has been the main industrial source of a precarious female-employment paying low wages, without deference and respect to labor rights, under appalling working conditions. This condition can hardly be expected to improve in a sector in which the competitive advantage is formed by the reduction of labor costs (Martinez Zabalo Tola and Arena, 2005).

The maquiladora industries take many different forms in terms of their operation, transformation and expansion. These depend, not only on their capital networks, but also on the different types of employment arrangements, on the subcontracting and special interaction with other institutions, regional and local actors. All these elements are part of the structure of the local production chain and its relationship with the world economy. The resulting reconfigurations of the territories in relation to the emergence of the new production chains put the emphasis on production decentralization. These trends or patterns are a result of territorial expansion based on a new regional development model, where the local political elites, and other regional institutions, play an essential economic role (Betancur, 2001; Méndez, 1998).

This paper aims to identify maquiladora's elements in order to contribute to the analysis of links, logic and dynamic relations and to determine the impact on employment creation and economic growth in Central American countries. The paper also analyses the economic context in which the maquiladora operates drawn from propositions of material production in peripheral regional areas, supranational and global levels together with the socio-political relations in the Central America region. Also, this paper searches answers to what has been the impact of maquiladoras on the territorial reconfiguration to shape a territorial development approach, focusing on the industrial paradigm, the strategy of accumulation followed by the regimes and modes of regulation such as free zones.

Context of maquiladora industry in Central America region

The Central America region extends over an area of 509,000 km², equivalent to one quarter of the area of the Mexican territory. Its production represents 3% of the Latin America region and 13% of Mexico. Guatemala has achieved the highest gross domestic product (GDP) in the region, about 32,000 million dollars. Costa Rica and Honduras are the countries that have exhibited the greater stability indicators and annual growth. However, Honduras has experienced political unrest during the last two years (2009-2010). Since 2000 and until 2008,

Honduras and Costa Rica have been attracting the highest foreign direct investment (FDI). Costa Rica is the country with the best quality of life and competitiveness in the region. Currently, just about half (45 to 60%) of the Central America maquiladoras are owned by local capitalist investors. Also FDI tend to be concentrated mainly in services and maquila sectors. The accumulated investments due to the maquila during the period 2003-2005 for U.S. were \$ 1,754 million.

The maquiladora industry in Central America region focuses on the textile sector, clothing, metalworking, electronics and footwear. The out of region exports of the maquiladora industries are concentrated in manufactured goods and food, which represent just 28% of total exports. The number of Maquiladoras, percentage added value has increased. In some Centro American countries the number of direct jobs created has grown on the average 25% annually. All of the above had led to better supply chains and diversified production capacity (Acevedo, 2008).

Impact on regional economic growth

The International Labor Organizations Report of 1997 (OIT, 1997) estimated that contribution of the maquila sector to the value added and exported to be about 20% for the Central America region. However, it must be remembered that statistics of maquiladora industry confuses value added with national content value because most of the inputs are imported. The ILO Report (OIT, 1997) estimated that over 90% of the sales of the Central America maquiladora industry are accounted for by United States. From this fact, it can be drawn a proposition that Central American countries are highly dependent on United States economy.

The maquila industry has increased its value to achieve almost 50 % in relation to total exports of the Central American Countries. Currently, over half of all exports in the region come from the maquiladora industry. Some researchers (OIT, 1997) have documented the weak connection between maquiladora industry and the other's national economic sectors. Most of the maquiladoras are economic enclaves of transnational corporations which are taking only advantage of cheap labor and some specific raw materials. Most of their inputs are supplied from abroad, from their parent companies and there is little room for local companies, in such a way that maquiladoras are not acting as economic hubs for the local business. The weight of Maquila in industrial production is not relevant when we take into consideration the contributions of small and medium-sized enterprises.

The output of the Clothing and apparel industry represents an important part of the maquiladora industry in Central American countries. Mexico which is the main competitor in the region has benefited from the North American Free Trade Agreement (NAFTA) (Campos, 2008). Less than 20% of apparel products manufactured in Central American countries are bound to the United States under the maquila's regimen and about 80% enter under the custom's regime of production – sharing. The residual production is integrated by the Asian

clothing maquila. Some of the implications are that the maquiladoras prefer to manufacture goods under a regime that give more incentives, such as not paying or paying the lower level of taxes to the host country, receiving subsidies, etc., which in turn their contribution for local economic development is low.

Companies' investments in advanced technology are low, compared with traditional investment flow which is still occurring in free zones. There is no evidence that maquiladora industry's technological complexity has a direct impact both in economic development and generation of well remunerated employment. Productive activities and development taking advantage of maquiladora industrialization are highly dependent both on demands' elasticity of final product and industrial differentiation's activities, but not on technological innovation and sophistication (OIT, 1997).

Although this economic phenomenon is common for Mexico and Central American countries, however, it has been fostered by local governments under specific development plans. The Puebla Panama (PPP) Plan proposal is totally opposed to endogenous development's dynamic advocated by both regional indigenous townships and social organizations. This is the main reason for rejecting the totality of the Plan initiatives, although it is recognized Meso-American region's economic vocation and local industries, besides their interest in development of instruments and local institutions promoting local and regional progress. Simultaneously, it is defined, and in practice imposed, the outward dominant development's vision toward exports. Impulse given to maquiladoras in the Southern-Southeast Mexican region, promotion of mega tourist projects or infrastructure serving to foreign trade become essential pillars of this kind of "development." Not all the existing maquiladora's infrastructure in Central America region is planned to generate an export processes platform.

To summarize, maquiladora industry's development in Central America countries is based more on reduction of production costs generated by cheap labor. On other way, technological innovation has not been a uniform process that benefits all economic sectors. The trend towards relocation of the maquiladora industry in Mexico and Central America region encourage participation of foreign direct investment. This investment together with domestic capital create value adding productive inter-related structures or development chains. Thus, both local and regional industry clusters interact to integrate the economic development processes.

Impact on the employment

According to research from the Union Federations of Central American Countries, the population of the entire region is close to 34 million. From this total, 21 million are in age economically active, and only 12 million have jobs, from that, 8 million are men and 4 million are women (Orellana, 2007). Employment generating by maquila industry is the main source of jobs for women, who account for up to 87% of the total.

Lack of clearness in the maquila concept affects employment estimates. In a situation where the economy grows without generating employment, strengthening and expansion of maquiladora industry activity is suppose to move towards creating a more flexible labor market. Instead, the implementation strategies and general practices make for even more precarious the living conditions of population. The trend of the process oriented to making flexible the industrial labor relationship, introduces changes into the work's organization systems, through many mechanisms such as to transfer fixed costs to variable costs and to externalize costs and responsibilities assumed by outsourcing in situations which allow subcontracting. To externalize costs and responsibilities means for the maquiladoras to transfer them to other institutions such as governments, civil society, etc., as for example the case of social security, welfare, pollution to the environment, corporate responsibilities, etc.

Some of the problems hindering development are the non-observances of labor rights and high turnover of workforce. The turnover of workforce is due partly to cultural differences in labor relationships. But in general these two reasons explain why employment generated by maquiladora industry is highly volatile and of poor quality. The lack of both a policy and a national development strategy for labor force development, protection and supply leave the maquila at the mercy of foreign capital investors, who take advantage of the cheap local labor; and exploit guarantees established by government, such as tax exemptions. Maquila companies violate workers' rights, taking advantage of national laws that have relaxed labor rules. These kinds of laws make it difficult for governments to enforce the worker's rights.

In 1996 there were in Central American countries about one quarter of million people employed by the maquiladora industry, which represented approximately 25-30 percent of the workforce employed in industry (ILO, 1997). Altenburg (1995) estimated that maquiladora industry had created about 15% indirect jobs.

Production output and employment in the maquiladora industry are linked to economic cycles. When the economy goes into recession, the maquiladora industry comes to a standstill; workers are fired leading to employment instability and allowing greater turnover in response to down turns in the economy and labor contradictions. Wolf Herrera, Bernal Mármol and Martínez (2003) reported in their research several incidents in which were an expression of a new collective force's consciousness that had put in danger governance, although workers are not allowed to join unions or to file grievances to local labor authorities.

It has been argued that greater job stability affects labor costs because it results in better labor conditions and improvement in the competitiveness and productivity of the workers. While firing workers saves costs of unproductive labor, however, in the long-run productivity decreases due to the turnover in employment (the recruitment of new and inexperienced workers). Low labor cost is one of the factors attracting for foreign investment to the maquiladoras. Industry labor costs are about 65 percent of operational costs. For example, the average wage for a worker in free zones in Nicaragua is three times lower than

the average salary in Costa Rica. This competitive advantage is translated into lower remuneration and consequently into a lower living standards and limited potential for both economic and social development.

Women, on average 20 years old and predominantly single mothers, make up as much 80 percent of labor force of the maquiladora industry in Central American. The average salary of a female worker in a maquiladora plant is about 68% of a male worker. The salary earned by a single mother is not sufficient to cover the living expenses of the household. Moreover, the burden of domestic work and responsibilities at home, make it difficult for women to do other economic activities that would allow them to increase their income. According to a report published in 1992, in Guatemala wages are one half of the required income to get out from extreme poverty, (La Estrella de Panamá, 1992). For 2007, Orellana (2007) reported average salaries of \$133 dollars, with extreme cases of \$ 50 dollars per month per worker. It should be noted that in the Guatemalan case the wages paid in activities considered typically female employment is below the generally lower than subsistence wages earned by the average worker.

In general, wages in the Central America's maquila are lower than those paid in Mexican maquiladoras. If it is calculated the wage gap in Central American countries, those which have the highest labor costs, are at disadvantage compared to those whose have lower labor costs for the same work units. By the same reason, this situation represents a comparative advantage for countries that have the lower labor costs. Costa Rica and Salvador have the highest labor costs, and also they have the highest levels of productivity and quality (Fernández, 2002). It may not be paradoxical, because lower money cost per factor unit does not necessarily mean lower real cost.

Labor relationships between maquiladoras and workers have been a grievous story. Unfortunately, actions of human rights agencies on labor issues that are clearly related have prevented any understanding of the real situation. In the garment industry most of the maquiladoras are owned by Asian capital, mainly Korean capital investors. As a result they experience many labor problems due to cultural differences between the foreign management and their local partners and workers. Several studies on labor rights violations in Central American's maquiladoras have been sponsored by international advocacy agencies for the rights of women workers. Studies conducted by Oxfam International (2002), Ramírez and Martínez (2001), Tinoco (2002), Ramos and Vargas (2002) have established a relationship between origin of capital and companies attitudes with respect to certain labor rights. But regardless of the origin of capital, there is a clear tendency towards anti union policies formulated and implemented by the maquiladoras being manifested in decisions to allow their workers to join trade unions. In a total of 1,212 enterprises just 45 had union in the year 2003 (ASEPROLA, 2003).

Women workers in Central American's maquiladoras denounced the poor working conditions, discrimination through pregnancy's test practices; job insecurity and unsafe working conditions; violations of the workers' dignity and personal integrity; absence of health care; lack of pensions' plans and the breach of collective contracts, according to research from trade union federations in Central American's countries (Orellana, 2007).

In general, women bore the burden of retrenchment in the sector. When maquiladoras close plants, the trend is that women workers are who most suffer the consequences of these layoffs. Research with focus on women workers in maquiladoras plants shows that these women far from feeling exploited, prefer working in maquilas rather than being domestic workers. They see for themselves the opportunity to experience a situation of emancipation and liberation from submission to patriarchal authority, because it them with purchasing power that allows them some independence from parents or mate. Despite low wages paid by maquiladora industries, workers and families achieve better living standard. For example, maquiladora's women workers of peasant origins, earn some revenue to be shared with their families for improving welfare and living standards. Moreover employment generates structural changes in the future economic and social development of Central American society, stressing the important role that women play.

Discussion

The analysis about the logic of capital accumulation and wealth creation derived from the production of maquiladoras is full of internal contradictions. The implementation of structural adjustment policies in a new economy environment focusing on a competitive market orientation implies the need for profound changes, both in labor relations, and in spaces and union behavior. The processes of economic globalization require that the liberalization of markets aim at increasing productivity while in a race to the bottom based on the lowering of production' and distribution costs.

Changes in a country's competitiveness occurred subject to a new international division of labor, in an environment where economic globalization processes, which have led towards a race to the bottom on the development of productive activities may not necessarily is sustainable in places where the costs of labor are lower. Critics believe that under the current economic policies, regional economies have reduced agricultural production and industrial bases, and have increased external dependence.

The current legal regimes in Central American countries related to maquiladora industry programs, generate both confusions and administrative rigidities. In all Central American countries, there are no criteria for homologation of promotional schemes for the maquiladora industry. And what is more absurd is that there is not a clear understanding about the role that this type of industry is playing in economic growth and national development. The lack of transparency in incentive programs and the tax benefits of export promotion schemes call into question the real scope of the benefits of trade liberalization.

Despite the outcome generated by the sophisticated maquiladora industry and its impact on economic development, modernization, and welfare of working population, there are doubts about its multiplier effects and the real impacts on economic growth and the generation of significant remunerative jobs. International maquiladora's knowledge on technology and innovation about and around the region is not homogeneous, since they have some specific differentiations. Development processes facilitated by maquila industry in Central America, has been uneven. The lack of uniform indicators makes it difficult to analyze the impact of the maquiladora industry on both regional economic growth and employment generation.

Wolf Herrera, Bernal Mármol and Martínez (2003) concluded that the persistence of poor working conditions and violations of labor rights in the maquila sector is due to the lack of political will, on the part of governments, to enforcing respect for existing laws. One of the biggest challenges is the enforcement and fulfillment of labor rights.

Prospective scenarios

The future of maquiladora exports is uncertain due to the fact that the World Trade Organization (WTO) has eliminated production subsidies granted by local governments to incentive exports, in accordance with obligations of the World Trade Organization (WTO) regulatory framework. The Puebla Panama Plan designed to foster economic growth and social development in Central American countries, favored mainly infrastructure projects and employment generation in maquiladoras located on the territory from the Southern and Southeast Mexico to Republic of Panama. This development strategy was based on a policy that was to exploit cheap labor as a competitive advantage. Increasing of the maquiladora plants in situ will contribute within certain limits to the creation of employment and thus to related welfare.

The connectivity logic of the maquiladora industries also serves to consolidate a regional approach to development in Central America. The maquiladora approach to development has the effect of serving to contain migration from Meso American countries to United States and defining the region as an assembly area. To achieve this, the Central America region promotes attractive tax incentives for businesses, cheap labor force, and the imminent possibility of reducing transportation costs through the construction of dry channels and seaports that favor the transferring of goods from domestic to export to foreign markets.

The emphasis towards increasing the focus on attaining a greater comparative advantage requires learning about the development of the maquiladora industry. It facilitates the convergence of more sophisticated maquiladora activities. This convergence requires scientific and technological training of workers that result in new transformation processes and regional technological innovation.

Adherence to codes of conduct by trade organizations belonging to the maquiladoras, in order to obtain certification for respectful human and labor rights, in most cases will continue to be a simple showcase, in the middle of a market of certification companies and independent monitoring from nongovernmental organizations (NGOs). Environmental and social responsibilities are also among these types of certifications.

Recommendations

To increase exports of maquila's industrial sector and value added is a tough challenge for local economies open to global markets. The challenge to increase the level of exports and improve competitiveness through an export strategy focused on maquila operations requires the establishment of a free trade area, and the abandonment of the economic model based on industrialization by import substitution. However, the opening of free trade areas and further more the opening of the local economies through both, the consolidation and expansion of access to the U.S. market, and negotiations with the European Union, the model of production based on maquiladoras is on the rise. Thus, free trade agreements are already required to expand and diversify markets of the maquiladora industry products, and to balance the strong dependence on the U.S. market.

To improve the economic development and social welfare, the maquiladora's industry should pursue a strategy to induce the investment of higher value-added businesses, such as aerospace, instead of large-scale assembly plants. An economic policy that offers to the foreign direct investors some incentives and tax exemptions, facilitates easiness of administrative procedures, a cheap workforce and raw materials,, etc., all these factors could lead to greater affluence of maquiladora plants in Central America.

An important challenge for economic growth in the Central American region is to develop competitive advantages different from those related to labor costs, such as technological innovation companies that require more specialized labor that has more sophisticated technological capabilities to generate greater added value. Moreover, the high-tech maquiladora industry interacts with research and development centers. This will expand the supplier base through the formation of clusters, networks and industrial associations. The development of these local and regional clusters and networks with greater involvement of local and domestic capital can help to accelerate the process of economic integration with the support of foreign direct investment.

The strategy implemented by the regional maquiladora industry to quickly achieve levels of innovation, quality and competitiveness required by the regional industrial modernization process has to be supported by strategic alliances with foreign companies. The activity of assembling high-tech products is a facilitator of potentialities for both employing human resources with higher levels of professional training and for investments in human capital. The orientation towards the promotion of foreign direct investment for the creation of the maquiladora industry of high technology, such as electronics, biotechnology, etc., to displace

the low-tech maquiladora industry, will allow Central American countries to achieve higher levels of competitiveness and quality to increase participation in market shares under processes of economic globalization.

The challenge is to formulate and implement an industrial policy combining different industrial schemes involving local, regional and global supply chains to produce non-traditional exports and maquila. Government policies should be focused on achieving labor stability, quality jobs, and democratic governance for the estimated 500 000 workers seeking better living conditions and to live with dignity. The implementation of training programs and job training will help strengthen the competitiveness and productivity, as well as improve the living conditions of the workforce.

The trend is towards an increase in the maquiladora industries in Central America countries, which would bring increases in rates of employment and exports, but the challenge is to ensure that these increases also enhance economic development and social welfare for the region.

Abstract

Based on theory and case studies, the merger literature suggests that implementation of integration approaches is important for effective post-merger integration. This hypothesis is tested with a relatively large sample by focusing on the fit of the integration approach to the synergy potential of the merged companies and the cultural differences between them. Findings suggest that the fit of the integration approach is positively related to integration effectiveness and mediates its relationship with synergy potential and cultural differences.

Keywords: Mergers and acquisitions, culture differences, synergy, fit of integration approach, performance.

Introduction

For the last three decades, the management literature has been trying to explain the enduring paradox of the high failure rate of mergers and acquisitions (M&A) vs. the growing activity and volume of M&As. Recent meta-analyses that examined the most studied variables (King et al., 2004; Stahl and Voight, 2008) did not provide clear answers for this paradox or for the high failure rate of M&As. Researchers indicated that the results concerning the predictors of M&A success are inconsistent and confusing. A possible answer to this paradox is that existing research on M&As provides limited and insufficient understanding of this important phenomenon, especially concerning the post-merger integration process. In other words, at the pre-merger stage top executives may perceive the M&A as a good step for corporate growth, but poorly implemented during post-merger process.

Few scholars have focused on specific problems such as integration approaches. Their studies focused on theoretical issues based on literature review (e.g., Nahavandi and Malekzadeh, 1988; Weber and Tarba, 2011; Weber, Tarba, and Rozen Bachar, 2011) or on case studies (Haspeslagh and Jemison, 1991; Schweizer, 2005) rather than on empirical systematic studies based on relatively large samples. Although these studies identified various

integration approaches with different typologies, they maintain that the fit between the recommended integration approach and the approach actually implemented is crucial for both integration effectiveness and overall M&A performance. These claims have never been empirically tested, however, with any one of the recommended integration approaches. Furthermore, most of these typologies were suggested about 20 years ago and did not incorporate findings from the last two decades about possible important factors in the post-merger integration process, such as cultural differences.

This article seeks to fill some of these gaps. The goal of the present study is to explore systematically, based on a relatively large sample, the vital but neglected role of the integration approach in the implementation of M&As. To this end, a theoretical framework has been developed to (a) suggest revised framework for integration approaches that incorporates empirical findings from the last two decades, and (b) use the fit between the recommended and the actually implemented integration approach to better explain integration effectiveness. The findings of this study can guide future research toward more consistent findings on M&A success and help shape practices for achieving success.

The synergy assumption

The finance and strategy literature has focused primarily on pre-merger factors to determine the success of M&As. The implicit assumption in these studies is that the activities and actions of the acquiring firm during the pre-merger stage are the sole determinants of value. Accordingly, studies either observe how managers of the acquiring firm search for alternatives or probe the content of their strategies, paying less attention to implementation. For example, strategic theories, especially the concept of strategic fit, suggest that relatedness between the buying and target firms determines the synergy potential, and as such is the key determinant of value creation. But the empirical evidence derived from studies of M&As that exhibit relatedness is mixed at best. More important, synergy potential was rarely measured in these studies. In other words, the presence of synergy potential was assumed based on indications of relatedness vs. unrelatedness, it was not measured directly.

The finance literature suggests further that on average M&As do not add value to the acquiring firm, and that more likely they are severely detrimental to long-term shareholder value. The results of a recent meta-analytical study on the effects of finance and strategy variables on M&A performance by King et al. (2004, 197) led the authors to conclude that "researchers simply may not be looking at the 'right' set of variables as predictors of post-acquisition performance."

Thus, an overarching theme of the present paper is that research utilizing traditional finance and strategy variables that focus on the pre-merger stage can predict only the potential of integration effectiveness, based on the assumption that synergy is present and that management knows how to harness it. In reality, the failure to find a consistent relationship between indicators of synergy based on relatedness and M&A success may stem

from an over-emphasis on the pre-merger stage at the expense of the negotiation process (Weber, Tarba, and Belkin, 2011a) and post-merger stage including the integration approach used during the processes of integration. With a few exceptions, the strategic and finance literature, has not considered the possibility that in the management of a merger, the problematic interaction between the buying and target firms (due to cultural differences), or low coordination and cooperation between managers (as a result of the culture clash following the merger) may play a key role in M&A success. Indeed, the management of the post-merger stage and the integration process are crucial in determining the extent to which the synergy potential is realized. To date, only a limited number of management studies have focused on identifying the factors that can contribute to post-merger integration success. It is likely, therefore, that strategic fit interacts with other systematic variables in the integration process to produce robust performance results.

Inconsistent Effects of Culture Clash on M&A Performance

To explain the variance in M&A performance, scholars have used “cultural fit” concepts that focused on the detrimental relationship between pre-merger cultural differences (both corporate and national) and post-merger integration effectiveness (For recent reviews, see among others, Björkman, Stahl, and Vaara 2007; Stahl and Voight, 2008; Weber, Tarba, and Reichel, 2009). But as with strategic fit, the empirical evidence of the effects of cultural compatibility on M&A performance is mixed and confusing. On one hand, organizational cultural differences have been negatively associated with various accounting measures and with stock market value following domestic M&As (e.g., Chatterjee et al., 1992; Datta, 1991). Studies also found this negative effect under conditions of both low and high integration level, when autonomy was removed from the acquired managers (Lubatkin, Schweiger, and Weber, 1999; Very et al., 1997; Weber, 1996).

On the other hand, some studies have recently argued that cultural differences do not always have a negative impact on M&A performance. Indeed, some have shown that cultural differences can also have a positive effect on post-acquisition performance (Reus and Lamont, 2009; Weber, Shenkar, and Raveh, 1996). For example, Weber (1996) found a positive moderating effect of autonomy removal on financial performance. He associated this finding with better coordination between the two merged firms, which in turn enabled better synergy realization. But synergy potential was not a variable in this, as well as in most studies.

Several possible explanations exist for the lack of consistency that permeates recent studies on the relationship between cultural differences and M&A performance. For example, Teerikangas and Very (2006) focused on the sources of complexity underlying these relationships. Others suggested that different measures of performance (Zollo and Meier, 2008), ignoring negotiation process (Weber, Tarba, and Belkin, 2011b), or micro- *or* macro-levels of analysis only, and *either* pre- or post-merger variables are not enough to find consistent relationships (Weber, Shenkar, and Raveh, 1996; Weber, 1996). Despite these

criticisms, however, the study of cultural differences altogether ought not to be abandoned. Rather, the implication is that more elaboration is needed in the cultural analysis of the various processes and mechanisms involved. For instance, scholars have examined how “attractive” one organization is compared with another, and the types of integration approach adopted by acquirers (Nahavandi and Malekzadeh, 1988). Veiga et al.,(2000) examined changes in cultural compatibility and found that the best performances were in cases where pre-merger cultural incompatibility turned into cultural compatibility after the merger. Larsson and Lubatkin (2001) found that successful acculturation is possible even in conditions of significant cultural differences, as long as the acquiring firm invests in formal and informal social control strategies.

Post-acquisition Integration Effects on M&A Performance

All value creation in M&A takes place after the acquisition, and it hinges on the combined firms’ ability to effectively integrate their operations. The term *integration* is used rather loosely in the literature, and few studies have attempted to define it directly (Schweiger and Goulet, 2000). But it is generally agreed that merging firms transfer capabilities, cut costs, and achieve synergy by integrating management decision-making as well as departments and functions, such as marketing, inventory, and others. Effective integration may produce positive overall M&A performance (Larsson and Finkelstein, 1999; Weber, 1996; Zollo and Meier, 2008).

In practice, integration is an interactive and gradual process in which individuals from the two organizations must learn to work together and cooperate. “Creating an atmosphere that can support it [the integration] is the real challenge” (Haspeslagh and Jemison, 1991: 107). To achieve effective post-merger integration, the acquiring top management typically intervenes in the decision-making process of the acquired management team and imposes standards, rules, and expectations on it. The intended integration may negatively affect the commitment of the acquired top management to the acquiring team and its cooperation with it (Weber and Schweiger, 1992; Weber, Shenkar, and Raveh, 1996). Furthermore, the intervention of the acquiring top management team in the decision making of the acquired management results in a loss of autonomy that elicits tensions and negative attitudes toward the merger. The result raises questions about the efforts invested in exploiting the synergy potential. Such efforts can cause human problems, destroy the synergy, and compromise the success of the integration process.

There is a clear trade-off between levels of integration and exploited synergy. High levels of integration may be needed to exploit high levels of synergy, but a high level of integration may cause intense culture clash and human resource problems that can destroy the value of the acquired firm and increase costs to an extent that offsets the benefits expected from the merger. Moreover, in case of very high synergy potential, it is possible that even under conditions of high cultural differences, which may destroy some of the synergy, M&A

performance still increases. Thus, high cultural differences may be associated with improved M&A performance when the level of synergy is very high. This example may explain the conflicting findings about the relationship between relatedness or cultural differences and merger performance, when other variables are not controlled. For example, some studies found that integration is positively associated with performance (Larsson and Finkelstein, 1999; Weber, 1996), whereas others found integration to be non-significant to M&A performance (Datta, 1991; Morosini, Shane, and Singh, 1998), and others yet found that performance was negatively related to integration (Calori, Lubatkin, and Very, 1994; Lubatkin, Schweiger, and Weber, 1999). For example, Lubatkin, Schweiger, and Weber (1999) found that the greater the level of integration (autonomy removal through the intervention of the acquiring top management in the decision-making process of the acquired top management), the greater the turnover of the acquired top managers. The turnover of these executives is viewed as a serious loss of valuable resources, which reduces the value of the acquired firm. And studies found that the greater the rate of turnover of top executives, the lower the performance of the acquiring firm (Hambrick and Cannella, 1993). A recent meta-analysis of the existing body of research (Stahl and Voigt, 2008) suggested that the relationship between cultural differences and post-acquisition performance is complex, and that unidentified moderator variables may be obscuring the effect of cultural differences on the performance of the acquiring firm.

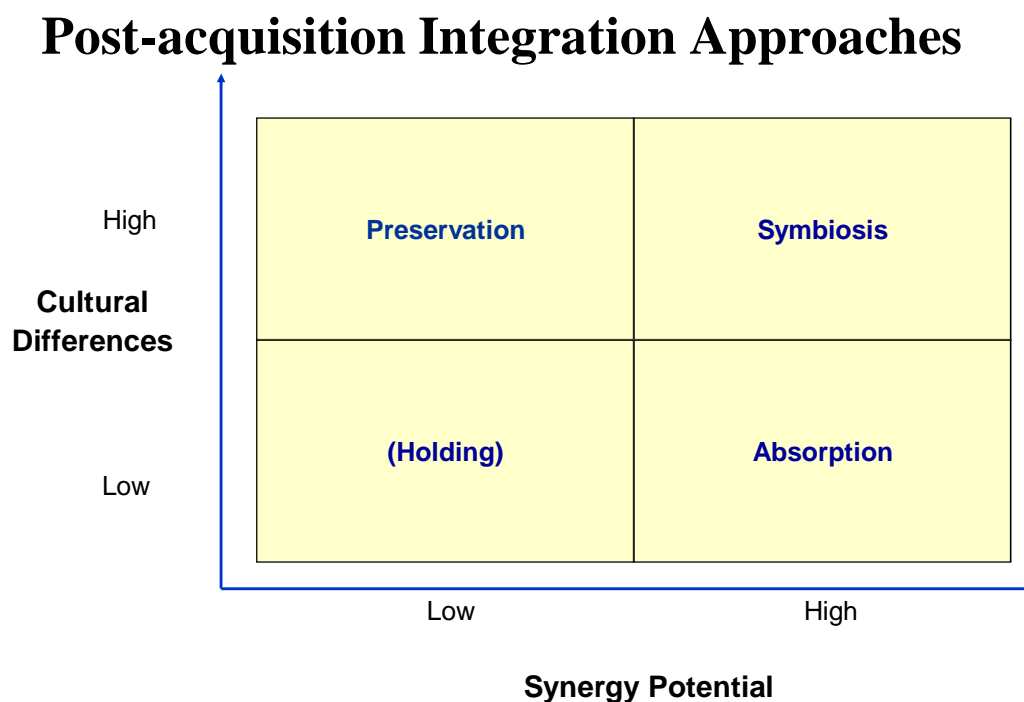

In sum, individually taken, the variables of cultural differences and synergy potential are not sufficient to explain M&A performance. Post-merger integration is a complex process that appears to need a better conceptualization than the simple linear relationship suggested by the studies mentioned above. The following sections suggest using a combination of these two factors together with the concept of configurational fit to explain integration effectiveness.

Post-Acquisition Integration Approaches

The combined firm's choice of integration approach is one of the most critical decisions affecting merger success (e.g., Haspeslagh and Jemison, 1991; Nahavandi and Malekzadeh, 1988). Integration approaches differ mainly in the emphasis placed on two crucial factors: synergy potential and implementation efforts necessary to realize them. Cultural differences, however, were not included in the above typologies of integration approaches. But based on findings of the last two decades, we argue that these implementation efforts depend also on the scope of cultural differences between the two firms engaged in M&A, as well as on the choice of the level of integration. Recent studies have highlighted the differences in management practices (Ellis, 2004; Ellis, Weber, and Raveh, 2003) and cultural features (den Hartog and Verburg, 2004) between integration approaches.

In light of the above literature reviews and of the importance of cultural differences to integration effectiveness, we propose to revisit the framework for integration approaches. Figure 1 presents the recommended integration approaches affected by synergy potential and cultural differences. The proposed framework uses the terminology of Haspeslagh and Jemison for integration approaches because (a) it describes clearly the differences between these approaches, (b) it has received some recent empirical support (Ellis, 2004; Ellis, Weber, and Raveh, 2003), and (c) it has been widely used (Child, Faulkner, and Pitkethly, 2000; Graebner, 2004; Schweizer, 2005; Weber, Tarba, and Reichel, 2011).

Figure 1. Proposed matrix for post-acquisition integration approaches

The straightforward synergy potential dimension in the matrix parallels the dimension in other frameworks such as relatedness (Nahavandi and Malekzadeh, 1988) and need for strategic interdependence (Haspeslagh and Jemison, 1991). But the suggested framework uses the “cultural differences” variable as the determinant of the recommended integration approach instead of the “need of autonomy” (Haspeslagh and Jemison, 1991) or cultural attractiveness and multiculturalism (Nahavandi & Malekzadeh, 1988). Several reasons based on the literature review have led to this approach. First, since Haspeslagh and Jemison (1991) suggested this framework, empirical findings have clearly indicated the critical importance of the effects of culture clash on integration effectiveness (e.g., Cartwright and Cooper, 1992, 1993; Datta, 1991; Chatterjee et al., 1992; Weber, 1996; Weber and Pliskin, 1996), on

international M&As (e.g., Datta and Puia, 1995; Morosini, Shane, and Singh, 1998; Lubatkin et al., 1998), and on both (e.g., Weber, Shenkar, and Raveh, 1996).

Second, the need for autonomy of the acquired managers has not been measured directly in previous studies, but other measures were used that suggest its importance to M&A performance. The empirical findings are not clear, however. For example, Larsson and Finkelstein (1999) hypothesized about a positive relationship between level of integration and employee resistance. This hypothesis was not supported. And although some studies show that autonomy removal is positively related to performance (e.g., Weber, 1996), other studies point in the opposite direction (Calori, Lubatkin, and Very, 1994; Weber, Shenkar, and Raveh, 1996) or have found no relationship (Datta, 1991).

Third, the extent of cultural differences reflects to some degree the need for autonomy. According to Nahavandi and Malekzadeh (1988), when considering the acquired managers' preferences, the question is how much do members of the acquired firm want to preserve their own culture and organizational practices? The answer may depend on the degree of differences. It is difficult to believe that when cultural differences are extensive, acquired members willingly relinquish their culture and most of their organizational practices, and completely give up their autonomy. Indeed, culture clash and employee resistance arise from the need to retain autonomy vis-à-vis a different culture. Weber, Shenkar, Raveh (1996) suggested that in international M&As, where cultural differences are clear, senior managers may regard themselves, and be perceived by others, as champions of the national culture they represent, which may stand against the national culture of the other party in the merger. In such cases of clear cultural differences, the need for autonomy is unmistakable. Thus, in certain cases the dimension of cultural differences can serve as a proxy for the need for autonomy dimension, but at the same time it is much richer and represents a wider spectrum of situations, even if the need for autonomy turns out not to be a problem at all. Finally, Haspeslagh and Jemison (1991) acknowledged the importance of cultural differences when choosing an integration approach (1991:145).

The integration approaches are absorption, preservation, and symbiosis. Absorption, implies a high level of integration and the lowest level of autonomy for the acquired management. It is recommended for achieving a high level of synergy when the level of cultural differences is low. Preservation implies the lowest level of integration and the highest autonomy for the acquired management. It is recommended for low synergy potential and high cultural differences. Symbiosis, with both high levels of synergy and cultural differences, implies a sophisticated level of integration to be considered in challenging situations (Haspeslagh and Jemison, 1991).

Hypotheses

Appropriate integration approach

Matrices that proposed integration approaches (Haspeslagh and Jemison, 1991) and modes of acculturation (Nahavandi and Malekzadeh, 1988) implied that there is a relationship between the selection of the appropriate integration approach and integration effectiveness. By contrast, the framework presented here is based on a different set of factors and considerations, and treats integration choices as ideal types to be applied in specific situations. Thus, a given integration approach, based on a fit between the recommended integration approach and the actual choice of integration approach being implemented, consistent with the characteristics of a specific M&A (synergy potential and cultural differences), can lead to superior integration effectiveness. Because cultural differences may be of critical importance to performance, the framework presented here takes them into consideration in the decision-making process that leads to the choice of the best integration approach. Thus, the proposed framework includes both synergy potential and cultural differences as major determinants of the recommended integration approach for high integration effectiveness. This point of view combines the pre- and post-merger stages. It suggests that both cultural differences and synergy potential should be considered as part of the choice of integration approach, and that a fit between the recommended and actual integration approach can lead to an effective integration process.

No integration approach fits all. Managers must determine the best integration approach that fits their specific M&A and leads to effective post-merger integration. The choice of the appropriate integration approach based on synergy potential and cultural differences should lead to effective integration of functions, capability transfer, etc. In other words, if the acquiring top management actually implements the appropriate integration approach, a fit emerges between the "right" integration approach (according the framework presented here) and the approach being implemented. This leads to the following hypothesis:

H1: A fit between the appropriate integration approach, based on synergy potential and cultural differences, and the actual integration approach implemented leads to higher integration effectiveness than when no such fit exists.

Synergy

The objective of the integration process is to seize the synergy potential through transfer of capabilities and resource sharing, leading to cost savings and increased revenue. During the integration process, each task aims to capture synergy can generate its own performance and together produce high integration effectiveness. But if there are no true synergies, the merger can yield only negligible benefits and low integration effectiveness. Therefore, the higher the level of synergy potential, the higher the integration effectiveness will be.

. The reason for the conflicting results of previous studies may lie in the broad terms in which relatedness and synergy have been defined, often using similarity and complementarity synergies interchangeably, or ignoring complementarity altogether (Makri, Hitt, and Lane, 2010). Synergy can be achieved through "economies of sameness" (Larsson and Finkelstein, 1999), such as the accumulation of similar operations and technologies, and through "economies of fitness" that arise from different products, markets, and knowledge that enhance one another and create synergistic complementarities. Whereas synergetic similarities arise from cutting costs of overlapping activities, the combination of complementary capabilities cannot be easily duplicated by other firms, and it provides M&As with outstanding potential for performance (Björkman, Stahl, and Vaara, 2007; Makri, Hitt, and Lane, 2010). The distinction between the two types of synergy leads to the following hypotheses:

H2a: The higher the synergistic similarities, the higher the integration effectiveness is.

H2b: The higher the synergistic complementarities, the higher the integration effectiveness is.

The fit of integration approach as mediator

Although the synergy potential determines the level of performance that can be achieved during the integration process, the "process perspective" on M&A success suggests that the realization of synergies depends largely on the ability of the acquirer to manage the post-merger integration process (Jemison and Sitkin, 1986; Haspeslagh and Jemison, 1991) and choose the appropriate integration approach. Therefore, only the fit between the selected integration approach and the appropriate integration approach, taking into account the specific level of synergy potential and problems of implementation due to cultural differences, can minimize the problems created by culture clash and harness the potential synergy. In other words, the fit of integration approach mediates the relationship between synergy potential and cultural differences and makes possible the achievement of synergy benefits during the integration process. Given different types of synergy, we hypothesize that:

H3a: The fit of integration approach mediates the relationship between synergistic similarities and integration effectiveness.

H3b: The fit of integration approach mediates the relationship between synergistic complementarities and integration effectiveness.

H3c: The fit of integration approach mediates the relationship between cultural differences and integration effectiveness.

Methodology

Sample

The sample of firms was drawn from an exhaustive list of mergers that took place during 2004-2006 obtained from the archive of the Israel Antitrust Authority. A sample of M&As was selected based on the following criteria: the acquiring company gained a controlling interest in the acquired firm, the mergers were related (i.e., from the same industry), and the names and addresses of the top managers affiliated with the acquiring companies immediately before the merger were available. Data were collected during 2007-2008. This sample included M&A with different integration approaches.

We focused on a sample of symbiotic mergers because the symbiotic integration approach is the most challenging one to implement (Haspeslagh & Jemison, 1991). The M&A characteristics leading to the recommendation to implement a symbiotic approach for the integration process are high synergy potential and high cultural differences. Managers in symbiotic M&As find themselves torn between the competing needs of preserving the culture of the acquired company and encouraging cooperation between managers from both companies to harness the synergy (Haspeslagh and Jemison, 1991). The high synergistic potential requires intense efforts and sophisticated processes of interaction and coordination (Weber and Tarba, 2010) to avoid the human resources problems resulting from cultural differences and to achieve high commitment and cooperation from both management teams (Lubatkin, Schweiger, and Weber, 1999; Weber, Shenkar, and Raveh, 1996; Weber, 1996; Weber, Rachman-Moore, and Tarba, 2011). Therefore, the need to select the appropriate approach to achieve high integration effectiveness is more important in symbiotic M&As than in other types of M&A, which require preservation or absorption integration approaches. For example, in an absorption M&A, the high synergy potential combined with relatively low implementation challenges due to low cultural differences can produce an effective integration even if the implementation process is not perfect. Similarly, in a preservation M&A with low synergy potential, the challenge of realizing the synergy is reduced because cooperation and interaction are less important, and the costs involved in these efforts are lower. Symbiotic M&As are therefore best suited for studying the effect of the fit of integration approach on overall integration effectiveness. Therefore, symbiotic M&As were identified from this sample of Israeli M&As, yielding a sample of 52 mergers.

Response rate for the large sample was 24%. Potential non-respondent biases were checked by comparing respondent and non-respondent firms with respect to the time that had elapsed since the date of the merger. This variable may affect the emotions and objectivity of the managers, and therefore their perceptions (Chatterjee et al., 1992; Lubatkin, Schweiger, and Weber, 1999). The t-test of mean differences was not significant, showing no evidence of a non-respondent bias.

Questionnaire and procedure

Ideally, cultural differences are investigated before the merger, and the results compared with data collected after the merger. It is very difficult, however, to gain access to such data in large samples during the negotiation period, and it is also inefficient because many negotiations do not result in M&As. This problem is compounded by another difficulty associated with the measure of corporate culture. Many elements of culture are unclear to its members because people take them for granted (Schein, 1985). Dramatic events, such as M&As and contact with other cultures, however, make differences salient (Louis, 1983), especially in conflict situations (Sales and Mirvis, 1984). Greenwood, Hinings, and Brown (1994) pointed out that it may take months or years for the acquired managers to form stable impressions about the compatibility of the merging organizations' culture. Therefore, retrospective data can be useful in studying the cultural differences and attitudes of top managers. It has been observed that attitudinal and behavioral data do not become less accurate over time, even after periods of 10 years (Finkelstein, 1992; Gutek, 1978; Pettigrew, 1979). Studies of this type, however, should follow the recommendations of Huber and Power (1985) regarding access to top management and the use of retrospective data.

A second methodological difficulty has to do with how data on corporate cultural differences and their outcomes are collected. Recently, several studies have used questionnaires to measure perceived organizational culture (e.g., Cartwright and Cooper, 1993; Hofstede, Neuijen, Ohayv, and Sanders, 1990) and perceived cultural differences in M&As (Chatterjee et al., 1992; Lubatkin, Schweiger, and Weber, 1999; Weber, Shenkar, and Raveh, 1996), and found them to have high reliability and validity. Self-report questionnaires of perceived cultural differences that can be used to reach large sample also have the additional advantage that people's behaviors and attitudes are determined by their perceptions rather than the "actual" or "objective" situation (Rentch, 1990). Finally, perceptual outcomes, such as the effectiveness of the integration process, are useful because they provide a direct connection to cultural values (Earley and Singh, 1995).

All respondents were guaranteed anonymity (the only identification on the questionnaires was the name of the acquiring company). The completed surveys were returned directly to the authors. Because the unit of analysis was not the individual manager but the merger management, responses were summed and averaged for each variable to arrive at merger management means (see Enz, 1988). This procedure permitted control for team size variations across firms. Similarly, the aggregation of respondent perceptions to arrive at group scores resulted in findings that were less distorted by individual biases (Schneider, 1975). Such distortion was further reduced by the fact that top managers were asked to evaluate not their own perception of cultural differences but those of the merger management. Moreover, multiple-respondent evaluations of each merger management made it possible to check reliability through a later calculation of consensus. Responses were aggregated only if a high level of consensus was demonstrated between the perceptions of

top managers in each merger. Finally, to avoid problems of common method variance and creating pseudo-relationships between variables by methodological and process artifacts, provisions were made against consistency and priming effects following the recommendation of Podsakoff et al. (2003). As explained below, the most important variable, the fit of integration approach, was evaluated by a procedure that involves respondents only partially, and therefore pseudo-relationships are minimized.

Measures

Cultural Differences. The instrument used by Chatterjee et al. (1992), Lubatkin, Schweiger, and Weber (1999), Weber, Shenkar, and Raveh (1996), and Weber (1996) to measure corporate culture differentials was employed. Based on the assumption that relative phenomena are best suited for comparison, particularly in contrast situations (Louis, 1983), respondents were asked to indicate the degree of pre-merger similarity between the acquired and acquiring top management on each item. Items were constructed to elicit responses about cultural differences on a 5-point scale, ranging from "very similar" to "very different." Following a test for inter-rater reliability, described below, a cultural difference index was computed across seven dimensions, each consisting of three to five items, with a total of 29 items. The seven dimensions (and the number of items used to measure each) were: innovation and action orientation (five items); risk-taking (five items); lateral integration (four items); top management contact (three items); autonomy and decision-making (five items); performance orientation (three items); and reward orientation (four items). Following the preliminary analysis described below, we collapsed the data into a single cultural difference index (Cronbach's alpha = 0.97) by summing the scores for all 29 items and taking their average.

Synergy from Similarities. Based on the concept of "economy of sameness" (the synergy that can be achieved from accumulating similar operations) and its measurement (Larsson and Finkelstein, 1999), synergy from similarities was measured by 11 items about the similarity of various operational functions such as marketing operations (geographic markets, customer groups, and industries) and production operations (types of input, process, and product).

Synergy from Complementarities. Based on the concept of "economy of fitness" (synergies that can be achieved by combining different but complementary operations) (Larsson and Finkelstein, 1999), synergy from complementarities was measured by 11 items about the complementarity of various operational functions such as marketing operations (possible transfer of marketing capabilities to new markets and products) and complementarity of production operations (possible transfer of production capabilities).

Fit of Integration Approach

To determine whether the fit between the appropriate integration approach and the one actually implemented by management was present in the merger, both recommended and actual integration approaches were evaluated separately and compared. To evaluate the

recommended integration approach, the values of corporate culture differences and synergy potential were classified into two categories, that is, two levels of dichotomy were determined for every variable: low and high. The cross-tabulation of the categories between the two variables created four groups, which made it possible to identify the integration approach that was recommended after completion of each individual M&A. Symbiotic M&As, with high cultural differences and high synergy potential, were selected for reasons explained earlier.

To identify the integration approach actually implemented by the M&A, managers were asked to choose the description of integration process from a list of descriptions of integration approaches used by Ellis (2004). The characteristics of integration approaches consistently described by Haspeslagh and Jemison (1991), Nahavandi and Malekzadeh (1988), and Marks and Mirvis (1998) served as the basis for developing the coding scheme in the list of integration approaches. They included descriptions of the primary motives for the current acquisition; the extent to which the combined firm would follow the operating procedures of the acquiring firm or seek to identify the best practices of both firms; whether any plans existed for restructuring and downsizing initiatives; and whether words such as assimilate, absorb, blend, or retain were used in describing the process of integrating the operations of the two firms. Statistical analysis comparing these integration approaches significantly confirmed the presence of differences between them (Ellis, 2004). Note that these descriptions of the integration process do not use any evaluation of synergy potential or cultural differences, to prevent creating any association between the two evaluations of the integration approach that may result from methodological and process artifacts. Evaluation of the fit produced 30 symbiotic mergers with a fit out of the 52 symbiotic mergers.

Integration Effectiveness. The instrument used by Weber (1996) to measure integration effectiveness was employed. The effectiveness of the integration process measure was based on 12 questionnaire items that addressed effectiveness along organizational dimensions, such as operations, production, marketing, research and development, and personnel. The use of key informants to assess effectiveness is common in organizational research, and the self-report measures provide respondents with an opportunity to incorporate implicitly economic and non-economic considerations (e.g., Dess, 1987). A 5-point scale, ranging from "very ineffective" (1) to "very effective" (5) was used.

Results

Table 1 presents the means, standard deviations, reliabilities, and inter-correlations of the seven dimensions of cultural difference measures based on the larger sample. Statistical analyses of the original sample showed that all the inter-correlations among the seven cultural difference dimensions are high (at least 0.33), significant ($p < 0.01$), and internally consistent (Cronbach's alpha ranging from a low of 0.70 to a high of 0.82). In keeping with the theory underlying the construction of the culture measures, the dimensions demonstrated

discriminant validity (Cronbach's alpha for each dimension was higher than the dimension's correlations with all or most of the other six dimensions).

Table 1. Mean, standard deviation, and Pearson correlations between dimensions of cultural differences and reliabilities

<i>Dimension</i>	<i>Mean</i>	<i>S.D.</i>	<i>IAO</i>	<i>RA</i>	<i>LI</i>	<i>TMC</i>	<i>ADM</i>	<i>PO</i>	<i>RO</i>
<i>IAO</i>	3.07	0.87	(0.81)						
<i>RA</i>	3.06	0.81	0.80	(0.81)					
<i>LI</i>	2.86	0.88	0.56	0.53	(0.79)				
<i>TMC</i>	3.04	0.95	0.51	0.57	0.65	(0.71)			
<i>ADM</i>	3.00	0.75	0.68	0.71	0.67	0.70	(0.73)		
<i>PO</i>	2.77	0.92	0.52	0.47	0.40	0.33	0.39	(0.73)	
<i>RO</i>	2.62	0.80	0.56	0.56	0.49	0.42	0.49	0.69	(0.75)

The data also provide strong evidence of convergent validity, indicating, as expected, that the seven dimensions are part of the same general construct (Buchanan, 1974; Rosenthal and Rosnow, 1984). Although each dimension measures a unique aspect of the phenomenon, all the dimensions refer to the same content domain, making it possible to combine them all into a single index, a procedure for which prior research provides theoretical and statistical support (e.g., Buchanan, 1974; Chatterjee et al., 1992; Porter et al., 1974). The combined internal consistency of the single cultural difference index was high (Cronbach's alpha = 0.94).

Table 2 presents the means, standard deviation, reliabilities, and inter-correlations of the two synergy measures. Each construct demonstrates a high level of internal consistency (Cronbach's alpha of 0.86 for synergistic similarities and 0.79 for synergistic complementarities). The inter-correlation between the two dimensions is low ($r = 0.09$) and non-significant, and therefore, as expected, these two constructs are different.

Table 2: Mean, standard deviation, and Pearson correlations between dimensions of synergy potential and reliabilities

	<i>Mean</i>	<i>S.D.</i>	<i>Synergy Potential: Similarities</i>	<i>Synergy Potential: Complementarities</i>
<i>Synergy Potential: Similarities</i>	2.93	0.74	(0.86)	
<i>Synergy Potential: Complementarities</i>	3.31	0.66	.086	(0.79)

Table 3 shows the means, standard deviations, and inter-correlations of the key constructs of the study. The results confirm that cultural differences are significantly and

negatively associated with integration effectiveness, and lend partial support for the hypotheses of the study. Consistent with hypothesis 1a, the fit is significantly and positively associated with integration effectiveness ($r= 0.34$, $p<0.05$). Moreover, consistent with hypothesis 2a, synergistic similarities are positively associated with integration effectiveness ($r=0.34$, $p<0.05$). By contrast, no significant association was found between overall M&A performance and fit or between integration effectiveness and synergistic complementarities.

Table 3: Mean, standard deviation, and Pearson correlations between the variables

	Mean	S.D.	Fit Integration Approach	Synergy Potential: Similarities	Synergy Potential: Complementarities	Organizational Culture Differences	Effectiveness of Integration
Synergy Potential: Similarities	2.93	0.74	.028	(0.86)			
Synergy Potential: Complementarities	3.31	0.66	.141	.086	(0.79)		
Organizational Culture Differences	3.18	0.47	.055	-.358***	.103	(0.94)	
Effectiveness of Integration	3.45	0.71	.344**	.335**	.222	-.328**	(0.83)

Table 4 presents the regression results for synergy potential. The results confirm that synergistic similarities explain a significant variance in the integration effectiveness of the symbiotic approach in a manner consistent with theory and as predicted by hypothesis 2a. Again, hypothesis 2b, concerning the effects of synergistic complementarities, is not supported.

Table 4: Regression results of synergy components on effectiveness of integration

Model (N=51)		
F-statistic	4.229**	
R ²	.150	

Most interesting are the results obtained for the mediation hypotheses. The present study is based on the implicit assumption that the effects of synergy and cultural differences on integration effectiveness are completely mediated by the fit of integration approach. To illustrate the principle involved, the complete mediation model has the form $X \rightarrow M \rightarrow Y$, where X (here, synergy potential and cultural differences) are the antecedents, M (here, fit of integration approach) is the mediator, and Y (here, integration effectiveness) are the consequences. The antecedent X is expected to affect the consequences Y only indirectly, through the mediator M . The indirect transmission of influence from X to Y via M indicates that all of the effects of X on Y are transmitted through M . Therefore, the typical mediation model is based on the premises that (a) functions $M = f(X)$ and $Y = f(M)$ represent linear, additive, and recursive (unidirectional) functions, and (b) M transmits all the influence of antecedent X to consequence Y , implying that X and Y are indirectly related and that the relation between X and Y vanishes if M is held constant (cf. Cook and Campbell, 1979; James and Brett, 1984; James, Mulaik, and Brett, 1982). If the predictions of the complete mediation model are confirmed empirically, one may infer that the model has been corroborated and is useful in explaining how X is related to Y through the intervening mediator M (James and Brett, 1984).

To test the theoretical model for complete mediation, we used the procedure described and illustrated by James and Brett (1984). This procedure is based on hierarchical regression analysis that checks whether the addition of the antecedent X (here, synergy and organizational culture) has significantly contributed to the explanatory power of the equation, as indicated by the R-square when M is held constant. The first step is to test whether cultural difference and synergy are related to integration effectiveness. Correlations and regression results indicated that cultural differences and synergistic similarities are related to integration effectiveness, whereas synergistic complementarities are not.

Therefore, to test whether the relationships of cultural differences and similarities were completely mediated by the fit of integration approach, these variables were added to the regression equation with the fit held constant. A non-significant increment in R-square due to the inclusion of the two antecedent variables would confirm the prediction that the fit of integration approach completely mediates the influence of cultural differences and synergistic similarities.

Table 5 presents the results of the regression analysis. The results show that the inclusion of synergy and organizational culture is not significant after the fit of integration approach was held constant in the equation. The results confirm hypotheses H3a and H3c that the fit of integration approach completely mediates the relationship between synergistic similarities and organizational culture on one hand and integration effectiveness on the other.

Table 5: Regression results of the fit of integration approach, synergy similarities, and organizational culture on effectiveness of integration

Discussion and Conclusions

The findings of the present study provide the first systematic evidence linking integration approach to integration effectiveness in M&As. Specifically, when management selects a symbiotic approach for the integration process, which fits the specific M&A situation (high level of synergy potential combined with high level of cultural differences), the integration is highly effective. If there is no fit between the selected and the appropriate integration approach, the integration process is not effective. The findings also highlight the importance of the integration approach as a mediator of the relationships between both synergy potential and organizational culture on one hand, and integration effectiveness on the other. Put differently, the positive effect of synergy potential and negative effect of cultural differences are completely transmitted through the appropriate integration approach to create high integration effectiveness. These findings suggest a direction in the quest for solving the long overdue paradox of M&A success. Consistent positive association between the synergy potential and M&A success can be found when the management of the acquiring company selects the appropriate integration approach. Finally, the findings are of practical importance because they show that managers who choose the appropriate integration approach can seize the synergy potential and at the same time mitigate the negative effect of cultural differences. The implication is clear: the management of the acquiring firm must pay at least as much attention to issues of integration approach to be implemented after the pre-merger search process, as they do to issues of strategic and organizational fit.

Measuring M&A success based on integration effectiveness is an attempt to bring the dependent variable of interest closer to the phenomenon under investigation. Traditional accounting and financial measures of M&A performance are problematic especially when examining internal process of integration. Similarly, assessing the overall M&A potential based on similarities and complementarities is more direct than relying on Standard

Industrial Classification (SIC) codes or other classification schemes that cannot differentiate between the various sources of value creation. The positive significant relationship between synergistic similarities and integration effectiveness reported here provides some support for this perspective.

The findings concerning the synergy effects on integration effectiveness are also of interest in light of recent studies that focus on synergistic complementarities rather than synergistic similarities. Although complementarities showed positive effects (Kim and Finkelstein, 2009; Makri, Hitt, and Lane, 2010) and other studies found that synergistic benefits are more likely to produce abnormal returns when based on complementarities rather than on similarities (Harrison et al., 2001), the present study shows that similarities are essential for integration effectiveness, at least in M&As in which the symbiotic integration approach is the most appropriate one.

Selection of the integration approach is often cited as an essential element in M&A success (e.g., Haspeslagh and Jemison, 1991; Graebner, 2004; Schweizer, 2005; Nahavandi and Malekzadeh, 1988), but no study has examined statistically its importance in a relatively large-scale sample of M&As and in conjunction with cultural differences. The present study clearly shows that despite the negative effect of high cultural differences on M&A performance (Chatterjee et al., 1992; Weber, 1996) and of other detrimental effects during the post-merger integration process, such as top executive turnover (Lubatkin, Schweiger, and Weber, 1999), it is possible to realize synergy potential if the management selects the appropriate integration approach that fits the characteristics of the merger. This finding is consistent with those of many previous studies (Larsson and Finkelstein, 1999; Schweizer, 2005; Weber, Shenkar, and Raveh, 1996; Weber and Tarba, 2010; Weber and Drori, 2011) and suggests that high synergy potential is not sufficient for M&A success: certain practices and structural changes must be undertaken to realize these synergies.

There are ample opportunities for further research following the findings and the theoretical framework presented here. For example, the present study warrants replication using an interdisciplinary approach, other forms of measurement (anthropological and other non-survey methods), expanded samples, sample containing other integration approaches (such as absorption), and unrelated as well as related mergers. Unrelated mergers may use a preservation mode of integration, and Absorption mergers have different operational synergies, and can be expected to show different synergistic similarities and complementarities. These types of M&A can be expected to show different types of contact between the combining management team which may attenuate or accentuate the findings of the present study. Replication studies should also try to measure M&A performance with other constructs (Zollo and Meier, 2008) and management perceptions, over different time frames, to establish stronger causal links between the fit of integration approach and overall M&A performance. Although access to such data may be difficult, any attempt at

triangulation would be useful in supporting both the internal and external validities of the present study.

Other research efforts could be directed toward understanding the fit of integration approach, degree of fit, its practices, and its effect on other factors in the post-merger integration process, for example, how the degree of fit affects such factors (observed in previous studies) as the turnover of top executives (Lubatkin, Schweiger, and Weber, 1999), intergroup conflict (Weber, Shenkar, and Raveh, 1996), drop in job commitment (Weber, 1996), identification with the merger (Rouzies, 2011), and the influence of leadership (Vasilaki, 2011).

Limitation of the Study

It is possible to argue that the present findings are a statistical artifact because of the reliance of the study on the perceptions of managers. It is essential, however, that some variables be measured based on the response of the top managers who are most knowledgeable about the merger process. Therefore, we took precautionary measures in constructing the questionnaire to avoid consistency and priming effects and limit situations of common method variance (Podsakoff et al., 2003). Evaluation of the most important variable in the study, the fit of integration approach, was carried out by a process that relied only partially on direct involvement of the respondents to minimize pseudo-relationships between variables due to methodological and process artifacts. Furthermore, the results of validity and reliability tests are grounds for sufficient confidence in the measures employed in the present study. Finally, to reduce the personal involvement of respondents, the questions addressed the perceptions of the top management team and of the merger team in general rather than respondents' own perceptions. The perceptions of individuals with moderate levels of emotional involvement are less likely to be distorted (Huber and Power, 1985), and the social desirability and consistency effects should be lower.

Abstract

The purpose of this paper is to advance cross-cultural management during mergers and acquisitions (M&A) an issue that remains poorly understood despite a large body of literature accumulated over many years of study and experience. Based on literature review and case studies of both successful and unsuccessful companies, this paper clarifies the concept, the assessment and the use of corporate culture and its dimensions during all mergers and acquisitions stages, and as such shows its role as an important and influential milestone in the international business environment exploration.

The paper arrives at the conclusion that the enduring paradox of the high rate of M&A failure vs. the growing activity of M&A may be due to lack of synchronized activities of all merger stages. The paper presents frameworks and managerial tools that can help researchers and practitioners conduct better corporate culture assessment during all stages of the M&A, including screening, planning, and negotiation, and enhance the effectiveness of interventions carried out during post-merger integration process.

The paper offers insights into corporate culture and its impact during pre-merger stage, negotiation, and the post-merger integration process.

Keywords: Culture, mergers, acquisitions.

Introduction

There is no other area of an M&A that is more frustrating for their management and consultants than culture integration and change during post merger stage. Usually, it is a combination of misunderstanding of the role of culture in all stages of M&A and management that is ill prepared to face the role of different dimensions of culture during integration process. The current paper aims to clarify the concept, the assessment and the use of cultural dimensions in all M&A stages. Thus, it may help executives and consultants to handle cross cultural issues in all stages of the M&A process to best promote cross-cultural management.

"There is a good way and a bad way to handle the implementation of mergers and acquisitions. Both require the same effort and time investment. The difference is that one leads to success, the other to failure." Former VP of Teva (the largest generic pharmaceutical company)

Mergers and acquisitions (M&A) activity around the world has been booming for the last three decades, but the intense M&A activity stands in sharp contrast with the high rate of failure and dissatisfaction with its performance. An analysis by the Hay Group in 2007 of more than 200 major European M&As over the preceding three years found that senior business leaders believe that only 9% were "completely successful" in achieving their stated objectives. Unfortunately, merger integration consultants are often not brought in until problems arise late in the post-combination aftermath stage, long after the merger or acquisition has been consummated (Buono, 2005).

The cross-cultural differences factor in merger and acquisition (M&A) success has been the subject of contradictory and perplexing findings (Teerikangas and Very, 2006; Weber, Tarba, and Reichel, 2009). On the one hand, many studies during the last two decades provide corroborative evidence that cultural differences have negative impact on M&A performance. On the other, several recent studies point to the fact that cross-cultural differences can have both negative and positive effects on M&A performance (e.g. Ahammad and Glaister, 2011a; 2011b; Reus and Lamont, 2009; Sarala, 2010; Slangen, 2006; Vaara, Sarala, Stahl, and Björkman, 2011; Weber, Tarba, and Rozen-Bachar, 2011).

The theoretical literature and empirical findings of the last 20 years suggest that the influence of culture differences on the post-merger integration process is crucial for M&A success (e.g., Brannen and Peterson, 2009; Chakrabarti, Gupta-Mukherjee, and Jayaraman, 2009; Graebner, 2004; Weber, Tarba and Reichel, 2009). In practice, however, cultural differences in the M&A decision-making process seem to be neglected. For example, cultural assessment appears to be low in the priorities of executives in the due diligence process (Angwin, 2001). Time and again, cross-cultural management is mishandled by top executives in M&As and eventually results in failure, as in the case of Daimler Chrysler merger (e.g., Kuhlmann and Dowling, 2005). There are two main reasons for the apparent divergence between conventional academic wisdom and executive practice. First, the scholarly literature focuses on the role of national and corporate culture only in the last stage of M&A, namely, post-merger integration, rather than on all M&A stages, including planning and negotiations (Weber, Belkin, and Tarba, 2011a). Second, the concept of culture is not entirely clear to executives, and therefore difficult to implement in practice, as for example in the assessment and measurement process (Weber and Tarba, 2010; Weber and Tarba, 2011).

The current paper aims at closing these gaps. First, it explains why corporate culture assessment is not being used in all stages of M&A. Second, it clarifies the concept of corporate culture by articulating the seven dimensions that were found to reliably predict human

resource problems in the post-merger integration process and overall M&A performance. Third, it suggests how to measure cultural differences. Finally, it suggests how to use culture assessment at various stages of the M&A process to best promote cross-cultural management.

Lack of culture assessment in the early stages of M&A

It is common knowledge today that M&As have a high chance of failure and that corporate culture, especially cross cultural management (Weber, Rachman-Moore, Tarba, forthcoming) is a key factor in the successful integration of two organizations (Stahl and Voight, 2008; Stahl, Mendenhall and Weber, 2005). For example, for Teva (the worldwide largest generic pharmaceutical company) that its fantastic growth based on successful M&A (Almor, Tarba, and Benjamini, 2009) the cultural issue play major role:

Post-merger implementation focuses mainly on cultural integration with Teva, talent management, retention, and adapting to local cultures. Once the acquisition of a company has been approved, cultural and economic issues are primary when it comes to integration. (Claus, 2006)

It is surprising, therefore, that differences in organizational culture have yet to become an important factor in the decision making of directors and senior management regarding such matter as the choice of the appropriate M&A, determining the price of the transaction, planning the integration of the two organizations, as well as in seeking to retain the human capital of the acquired company, which tends to leave shortly after the merger.

Two main independent streams of management research have studied either the *pre*-acquisition or *post*-merger integration stages. One stream that focuses on the pre-acquisition stage examined the relationship between firm-level measures of financial performance and the strategic fit between buying and selling firms (Singh and Montgomery, 1988; Palich, Cardinal, and Miller, 2000), with a focus on the potential synergy and added value of the acquisition to the buying company, in other words, on choosing the right merger. But a recent meta-analysis (King et al., 2004) failed to find a consistent relationship between performance gains and the degree to which the merging firms share similar functions, or other related financial factors such as the choice of payment methods. The authors indicated that other factors must be investigated, in addition to the financial ones, to understand M&A performance.

The second stream of research focuses on the post-merger stage and examines the cultural fit of the buying and selling firms, and its impact on the success of the merged company (Chatterjee, Lubatkin, Schweiger, and Weber, 1992; Sarala and Vaara, 2010; Stahl and Voight, 2008; Weber, Shenkar and Raveh, 1996; Weber, 1996; Weber, Tarba and Reichel, 2009; 2011). But findings are not always conclusive (Stahl and Voight, 2008). These studies have paid little attention to cross-cultural management, for example, to the role of HR practices, given the effect of cultural differences on the success or failure of domestic and international M&As. Note that the various bodies of literature on M&A seem to exist in a state of splendid

isolation. This issue has been raised by several scholars many years ago (e.g., Weber, Shenkar and Raveh, 1996), but the situation has not changed much since then. Although they share some definitions and terms, authors writing about pre-merger and post-merger issues generally refrain from stepping onto each other's territory, thereby missing out on opportunities to fully understand the M&A process and the effects of each stage on M&A performance.

Scholars and executives must understand that to seize the potential of M&A that is usually identified in the pre-merger stage, the steps to be taken in the integration process must be discussed as part of the merger choice. For example, with its breadth of acquisition experience, Teva has structured HR tools for due diligence. Due diligence covers all HR aspects (legal, economic, structural, demographic, and turnover data) as well as other "soft" issues especially culture (Claus, 2006).

Finally, the negotiation is also an essential part of a successful M&A (Weber, Belkin, and Tarba, 2011b). For example, in Electrolux, well known for its impressive growth based on many successful M&A, Ghoshal and Haspeslagh (1990) indicated that "It was standard Electrolux practice to have a broad but clear plan for immediate post acquisition action well before the negotiation process for an acquisitions was complete (1990: 7). Similarly, in Teva:

"With this breadth of acquisition experience, Teva has structured HR tools for due diligence. Due diligence covers all HR aspects (legal, economic, structural, demographic, and turnover data) and other "soft" issues (culture)." Says Director of Labor Economics Muki Gilat, "If one of the three core disciplines [R&D, operations, and HR] does not recommend the deal, Teva will not acquire the checked company."

It is important to understand, therefore, that all stages are pre-requisites of M&A success (Jemison and Sitkin, 1986). One of the main reasons that culture and cultural differences are not assessed in the pre-merger period, and therefore not taken into account at the negotiation stage, is the use of various consultants, technical staff and specialists in strategic decisions about the merger (Jemison and Sitkin, 1986; Haspeslagh and Jemison, 1991). Chief impediments in the M&A process, especially in the assessment during the pre-acquisition stage, are activity segmentation and fragmented perspectives. The technical complexity of the analysis requires experts from various fields such as transaction advisor (i.e. legal, accounting, finance, auditing, investment banking and more) and post merger integration consultants, each responsible for part of the analysis. For example, in the pre-combination stage of preliminary planning, transaction advisors typically drive the process without the involvement of merger integration consultants. Makov, former CEO of Teva explained:

After planning there is the due diligence review. "This stage is frightening. You always find skeletons in the closet, and you have to decide which ones are important. If you leave it to the accountants and lawyers, the deal will never go through, because they'll turn every skeleton, or shadow of a skeleton, into a dinosaur (Weinreb, 2008).

Ideally, the consultant's interventions should span all M&A stages. However, much M&A consulting is far more piecemeal and reactive, as different consultants are brought in to help resolve a particular problem that emerges in one aspect or another in the overall M&A process (Buono, 2005). Individual teams work in isolation from one another, and the difficulties in coordinating the various areas of expertise and methods result in a strong emphasis on quantification of estimates and their translation into financial numbers. The outcome is usually the omission, or underestimation, of factors that are difficult to quantify, such as culture and cultural differences. This is because the concept of culture is not clear and the way to measure culture and cultural differences is not known. The following quote is typical to many problematic M&A:

"I think Alcatel-Lucent was a merger that sounded good in a PowerPoint presentation," said Mark Sue, an analyst at RBC Capital Markets in New York. "But there have been a lot of serious integration challenges, including cultural issues, that were underestimated and still linger." (Jolly, 2008).

Such situation has further implications on HR issues that make M&A unsuccessful. As former CEO of Creo-Scitex merger noted:

The processes of the merger moved slowly; Michelson admits, "The primary conflicts that arose after the merger were on the management culture and methods." and "The senior managers of Scitex left since they did not internalize Creo's management style." (Ginsburg, 2001).

Thus, in unsuccessful mergers the timely assessment of post-merger integration problems and related HR challenges due to culture clash remains outside the negotiation stage and the decision-making process at the pre-merger stage, while in successful merger, those assessment in pre-merger stage are implemented immediately after the deal is sign according to early planning. For example, in the case Electrolux-Zanussi merger "a matter of hours after the signing of the final agreement, {Electrolux management} announce complete change in top management of Zanussi....Rossignolo was seen as an ideal bridge between the two companies and their vastly different cultures and management styles (Ghoshal and Haspeslagh, 1990:8).

. The following sections clarify the concept of culture, cultural differences, and the way in which to assess them and measure cultural differences.

Evaluating and measuring differences in management culture

Many managers know that it is far easier to close an M&A deal than to implement it in the years following the signing of the agreement. Countless research studies and surveys of senior managers have shown that one of the main causes of the failure to properly integrate the two organizations is rooted in differences in management culture and their implications on the human factor, such as the departure of managers and key personnel from the acquired company (Hambrick and Cannella, 1993; Cannella and Hambrick, 1993; Lubatkin, Schweiger

and Weber, 1999). For example, 20 out of 25 senior Scitex managers left the company in the first year after its acquisition by Creo, despite efforts to retain them in the merged company. In this case, differences of national culture apparently exacerbated the difficulties (Weber, 2003).

Many mergers fail because of a lack of methodical and thorough measurement of culture differences. One of the better known examples is the acquisition of NCR by ATT at the beginning of the 1990s. The conservatism and centralized management of NCR did not suit the openness and creativity of ATT. Eventually, NCR was sold at half its market value, and ATT lost three billion dollars. By contrast, in the acquisition of the Morris Aviation Company by the Southwest Aviation Company, the acquiring company invested two months in learning the culture before the agreement was signed, and ended the integration process in eleven months instead of the three years allocated during the initial evaluation.

What is organizational culture?

The word “culture” has many meanings, various connotations, and different definitions, and there is no agreement among researchers as to its exact meaning. But there is one definition of management culture that points to the ability to predict many phenomena, including the success or failure of M&As. According to this definition, management culture is a **developing system of beliefs, values, and assumptions shared by the managers about the desired way of managing the organization so that it can adjust to its environment** (Chatterjee et al., 1992; Lubatkin, et al., 1999; Migliore, 2011; Rosenblatt, 2011; Schein, 1985; Weber and Pliskin, 1996; Weber, 1996).

This definition focuses on the process of measurement and analysis by management. The focus on management approaches and style has many advantages in the M&A context and makes it possible to measure and evaluate corporate culture, including beliefs, values and fundamental assumptions, ceremonies, dress code, and other aspects of the organization at a relatively low cost. The important aspects for M&As are the ones that are included in the definition proper; the rest provide additional information for confirmation of the findings.

The system of beliefs and fundamental assumptions about work methods and approaches that lead to success evolves from the accumulated experience of the organization’s management and workers in the course of dealing with the competition and with various factors in the business environment. Dealing with management challenges in this way requires interpreting the information that has been collected and taking action on the basis of the interpretations. Thus, corporate culture is an acquired system of knowledge and frameworks of reference that make possible the understanding and explanation of what occurs in the organization, in the sector, and in the world at large. Culture is critical in the preparation of programs and the making of decisions for coping with various management challenges on an ongoing basis. Because the interpretations depend on additional factors, such as the nature and background of the people involved, the actions undertaken, and the

interpretation of the success of these actions, every management team develops a different management culture even when the organizations and their managements operate within the same sector and in the same country.

All the beliefs, assumptions, and fundamental hypotheses of the management team become a complete system with unique content that shapes the processes of decision making and influences the choice of strategies, policy, principles, and behaviors in the organization. For example, a management group may decide upon its financial goals and significantly increasing its debts, while other management team will avoid an increase of debts. This different course of action followed from the beliefs and assumptions of each management team regarding the risk that should be taken during strategic operations. Assumptions of this type influence, among others, the levels of investment in areas of research and development in various projects, the testing operations, the level of autonomy granted to managers, the organizational structure, and many actions adopted by various divisions within the organization.

The system of beliefs that constitutes the organizational culture operates as a filter through which members of the organization perceive the reality they confront (Schein, 1985). As such, it plays two essential roles. First, the system of beliefs enables the translation of a complex world and of considerable uncertainty into familiar, comprehensible terms. Second, it provides continuity and stability when changes threaten to undermine the knowledge accumulated by experience. Thus, the culture supplies control functions that allow deviations from the accumulated knowledge and experience. These roles make the culture important to those who share it, but at the same time they make it difficult to carry out necessary changes, as in the case of a M&A, and become the root cause of conflict between the two cultures that meet in a M&A. In the same vein, the study conducted by Dolan and Raich (2009) indicated that failure by the senior management to perceive the changes or to take action can lead to catastrophic consequences for the incumbent organizations, and concluded that there is a great need to change the fundamental principles away from dominance towards partnership and care.

Dimensions of organizational culture

The beliefs and basic assumptions that managements hold are subjective and relate to an infinite variety of topics. Nevertheless, the literature shows that it is possible to isolate and measure with high reliability and validity several important assumptions and beliefs that characterize cultures of organizations (Chatterjee et al., 1992; Weber, 1996; Weber et al., 1996; Weber and Tarba, 2011). Beliefs are not necessarily good or bad, and we can find any number of successful organizations in the same industry that have their own, different cultures. Most important, as M&A research has consistently showed these beliefs and assumptions can help predict critical phenomena that affect the success of M&As (Chatterjee et al., 1992; Weber, 1996; Weber et al., 1996; Weber and Tarba (2011). This M&A research also elaborate how on

how the different beliefs and assumptions can be assembled into seven areas that constitute the dimensions of organizational culture.

Approach to innovation and activity

Managers with a strong orientation for innovation and dynamic activity encourage rapid response to changes and to competition in the outside environment. They attempt to exploit opportunities for new products and markets. Organizations with a different corporate culture prefer stability, intensive planning, and a relatively high level of formality. They do not try to seize every opportunity, are mindful of the risks inherent in uncertainty, and believe that "haste is of the devil." This difference in management approaches derives from different perceptions about the urgency of response to changes.

Approach to risk

Management philosophy and beliefs about risk taking are among the main factors that differentiate between organizations. The tendency to take risk affects many decisions such as investment in new initiatives, acquisition and investment in production equipment and technologies, the level of investment in research and development, management of cash flow and credit, and even the way in which pension funds are handled. A relatively high correlation has been found between this dimension and the previous one, approach to activity and innovation (Chatterjee et al. 1992; Lubatkin et al., 1999; Weber et al., 1996). For example, to achieve a competitive advantage using innovation requires investment in R&D, which can be risky because of uncertainty in the company's development capabilities, the required time, and the fit to market. The degree of the perceived urgency reflects management's perception of the threat and of the risk of failing to respond. The same is true for the exploitation of opportunities: the degree of urgency that follows from the approach to risk affects the approach toward activity and dynamism.

Horizontal relationship

Managements have different approaches to the importance of cooperation and connection between units of the organization for the achievement of enterprise goals or the encouragement of competition between units to increase motivation and effort. Some organizations have complex coordination mechanisms, whereas others use simple means of synchronization, such as schedules and standardization. The importance ascribed by management to cooperation and communication is reflected in the encouragement of knowledge sharing, understanding the difficulties and problems of parallel position holders, and help offered to other units within the organization.

Vertical-hierarchical contact

This dimension addresses management beliefs about attitudes toward subordinates, such as support, understanding, and encouragement. These beliefs have to do with human nature and therefore can vary extensively, for example, reflecting the X and Y theories that used to

be prevalent in the past. Thus, the assumption that people tend to let go, become sluggish, and avoid responsibility (the X theory) leads to an organizational culture diametrically opposed to one that is based on the Y theory. Managers differ in the degree to which they encourage subordinates to attempt new ideas, be creative, and take risks, in the same way that they differ in allowing employees to overtly criticize the management and discuss conflicts.

Autonomy and decision making

A fundamental characteristic of management is the belief about the level of autonomy and responsibility that should be delegated in important decisions. These beliefs affect the form of the organizational structure, the definitions of the roles and procedures within the organization, and the level of formality of these definitions.

Approach to performance

The requirements placed on managers and employees and the focus on performance evaluations are important aspects management culture. Managements differ in their beliefs about the need to require constant improvement and achieve goals, at times challenging ones. For example, the motto of an Israeli high-tech company is "Can do – will do," in other words, everything that can be done will be done, whatever the difficulty (Weber, 2003). Other beliefs reflect the importance of the requirement for managers to assume responsibility for their performance and the expectation that performance will be measurable. Differences exist also in the emphasis on the types of performances, for example, between the requirement for efficiency and the manner of task performance as opposed to the effectiveness and the achievement of goals, even at the expense of efficiency.

Approach to rewards

Organizational culture can also be expressed in the manner in which rewards are granted. The answer to the question "Who is rewarded and why?" provides a clear indication of the beliefs and values favored by management. Management approach to rewards is related to beliefs about the need to reward fairly and competitively relative to other organizations in the industry and to link reward with performance, and it affects the extent to which this linkage is reflected in salary, benefits, and other related aspects.

These dimensions of culture are important predictors of manager and employee behavior, including executive and employee turnover, and of the expected success of the merger. But these are not the only areas important for the understanding of management and organizational culture, an understanding that is instrumental for proper analysis of the situation before the agreement and for preparing the programs needed to cope with the differences in culture after the agreement, during the process of integration. The additional areas include considerations of labor relations and the influence of worker committees within the organization and ownership of the organization (private vs. public). Table 1 shows

culture differences in other areas of activity (in addition to the seven dimensions of culture) presented to the CEO of a company that was considering a merger.

Although there are no inherently good or bad management preferences, certain organizational cultures are not well-suited for activity in a given industry, resulting in poor performance. Thus, organizational culture is related to the organization's performance, but there is no single culture that produces a high level of performance; rather, there can be several organizational cultures, each one leading the organization to adequate performance.

The seven dimensions of culture come into play also when examining mergers between organizations from different countries. In the case of international mergers, it is necessary to examine *several additional* dimensions of international differences of culture, such as Hofstede's (Hofstede, 1980; 2001; Minkov and Hofstede, 2011) and GLOBE's (House *et al.*, 2004) dimensions, that can raise difficulties in the integration processes.

Finally, it is also important to examine management priorities with regard to certain beliefs. Even if organizations have similar beliefs, and it would appear that they have similar organizational cultures, the emphases and priorities of the various beliefs may be different. For example, managers in many organizations ascribe importance to discipline, but Intel is one of the few organizations that until recently placed discipline at the top of its priorities.

Table 1: Differences in Management Culture (in Addition to the Seven Dimensions of Culture)

<i>Areas of Activity</i>	<i>Company M</i>	<i>vs.</i>	<i>Company H</i>
<i>Structure and decisions</i>	<i>Cooperation</i>	<i>vs.</i>	<i>Hierarchical, centralized</i>
<i>Labor relations</i>	<i>Harmony</i>	<i>vs.</i>	<i>Conflict, unilateral, top-down</i>
<i>Communication</i>	<i>Diplomatic</i>	<i>vs.</i>	<i>Direct</i>
<i>Individuality</i>	<i>Group / teamwork</i>	<i>vs.</i>	<i>Individualized</i>
<i>Time orientation</i>	<i>Flexible</i>	<i>vs.</i>	<i>Defined, rapid</i>
<i>Ownership</i>	<i>Public</i>	<i>vs.</i>	<i>Private</i>
<i>Management approach</i>	<i>Engineering, process</i>	<i>vs.</i>	<i>Financial, costs</i>
<i>Worker committees</i>	<i>Yes – significant</i>	<i>vs.</i>	<i>No</i>

Measurement and evaluation of culture differences

The principles of measurement and evaluation of culture differences in M&A are described here briefly. Note that part of the planning process includes the evaluation of culture differences that is undertaken before the merger, and during the negotiation process. In other words, it is important to perform at least the evaluation, if not the measurement, of culture differences as early as possible and before the due diligence process.

The evaluation of culture and cultural differences is a complex task. Methods of evaluation can be based on direct or indirect contact with the company to be acquired. If there is considerable contact with the target company, it is possible to use primary sources of

information (from the company itself). If there is no contact (or very little contact) with the target company, secondary sources of information must be resorted to, outside the company. During the planning process, reliance is primarily on secondary sources of information provided by companies that collect information about competitors, suppliers, etc. within the framework of business intelligence operations. The following sources can provide *ad hoc* information about the target company:

- Information published by the company itself, describing its characteristics, credo, mission statement, and more. The company's presentation on its website and press releases are good sources for this type of information.
- Articles and interviews in the press with senior managers from which it is possible to glean the management approaches to various issues, and articles that appear about the organization in the business press.
- Lectures and speeches delivered by members of the target company's management team.
- Research divisions of various organizations collect information on many companies in the industry sectors in which they operate.
- Interviews with managers and employees of your organization who have worked or had a business relationship with the target company.
- Conversations and interviews with clients, suppliers, and competitors who have worked with the target company.
- Conversations and interviews with information holders, such as accountants, lawyers, management consultants, investment bankers, etc. who have been in contact with the managers of the target company.
- Conversations with the managers and employees of the target company at various events and encounters, such as workshops, seminars, exhibitions, etc.

In the case of a public company, it is possible to examine its financial reports that generally contain announcements from the CEO to the stockholders, which can provide valuable information about the organizational culture. And there is always a great deal of interesting information the company makes public when it raises capital.

The evaluation of culture and cultural differences is undertaken on the basis of the dimensions of culture and of the additional areas of activity described above, ranking the target company on the various dimensions. All the collected information is cross-checked for reliability and examined against other content to ensure validity. Ranking may be carried out using two or three raters, allowing a comparison of the reliability of the various scales. Raters can be two executives from the same organization, or executive and employee each from different unit, etc..

Data collection must also be performed in the course of the negotiations. Negotiations are generally conducted by a team, and team members must undergo training. Each team member can collect information and rank the culture of the target company or the cultural differences on the various dimensions and areas of activity. Data collection about organizational culture in the course of the negotiation process can include the following:

- Questions prepared ahead of time, during preparations for negotiations, about management approaches, focusing on the dimensions described above.
- Direct questions about the company's management culture.
- Observation of the behaviors, rituals, and language of the other team.
- Observation of the attitude toward various issues that arise in course of the negotiations that shed light on the company's mode of operation. For example, the manner in which team members refer to the use of loans and outside capital, the importance ascribed to investment in R&D, the way in which performance is rewarded, the organizational structure, the delegation of authorities, the degree of formality in the decision-making process, etc.
- Request for documents that can serve as indicators of management style, way of thinking, and other characteristics.

The information collected by the team members during the negotiations is coded, ranked, examined for reliability, and cross-checked against information gathered from other sources.

Implications for the various M&A stages

The measurement of culture differences makes an important contribution to all stages of M&A: planning, negotiations, and the integration of the organizations (see Table 2). For example, during the stage of planning and evaluation of the profitability of the M&A, the level of culture differences on the different dimensions serves as an indication of the challenges to be anticipated in the implementation process, can help determine the integration approach to be followed after the agreement, the time frame and the costs needed for integration, and can serve to assess the ability to realize the synergy potential.

Table 2 - Uses for the Measurement of Differences in Management/Organisational Culture in Management of Mergers/Acquisitions

Stage 1 - Planning
<p><i>Measurement and Analysis of Cultural Differences</i></p> <p><i>Identification, analysis, and measurement of the organization's management culture</i></p> <p><i>Characterisation of the cultures of the firms that are candidates for merger/acquisition</i></p> <p><i>Analysis of the cultural differences between the organisation and the firm that is a candidate for merger/acquisition:</i></p> <p><i>Strength of the cultural differences</i></p> <p><i>Areas of cultural differences (risk, decision making processes, rewards, etc.)</i></p> <p><i>Cultural differences in functions (marketing, R&D, etc.)</i></p>
<p><i>Significance of Integration of the Merger/ Acquisition and Realisation of Synergy</i></p> <p><i>Evaluation of the challenges in the implementation of the merger/acquisition strategy for each candidate</i></p> <p><i>Determination of the appropriate integration approach for the merger/acquisition (preservation, absorption, symbiosis)</i></p> <p><i>Evaluation of the duration of time required for integration of the organisations after the agreement</i></p> <p><i>Evaluation of the degree to which the synergy potential is exploited after the merger (in marketing, R&D, collaborations, etc.)</i></p>
<p><i>Financial Assessments</i></p> <p><i>Expenses required for implementation</i></p> <p><i>Postponement of income due to integration difficulties</i></p> <p><i>Influences on cash flow</i></p> <p><i>Value assessments</i></p> <p><i>Anticipated influences on EPS in different types of financing (loan, payment in stock)</i></p>

Stage 2 –Negotiations
<p><i>1. Preparation for Negotiations</i></p> <p><i>Understanding of the obstacles in communication following differences in management culture</i></p> <p><i>Preparation of managers for negotiations (strategies, tactics, red lines, etc.)</i></p> <p><i>Identification, location, and confirmation for analysis of the culture differences in the framework of the negotiations process</i></p> <p><i>Cost of merger/acquisition. Set the maximum price (abandonment price)</i></p> <p><i>Set the modes of payment (cash, shares)</i></p> <p><i>Set the payments according to the integration progress</i></p>
<p><i>2. Negotiations Stage</i></p> <p><i>Creation of appropriate atmosphere.</i></p> <p><i>Use of culture differences and implementation difficulties anticipated for the achievement of the negotiations objective.</i></p> <p><i>Tools for the performance of due diligence within the limits of knowledge, speed, and confidentiality.</i></p>
<p><i>3. At the Signing of the Contract</i></p> <p><i>Acceptance of the correct price, taking into account cultural differences and implementation difficulties.</i></p> <p><i>Determination of implementation plan and cooperation.</i></p> <p><i>Determination of payments on the basis of progress in implementation.</i></p> <p><i>Determination of the price before change of share value after the agreement.</i></p>

<i>Stage III – Process of Integration of the Organisations</i>
<p><i>1. Set the Appropriate Integration Approach</i></p> <p><i>2. Choose units in the organisation for integration with focus on</i></p> <p style="padding-left: 40px;"><i>Strength of the differences</i></p> <p style="padding-left: 40px;"><i>Type of the differences</i></p> <p style="padding-left: 40px;"><i>Functions of the differences (marketing, R&D)</i></p> <p><i>3. Definition of the Desired Shared Culture</i></p>

Information about the extent of cultural differences and integration difficulties can facilitate the evaluations of expected cash flow, the anticipated effects on EPS, the effects on the change of stock prices after the agreement, and the risk inherent in each alternative. In this way, during the stage of planning, screening and classification of several potential mergers, it is possible to compare the advantages and disadvantages of each candidate for merger.

During the negotiation process, managers must be prepared for the negotiation stages and for the evaluation of cultural differences in order to identify expected obstacles in communication caused by differences in corporate culture, and to acquire tools for the bargaining stages. Understanding the challenges of implementation will affect the setting of the maximum price to be paid and the mode of payment, taking into account the expected course of the integration process. The price must also take into consideration the anticipated implementation difficulties and make it possible to link payments to progress in implementation, or setting of the final price based on the expected change in the value of the shares after the agreement.

During the integration stage, correct analysis of cultural differences can determine the choice of units that are to be integrated during the early or late stages of the process, according to the types and strength of the differences. When the cultural differences between the organizations become clear, it will be possible to define a desired shared culture. This will make it easier to cope with the challenges raised by the human factor, prevent the leaving of managers and key personnel, and preserve commitment, cooperation, and motivation, all of which are important factors in the post-agreement period. A fundamental understanding of cultural differences makes it possible to prepare and implement various HR practices such as communication methods, staffing, recruitment, and training, (Weber and Tarba, 2010) as well as implementation program by integration task forces with planning, identification, and capture of the synergy potential. Finally, measurable values of management culture

and cultural differences enable good supervision, feedback, and improvement until the objectives of the M&A are achieved.

Conclusions

The aim of the present paper is to foster the application of cultural difference assessment and measurements in all stages of M&As. Much of the academic literature describes cultural differences as essential for post-merger integration but less so for other M&A stages, such as planning and negotiation. The present paper emphasizes that consideration of cultural differences is also essential in making the choice of the right partner for M&A, and should be assessed and measured during pre-merger planning and negotiation stages. Thus, the major implication of this paper is that merger integration consultants will share the table more frequently with transaction advisors, and earlier in the process of due diligence. Consulting engagements should become longer term, going beyond isolated interventions that focus on one particular problem of M&A integration. One thing will not change. To achieve better success, M&A consulting interventions will need to be based more on measurement of cultural differences

The frameworks presented here also provide for a systematic research of the relationships between cultural difference assessment and M&A performance. First, the relationships between the level and depth of cultural assessment in the pre-merger phase and the negotiation outcomes should be investigated, together with the relationship between the use of cultural differences in the negotiation stage and post-merger integration success. Second, the present paper suggests the need to formulate multiple hypotheses based on the above (and other) relationships between cultural assessment and various factors in the M&A decision-making process on one hand, and overall performance on the other. For example, Angwin (2001) found that acquirers from different countries assign different levels of priority to cultural assessment during the due diligence process. It is therefore reasonable to hypothesize that those who pay less attention to assessing cultural differences during the pre-merger stage will also pay less attention to it in the post-merger stage, and are likely to face more problems of post-merger cross-cultural management and achieve lower success. Finally, the frameworks presented here can help consultants and executives conduct better cultural difference assessment during all stages of the M&A, including screening, planning, and negotiation, and enhance the effectiveness of interventions carried out during post-merger integration process. As such our study emphasizes the role of the corporate culture analysis as an important and influential milestone in the international business environment exploration.

IDENTIFYING FUTURE RESEARCH OPPORTUNITIES IN ONLINE CONSUMER REVIEWS: THE CASE OF TRAVEL REVIEW WEBSITES

Whitehead, Lisa Marie¹

¹Research Fellow, Department of Economics and Social Sciences, University of Agder, Norway.
Email: lisa.whitehead@uia.no

Abstract

The aim of this article is to identify future research opportunities in online consumer reviews, especially for travel review websites such as TripAdvisor.com. The literature review covers the Internet and growth of eTourism, virtual communities, virtual community typologies, and the importance of TripAdvisor.com for travel research, electronic word-of-mouth (eWOM), social networking and the impact of online travel reviews on consumers. Propositions and future research opportunities are then raised.

Keywords: online consumer travel reviews, Trip Advisor, consumer purchase intentions, ETourism, eWOM, virtual community typologies

Introduction

We are all becoming more networked than ever. A recent survey of 22 countries for the Global Attitudes Project⁸⁸ showed Internet, cell phone and computer usage have increased and social networking via websites such as Facebook.com, MySpace.com and YouTube are particularly widespread across early adopter countries such as USA (46%), Poland (43%), Britain (43%) and South Korea (40%). The Global Attitudes Project also found significant demographic differences in social networking between age and educational level across the countries, but little gender difference. In general, social networking and Internet usage is popular amongst the younger (under 30s) and college educated. Education gaps of 50 percentage points or more were found between college educated and other education levels in Jordan, Egypt, Kenya, Brazil, Turkey and Mexico. Whereas in Norway, a national survey found⁸⁹ (Statistics Norway, September 2010) 93% of the population having used the Internet over the last three months. These statistics show some demographic trends in Internet usage across the globe, as well as the general shift for people to become more “technologically connected” and “socially networked.” At the same time, there is an increasing “technology divide” between those who have Internet, cell phone, computer and social networking website access and those who do not.

In terms of this research paper, the aim is to identify future research opportunities in one type of virtual community, the online consumer review website. There is an emphasis placed

⁸⁸ In Pew Internet Report, April - May 2010 - Global Attitudes Report - see online references

⁸⁹ In Eurowatch New Media Trends Norway statistics - See online references

on travel review websites such as www.TripAdvisor.com. The literature review starts by covering the Internet and growth of eTourism then moves to virtual communities and virtual community typologies. Following this, the importance of TripAdvisor.com for travel research is then covered followed by electronic word-of-mouth (eWOM), social networking and the impact of online travel reviews on consumers. Propositions and future research opportunities are then raised. The paper now begins with the Internet and growth of eTourism.

Literature Review

The Internet and growth of eTourism

Having reviewed 149 eTourism research articles over the past twenty years, Buhalis & Law (2008) state how there are few service industries that have experienced so profound and fast-moving change to their business strategy, structures and processes over this period than for travel and tourism. These changes occurred alongside rapid growth in Information and Communications technologies (ICT), such as establishment of the Computer Reservation Systems (CRSs) in the 1970s, Global Distribution Systems (GDSs) in the 1980s and development of the Internet in the late 1990s. In terms of pre-Internet strategy, tourism suppliers had no choice but to use traditional intermediaries, such as travel agents and tour operators for distribution functions, as well as CRSs and GDSs for intermediation processes (O'Connor, 2003; Sheldon, 1997, Buhalis & Law, 2008). Buhalis & Licata (2002) showed how traditional electronic intermediaries were being replaced by new tourism eMediaries selling direct via the Internet including; tourism suppliers, destination management systems, web-based travel agencies, offline travel agent, internet portals, vertical portals, media companies, television networks, online last minute agencies, reversed pricing agencies and auction sites. Buhalis and Law (2008) added Web 2.0 or Travel 2.0 providers and price prediction sites to these earlier categorisations. Buhalis & Law (2002) saw conditions for emergence of new eMediaries being based on three ePlatforms; the Internet, Interactive Digital Television (iTV) and mobile devices if forecasting forward by 5 and 15 years. Buhalis & Law (2008) uncovered three main themes in the tourism and hospitality literature regarding eTourism: a) consumer and demand dimensions; b) technological innovations and c) industry and business functions. Consumer and demand dimensions relate to aspects such as online information search, impact on pricing, consumer behaviour, security and privacy issues, virtual communities, expanding consumer choice, use of recommendation systems, complaints and feedback systems, as well as differential online tourist market segments. Technological innovations cover increased multimedia developments, increased web design functionality, usability and progress in mobile and wireless technologies and increased interoperability and ontology. Industry and business functions cover strategic and operational dimensions of ICTs for tourism strategy, including changes to marketing and distribution. Buhalis & Law (2008) note how previous tourism research has used Porter's Five Forces (1979, 1980, 2001) to

show how the Internet has changed conditions for competition in the marketplace. Buhalis & Law (2008) saw the Internet promoting mass-customisation of tourism products, supporting the industry to target niche markets in different geographical locations and as a means of boosting interactivity between partners to maximise value-added to customers. Finally, Buhalis & Law (2008) see eTourism research being in its' infancy with future research being centred on understanding consumer-centric technologies that support organisations to dynamically interact with their customers. Future innovative technologies will support interoperability, personalisation and constant networking. Dynamic interaction via virtual communities and website types are now covered below.

Virtual communities and virtual community typologies

Community has been at the heart of the Internet since its inception. For years, scientists used the Internet to share data, collaborate on research and exchange messages (Wang et al, 2002). This scientific emphasis expanded to cover commercial online activities and during the 1990s there was a convergence of email, groupware systems and the World Wide Web that provided the general public with the opportunity to participate in groups where there was little or no face-to-face interaction (Cothrel & Williams, 1999). Online communities, virtual communities and electronic communities are all synonyms for what Rheingold (1993) originally termed the "virtual community." See Table 1 for Rheingold's definition.

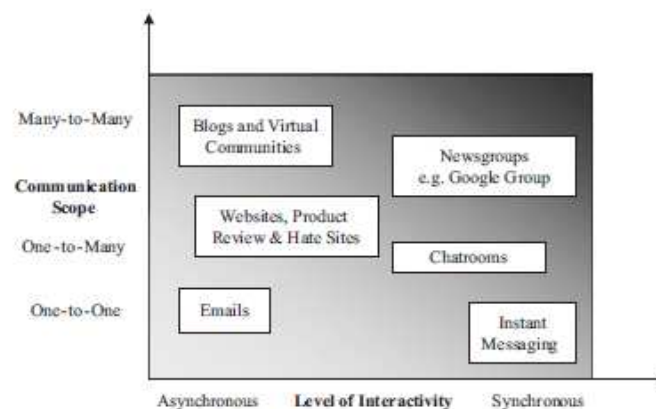

Armstrong & Hagel (1997) discussed the need for virtual communities from both a vendor and member perspective. They saw virtual communities aggregating people and providing an engaging environment for interaction. People are drawn to virtual communities to fulfil four basic needs; a) interests b) relationships c) fantasy d) transactions (Armstrong & Hagel, 1997). Preece (2000) see online communities consisting of a) people who interact as they strive to satisfy their own needs or perform special roles; b) a shared purpose of people with shared interests, needs, information exchange or service requirements c) policies that guide people's interactions d) the computer systems that support and mediate the social interaction and facilitate a sense of togetherness. Wang et al (2002) provide a theoretical foundation for the concept of virtual community, including core characteristics of virtual communities and fundamental needs of community members. The core characteristics of virtual community are; a) virtual community as place b) virtual community as symbol and c) virtual community as virtual (Wang et al , 2002). Place is where people can develop and maintain social and economic relationships whilst exploring new social organizations centred around certain communalities such as fellowship, profession or interest. Symbol refers to the symbolic dimension of meaning that humans attach to the community. Virtual refers to the new communication element i.e. the computer that is used in the process of community building online. It is just the means of communication that differs. Also in line with Fernback (1999), Wang et al (2002, p. 411) see,

“The virtual communities are characterized by common value systems, norms, rules and the sense of identity, commitment and associations that also characterize various physical communities”

Wang et al (2002) also saw virtual communities fulfilling three fundamental user needs; a) functional needs b) psychological needs and c) social needs.

Virtual community website typologies, both general and travel specific, have also been created. Kozinets (1999) pinpoint five different types of virtual communities of consumption based on social structure and group focus. These include a) boards, b) rings c) lists, d) dungeons e) chat rooms. In terms virtual community travel typologies, constant networking, personalisation and interoperability (Buhalis & Law, 2002, p. 620) have already impacted heavily on the ways in which consumers search for travel information on the Internet and make their consumer choice behaviour. For example, pricing and quality information has become more transparent over the past 10 years, as consumers seek information through a variety of social media sources that appear in their search engine in the context of travel-related searches. Fernández-Barcala et al (2010) differentiate between a) sales websites b) advice website in this context. However, Litvin et al, (2008) note how online searches are carried out through company-sponsored websites as well as via independent sources such as product review sites or even hate sites. Litvin et al (2008) provide their breakdown of websites as part of a general typology of electronic word-of-mouth (eWOM) channels. This can also be applied to the travel and tourism industry. The typology is shown as Figure 1.

Figure 1: A typology of electronic word-of-mouth (eWOM) channels (Litvin et al, 2008)

Litvin et al (2008) see interpersonal communications and eWOM as key when consumers purchase intangible products, such as a hotel room booking or beach holiday. The article helps position social media websites within a eWOM context and highlights the increasing importance of online sources in the consumer’s decision-making process. Xiang et al’s (2008) study of travel information searches using the Google engine found travellers only access a small fraction of information on the domain and a relatively small number of websites

dominate the search results. In a follow-up study, Xiang & Gretzel (2010) found significant differences in both type and frequency of social media websites uncovered by the Google search engine when searching for travel information purposes. Only a relatively small number of unique domain names (335 Websites) formed a core of the results. The top 20 unique domain names represented approximately 50% of all the 1150 websites. The largest of these domains was TripAdvisor.com. Virtual communities (40%), consumer review websites (27%) and blogs (15%) were the largest three social media website types represented in the findings. Differences in information search were also found by Pavlou & Dimoka (2006). Here, customers rarely viewed feedback comments online beyond the first two pages on the website EBay.com. The articles from this section are now summarised in Table 1.

Table 1: Virtual Communities & Virtual Community Typologies

Article	Type	Main Concepts	Travel Specific?
Armstrong & Hagel (1997)	Book	Virtual communities are required from both a vendor and member perspective. People are drawn to virtual communities to fulfil 4 basic needs; <i>a) interests b) relationships, c) fantasy d) transactions</i>	No
Cothrel & Williams (1999)	Review Article	The history of online community growth	No
Fernández-Barcala et al (2010)	Research Article	In their empirical research, the authors differentiate between two types of hotel quality information providers on the Internet <i>a) sales websites (fee financed) b) advice websites (advertising financed)</i>	Yes
Kozinets (1999)	Conceptual Article	Kozinets created a typology of 5 virtual communities of consumption , based on loose versus tight structure and group focus. The typology includes <i>a) boards, b) rings, c) lists, d) dungeons, 5) chat rooms</i>	No
Litven et al (2008)	Conceptual Article	The authors created a typology of different electronic word of mouth (eWOM) channels , which included blogs and virtual communities. This is applied to hospitality and tourism management. Channels in the typology are differentiated by <i>a) communication scope (many-to-many, one-to-many or one-to-one) and b) level of interactivity (asynchronous versus synchronous)</i>	Yes
Pavlov and Dimoka (2006)	Research Article	Empirical research using the website EBay.com. The findings revealed differences in information search online . Customers rarely view comments beyond the first two pages of feedback text comments	No
Preece (2000)	Research Article	Online communities should consist of; <i>a) people who interact to satisfy needs or perform roles b) a shared interest, need, information exchange or service requirement c) policies d) computer systems</i>	No
Rheingold (1993, 1997)	Book	Was first to define the virtual community as, “ <i>Social aggregations that emerge from the Internet when enough people carry on those public discussions long enough, with sufficient human feeling, to form webs of personal relationships in cyberspace.</i> ”(p. 5)	No
Wang et al (2002)	Review article	Review the virtual community literature, define the virtual tourist community and draw conceptual models <i>a) pinpointing the core characteristics of virtual communities (virtual, place and symbol) b) fundamental needs of community members (functional, social and psychological)</i>	Yes
Xiang and Gretzel (2010)	Research article	U.S.-based research into the patterns of consumer travel information searches whilst using the Google search engine. The findings revealed significant differences in the type and frequency of social media websites visited when searching for travel information search purposes. The top 20 unique domain names represented approximately 50% of all 1150 websites visited in the study. The largest of these was TripAdvisor.com, with other social media websites also well positioned in the top 20 ranking of domain names. Virtual communities (40%), consumer review websites (27%) and blogs (15%) were the largest three social media website types represented in the findings. The research also uncovered a relationship between social media type and search query keywords a traveller is likely to use. The findings revealed <i>a) virtual communities more closely tied to “core” tourism businesses such as attractions, activities and accommodations; b) consumer review sites related to shopping, hotels and restaurants, c) social networking sites, blogs and photo sharing sites related to events, nightlife and parks.</i>	Yes

Why use TripAdvisor.com in travel research

Findings from Xiang & Gretzel (2010) show TripAdvisor.com holds a strong and powerful place as a unique domain name in the Google information search for travel information relating to 9 U.S. cities. This makes TripAdvisor.com an important consumer review website for research purposes. TripAdvisor® Media Group is operated by TripAdvisor LLC and attracts more than 50 million unique monthly visitors across 18 popular travel brands (ComScore Metrix, Worldwide, August 2010). The TripAdvisor-branded sites alone make up the largest travel community in the world, with more than 40 million unique monthly visitors (ComScore Metrix, Worldwide, August 2010), 20 million members, and over 45 million reviews and opinions. The sites operate in 27 countries worldwide. TripAdvisor.com sells its' services as an advertising agency Trip Advisor for Business that offers advertisers the vehicles to reach Trip Advisor's large customer base. As Xiang & Gretzel (2010) show, TripAdvisor.com holds a dominant position in consumer online travel reviews and on this basis, should form the object of analysis for future online consumer travel review research, particularly concerning attitude towards reviewer.

Electronic word-of-mouth (eWOM) and social networking

In Europe, social networks are playing an increasing role in everyday life, particularly in terms of online travel information search and decision-making. A recent poll of 1,000 UK holidaymakers surveyed respondents about the impact of social media during their decision-making phase. 64% of the sample did not use social media sites. But within the remaining 36%, Trip Advisor was the most popular site, with 66% of those polled consulting the site. Around 34% referred to Facebook, 21% to YouTube and 17% to Twitter. Travel and tourism chat rooms and forums attracted 28% of the social media users & blogs 9%. WTM's research found that 42% of social media users went ahead and booked their original choice, but more than 35% changed their hotel as a result. (HOTELMARKETING.COM, November 2010)⁹¹. This shows the real impact social networking sites are having on consumer decision-making in the travel and tourism sector and yet little research exists in this area. This also applies to eWOM in a travel context, so three general eWOM research findings now follow.

Electronic word-of-mouth (eWOM) has been defined as,

"any positive or negative statement made by potential, actual, or former customers about a product or company, which is made available to a multitude of people and institutions via the Internet." (Hennig-Thurau et al, 2004, p.39)

Building on Balasubramanian and Maharan 's (2001) earlier eWOM framework which included three types of social interaction utility; focus-related utility, consumption utility and

⁹⁰ In Eurowatch New Media Trends Norway & UK statistics - See online references

⁹¹ In Eurowatch New Media Trends UK statistics - See online references

approval utility, Henning-Thurau et al (2004) extended the typology to include moderator-related utility and homestase utility. Henning-Thurau et al (2004) extracted 8 factors that impact on consumer motives for eWOM which were; platform assistance, venting negative feelings, concern for other consumers, extraversion/ positive self-enhancement, social benefits, economic incentives, helping the company and advice seeking. The findings showed social benefits having the strongest positive impact on consumer platform visiting frequency and on the number of comments written on virtual platforms. Social benefits were closely followed by concern for other consumers and extraversion/ positive self-enhancement in terms of strength of positive impact. Whereas, platform assistance and venting negative feelings had a negative impact on consumer platform visiting frequency and the number of comments written. Hennig-Thurau et al (2004) also used cluster analysis to segment the customers into the following types; a) self-interested helper b) multiple motive consumers c) consumer advocates d) true altruists. This study provides understanding of different consumer motives for their eWOM communication and the impact of eWOM on consumer behaviour.

Sen & Lerman (2004) examined negative consumer reviews on the web and found that product type; whether hedonistic or utilitarian moderated strength of valence of consumer review. Review readers also exhibited negativity bias but for utilitarian product reviews only. Utilitarian products are where utility is measured as a function of the products' tangible attributes (Drolet, Simonsen & Tversky, 2000), such as with consumer durables. Hedonic products are those where consumption is primarily characterised by an affective and sensory experience of aesthetic or sensory pleasure, fantasy, and fun (Hirshman & Holbrook, 1982). Hedonistic products satisfy emotional wants.

This section highlighted nuances in eWOM, as well as consumer motives towards communicating via eWOM. In terms of social networking and online travel website usage, the effects on consumers will now be covered.

The impact of online travel reviews on consumers

The existing research regarding impact of online travel reviews on tourism service, quality and consumer behaviour/ consumption patterns is still in its' infancy. Some of the most current research will now be reviewed.

Vermeulen & Seegars' (2010) analysed the impact of online hotel reviews on consumer consideration sets in Holland. The study used review valence, hotel familiarity and reviewer experience as independent factors. Findings supported the view that exposure to online reviews enhances both positive and negative attitude towards hotel consideration in consumers. In addition, positive reviews actually improved attitude towards hotels. This effect was stronger for lesser-known hotels than for well-known hotels. Ye et al (2009) also provided a review of impact of review polarity (positive versus negative) on hotel sales using the largest travel website in China, www.ctrip.com. Ye et al (2009) found positive online

reviews significantly increase the number of hotel bookings. A 10 % improvement in reviewer rating increased sales by 4.4%. Additionally, variance/polarity of word-of-mouth for reviews had a negative impact on sales volumes. A 10% increase in review variance decreased sales by 2.8%. Ye et al (2009) found hotels with higher star ratings received more online bookings, but room rates had a negative impact on the number of online bookings. Finally, the GDP (CityRank) of the host city had a positive impact on online bookings. In summary, Ye et al (2009) found online consumer-generated reviews having an important impact on online hotel bookings.

Two studies detail hotel quality and appraisal on the Internet. Cunningham et al (2010) compared TripAdvisor.com review ratings of Irish and Las Vegas hotels from 2007-2009. They found an improved rating for Irish hotels but not Las Vegas hotels. The reason Cunningham et al (2010) state for this finding is that the Irish hotel sector is a relative newcomer to Trip Advisor whereas the Las Vegas sector is mature. So, Las Vegas hotels will already have improved service levels reacted on customer feedback from online reviewers, unlike Irish hotels. In the second research, Fernández-Barcala et al (2010), compared star ratings for 744 Spanish hotels on sales websites (fee financed) such as booking.com versus advice websites (advertising financed) such as TripAdvisor.com. They showed sale websites provide an assessment quality of hotels on average 7% higher than the equivalent assessment of advice websites. This difference was found to significantly increase with hotel category, with a 9% increase found for 5-star hotels. These results show that there are systematic differences in quality appraisal between the two difference types of information providers.

In terms of analysing the effect of gender and/or age of reviewer on consumer travel purchase intention, this review revealed one existing study by Kim, Lehto & Morrison (2007) relating to gender differences in information seekers' attitude towards information channels and their search behaviours in the online travel environment. Kim, Lehto & Morrison (2007) found women more positive towards website functionality than men, searched using different keywords, used both online and offline information sources and become more involved in the online search process. So, further research could pinpoint gender and/or age-based differences in information search on travel online review sites.

Future research may also pinpoint gender and/or age differences in hedonistic versus utilitarian travel product searches online. Smith et al (2005) examined the effects of online peer versus editorial recommendations, trust and choice in virtual markets. Smith et al (2005) differentiate between utilitarian and hedonistic product types. Smith et al (2005) propose when shopping goals are utilitarian, consumers will rely on peer recommenders' level of expertise as a cue to judge trustworthiness. Conversely, when shopping objectives are hedonic, consumers will rely on level of perceived rapport or closeness shared with the recommender to judge trustworthiness. Smith et al's (2005) findings showed many online consumers seek and accept recommendations in order to effectively manage the amount of

information available during the online search process. In terms of travel-based online reviews, Smith et al (2005) and Sen & Lerman (2007) could prove useful in determining differences in holiday product type (hedonistic versus utilitarian travel needs). From Smith et al (2005) perceived rapport and similarity between reviewer and consumer may play a role in a consumer's strength of purchase intention. So it would be interesting to explore, which elements of the reviewer profile consumers share a high level of trust or rapport with? Does same gender, nationality or similar age impact on the consumer's strength of purchase intention? This is a substantial gap in both the mainstream consumer behaviour and online travel research.

Country of birth /origin cues have been researched and show how consumers are often positively biased in their evaluations in favour of domestic products versus foreign alternatives (Verlegh , 2007) From this perspective, we might expect Trip Advisor reviewers to review home country travel offerings more positively than foreign alternatives and for this bias to be evident in consumer attitude too. In their cross-cultural analysis of travel service consumer evaluations, Crotts & Erdmann (2000) found significant differences between respondents' evaluations dependent on the respondents' country of birth. Differences related to country level of masculinity or femininity from Hofstede's (1980) Value Survey Module (VSM). The research used tourist in-flight and airport surveys from respondents with 5 different "countries of birth" i.e. the United Kingdom, Brazil, Taiwan, Japan, Germany. The sample was split into; high masculinity (Japan), middle masculinity (UK, Germany) and low masculinity (Brazil and Taiwan). Findings showed respondents from high masculinity countries (Japan) raised more complaints about airline and airport facility quality, had lower evaluation scores and more often sat in business or first class on the aircraft than respondents from medium (UK, Germany) and low masculinity (Brazil, Taiwan) countries. So, firms who serve visitors from masculine countries where assertive behaviour is encouraged should expect lower average satisfaction measures when compared to visitors from more feminine countries. The VSM (Hofstede, 1980) contains four further scales a) power distance b) individualism c) uncertainty avoidance d) long-term orientation. These national culture dimensions could also affect consumer online review ratings, so future research could pinpoint differences in consumer reviews and consumer attitudes to purchase travel services that fit the Hofstede (1980) dimensions.

Table 2 summarises some potential future research propositions, based on the literature reviewed in this paper. Propositions 1-9 largely summarize existing research findings, whereas proposition 10- 17 represent potential new research ideas. Many of these new research directions were first proposed by Vermeulen & Seegars (2010, p. 127) and Litvin et al (2008, p. 466).

Table 2: Propositions for Future Research

<i>Proposition Number</i>	<i>Proposition</i>	<i>Research referenced</i>
1	<i>Positive online travel reviews will yield positive consumer purchase intention</i>	<i>Vermeulen and Seegars (2010), Ye et al (2009)</i>
2	<i>Negative online travel reviews will yield negative consumer purchase intention</i>	<i>As 1 above</i>
3	<i>Exposure to positive reviews increases consumer purchase intention more for lesser-known hotels than for well-known hotels</i>	<i>As above</i>
4	<i>Exposure to the online reviews increases hotel awareness</i>	<i>As above</i>
5	<i>Hotels with higher star ratings will result in more positive consumer purchase intention</i>	<i>As above</i>
6	<i>City/ Regional GDP will impact positively on consumer purchase intention</i>	<i>As above</i>
7	<i>Price of room will impact negatively on consumer purchase intention</i>	<i>As above</i>
8	<i>Consumers will use sales websites and advice websites for different purposes in their online search process</i>	<i>Cunningham et al (2010), Fernández-Barcala et al (2010)</i>
9	<i>Consumers will trust advice websites (such as Trip Advisor) more than sales websites (such as Booking.com)</i>	<i>As above</i>
10	<i>Male consumers will show greater purchase intention than female consumers when solely one source of information is provided during the information search process</i>	<i>Kim, Lehto & Morrison (2007), Vermeulen and Seegars (2010)</i>
11	<i>There will be a positive correlation between same gender (male or female) of both the reviewer and consumer and positive purchase intention.</i>	<i>Sen and Lerman (2007), Smith et al (2005)</i>
12	<i>There will be a positive correlation between similarity of age of both the reviewer and consumer and resulting consumer purchase intention</i>	<i>As 11 above</i>
13	<i>The strength of purchase intention may be moderated by differences in product/ service type (hedonistic versus utilitarian).</i>	<i>As 11 above</i>
14	<i>There will be a positive correlation between consumer purchase intention and similarity of location (country) stated in the profile of the reviewer and the consumer's country of birth</i>	<i>As 11 above</i>
15	<i>Consumers will be more positive towards consumer reviews for home country travel offerings (such as a hotel room) than for foreign country alternatives</i>	<i>Verlegh (2007)</i>
16	<i>There may be a relationship between national country differences in the star rating level and nature of consumer review, dependent on the reviewer's nationality. The effect on consumer purchase intention might be either positive or negative.</i>	<i>Crotts & Erdmann (2000), Hofstede (1980)</i>
17	<i>There may be a positive relationship between consumer purchase intention and similarity of cultural dimension(s) Hofstede (1980) of the reviewer's home country and the consumer's nationality.</i>	<i>As 16 above</i>

Conclusion

This literature review used TripAdvisor.com as it's' research focus, and pinpointed substantial research gaps in our current understanding of consumer review websites. Some research gaps are summarised in Table 2 above. The paper highlights the role of demographic reviewer profile, such as gender, age and nationality cues on strength of valence (positive and negative) perception of the review and reviewed. The paper also shows how national cultural dimensions, can play in information search strategies and actual reviewer ratings on online travel review websites. Further, the literature review has revealed eWOM and social networking sites being of increasing importance to both travel and tourism industry and firms in general. Understanding more about attitude towards reviewer profile can help form a basis for future research into the growing size and role of such social networks.

Abstract

This research contributes to the literature regarding the similarities and differences of professional managers and owner managers in terms of their corporate social responsibility (CSR) perception and practices. The sample is composed of 60 top executives from the largest Turkish companies. Stratified random sampling method is used. In depth interviews, archival documents and observation techniques are used to gather data. The findings indicate significant differences between owner managers and professional managers along CSR perception and practices. The latter having a certain consciousness of CSR, tend to perceive it as an instrumental issue, as other managerial tools, often without culturally oriented values. The owners, on the contrary, present a variety of attitudes toward CSR. However this variety in perception and practice is basically observed in the case of male executives. No perception difference could be detected when female owner managers and female professional managers are contrasted. They usually appeared to be more sensitive to CSR issues independent of the fact whether they are owner or professional.

Keywords: Professional managers, corporate social responsibility

Acknowledgement

Theoretical Background

Business organisations are increasingly expected to contribute to community and society in which they operate alongside their primary contribution of adding value to economy through wealth generation and employment. Particularly as firms grow in size and influence, they are expected to reconcile and skilfully balance multiple bottom lines; meet the demands and interests of multiple stakeholders and develop capability to act more independently as moral agents (Jamali, 2006; Jamali et al. 2008; Tengblad and Ohlsson, 2009). Discussions about the expectations from the firms are elaborated within the framework of corporate governance

(CG) and corporate social responsibility (CSR) which are characterised by a wide range of conceptual definitions. Explicit definitions of those key terms are therefore important. Corporate governance is defined as “the system by which companies are directed and controlled” (Cadbury, 2000:8) from an enforced system and accountancy perspective (MacMillan, Money, Downing and Hillenbrad, 2004; Jamali et al., 2008). This is a rather narrow approach to defining corporate governance that highlights its normative aspect. As noted by Aguilera, Desender and Kabbach-Castro (2011), corporations, irrespective of the legal constraints imposed on them, have significant degrees of freedom to choose whether to implement different levels of a given corporate governance practice depending on their labour and product markets and the frameworks of the financial markets with which they co-exist.

An in-depth exploration of internalisation of governance practices can be achieved by approaching the topic from a ‘process-relational perspective’ (Shotter, 2006) that calls for an emphasis on understanding and managing relationships between different stakeholders. In this view governance is defined as a chain of relationships that encompass a range of policies, strategies that executive managers and directors develop and implement in order to manage themselves and fulfil their responsibilities to internal and external stakeholders (McNulty, Roberts and Stiles, 2005). Similarly, for Huse (2005), stakeholder perspective (e.g. Freeman, 1984; Clarksson, 1995; Jones, 1999) is not new to the study of organizations in general and to that of corporate governance and social responsibility in particular. The so-called ‘process-relational’ approach does more than doing justice to the emphasis on stakeholders. This view highlights three key elements of governance: First is corporate leadership and hence strategy development and implementation. Second is integration of stakeholders into the equation. Third is its multi-layered nature: the antecedents and impacts of corporate governance operate at multiple levels (Judge, 2011). Leadership and strategy development aspect has significant bearings on the exercise of power and decision making in an organisation. Leadership is instrumental in moving organisations forward toward a long-term vision of the corporation, while according due regard to their responsibilities towards stakeholders (Mallin, 2005; Jamali et al., 2008). Business leaders are responsible for using power, autonomy and discretion that they possess to produce fair and generous outcomes for their various stakeholder groups. Therefore, deeper investigations about different groups of business leaders are needed to further shed light to our understanding of CSR. The relevance of business leaders in corporate governance and CSR induced us to compare the CSR perception and practices of owner CEOs and professional CEOs to have a better understanding of the topic.

Strategic leadership

Although strategic leadership in general and CEOs in particular are well studied topics, CEOs are usually treated as a single category regardless of his/her kinship ties. However, there might be significant differences between family and non-family CEOs. Poza et al. (2004)

found that perception of managerial practices of family CEOs were different than that of the rest of the family as well as non-family executives. According to modernization argument, professional managers are better equipped because of their technical managerial knowledge, skills and tools they possess to run business enterprises more efficiently and effectively (Church, 1993; Scott, 1997). In Turkey, professional managers appear to have a higher education level compared to owner CEOs (Yamak and Üsdiken, 1997; Yamak, 2008). In general Turkish top executives in private sector are found to have a high level of education (Yamak, 1998; Yamak & Üsdiken, 2006). However, better education of the younger generation family members who typically occupy CEO position is also becoming common along with their long experience in the family business starting from early ages (Alpander, 1966; Buğra, 1994). The background differences of owner managers and professional managers may influence their CSR perception and practices.

A growing body of literature looks into perceptions and practices of owner-managers in the area of social responsibility and highlights significance of owner-managers in developing and implementing CSR, particularly in SMEs (e.g. Jenkins, 2006; Murillo and Lozano, 2006; Perrini, 2006; Russo and Tencati, 2008; Del Baldo, 2010). There is a dearth of studies, however, examining perceptual differences between owner-managers and professional managers. One particular study conducted by Tafel-Viia and Alas (2009) has analysed such differences as source of conflict in the context of Estonian SMEs. The authors argue that the focus of emphasis differs for owner-managers and professional managers mainly due to their different roles in the organization. Owner-managers tend to develop and use CSR as a strategic tool in order to relate to certain interests groups and stakeholders such as state, politicians, media and public opinion, whereas professional managers focus on other stakeholder groups such as suppliers, customers and employees.

Our study has explored perceptual differences of owner-managers and professional managers pertaining to CSR strategies and practices in the context of the largest Turkish companies. Turkish business context is dominated by the family business holdings which grant to owner managers a privileged position. However, as companies grow in size and go through generations of owners, a community of professional managers also emerges. Therefore, it is worth investigating the relative perceptions and practices of both owner managers and professional managers to have a better view of corporate governance and corporate social responsibility in an emerging country context.

Corporate Social Responsibility

CSR is often considered to be a new mode of governance, which can overcome the weakening of legal frameworks whose applications are usually confined within national boundaries (Bethoux, Didry and Mias, 2007). This weak legal structure brings about the fact that managerial discretion and decision making become important factors in designing CSR

policies. Therefore, it is worth understanding how owner managers and professional managers perceive and practice CSR.

CSR is not a new concept and it has been defined and discussed from various angles. Carroll's (1979, 1981, 1999) definition of CSR has been often cited and applied in the field. In her classic article, she has argued that "the social responsibility of business encompasses the economic, legal, ethical and discretionary expectations that society has of organizations at a given point in time" (Carroll, 1979, p. 500). Drawing on Carroll's aforementioned four pillars of CSR, Wood (1991), for example, has suggested CSR principles of social legitimacy (institutional level), public responsibility (organizational level) and managerial discretion (individual level). Business for Social Responsibility (2001) defines CSR as socially responsible business practices that are aimed to strengthen corporate accountability, respecting ethical values in the interests of all stakeholders. The underlying philosophy is to improve the quality and opportunities of life by empowering people and invest in communities where a business operates. European Commission's (2006) definition echoes this view and adds the voluntary dimension to the definition. CSR is a concept whereby companies integrate social and environmental concerns in their business operations and in their interaction with their stakeholders on a voluntary basis (EC, 2006). CSR is defined, for the purposes of this study, as the organisation's commitment and active response to issues beyond the narrow economic, operational, legal and ethical requirements of the business (Carroll, 1979, 1991, 1999); it is the organisation's evaluation of the impacts of its decisions and activities on the internal and external social system in a way that will ensure social benefits alongside the traditional economic gains (Matten and Moon, 2008; Argandoña and Hoivik, 2009). This expanded notion of CSR differs from a conventional understanding of CSR in terms of philanthropy, and from a normative perspective on CSR that places emphasis on compliance with standards relating to corporate behaviour (Epstein, 1987; Deakin and Whittaker, 2007), and from that of the market orientation perspective (Brik, Rettab and Mellahi, 2011) that insists on the relationships between CSR and the firm's increasing competitive advantage as a consequence of serving effectively to its customers as a dominant group of stakeholders. Hancock (2005) suggests four pillars of CSR as strategic governance, human capital, stakeholder capital and environment. His argument is centred on the notion of value creation, which is contingent upon leveraging human, stakeholder and environmental capital through good strategic governance. CG and CSR are organically related in this view, which is consistent with the findings of Elkington (2006) and Jamali et al (2008), who claim a salient two-way relationship between CG and CSR.

Departing from the premise that CG and CSR are intricately connected, in this paper we seek to explore the perception and practice of CSR by both owner managers and professional managers as a governance tool in managing relationships between different stakeholders through a qualitative study in the Turkish context. More specifically, we address the following research questions: How do the owner managers and professional managers

perceive and practice CSR? What are the reasons behind the possible convergences and divergences between these two groups?

A central contribution of this study is to show the significant difference between owner managers and professional managers in the perception of corporate social responsibility. The position of the manager vis-à-vis the capital is an important indicator to of his/her notion of CSR. On the other hand, the size and the historical background of the firm plays also an important role to determine the manger's attitude which varies on a continuum, going from a lack of the notion of CSR to the highly institutionalized practices referring to a certain macro view of the society.

The idea that we, as scholars, are charged with the responsibility of generating and disseminating useful knowledge generated through an active engagement with, and study of, real organisational issues and phenomena is gaining increasing recognition in academic spheres (Kilduff, 2006; Van de Ven, 2007; Vermeulen, 2007; Sandberg and Dall'Alba, 2009; Ozbilgin, 2010; Corley and Gioia, 2011; Sandberg and Tsoukas, 2011). This accounts for relevance to practice in a much more substantive manner. The investigation of CSR perception of different groups of business leaders may have important practical implication by providing useful hints on how to improve CSR understanding and practices. The findings delineating different patterns of perception and practice on the part of owner managers and professional managers may help companies in their design of CSR policies by clearly showing the possible shortcomings and advantages of the perceptual differences between the two groups.

In the next part, we will explain the research process with associated methods of data collection and analysis which is followed by the section covering research findings. Last, there is discussion of the findings.

Research Methodology

The sample of the study was drawn from the owners and the managers of the largest 500 Turkish companies ranked by the Istanbul Chamber of Industry. A total of 60 interviews were conducted. Since we were keen to have a representative sample of Turkish business elites covering the whole country, a stratified random sampling was used. For this purpose we have taken into consideration the regional breakdown of the largest 500 companies in Turkey and the sample included top managers from both rising and declining regions in Turkey. Our sample included companies from 3 main zones as identified by Pamuk (2008) and also the remaining periphery zones. Thus, the proportion of the largest companies in different regions was taken into consideration by using stratified random sampling. About 45 percent of these companies originate from Istanbul and the remaining 55 percent from the rest of the country.

This is an exploratory study which assumed an interpretive paradigm. An interpretive qualitative study consists of a research design involving the exploration of a research topic or

theory rather than being a test of it (Myers, 2009:23) We gathered a triangulated qualitative data set, including interviews, non-participant observation, and documentary searches (Eisenhardt, 1989) during this study. We developed our semi structured questionnaire based on literature and feedback from pretesting. A total of 60 in depth interviews were conducted with one of the key informants with executive roles such as CEO, chair or vice chair of the board in each company. Respondents were ensured that their responses would be kept strictly confidential and they would only be used for scientific research. At least two researchers were present in each interview except for two cases. Interviews lasted typically two to three hours, of which 58 were audio taped. Only in two cases we were not allowed to tape-record and we took detailed notes during the interview. Field notes were taken independently by each researcher on the observations. A wide range of archival documentary materials were collected regarding each interviewee and his/her company. Furthermore, through observation (offices, building, etc) extensive notes were taken about the symbols. The data was collected starting from October 2009 up to October 2010. Discourse analysis is conducted to analyze the data.

For the analysis we build up codebooks as suggested by Boyatzis (1998). We have provided labels and long descriptions for each code. We have prepared a list of inclusion and exclusion criteria for each label and identified typical and atypical examples as described by Bernard and Ryan (2010). For reliability two different researchers independently coded the data. The interrater reliability was around 83 percent. When an agreement could not be reached among the two researchers the theme was dropped from analysis or reconstructed until arriving to full agreement between the researchers (Boyatzis, 1998). By using NVIVO 9, we have developed profile matrices which contain measurements of variables for a set of items.

Top managers are differentiated in this study depending on whether they have a kinship tie with the owner/founder of the company. Top executives who possess ownership stakes in the company or those who are relatives of the owners and/or founders are taken as owner managers. Family membership included both the immediate and extended family such as the spouse, children, grandchildren and siblings of the founder(s), spouses of their children, grandchildren and siblings, nephews and nieces of the founder(s) and spouses of these as well as the cousins and their spouses. Professional managers are defined as top executives who do not possess any kinship link with the founder/owner family.

Research Findings

The findings of the discourse analysis display differences at both inter and intra group level between owner managers and professional managers. Based on the findings of the discourse analysis, we tried to construct a typology of CSR awareness and practices along a continuum which gathers different tendencies among owners and professional managers. This enabled us to compare them as main categories, but also along their inner varieties. Both extrapolations seem to have a crucial functionality for a better understanding of, not only

CSR practices, but also, the significant discrepancies between the perceptions of the very concept of CSR itself. Indeed, as it is shown below, before finding out different projects and values underlying them, we have noted that there exists a series of differences among business elites, on the conception of the CSR. The CSR perception of the owners and the professional managers seem to differ considerably from each other. Differences do not only appear at the perception level, but also in the level of involvement into CSR projects. The mentality of the owner appears to be entirely identified with his/her capital and capitalistic posture. The professional manager, on the other hand, identifies him/herself with the activity and rationale of managing.

Owner managers

Most intriguing finding in the owner managers group was the absence of the CSR notion in some interviewees. Indeed, some of them had a certain difficulty to understand the concept when pronounced as such or reformulated differently, if not totally misunderstood it. When those who take CSR as inner organizational activity of the firm (in form of a system of mutuality at best, or as an ad hoc obligation pragmatically-driven by external pressures, such as requests coming from the public political actors, particularly the local ones) is added to this first cluster of those who are totally unaware of CSR, we can tell that a not-negligible part of business elites do not agree upon the definition of a CSR. But this ignorance of CSR was only observed in the case of owner managers. Professional managers seem to be more familiar with the concept, though they act differently in accordance to their managerial policies. Therefore, there are, significant discrepancies between the two groups about the CSR awareness. Although a few, some of the owner managers appeared really unaware of the concept and did not seem to have an idea about what CSR meant. However, one of the CEOs in this same group was able to lead a sound discussion on debates related to CSR and even capable to name major thinkers in the field such as Friedman.

Owner managers display variance in terms of CSR perception and practices. On the one end of the continuum there are owner CEOs who are unaware of the CSR concept. Next comes those who define CSR as *“providing what municipality asks from us”* Male, 51 yrs, owner of a large industrial firm. The same person stressed the *“need of getting along with the municipality which otherwise may make life hard for the business”*. He told that he constructed a basketball play ground for the municipality upon request. Same comment was repeated by several others as well. So, for this owner managers group, CSR is perceived as a tool for easing the life of the firm through networks with local regulatory institutions. So it is instrumental. There is not an awareness of and sensitivity to different stakeholders. For example, downsizing is perceived as a necessary and useful tool to safeguard profits without considering the responsibility to employees. This “low awareness” group’s CSR activities are also characterized by unsystematic efforts about what is considered as CSR. The activities are performed as request arises. There is no institutionalized pattern or department or team about CSR.

Next point on the continuum is composed of the owner managers who display sensitivity to stakeholders within the limits of their interests. *“We started the restoration of an old mosque from Seljuk period” Male, 54 yrs, owner of a large industrial firm who also collects antiquities. “In the production of the feed for our animals, we collaborate with the local farmers by bearing all the costs. So this is rather social activity”. Male, 54 yrs, owner of a large industrial firm and animal farm.*

Further ahead on the continuum, we see first generation owner CEOs aiming to contribute to society. These are among the new elites who appeared after the adoption of liberalization program in 1980. They are usually personally and highly involved in CSR activities along different lines. This is a self actualization for them. *“My mission is to satisfy the needs of masses at macro level. I expect also my son to serve humanity by fulfilling another unsatisfied need” Male, 40 yrs, Owner manager of a large industrial company.* The focus of these owner managers is on macro issues which involve the whole society and not only the small surrounding. *“My mission is to improve the conditions of women in Turkey. I devote considerable time to these activities by activating different chambers of commerce, universities and NGOs in different cities. I organize my business along this mission” Female 59 yrs, owner manager of an industrial group.*

The very end of the continuum is composed of second generation owner CEOs. *“My mission is to prove that succeeding in business and preserving values may coexist. I have inherited from my father a value system along with a business. I define our company not by its products and services but by its values which I try to preserve. Contributing to the community is a must”. Male 61 yrs, Owner manager of a large family holding.* In that case the CSR perception is value-based. Ethics is very much emphasized. The same owner manager affirms that his company invests only in the sectors where ethical behaviours do not harm competitive position, and quits the industries which are subject to unethical behaviours. Such owner managers are actively involved with CSR activities along different lines such as education, arts and sports. These are institutionalized and systematic activities. The owners are also personally involved in the projects which create for them an opportunity of self actualization.

It is also observed that the presence of a social entrepreneur within the previous generation (father, grandfather and grandmother) is a common characteristic for this type of owner managers. Although CSR seems, at first sight, as a pragmatically-oriented activity, the rational use of it, necessitates, nevertheless, a cultural acquisition of the CSR as attitudes and activities. When conceived and lived as a trans-generational practice, CSR becomes rather as a part of a habitus. This is also the passage of the CSR notion from the traditional obligations to political strategies. Arts seem to be most frequent topic in this group which is followed by education.

Owner CEOs and their families are usually the final decision-makers about the CSR activities. Furthermore, some of the owner managers affirm explicitly, and mostly proudly, this fact of being the sole or final decision-maker, and there seems to be a naturalized form of

domination, linked to a traditional, if not feudal, conception of autocratic management. Thus, CSR becomes, in such context, the exclusive grant of the well-intentioned boss. Consequently, the choices made by these autocratic managers are products of their own interests and conception of CSR.

Professional managers

Contrary to owner CEOs, all the professional CEOs seem to be aware of the CSR discourse. On the other hand, professional managers tend to perceive CSR as a marketing or reputation management tool. They are very much business-oriented and perceive CSR as a tool to avoid regulatory pressures, to improve company reputation and to increase sales. This is consistent with the growth focus of the professional managers. In fact, several researchers point to managers' preferences for growth (Amilhud & Lev, 1981; Bethel & Liebeskind, 1993) to advance their future career alternatives. Therefore, professional CEOs are more inclined to consider micro-issues at firm level as possible CSR topics.

If we try to locate on a continuum different types of professional CEOs in terms of their CSR perception and practice, at the one end, we see the most institutionalized and systematic CSR activities related to *reputation management*. Indeed, this tendency is observed as a generalized underlying idea. Nevertheless, this kind of manager for whom CSR activity is exclusively based on the need to promote the reputation, prioritizes CSR activities as tactical issue. Yet, s/he perceives them as an obligation rather than a well-rationalized managerial conception. This obligation mostly appears as a transposed extension of traditional/religious imperative (helping the poor, expiating the commercial gain), into relatively more contemporary capitalistic circumstances. The most important aspect in the eyes of the manager, seems to develop a fully pragmatic schema of survival in social-political conditions where CSR is one of the best ways to keep the capitalistic activity functioning. Apparent motives differ, but the underlying motivation is the same.

This group is followed by the professional CEOs who perceive the CSR as a *marketing tool* to increase the sales of different brands. Activities are directly associated with the brands and products. Given that professionalism inevitably necessitates a highly rationalized conception of business, converting every single activity related to work, into profit-generation possibility, the professional managers tend much more strictly to conceive CSR as a growth opportunity for the firm. This will also strengthen the relatively precarious position they occupy, in comparison to that of the owner manager who is well anchored to his/her capital.

Next group is the professional managers who act within *logic of balance*. They admit that they pollute the environment and to balance the harm caused by their activities they initiate environmental activities such as planting trees, etc. This group can be, in a sense, conceived as an ideal-type representing the ever-existing unconscious or hidden idea that the industrial activity, anyway, creates a social, and mostly ecological harm, which is engraved into the mind of the entrepreneur. As the most explicitly formulated attitude concerning this

structural particularity of the industry, the logic of balance perceives CSR as a mechanism of compensation, while trying also, if possible, to derive from it, a certain material and non-material gain, this, on the other side, could help to support the firm's social reputation. The most characteristic aspect of such attitude is the fully instrumental perception of CSR.

The next typology in our sample of professional managers is the *enlightened manager* who confesses his own previous unconscious behaviours regarding different stakeholders (often the natural environment) and takes corrective action. They usually think and act within the framework of the company or its close surrounding. So they are mostly focused on micro issues.

Macro thinking is relatively limited in the case of professional managers. It is only observed in a very limited number of cases where the professional manager tried to improve industry in one region. Moreover, they arise as fully conscious actors, in relation to CSR notion, values and practices. They usually adopt CSR for macro-level social-political involvement, in any case hold a *wide vision of society* implying an historical responsibility toward it. These professional managers display strong social entrepreneur characteristics. They are not capital owners but they are among the founders of their respective companies.

Due to the dominance of family businesses in Turkish business life, the fact that the owner managers continue to be the major decision-makers limits the power of professional managers (Yamak, et al., 2006). Similarly, in the decisions regarding the CSR activities owning family members are among the major decision makers. Therefore, professional managers seem to have limited discretion on CSR activities too. This fact may further induce them to perceive CSR as a PR or management tool rather than a system of thinking.

An interesting finding of the study is about the female top managers. Being an owner manager or a professional manager does not make any difference in the CSR perception and practice of female executives. Both groups seem to be equally aware and very sensitive to CSR issues. Women managers display a variety of CSR activities integrated also with their business activities.

Discussion

The evidence derived from our field research depicts variations in the perception and practices of CSR activities among top executives. As is well-known, corporate social responsibility is not only the philanthropic initiatives, but also a series of values and actions conjugated in terms of these values. Our study enables us to constitute a typology in relation to strategic leadership and CSR. The concept of CSR presents a vast variety of uses and perceptions. At the basic level, we observed that an important part of the managers do not even have the notion of corporate social responsibility. Certain others, on the contrary are not only fully aware of the CSR notion, but they derive a macro vision of society from it. Therefore, measuring the CSR values and practices confirms the existence of traditional and

autocratic management forms. However, there are also multiple ways, meanings and expectations of CSR. The most apparent finding of our research is the significant difference between owner managers and professional managers. The latter having a certain consciousness of CSR, tend to perceive it as an instrumental issue, as other managerial tools, often without culturally oriented values. The owners, on the contrary, present a variety of attitudes toward CSR. We should note, in this context, that the cultural capital owned and mastered by the manager plays a crucial role in developing a long-range policy of CSR, along with the expansion of the economic capital. Consequently, as the firm gets older through generations and adopts a tendency to increase its capitalistic capacities toward a global market, the CSR policy becomes systematic, rational, not traditionally-determined (e.g. supporting the poor because of a religious motive), and it assumes the mission of designing the country's socio-economic scope. In other words, when sufficiently uprooted and well-established, a capital group not only constantly generates pertinent and continuous projects, but it also aims to be an intervening force into the national politics, by mostly indirect forms. Thus, in such case, CSR projects and the values linked to them, are functioning on a higher register than the ordinary philanthropic activities held by the economic actors. This can be perceived as a form of doing politics without concretely entering in the domain of the *realpolitik*. Therefore, CSR applications are over-passing the corporate or managerial objectives, and of course the traditional acts of social assistance, to become a way of political involvement without being the part of established politics. Paradoxically, the less the firm adopts macro-policies of CSR, and pretends avoiding doing active politics, the more it is subjugated to the direct oppressions of the political actors who demand the satisfaction of various local public needs.

The degree of consciousness observed in professional managers should be understood, not in terms of personal interests or cultural dispositions, but rather, of the fact that they are situated at relatively precarious positions, even when they are considered as pillars of the firm, in comparison to the owner, who is the explicit representative of the capital. The difference between owners and professionals is also a matter of identification with the business. In other words, as professionals are ideologically identified with the capital they manage, but, in most of cases they do not possess it, nor they have not the underlying control of it, but the symbolic use of it, they always appear as well-equipped and highly rational individuals. Consequently, CSR is conceived by the professional managers always as a rationally taken and instrumentally used asset, while owner managers present a much more varied set of motives in their involvement with the CSR notion and values.

As a not-too-surprising result is the gendered situation of CSR in the business world. Indeed, without meaningful differences between owners and professionals, women managers seem to have developed a visibly more multi-faceted and sincere sensibility to social issues, which are, in their business practices, transformed, as far as it is possible, into well-interiorized values related to the social consequences of the work they do, and, of course, a

series of projects with which they seem extremely identified. Here, we observe a dramatic difference between men and women managers, at the degree of self-devotion to the concept and practice of CSR. Once again, we notice that women, irrespective of capital ownership, can develop a strong sense of social responsibility. This is of course due to the fact that womanhood is deeply engraved into their minds, so that they act not only business-oriented persons, but also as highly gendered individuals who import their gender roles (female roles associated with protective and organizational attitudes) into their business, even in a highly male-dominated field. Nevertheless, it is also possible to decipher the same fact from the opposite side, while emphasizing that women managers are encircled by two main sources of pressure: (1) Surviving in a male-dominated field through the obligation of being equal to the men's performance; (2) being better than men in their job to surpass the stereotyped perception of women in powerful positions. This leads them, in our view, to take initiatives for social responsibility, and frequently for the improvement women's social status.

CONQUERING THE POWER OF CHANGE – A PRIVATE UNIVERSITY CASE STUDY

Yiannaki, Simona Mihai¹

¹Assistant Professor, Programme Coordinator for Banking and Finance, Department of Accounting, Economics and Finance, European University Cyprus. E-mail: S.Mihai@euc.ac.cy

Abstract

Leadership has become a global obsession in many ways, but managing change within private universities has put the breaks on organizational learning and learning in general. Our case study attempts to show the manner by which change has been introduced and dealt within the Business School of a private Cypriot University, the European University Cyprus. Then it tries to demonstrate if the success of the change process has its roots in the history of the organization, or its current representative strategies as per the theoretical framework drawn from literature review. Following a qualitative study based on semi structured interviews it emerges that it is the trust placed on the organization by the management, the staff and the student body that can bring high standards of education to the change process. This does not come alone, but together with the acceptance of the change process and embedded innovation. At the other end, there are still strong drawbacks that hinder change management to its full positive results. These reside mostly the inequalities, the social contract issues and keeping promises.

Keywords: Change Management, Business Administration, Case Study, Higher Education, Learning

Introduction

Great leaders are capable, visionary and inspiring, that does not mean they are rational (Kets de Vries, p.183 2004)

Not so recently, organizations worldwide are challenged by continuously turbulent environments, more demanding times and shareholders, less time to act and more astute “customers”. This is why many are restructuring their business to meet at least these tests. The only question mark is on how much time and change dependent are such requirements and which is the sustainable effect foreseen in changing learning systems and in the education industry as a whole.

When usually leaders want to change individual’ or group’s behaviour, they usually tend to implement a simplistic behavioral change program.

Such a program may have a positive effect, to be sure, but that effect will not last long. Making that sort of an intervention is like trying to change the weather by turning up the

heating system inside one's house. It may keep the inhabitants warmer for a time, but it will not change the temperature outside. (Kets de Vries, p.195, 2004)

Within this general context, private universities have to develop and adapt to the new demanding market needs, to the change time schedule, to regulations that govern the operations of a university teaching and research type institution and continue to be self-reliant and economically viable. Meanwhile, change is inevitable, while circumstances continue to produce new challenges.

In our case study, the oldest private Universities in Cyprus, the European University Cyprus (EUC) the human resources seem to have been re-developed, sound personnel policies adopted, proper manpower planning implemented and assessment and a conscious policy revised to improve work and management at all levels. But, it is only the trust placed on the organization by the management, the staff and the student body that can bring high standards of education to the change process? These have been important factors that have contributed to its success story. However, the effects of change are still affecting everyone in their daily activities. Therefore proper change management skills are imperative, if all mismanaged it could have disastrous effects.

The paper is drawn under a case study and event study methodology combined with exploratory research since the moment of the accreditation of EUC in 2008 till 2011. We plan through this study to capture and integrate people's perceptions, behaviour, cognition or knowledge and creative ideas in the way they have faced change in their environment and then propose a pattern for dealing with concrete change management problems and actions to prevent potential activity disruptions.

Altogether, our study also tries to collect and present information related to the way EUC has dealt so far with current change management issues, especially value changes at its strategic level. Additionally, the study wants to raise the need to know how to handle appropriate ways of correct and wrong application of change management in this industry.

Last but not least, the study aims at redesigning a conceptual framework encompassing strategic and practical aspects emerged from the data analysis that can help managers of other European Private Universities deal in a better and sustainable way with such phenomena.

Literature review and research theoretical framework

Whether a large or a small organization of any particular industry, the first thing one must understand about dealing with change is that it is a continuous process rather than a status quo. Change implementation difficulty relates mostly its communicating vessels effect. Blaise Pascal proved in the seventeenth century that the pressure exerted on a molecule of a liquid is transmitted in full and with the same intensity in all directions. Meaning, if you change something in one area, it affects other areas triggering thus changes in those areas too. This is

to say that change is a continuous process, mostly cyclical (Lawrence *et al.*, 2006), that needs adjustment at any of its phases and various types of leadership control, strategies and behaviour.

Also, no matter the organization, change may be applied at different levels, which have different power to force change themselves. These levels are considered in our research to include the most important 4P's:

- The people at work, first, as they are the main trigger for change due to their changing nature, second due to their active role in implementing. Changing people offers the least amount of change leverage, due to its actual "impossible task" character to be achieved in a certain timeframe. Bureaucratic systems are designed to work in the way they do, not considering who does the job. One needs to change the culture of those people, but this is a long, slow process that seldom pulls change back through the system.
- The processes of work determines how work is performed. Changing work processes is important, but it won't force change anywhere else-in fact, it is hard to change work processes without changing the organizational structure and administrative systems of an institution.
- The power of system within which the organization functions, including the support system or the administrative one. If you change the education system, you can force change in every institution within it. Systems control their organizations through their administrative systems-budgeting, personnel, procurement, accounting, auditing and the like. Hence changing these administrative systems also creates remarkable leverage.
- The profile of the organization level. Learning organizations have been described in reverential terms like employees' paradises, good management practices, socialistic models and workplace democracies etc These organizations provide working environments where the employees and management together reflect on all decisions, resolve all differences, if any, through mutual dialogue, and open communication systems resulting in high levels of trust, co-operation and commitment on the part of the employees which enables generation of learning. (Akella, 2008). Universities are close to be this type of organization that is however still constrained by the system's rules and incentives, as well as its administrative systems. One can change much within an organization, mostly if one can put up some flexibility from the administrative systems. But, clearly one has little influence to force change in all Schools within the University, due to the diverse panoply of needs.

Either public or private education institutions, due to their publicly originated system in certain countries, have some basic building blocks of organizational structure. This structure must relocate itself from a bureaucratic to a more entrepreneurial model. Such a model would include five basic strategies that have power over change implementation. We have named them as the "five C's.". These strategies can trigger the "authentizotic" organization, meaning authentic and alive, that Kets de Vries (2004) tries to imply as a success in any leadership.

- The Core Strategy. Creating clarity of purpose for University reform.
- The Culture Strategy. Changing employees' habits, modus operandi, hearts and minds.
- The Customer Strategy. Making Universities accountable to their customers.
- The Control Strategy. Pushing control down from the top and out from the center. Do not fear serendipity though.
- The Compilation Strategy. Creating a set of actions for performance measurement and responsibilities.

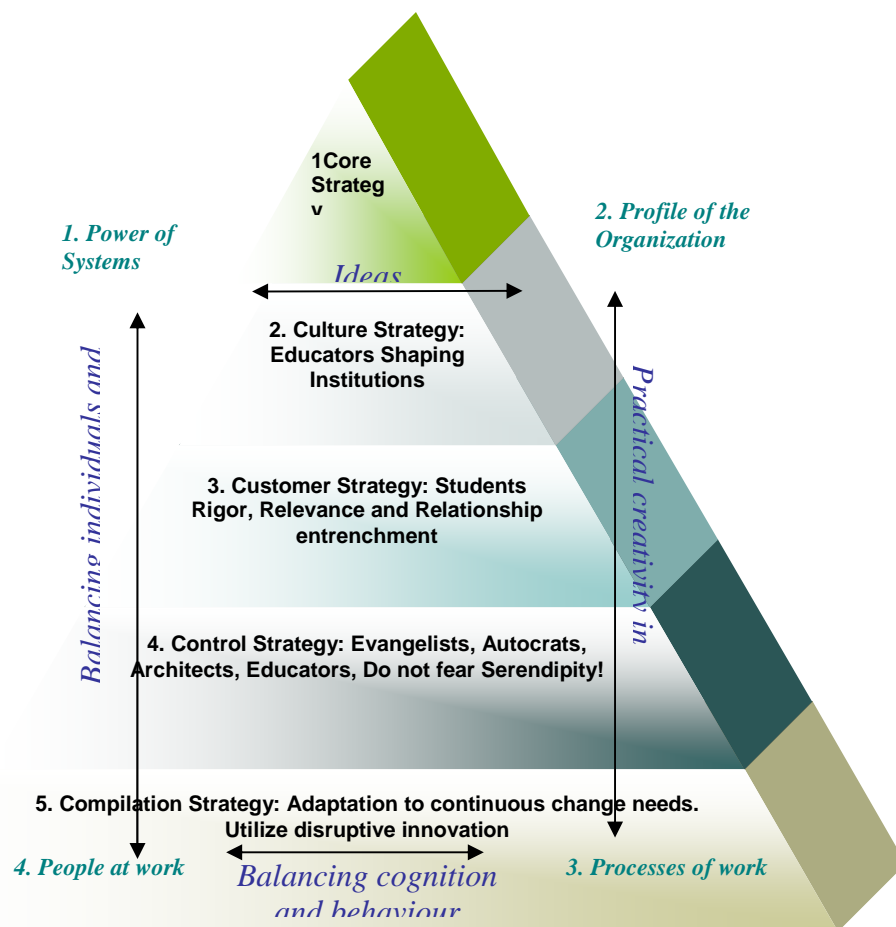

Fig. 1. The Research Theoretical Framework (Source: Authors' research)

The study's theoretical framework creates under a 5Cs format of strategies, a pyramidal 'non-vertical' relationship concept that is supported by the interactions among the 4Ps presented above. In this framework, the bond between the 5Cs and the 4Ps resides in:

- Ideas implementation, (when it comes to implementing the system's requirements into the profile of the organization)
- Practical creativity in collective behaviour is necessary both ways when designing the University profile to match the underlying processes of work, as well as restructuring these processes in order to redefine a new organizational image.
- Balancing cognition and behaviour at both individual and group level is know-how and skills related double way of accommodating people in the new processes of work, as well as tailoring such processes for the people's needs.
- Balancing individuals and systems (when trying to fit systems in for people and when accommodating people's need into the system).

In order to acquire strategic stance in restructuring such institutions one must get leverage as high in the system as possible and one must change as many of the fundamental construction blocks (the 5C's) as possible. By creating a clear purpose and decentralizing power are major changes, for example-but without compilation for performance they are barely sufficient. If the five 5C's represent the central levers for restructuring, then how do they work?

The Core Strategy

The core strategy focuses on steering, not rowing-making policy and setting direction rather than producing services. It involves three basic approaches:

The first is removing what does not add to the purpose of the University-by abandoning it. This move offers to the decision makers the clarity of purpose they need to manage effectively.

A second approach is uncoupling steering from rowing and compliance from service functions. Separating these roles into distinct organizational units with separate missions can enhance the quality and effectiveness of both steering and rowing. The British and New Zealanders, which are relatively far from the Cypriot education system, have done this systematically, at both the national and local levels. It has helped these two countries achieve enormous improvements in the efficiency and effectiveness of their educational systems.

A third core approach is to clarify the aim by creating new steering mechanisms. This is a specific move in the American educational system. In Cyprus, steering functions tend to be concentrated in the hands of a few people rather than in elective bodies. But elected bodies

like the Academic Senate, the Board of Directors, have great difficulty thinking and acting strategically.

There are, however, ways to get around this. When adopting long-term outcome goals of the University, then these are translated into medium- and short-term outcome goals, which then translates into output targets for other Schools and departments. EUC has created a highly visible body representative of stakeholder groups in the community, under the new EUC brand name. It has set long-term goals, which may act as benchmarks, and it measures progress and reports to the all stakeholders including to the community.

While all educators must play key roles in changing mentalities, the burden is even greater for those in leadership positions. Leaders must respond to change appropriately, as they are 'mirrors' for their followers, by creating room for creativity and innovation and releasing any other constraints in their staff's activities.

By nature, researching and teaching is a creative work and a liberal individualistic one. and those trying to impose systems in this industry will not perform well at all. Besides, people like to feel comfortable and do not want to disturb authorities for the sake of being themselves protected. In such case, no development is possible.

The Culture Strategy

This strategy is the weakest of the five C's in terms of implementation and transparency. However, it is a key component of the pyramid that must be fine tuned when implementing change. The other C's will coerce changes in the culture-but they will not always create exactly the culture reformers want. At some point in the change process, all successful implementers discover that they must deliberately work to change their employees' habits, modus operandi, hearts, and minds.

One approach that creates the most leverage is to change what people do. If one creates new experiences and new behaviour, new thinking will come in. Available tools include interactive strategic planning, job and role rotation, internships and externships, cross-walking and cross-talking (e.g., interdepartmental or inter-schools task forces), and contests.

Dealing with people's emotions has leverage because emotions are far more powerful than ideas. You can do this by celebrating successes in outcomes, processes and initiatives and honoring failures; creating new symbols; setting up new rituals; team building; and investing in your employees and their physical and virtual work space.

The final approach to working the culture lever is what the author likes to call "charming minds". Some leaders develop new mental models by involving their staff in the creation of mission statements, in the vision processes, and in articulating their beliefs, values, and assumptions. Others use systems models to create familiar understanding of the way things work and how changes will be successful.

Frequent barriers with these strategic levers are related to:

- elected authorities/managers who play politics when leadership is needed;
- the blockage of having no choice in voting for leaders due to inflexible rules;
- staff rules that eliminate the flexibility employees need to produce changes;
- unions that see their role not as asserting employee's welfare and principles, but as maximizing their connections;
- the intricate array of stakeholders in the existing system.

For sure, there are ways around these various barriers to better serve stakeholders' needs, but they are not easy, they need to be "worked-out."

The Customer Strategy

The first best way to change private higher education institutions is to make it accountable to its customers. In terms of customers we have considered students, academic and administrative staff.

When we talk about "customer needs" and stakeholders in education, we come across a lack of consensus for the student as customer concept (see Eagle and Brennan, 2007 vs. Svensson and Wook, 2007). Trying to advance the study's theoretical framework, the author uses concepts from relational theories, acknowledging that higher education is largely a private good and this essentially "makes the student the customer in the higher education process" (Eagle and Brennan, 2007, p.48).

Related to the internal customers - the academic staff, several countries in the EU including Sweden, Australia and the UK have gone as far as considering compulsory teacher training for lecturers. Some countries, (eg Norway), are currently implementing such a policy. We are not suggesting a similar policy but the acknowledgement that, if you 'train higher education teachers to teach, they will do a better job than untrained ones' (Trowler and Bamber, 2005: 80). Also if you train key leaders in change management and use teaching staff from the field from various organizations that used to be exposed to high pace of change, it proves more effective and less time consuming rather than doing it otherwise.

In most public or highly stratified organizations, accountability flows up the chain of command. The most prevailing way to achieve goals that are important to the customer is by creating customer choice. If customers can choose the service providers they prefer-the flow of money follows their choices-then the institution that serves them must be accountable for satisfying their needs.

The second approach is quality assurance. One can set "customer" service standards and require Universities to meet them or offer their customers some form of redress.

However, in order to use the customer strategy, one has to listen to the both internal and external customers, using surveys, focus groups, interviews, rating systems, complaint

tracking systems, etc. Although necessary, this is not sufficient to enforce change. The University management may find out what the customer wants, but it may not be willing to go through the pain of the changes required to carry it through for the sake of “push” rather than “pull” and avoiding serendipity (Hagel *et al.*, 2010).

In terms of the change application for Universities at their most “visible customer” level (i.e. the student) the Rigor/Relevance Framework further presented in Fig. 2.below (Jones, 2008) may prove an interesting view point knowledge-related. It uses four quadrants that represent levels of learning.

On the Knowledge axis, the framework defines low rigor as Quadrants A and B and high rigor as Quadrants C and D. On the Knowledge axis, Quadrant A represents a basic understanding of knowledge per se. Quadrant A is named “Acquisition” because students gather and store parts of knowledge and information.

Quadrant C, “Assimilation,” represents more difficult thinking, yet still knowledge for its own sake. In Quadrant C, students extend and refine their acquired knowledge to be able to use it automatically and routinely to analyze and solve problems and to create unique solutions.

Quadrants B and D represent actions or high degrees of application. In Quadrant B, “Application,” students use asked to solve problems, find solutions, and finalize work, fulfilling thus some employability criteria (Yorke and Knigth, 2006).

. In Quadrant D, “Adaptation,” students have the competence to think in complex ways as they apply knowledge and skills they have acquired to new and unpredictable situations. Students create solutions and take actions that further develop their skills and knowledge.

Knowing that students need a rigorous and relevant curriculum taught in a climate of positive relationships is an important step in school reform (Jones, 2008, pp 7), while the same way of thinking can be applied to other “customers “of the University.

Fig. 2. Rigor/ Relevance framework Source (Jones, 2008, pp 5)

Nevertheless, Jones (2008) matrix misses a control unit and measure and constant rethinking of the necessary double loops and feedback types necessary in learning and managing the process of learning and change, issues that we further discuss.

The Control Strategy

The control strategy pushes considerable decision-making power down through the hierarchy and at times out to the community. It transfers the form of control from detailed rules and hierarchical instructions to shared missions and systems that generate accountability for performance. But what is performance for Universities: knowledge towards students, developing life-long learning skills, creating employability, generating academic knowledge, developing a great name worldwide, increasing shareholder's value no matter what? Maybe all together.

We have suggested four approaches in tackling this strategy:

- Organizational empowerment moves control down to organizations by loosening the grip of the central administrative structures, such as budget, personnel and procurement systems that are run under equalitarian terms.
- Organizations then use employee empowerment to push decision-making authority down to those with front-line knowledge. Finally, some re-inventers use a third approach, called community empowerment.
- They shift control from the University towards the community, empowering community members and other organizations to solve their own problems and take responsibility of their actions.
- Last but not least modifying the assessment methods of learning at all levels (student, instructor, management, community).

In terms of control tools, Private University managers and academia are relatively reluctant in using the Internet, in the sense of not letting it change exclusive knowledge management practices. However, implementation of Internet had been adjusted to acceptance of intranet and fostering communication among personnel for academic, managerial and supporting roles. It wants to exploit the advantages of online communication without letting such communication challenge its expertise model. But one cannot have it both ways. One cannot participate in a medium fundamentally developed around the concept of ingenuousness if one insists on a closed model of know-how and knowledge control, such as the above mentioned frame: the intranet.

In terms of managerial control over the teachers' unions and vice versa, one cannot act towards major changes unless it offers that "little something" gradually. Teachers' Union

negotiations with the management should not be “over the bush”, but transparent and with advancements based on concrete propositions and adjusted upon European benchmarks and accomplishments. In this respect, control pressure from the Union should be made from a third party/ consultant involved both in the negotiations process as well in drafting terms and conditions. The Union is always a tool for auditing and maintaining University regulations and system of work down to people.

The Compilation Strategy

Creating a compilation of strategies and using consequences for performance is probably the most powerful lever in the reformation tool kit.

There are three approaches to working this lever:

- When appropriate, the greatest impact of this strategy can be achieved by using enterprise management: putting the University in a competitive market, making it dependent on its “customers” for its revenue, and letting it sink or swim based on how well it serves its customers. There is nothing like competition to force rapid change. This approach is only appropriate for services that should be paid for directly by their customers, but not for the academic and research work, where competition should come in terms of services and stimuli offered to “internal customers”.
- A second approach is called controlled competition. If you cannot put the University in a market you can often create competition through competitive contracting, by using “market testing” approach. As a paradox though, when a British University introduced a certain innovative programme, another American University won the funds in their own country on the same idea. The same thing can happen internally in Cyprus, when private universities compete in coping each others programmes instead of being innovative, searching for blended learning techniques, become innovative and focused on developing student’s creativity (MihaiYiannaki and Savvides, 2010) and diversity both in curricula development and in course delivery. Eventually, utilize disruptive innovation, a term of art coined by Clayton Christensen (2010), that can be introduced as a process whereby simple application of creativity related programs and change management for the bottom of a market can then relentlessly moves ‘up market’, eventually displacing established competitors.
- The third approach is performance management. If you cannot use competition, you can measure results and create incentives or rewards for those who accomplish them. You can use tools such as performance awards, performance pay, performance-based budgets, and gain-sharing to create incentives for high performance at both students and staff members’ levels.

Research Methodology

The qualitative approach has been chosen by the research team as it provides an inventory of in-depth data with higher information content that cannot always be anticipated at the outset of the research process.

The significance, in particular, of qualitative methodology is also in the fact that it enables a contextual and social placement of gathered information, includes the process, causal and related nature of phenomena, and does not study and acquire, respectively, the data separately from other accompanying phenomena. Similarly, it allows for the acquisition of the so called “concealed” contents, which can easily escape the classical positivistic approach. Finally quantitative research often restricts experiences that are so crucial to ‘attitudes/opinions’ which is the focus of this research.

As the moderator can challenge and probe for the most truthful responses, supporters claim, qualitative research can yield a more in-depth analysis than that produced by formal quantitative methods.’ (Mariampolski, 1984).

These interviews contain standardized instruments that emerge from the literature review and the research theoretical framework grouped primarily on the categories of 5C’s and 4Ps. Also the purpose of the interviews was to discuss the importance of enhancing change adaptation, change behaviour, response to change and acceptance of change within the University/ Business School. Upon the obtained results, the paper has identified the main barriers and constraints related to change introduction in the Business School as well as has improved the research framework.

The main data collection instrument, the semi-structured interview was initiated with 4 of the members of the University and Business School authorities, managers and chair persons. Analysis has been conducted in the spirit of the Miles and Huberman’s (1994) approach, manually and mechanically. The manual part has included traditional analytical methods such as introducing marginal remarks and memos within the transcripts and then producing a one-page summary with key points for each semi structured-interview. At this stage, analysis was conducted in search of relationships and patterns.

Coding, for both instruments, was a combination of pre-coding and open coding. The pre-assigned codes were derived from the literature and the study’s objectives. Open coding was carried out during analysis, both at the manual and mechanical level.

Following the culmination of the above procedures, the research team was able to describe the current situation and isolate the knowledge, training, coaching and attitude deficiencies which needed to be addressed and included within change management recommendations part. However the results of the project provide an excellent opportunity for the future expansion of the topic idea at European and International level.

Research Results Interpretation

<i>Organisational Imbalance</i>	<i>Change Pathology</i>	<i>Management responses</i>
<i>Over-reliance on individuals: too many evangelistic and autocrats few architects and educators</i>	<i>Creativity without learning</i>	<i>-No creative culture implemented, nor efforts in this way undergone till the settlement of change.</i>
<i>Over-reliance on systems: too many architects and educators few evangelistic and autocrats</i>	<i>Institutionalisation without creativity</i>	<i>-Overreliance on MIS, without understanding its role in the general strategy, fear of regulators, but positive feedback from them.</i>
<i>Over-reliance on thinking: too many evangelistic and educators few autocrats and architects</i>	<i>Ideas without implementation</i>	<i>-No initiative follow up, despite medium to high level of novelty acceptance, advertising is seen in a heterogeneous way. Bureaucracy gets things stuck.</i>
<i>Over-reliance on doing: too many architects and autocrats few evangelists and educators</i>	<i>Change without strategy</i>	<i>-Strong focus on customer strategy without innovation, but based on diversification, which may lead to control, quality and time management issues.</i>

Table 1. The Pathologies of Changes and EUC management response:

Source: (Lawrence et al., 2006, pp.65, and research results)

<i>Strategy Analysis</i>	<i>Research Results</i>
<i>The Core Strategy. Creating clarity of purpose for University reform.</i>	<i>Clarity recognized at managerial level in both form and content, but the strategy of change is very diversely seen.</i>
<i>The Culture Strategy. Changing employees' habits, modus operandi, hearts and minds.</i>	<i>Culture is not identifiable yet at managerial level. Initial stage of shaping organizational culture due to lack of specialized continuous training and human resources allocation. All is based on trust and on existing people's capabilities.</i>
<i>The Customer Strategy. Making Universities accountable to their customers.</i>	<i>Very diverse opinions on customer strategy, approach and education, as well as regarding supporting issues and processes.</i>
<i>The Control Strategy. Pushing control down from the top and out from the center. Do not fear serendipity though.</i>	<i>Very tall organization, with limited power of action at bottom level, lacking serendipity support and liberty of action regarding investments in people, systems and processes, and non-rigid but framed assessment systems.</i>
<i>The Compilation Strategy. Creating a set of actions for performance measurement and responsibilities.</i>	<i>Balanced compilation strategy, yet with missing parts affecting the overall change results, especially linked to management of resource allocation and lack of HRM transparent policies.</i>

Emerging Recommendations for How to Change in Business Schools

The following eight components have been identify the more specific actions that schools must take to achieve rigor, relevance, and relationships. These eight are not sequential, but all must be addressed if schools are to prepare students adequately for their future. The aspects of the living system model should be reflected through each of these components.

- Be guided by a Common Vision and Goals through the Rigor, Relevance, and Relationships framework. Everyone must be committed to shared goals to measure success, and personnel must have the same viewpoint as to what is the main goal of the University.
- Be ready to avoid the pathologies of change in the University, by knowing well its imbalance, where is the vision and mission and the next following steps.
- Give power to Leadership Teams to Take Action and Innovate. Leadership does not reside in a single position, but reflects the aptitudes and attitudes of all personnel, as role models, who take action and improve through effective learning communities.
- Notify decisions virtually and through CIO (Cognizant, 2010) and allow budgetary liberty. The entire University reform is a continuous process guided by a well-developed data structure based on several measures of student learning. There is a need for quality data to make fast decisions about curriculum, instruction materials and methods as well as assessment. But, there is a need for separation of budgetary issues for better providing incentives to staff development, trust, commitment and bonding.
- Adopt effective Instructional Practices for lifelong learning. More than excellent marks, successful instructional practices include having a broad range of strategies and tools to meet the needs of diverse learners in all disciplines and grade levels.
- Make Clear Student Learning Expectations, letting though in innovation and creativity. When clarity takes place in explaining students what they are expected to learn, they meet with success in improving student realization, but also if creative incentives and modus operandi are enforced.
- Address Managerial Structures and Processes. Managerial structure should be determined by instructional needs. Only after a comprehensive review of instructional practices should schools begin to address managerial issues such as school schedules, use of time, unique learning opportunities, school calendars etc.
- Monitor Progress/Improve Support Systems. Highly successful programs recognize the need to monitor student progress on a regular basis. Successful higher education institutions use formative assessments in an organized, deliberate, and ongoing way to monitor student advancement. More, they use this data immediately to adjust instructional methods and adapt to meet student needs.
- Redefine and reinvent process on an ongoing basis and assure quality without copying models, but basing them on ethical standards and organizational culture. High-performing schools realize that success is a continuing and ever-changing course of action. This step in the process, in fact, should refresh the process and

cause University/ Business School leaders to consider new challenges and search potential solutions and successful practices internationally, find benchmarks and assure quality.

Deliverables from managing change in our research and case study

The following three form the core still pending deliverables of our managing change framework at Universities/ Business School level:

- (1). Aim for rigor, relevance, and relationships, inspiring trust,
- (2) Begin with the end in mind, and look at the open non-vertical pyramidal cluster of strategies, allowing open innovation and creativity in process, content and form.
- (3) Consider Universities an organism that links the above strategies with the 4Ps through its 4 borders.

Conclusions

This research has produced a theoretical framework backed by a case study where change management was interpreted in terms of semi-structured interviews and event methodology results for the European University Cyprus for the period of 2008-2011. We can conclude that this framework proves to be valid in the conditions and that a series of 10 principles result as conclusions to our research study.

These principles give improved detail to the practices that one needs to focus on when implementing quality changes and learning in higher education institutions:

1. Decide with data, not intuitions. True data-driven achievement involves much more than simply reacting to “low-test” scores. The choice of what and how much to change must be based on data that shows what the world beyond the Business School expects graduates to know and be able to do, but also what is ethical to know and do.
2. Enlist passionate people who glimpse opportunities. Leadership is one of the keys to success. That leadership is started and designed by a main leader, but is not restricted to a single individual. Successful Universities thrive with models of team and shared leadership.
3. Develop staff through professional and personal learning, training in managing change, and conflict. A staff team that functions as a professional learning community comes together for learning within a supportive community. At the same time conflict, which in times of change is inherent, should not be a threat to cooperation, nor needed to be resolved rapidly and permanently (Huczynski and Buchanan, 2001), but rather in a correct and just manner.
4. Inspire innovative instruction and engagement. Just as standards and tests do not constitute a curriculum, high-performing Business Schools recognize that curriculum is not instruction. The idea is to play the game on the uniqueness of each student and become a student centered organization. Prioritize the curriculum, as less is more. Teachers need to

engage in a clear way to help differentiate among curriculum topics that are essential for all students and those that are only nice to know.

5. Make good use with the community to form true partnerships based on keeping the promise and thus enhancing trust. Community and business partners bring many benefits to a University and especially to Business Schools in terms of learning, teaching, sharing, financial support and not least employability (Yorke and Knight, 2006)

6. Hold teams accountable for learning results. Good leaders not only set powerful visions and high expectations, but also follow up to make sure staff implement approved practices.

7. Know your “customers”, know your strengths. Business Schools need to find ways to customize instruction by fully understanding the culture, prior experiences, learning styles, backgrounds, and interests of its all “customers”. At the same time they have to offer various success paths without distorting the most performing ones who are already implemented and have proven unbeaten. Rather than holding instructional approaches constant and putting up with different results in student accomplishment, multiple pathways create different alternatives for students’ assessment and ways to acquire the same learning.

8. Measure learning by know-how. Many Business Schools need to reexamine grading policies both at the school and classroom levels to ensure that student achievement measurement results in students being graded on proficiency rather than seat time.

9. Compel to high expectations. Business Schools that establish high expectations for all students and provide the support necessary to achieve these expectations have high rates of academic success. High expectations have to be a way of life and drive daily behaviors and actions.

10. Foster positive relationships to close the loop rigor/ relevance/ relationship. Strong relationships based on trust and commitments are decisive in students carrying out thorough work. Students are more likely to make a personal vow to engage in rigorous learning when they know teachers, parents, and other students actually care about how well they do.

Appendix 1. Research Semi structured Interview Base

The Interview questions are valid for the period 2008 to 2010. The questions “how much” have been scaled from 1 to 5. (Where: 1. is very little, 2. little, 3. some, 4. significant and 5. very much.)

- What is your opinion about change at University level in general?
- How much has the education environment changed for the past two years?
- Which are the areas of change needed in the University? (Name at least 3 areas).
- Where do you see your University coping best with change?
- What are the most difficult tasks in this respect?
- What are the three things you would change first now?
- Have you benefit of training in change management?
- How can the University improve service to its stakeholders?
- Students; B. academic staff; C. administrative staff; D. the community
- How much does money help you in managing change?
- What financial aids you consider in implementing change?
- Would a specific strategy that is known to everyone help you in implementing changes? Which is this one?
- How much uncertainty you think is acceptable when implementing change, if any from a scale of 1 to 5?
- How much planning do you use when implementing change in general and how much you use for this case?
- Do you involve your team in implementing change?
- Yes, why? To what level/ which areas? And how many of all your team members? Do you allocate extra members for this?
- No, why?
- How much of change do you consider in your core strategy?
- How much change you allow in controlling the business?
- How much have you changed in your department/ area?
- How much budgeting do you do when implementing change?
- What are three budget items you consider necessary but had not really thought about prior to this year’s change and where would you cut this budget for this year?
- How much you want to change the believes of your personnel? If so how much you think you have changed their believes?
- How much you want to change the believes of your students? If so how much you think you have changed their believes?
- How much creativity from your staff do you allow when implementing change?
- Do you consider change at advertising level and publicity of your University and by which means?
- Do you consider change in the pricing, what prices would you use for students fees (promotional, skimming, etc)?
- Do you consider change in the type of customer niche and which would be this one?
- Do you consider change in the offerings of products? And to what degree of diversification?
- Do you consider change in the relationship with your partners (business ones) and other organization? How do you think this would this affect your future business?(How do you keep them happy?
- How much importance you give for free interchange of ideas?
- How much leadership you think is required in times of change for your University?
- How much novelty do you think is acceptable for your University?
- Do you think is good to follow the market or follow your own strategy?
- Have you reconsidered changing the goals set up two years ago?
- What are you most important performance indicator for your Institution?
- The human resources have had to be re-developed, sound personnel policies adopted, proper manpower planning implemented and assessment and a conscious policy adopted to improve management at all levels. How did you achieve this in your area?

- Regarding research / (your department) area what was the biggest change you (want to be) implemented?
- Are you satisfied with the achieved change strategies implemented at your University?

Appendix 2. Research Semi structured Interview Responses

Question	No. 1	No. 2	No. 3	No. 4
1	change is inevitable, represents a continuous process, we have to learn from it, available to all academics and the society	very important, especially in the light of changes in the EU in higher education of the Bologna process framework.	under the factor of change as a positive promotor regarding the transformation from college to university status ther was a need for rapid change.	it is a fulfillment of the strategy of the Ministry of Education of Cyprus, one of the axis of the strategy of Cyprus for education and health for the next 5 years
2	very significant in the private university area, less in public ones, in order to conform to legislation, internal procedures	in the private higher education yes a lot, nut much in education in general	It has changed subsequently for more than 2 years. It has been expressed in process and procedures to be a university relevant and pertinent to the University status.	The university environment has changed a lot. Level 4 to accommodate students at each stage of the strategy.
3	teaching, research, administration, strategic development, change of bureaucratic procedures	quality assurance, development and implementation of international qualifications frameworks with 3 cycles, lifelong learning	overall university culture, autonomy, the research factor	culture of the people and instructors, systems and procedures, infrastructure (MIS)
4	teaching, because research is at its early stage and so is administration	quality assurance and ECTS	in research and cooperation with other universities or established academic networks	procedures we start coping with problems at MIS, infrastructure
5	assessment, find out new changes in the teaching methods, quality is very difficult to assess, how you assess only students' evaluation, faculty assessment is difficult and is done subjectively by students, peer review being done only during the first year and not later on.	got everyone involved	the adaptaion of university culture in both administration and academic personnel	culture is very difficult to change due to resistance to change and systems
6	Schedule, too many things to do at the same time for the requirements of others, the system that we have, reducing the teaching load, changing mentalities, which is a long term process	more development of quality assurance, lifelong-learning, social inclusion, social responsibility in the community, capturing older graduate in catching up with their studying	comply with the University Charter, as the operations of schools and departmetns, mentalities	It is very difficult to change things, try to change the attitude of instructors to see themselves as faculty members for 24 hours in this job, to do continuous research oriented institution and in teaching in class
7	Only during my studies it was part of my subjects	Continuously, due to the evolution in various areas in the Higher Education.	yes, when this training is not instrumental oriented services	very difficult to convince and get accepted
8	a), reorganising the advising service, hire professional people just for that,b), by not overloading them, c), should reorganise their MIS, d), increasing contacts with them	a,further enhancement of students Centre approach, b. more opportunities for development, c. more opportunities for development, d. give also programmes that serve university employees, private and public, municipalities.	a. by establishing a constant and perpetual feedback process and procedures. B. establish proven respect of academic outcomes, c. by providing regularly training and management and university oriented culture issues, d. Be again in constant and perpetual communication with community, an open locus for discussion and activities, collaborative type of activities and synergies in new projects that are of paramount importance for the community	a. see students as clients, adapt all services to be student oriented, to care, continuous monitoring and academic feedback of students, b. developing academic staff, give them opportunities to undertake research and more time for doing that.c. trining and developing career paths, proper procedures, d. create research centres to solve problems of communities, respond to community needs through expertise and faculty members

Attracting more grants and financial support for the university	A new research policy that will affect the whole operation of the university and codification of all research performances.	involve faculty members more
36	teaching and MIS	yes, so far so good. Significant level 4.	to an extended part yes	not really, level 2

CURRENCY RISK HEDGING DURING THE FINANCIAL CRISIS: A CASE STUDY**Yiannaki, Simona Mihai¹**

¹Assistant Professor, Programme Coordinator for Banking and Finance, Department of Accounting, Economics and Finance, European University Cyprus. E-mail: S.Mihai@euc.ac.cy

Abstract

This study tries to identify if the financial risk of foreign exchange exposure is neutralized or not for any given importer hedging an average of euro 100,000 per month with forward contracts. The exploration is based on the case study methodology triangulated with primary data collection and secondary data analysis of the exchange rates for forward contracts rates versus actual spot rates given by a Cypriot Bank for EURO versus USD, GBP and JPY.

The hypothetical question is tested by the Sharpe ratio and regards only the hedge or not hedge situation, out of the possible combinations, disregarding intermediary choices or transaction and translation costs. We have looked at the overall, but also annual results of the total hedging versus the total non-hedging strategies for the period of the financial crisis (March 2007-February 2010) and analysed the forward rates under the 'unbiased predictor' preconception. Our results show that always hedging is preferable to remaining un-hedged for the Cypriot importer for JPY exposures, remaining un-hedged is a better solution to GBP currency exposures, while the decision to hedge or not to hedge against the USD depends on the firm's perspective of data analysis and especially cash flow changes. Subsequently, we found dependency on non-hedging more to the currency depreciation, the reduction of the risk free rates, the volatility of the FWD and actual future Spot prices in the market, as well as longer time periods.

Keywords: currency risk, derivatives, FX exposure, financial crisis, hedging

Introduction

Cypriot importers have a significant FX risk exposure due to their regional positioning as well as to the tight competition within the international market. However, Cyprus banking and corporate sector have few corporate hedging techniques available as derivative banking product solutions to mitigate such exposures. In practice, the only product available in the currency market is the forward exchange contract (FEC). Among the panoply of reasons for which this study is intended, one can mention the risk aversion of banks towards innovative financial derivatives, the lack of consensus in the local and international legislation in this field, as well as the mixed results in the empirical studies of theory of efficient foreign exchange market hypothesis.

The subject of this study is the analysis of a hypothetical Cypriot importing firm exposed to payments in GBP, USD and JPY against its receivables in EURO.

Specifically, the research is carried out for observing the performance of two opposing strategies in terms of their ability to optimize the domestic currency value (EURO) of the exposure versus the other three currencies. Hence, the first strategy is always hedge by using 1 month FEC at locked forward rate (FWD). The second strategy is not to hedge at all for all period of time; both strategies taking the possible risk of FX loss, but also the possible gains.

The study is based on secondary data analysis, collected on forward currency exchange rate, on actual rate as also on spot rate (each collected on the first trading day of each month) quoted for 36 months. Our research time span supports a 3-year data analysis, a special time due to the experienced financial crisis of 2007-2010. All the raw data are collected from the Treasury Department of the Bank of Cyprus (BoC) Public Company Ltd upon the authorization of the Department's Manager, as well as from the organised Money Market.

The study's questioning is if there any benefits to hedge FX exposure through the purchase of Forward Exchange Contracts (FECs) during the financial crisis, and challenges the literature (Eun and Resnick, 1997), who tested the hedging usefulness of FECs and their impact on lowering the possibilities of a financial distress.

Since Morey and Simpson (2001) considered FEC and measured their performance with *ex post* efficient frontiers and a simple return per unit of risk measure, like Jong *et. al.* (1997) who compared futures to remaining unhedged and used the Sharpe-ratio and minimum-variance as measures, the study is based also on *ex-post* data. Thus, our study uses primarily the Sharpe-ratio method for measuring the relative levels of risk for both strategies, but also their returns.

Literature Review

Market Efficiency and Foreign Exchange Risk Exposure

All currency fluctuations experienced during the last few decades has drawn attention to the potential vulnerability of multinational firms to FX risk. This topic has also produced a considerable amount of research (e.g. Giddy and Dufey, 1992; Jorion, 1990; Amihud, 1994; Bartov and Bodnar, 1994; Berkman and Bradbury, 1996; He and Ng, 1998; Allayannis and Ofek, 2000; Griffin and Stultz, 2001; among others).

Shapiro (1975), Hodder (1982), Levi (1994) and Marston (2001) argued that, exchange rate fluctuations are an important source of macroeconomic uncertainty; since having a significant impact on firm's value, regardless of whether the firm is domestically or internationally oriented.

However, due to the rapid pace of globalization few firms today could be considered as purely domestic and unaffected by exchange rate fluctuations (Bartov and Bodnar, 1994).

Consequently, the procedure of identifying and mitigating such mentioned risks through financial or operational hedging is defined as FX risk management which is absolutely essential, due to the increasing number of firms operating in multiple currencies.

The level of rate fluctuations is not certain or predictable, as it depends on the price, volume, volatility, interest rates, time to maturity etc of the FX exchanged at the transaction's date, but also as also on the efficiency of the FX markets. Research in the area of efficiency of FX markets has established only a weak form of the Efficient Market Hypothesis (EMH) (Fama, 1965) which implies that successive changes in exchange rates cannot be predicted by analysing the historical sequence of exchange rates (Soenen, 1979).

However, when the efficient markets theory is reasonably applied to the FX market under floating exchange rates there is some evidence to suggest that the present prices properly reflect all available information (Giddy and Dufey, 1992). This suggests that exchange rates react to new information in an immediate and unbiased way, so that no contestant can make a profit from this information. And certainly so, information on direction of the rates arrives randomly as exchange rates also fluctuate randomly.

Unbiased prediction means that the FWD on average will overestimate or underestimate the actual future spot rate in equal frequency and degree as presented in Eitman *et al* (2007, p.121). Differently said, the expected mean value of deviations in predicting FWDs is zero. Yet, in reality the FWD may never equal the future spot rate. In fact, the market efficiency assumes that: all relevant information is reflected immediately in the spot and forward exchange rates, transaction costs are low and instruments denominated in different currencies are perfect substitutes for one another (Eitman et al., 2007)

However, tests of FX market efficiency have come to a consensus that rejects this hypothesis; it appears that the FWD is not an unbiased predictor of the future spot rate and that it does pay to use all intelligence to try forecasting such rates. Moreover, Bodnar and Gentry (1993) among others argued that exchange rate movements affect some industries in a different way than others because some are more export or import dependent than others. They reported important negative exchange exposure for industries such as metal mining, heavy construction other than building, petroleum refining etc.

In our case, our hypothetical importing firm is exposed to such risks automatically, due to its exposure to foreign trade activities. And, since risk management plays a significant role for our Cypriot importer, the necessity of developing appropriate strategies to manage foreign exposure becomes crucial.

Missing empirical support

The most surprising fact is the lack of empirical support for a statistically significant relation between firm's value and exchange rates; the possible reasons will be explained below. More precisely, Jorion (1990) investigated the currency exposure for a sample of U.S multinationals but found weak evidence of such a relation. Afterwards, Bodnar and Gentry (1993) examined the industry-level exposures and found that from industries in Canada, Japan and the U.S only 20% to 35% of them have significant exchange rate exposure.

In an attempt to explain the limited success of finding significant correlations from earlier studies, Bartov and Bodnar (1994) argued that one drawback possibly was the sample selection. Respectively, only firms that are heavily exposed to currency rate changes, as well as those with the same 'sign' of exposure – meaning that all firms benefit from either an appreciation or a depreciation of the exchange rate. Another potential drawback could be due to the existence of mispricing. Investors might incorrectly estimate the relation between firm's value and exchange rate movements introducing with this way, systematic errors. For the above mentioned reasons, they suggested the inclusion of lagged changes of the exchange rate and the simultaneous effect. Therefore taking a sample of firms they investigated the correlation between abnormal returns, derived from the market model and both contemporaneous and lagged changes in dollar. They did not find correlation with the dollar movements in the same time period but one period lagged-change had significant impact on the abnormal return. They performed also other tests but they came to the result that, it is difficult to establish a clear link between stock returns and changes in the exchange rates; these results are in line with Amihud (1994).

In a more recent study by He and Ng (1998) 171 Japanese multinational firms were analysed and significant exposure to exchange rate fluctuations for about 25% of the firms was found. He and Ng also looked at the determinants of exposure and found the estimated exposure are positively related to the level of a firm's export ratio as also it is related to variables that are proxies for firm's hedging incentives.

Based on the above mentioned surveys, we will examine whether or not as also at what level fluctuations on FX rates on GBP, USD and JPY currencies affects our firm's value and its overall portfolio returns.

Why stay un-hedged?

Nance, Smith, and Smithson (1993) surveyed large U.S firms and reported that 38% did not use hedging instruments in 1986. Berkman and Bradbury (1996) found that 52% of publicly traded New Zealand firms did not hold derivative instruments for hedging purposes in 1994. Mian (1996) reviewed 1992 financial statements and found that 74% of the companies did not use derivatives. Geczy et al. (1997) also reported that, 59% of large non-financial U.S firms, did not use currency derivatives in 1991.

From a survey of Bodnar *et al.* (1998) for non-financial firms it was found that, the percentage of firms that uses derivatives has remained relatively constant over the past few years. He also reported that partial hedging is not uncommon for FX derivative users. In this respect, one possible reason could be the managers' belief that individual investors can hedge on their own if they desire to adjust their exposure, getting in line with several aspects of the EMH. Smith, Smithson and Wilford (1990) also argued that hedging can increase firm's value due to market imperfections and economies of scale.

In theory, shareholders may be able to diversify their exchange rate risk with portfolio strategies (e.g. Allayannis and Weston, 2001). On the other hand, Modigliani and Miller (1988) supported that the fact

that shareholders can hedge from their own, is not valid due to the highly transaction costs and their lack of knowledge about financial manipulations, however unavailable in this study.

Additionally, taking the fact of fully awareness of their exposure, as also reducing the possibility that shareholders can effectively hedge from their own, another reason could be that firms' managers may decide that cost outweigh the benefits. For example, Business Week (October 26, 1998, pp74-77) reported that an aggressive hedging strategy at Eastman Kodak was terminated because the costs outweighed the benefits; briefly speaking the company incurred losses when using such strategy.

Taking the above mentioned into consideration, we consider that the second strategy of our analysis takes place due to the importer's belief that derivative tools are neither appropriate nor sufficient to mitigate firm's exposures. It is also important to mention relevant studies that showed the consequences for the firms that stayed un-hedged.

Referring again to the survey of Eun and Resnick (1997), who firstly used the traditional passive hedge of FECs, but also introduced a passive strategy using put options; they also considered a number of variants of the random walk as the basis of the selective strategies. Using Sharpe measure of portfolio performances their results showed that the selective strategies based on random walk offer superior outcomes for an internationally diversified stock portfolio rather than of the passive strategies or remaining un-hedged.

On the other hand, Morey and Simpson (2001) considered different data and expanding the set of selective hedging strategies. They considered hedging only when the forward premium or the pricing of the deal is historically large and when relative purchasing power parity (PPP) model (Gustav Cassel, 1918) indicates an incorrectly priced bilateral exchange rate. Using ex post efficiency frontiers and return per unit of risk to compare the strategies they found that for 12 month time period the 'large premia' strategy (selective strategy that will not be used in this study due to lack of derivative price dissociation from the actual exchange rate) gives the best result and in all cases they noted that the un-hedged strategy performs better than the always hedge strategy.

The Use of Forward Contracts

When hedging, companies are mainly using forward or future contracts, options and swaps. This study has focused only on the forward contract as it is the only one used by Cypriot companies in their local currency market. Moreover, the most reliable derivative providers, the banks use only the forward as a hedging method. Jesswein *et al.* (1995) examined the use of foreign exchange risk management products by 500 U.S firms. The results showed that, 93% of the respondents used forward contracts followed by swaps and options. Yet, perhaps the reason may be the simplicity in understanding the pricing and the transaction in itself. A study made by Joseph (2000) showed that British firms employed a narrow set of techniques to hedge exposure, as also they put emphasis on currency derivatives than on internal

hedging techniques. Possibly this issue has to do to the relative stability or the not so frequent 'setbacks' of the GBP compared to other hard currencies.

Moreover, Marshall (2000) studied the FX risk practices of 179 large British, American and Asia-Pacific multinational firms and found that the most popular external method for managing translation and transaction exposure is the forward contract, although swaps are most popular in British firms. Later on, Chan *et al.* (2003) examined the hedging practices of New Zealand, and he found out that the most frequently used as derivative tools to against FX risks, are the forward contracts. Some other surveys examined the use of derivatives to manage particular types of exposures (e.g. Eun and Resnick, 1994, Brealey and Kaplanis, 1995; Allayannis and Ofek, 2000; among others).

Glen and Jorion (1993) included in investors' strategy not only forward contracts but also primitive assets. They compared between the risk-return performance of globally diversified portfolios with the use and non-use of forward contracts. They showed that the use of forward contracts resulted in statistically significant improvements in the performance of the internationally diversified portfolios. Their particular study alters the equation though without specifying the integratory effects and compatibilities of the primitive assets.

On one hand, Eun and Resnick (1994) considered the impact on the investment results when exchange rate risk is hedged with FECs. The study showed improvement of the risk-return outcome when the international investments were hedged, which is an aspect we evaluate in the data analysis, when applying the Sharpe ratio interpretation.

On the other hand, Brealey and Kaplanis (1995) showed that commonly used strategies to hedge against currency risk, such as one-period cash flow hedges and long-term fixed hedges, may leave the firm exposed to FX risk. A continuously rebalanced hedge is needed in order to enhance the hedging effectiveness of a forward contract. But, this method is rather time and resources consuming, while it may need dedicated software or an automatic system for calculations, besides analysts for data interpretation. However, through this study we may see what happens on a medium period of time.

Allayannis and Ofek (2000), and Graham and Rogers (2000) observed the use of currency derivatives as the only particular type of exposure, since the adoption of such 'method' increases the ability to control the variation in intrinsic values, a much debated topic for finance people. It is important to mention that despite the fact that the purchase of FECs can be modified to the needs of each party, the firm losses the opportunity to benefit from a better spot rate prevailing in the date of transaction compared to the FWD given. A hedged position will hence not produce the benefit of favourable exchange movements, but on the other hand 'insure' the firm against undesirable exchange rate fluctuations.

To sum up the literature review findings, we have considered the hedging and non hedging results for different geographic areas, for different periods of high fluctuations or non-crisis related ones. Moreover,

a correlation with other derivatives has been presented, the competitive influence or the way they are interrelated.

Ultimately, considering all the above mentioned conflicting research results and theories, doubt still remains over the issue of whether a firm should hedge or not hedge its position. Also evaluating the consequences obtained from the decision to not hedge at all, we test out the level of consistency with previous researchers.

Therefore our research questions levitate around two important issues:

1. Are there any benefits to hedge FX exposure through the purchase of FECs and how this change during financial crisis? Which returns portfolio outperforms? (Use or not-Use FEC)
2. Does the research exercise reflect the EMH so that the FWD is an unbiased predictor of the future spot rate?

Methodology

The study methodological tools

Secondary data include both quantitative and qualitative data, and they can be used in both descriptive and explanatory research (Saunders et al, 2003), as well as permanent and available (Denscombe, 1988). The first set of secondary data we use in this research is both raw data, such as the LIBOR one month (1M) rates collected from the Internet specialised websites (www.global-rates.com) for the three currencies' interests used (GBP, USD, JPY), and compiled data that have received some form of selection and summarising (Kervin, 1999) from multiple sources. The second set of secondary data refers to the selection for the period of March 2007-February 2010 (i.e. 36 consecutive months) for the today's spot rate (SP1) which is the closing day rate of the bank, then for the actual or future rate (SP2) which is the next month rate and for the one month forward rate (FWD 1M) all being bank indirect quotation for (GBP/Euro, USD/Euro, and JPY/Euro). Such category of data is obtained from the Cypriot Bank's treasury department system.

The forward quotations obtained are expressed as a percent-per-annum deviation from the spot rate, method of quotation facilitating comparison of premiums or discounts in the forward market with interest rate differentials. However, our research is not focused on the analysis of the forward price based on the interest rate differentials, due to lack of direct transaction pricing, and the lack of the actual deposit rate offered in the interbank market.

All returns are calculated according to the direct quotation system available in the importer's country (i.e. Cyprus).

$$\% \Delta = \frac{(\text{Ending rate} - \text{Beginning Rate}) \times 100}{\text{Beginning rate}}$$

The advantage of the secondary data in our case allows a larger historical selection of data to fit our analysis of the FX rates during the financial crisis; as also it is unobtrusive, quickly obtainable and provides room for longitudinal studies.

Our main interpretation tools are eventually the standard deviation of returns, the average of returns and risk free rates which are analysed for each compiled portfolio, while the Sharpe ratio will emphasise the reward for risk in both chosen trading strategies (actual vs. forward).

What we try to observe over the entire 36 month period, is the total net proceeds that come from transacting Euro 100,000 at the rate differentials (FWD-SP2) for hedging compared to the total net proceeds that come from the rate differentials (SP2-SP1), for non-hedging. Then we compile all these in the same way to find our targeted Sharpe ratio and interpret it as a measure of risk-return appetite and volatility.

Methodology

Saunders et al. (2003) mentioned, there is no clear solution to problems facing measurement invalidity. While organizations may argue their records are reliable, there are often inaccuracies and inconsistencies, however the fact that the screen-prints of the rates are directly extracted from the Bank's live-database and by an official of the bank, these strengthens the reliability and validity of the data, besides the fact that they do not refer to the current business of the bank but to historic ones.

Sharpe Ratio (S) in depth

Since Sharpe ratio is a risk-adjusted measure of return that is often used to evaluate the performance of a portfolio; making the performance of one portfolio comparable to that of another by making an adjustment for risk. The study employs the Sharpe ratio for calculating the average return and above the risk free rate (R_f) of return per unit of portfolio risk. The ratio uses the standard deviation of a portfolio's total return as the measure of risk (Eitman et al., 2007). We have used this measure accordingly, by dividing the difference between the average returns and the average of the R_f (LIBOR 1M of each currency) to the standard deviation of such portfolio returns.

The formula of Sharpe ratio used is:

$$S = \frac{E[R] - R_f}{\sigma}$$

Where:

For our research calculations these estimators are based on the actual returns when analyzing the monthly Sharpe ratios, but also on returns averages, when analyzing both the annual and the three year period.

R_f : is the benchmark rate called risk free rate of return different for each month, as Libor interest rates are not constant through the year, fluctuating daily. We use R_f as such when calculating Sharpe measure per month, while when calculating the same ratio for the year and for the 36 month period we utilize its average value.

$E[R]$: is the expected value of the rate of return derived from each strategy.

R : is the rate of return (i.e. R_1 (FEC), R_2 (non-FEC)).

σ : is the standard deviation of the amounts obtained either when hedging at FWD or not hedging at SP2; σ is computed for the portfolio of monthly, annual or the 36-month period returns.

The reason for choosing the LIBOR rate is that such R_f is closer to the actual price of each currency, rather than treasury bills interest rates, which are more appropriate in equity markets where it offers investors an opportunity to participate in a company's success through an increase in its stock price. To ensure a smooth timeliness support for the reward risk analysis through Sharpe measure, we have looked also at the monthly estimated return for each strategy and the R_f of each month against the incurred risk (Stdev) of the two strategies.

Drawing on the thread of literature in order to evaluate the portfolios that are created, the Sharpe-ratio model of Howard and D' Antonio (1984,1987) is used as it mentioned previously. Due to the fact that we use historical data, the version of ex-post Sharpe ratio (ex post calculations) is used to where the differential returns is the average over several months.

Additionally, Sharpe ratio has as its principal advantage that it is directly computable from any observed series of returns without need for additional information regarding the source of profitability. Other ratios such as the bias ratio indicator have recently been introduced into the literature to handle cases where the observed volatility may be an especially poor proxy for the risk inherent in a time-series of observed returns and hence it is not appropriate for our approach.

Also, our selection based on the Sharpe ratio's independence on time over which it is measured. It will change with time period depending on the actual historic data, but there is no correlation between it and the length of time period. This is because the return and the standard deviation both increase with time. The Sharpe ratios which are calculated over different months are directly comparable. Moreover, our selection of Sharpe ratio based on the fact that a differential return represents the result of a zero-investment strategy.

Concluding this part, it is essential to mention the reasons for selecting Sharpe ratio rather than other available methods. We did not use the Sortino ratio (Brian M. Rom, 1986) as it uses downside deviation for the denominator instead of standard deviation, the use of which doesn't discriminate between up and down volatility. Therefore, the reason for not employing such method is due to the high probability of its non-consecutive occurrence in our sample and the importance of taking into account not only the returns

that have downside price volatility but also the effects of upward price movements; thus to evaluate which strategy is better to choose, for hedging purposes. In addition, we do not use the Treynor ratio (Jack L. Treynor, 1966) is that it focuses only on systematic risk of a portfolio as it assumes a portfolio manager has diversified away all the unsystematic risks in contrast with the Sharpe ratio that works with both systematic and idiosyncratic risks. Another reason of rejecting this method as a measure in our samples is that, it is not straightforward and intuitive as the Sharpe ratio and requires an understanding of the Capital Asset Pricing Model -CAPM (Jack Treynor; 1962). Recently, the (original) Sharpe ratio has often been challenged with regard to its appropriateness as a fund performance measure during evaluation periods of declining markets, such as the assumed period for our analysis.

Unbiased predictor test formula

Eventually for the unbiased predictor test, we check the formulaic representation of the forward rate for GBP/Euro for example:

$$\text{Fwd (GBP/Euro)}_{30\text{days}} = \text{SP (GBP/Euro)} \times \frac{[1 + (i\%_{\text{GBP}} \times 30\text{days}/360 \text{ days})]}{[1 + (i\%_{\text{Euro}} \times 30\text{days}/360\text{days})]}$$

Where $\text{Fwd (GBP/Euro)}_{30\text{days}}$ is the forward rate for the next month that we try to predict based on the spot rate of today (e.g. $\text{S}_{\text{GBP/Euro}}$), the $i\%_{\text{GBP}}$ and $i\%_{\text{Euro}}$ are the risk free rates represented by LIBOR 1M for GBP/ USD/ JPY respectively and Euro.

For this reason we calculate the difference between the predictor and SP2 and then the difference between the Predictor and the FWD (FEC) applied to the amount of Euro 100,000 in order to see if the changes in the FWDs and the predictor follow or not the market changes, meaning the SP2 (as presented in Appendix 4).

Data Analysis

Data analysis is presented based on five appendices presented at the end of the study and hence in 5 subsections: Appendix 1 (GBP/Euro), Appendix 2 (USD/Euro), Appendix 3 (JPY/Euro), Appendix 4 The unbiased predictor analysis and Appendix 5 Research Data Analysis Results against the findings of previous researchers and against our research questions.

The GBP/ Euro results

Regarding the returns comparison presented in the charts and the tables of Appendix 1, it appears that the rate of returns for every period R_2 (non-FEC) > R_1 (FEC). For brevity reasons, it becomes apparent that for each period separately the result follows the same pattern; as $R_2 > R_1$.

Combining briefly these results, the returns volatility is the highest in period 2, incurring contradictory positive large returns for non-FEC and negative large returns for FEC; the same pattern being applicable for period 1 and 3 even if for these periods the risk taken for R_2 is slightly higher.

Moreover, compared to the huge discrepancies registered with the associated returns outcome as shown at Box 4.1.1.2, there is no traditional correlation between risk and return of the two portfolios. What we can notice is that the high risks associated with the portfolio returns are providing either good gains or large amounts of losses. Thus, even if the risk level from both approaches on this date is at highest level, one can conclude that the importer is better off not to use FEC as it generates high returns otherwise.

Sharpe Ratios values

The Sharpe ratios values (S1, S2) for each period and overall in Appendix 1 shows the most of them bearing negative values for both strategies during the entire period of analysis; meaning that the lesser the negative outcome the more effective strategy for the importer. All these negative relative results are generated by the fact that in most cases the LIBOR 1M rate for each currency, exceeds both rates of returns R1, R2 ($R_f > R_1$ (FEC), $R_f > R_2$ (non-FEC)). A uncommon situation occurred in the period 1 (chart 4.1.2.1), in August 2007 and June 2007, where both S1 and S2 reached their lowest value (-0.01685%, -0.00763%) respectively. due to the fact that both rates of return are importantly smaller than the R_f .

Observing the Sharpe ratio values during period 2, the most impressive difference (S1-S2) takes place only on June 2008 where both S1 and S2 reached their lowest values on the whole financial crisis period; while this result is presumably based on previous results where both $StdevR_1$, R_2 reached their highest value. Thus the difference between the R_f and the rates of returns has a determinant role while for both approaches R_f is superior.

Evaluating the illustrations presented in Appendix 1, the results show that during all periods separately the rewards of S2 are better than of S1 ($S_2 > S_1$); while the R_f had sharply diminished period by period, while the discrepancies between both S1, S2 had reduced, too.

Closing the analysis of the Sharpe ratio values as it is shown on the above Box illustration of the total value of them, one can clearly notice that $S_2 > S_1$; which means that choosing an un-hedged approach provides a relative profit, as also superior returns on average while taking similar risk. Selecting to hedge against GBP through the purchase FEC, is proved that the importer, registers a loss under similar risk conditions.

From the aforementioned results it has been demonstrated how the difference between rate of returns and risk free rates in both S1 and S2, has a determinant role. The essential difference between S1, S2 and R_f is due to the depreciation of the British pound and the BoE's intend to help UK exports become more attractive internationally and keep the economy of Britain in good shape after the Northern Rock event in 2007. The BoE needed to enhance liquidity after the 'credit crunch' especially in the banking industry, the economy propeller.

The Euro/USD results

Combining the results shown in Appendix 2, following the same methodology, it is obvious that for periods 1 and 3 the $R2$ (non-FEC) > $R1$ (FEC) and for period 2, $R1$ (FEC) > $R2$ (non-FEC). Also, during period 2 both of the rates of returns reached their maximum and their minimum values for the entire time horizon.

Specifically, one can notice that during all the periods and overall the FEC returns are riskier than non-FEC, i.e. $StdevR1 > StdevR2$.

Sharpe Ratios values

It is obvious that during period 1 the $S1 < S2$, hence the rewards for staying in un-hedged position with the same risk taken were favourable than to hedging through the purchase of FECs.

During period 2 $S1 > S2$; while the superiority of $S1$ occurred with the highest difference up to 0.00046% denoting that the rewards gained from hedging were much better than those from non-hedging regardless of the higher risk taken.

Analyzing period 3, one can clearly notice that the rewards of $S2$ are higher of $S1$ with smaller risk taken ($StdevR2$), meaning that the decision for the importer not to hedge his risk generates higher rewards.

Chart 4.2.2.5 is a summarized chart, illustrating clearly the level and pace of shrinking the difference between $S1$ and $S2$ while coming in line with the previous results; $S2$ prevails in periods 1 and 3 so having higher rewards for the same level of risk taken and $S1$ prevails in period 2. It is important to mention that as the USD Libor Interest rate was diminishing during the each period (Box 4.2.2.1 in Appendix 2) the discrepancies between $S1$ and $S2$ are substantially reduced too.

Surprisingly, one can notice that for the entire financial period, $S1$ yields even with slightly difference higher rewards than $S2$ does; meaning that the rewards gained from the hedge position generates higher returns. However, it is important to analyze at what level risk free rates decline affected both $S1$, $S2$. These reductions affected the rewards taken from both strategies rising the question of which strategy is better in such situation as the differences between $S1$ and $S2$ in total are very small and the amounts of the latter during the whole period is gradually increasing.

The Euro/JPY results

Evaluating the results shown in Appendix 3, it is obvious that for period 2 and 3, $R1$ (FEC) > $R2$ (non-FEC); while in period 1 $R2$ (non-FEC) exceeds $R1$ (FEC).

Evaluating the periods separately, it is shown that for period 2 and 3, the decision to hedge against JPY proved to generate positive returns while hedging in period 1, the returns were negative.

In terms of acceptable risk, when combining the illustrations in Appendix 3, one can notice that the Stdev's of all the returns follow one another, having close values, with the risk of hedging being lower than non-hedging overall. In detail, StdevR1 compared to StdevR2 proved to show less risk during periods 1 and 2, but riskier during period 3, despite the high volatility incurred during period 2 for both portfolios.

Considering now the previous return results (Box 4.3.1.2), the best period to hedge proved to be the period 2, where the R1 supports smallest risk, as at the same time generating higher rewards, compared to R2 which is backed by high risk and incurs large amount of losses.

In contrast with period 3, where $StdevR1 > StdevR2$, the rewards gained from choosing FEC (R1) are positive JPY 114,660 compared to R2 which generates a loss of - JPY 177,000, which is exactly the opposite case we have in period 1.

Sharpe Ratios values

Analyzing the results shown in Chart 4.3.2.1 and Box 4.3.2.1, we notice that during period 1, S1 and S2 have similar values. Considering the factors that influenced such results, one can exclude the factor of the Rf which remains approximately in the same level from the previous month (just 0.01% difference, as it shown in Appendix 3), the result shows that this situation is due to the continuous appreciation trend of the JPY against most currencies and most importantly for our case, JPY depreciation against the Euro.

Analysing period 2, the results shown that $S1 > S2$ making the decision to hedge to be favourable for the importer. Chart 4.3.2.3 shows S1 mirroring S2, but bearing values in opposite direction. In correlation with Box 4.3.2.1, one can notice that for the whole period 3, $S1 > S2$ despite small differences; meaning that the rewards gained through the purchase of FEC are higher at the same level of risk.

Chart 4.3.2.4 summarizes the Sharpe ratio values for each period separately, in consistency with the results shown so far, with the $S1 > S2$ for the periods 2 and 3 while $S2 > S1$ in period 1.

Combining these results with the results given in Box 4.3.1.2 and 4.3.1.3, we noticed that in period 1, the decision to stay in un-hedged position, provides higher rewards, higher volatility of returns at a slightly higher level of risk, while the hedged position provides substantial losses.

During periods 2 and 3, it proves that the hedged position is profitable compared to the losses registered while un-hedged, despite contrasting discrepancies between the risk values (Stdev).

An analysis of Sharpe ratios totals it essential now in order to evaluate which strategy generates favourable rewards for the full period of financial crisis.

The unbiased predictor role of the forward rate

Considering the charts presented on Appendix 4 as the base of discussion for each currency evolution regarding the unbiased predictor theory, we have compared actual/future spot rates SP2 to the predictor

rate, as well as the predictor with the quoted FWD given by the bank. The results show in all cases very similar results for FWD and the predictor, meaning the bank is utilising a certain predictor formula close to ours. However, concomitantly, the actual market (SP2) does not follow the predictor, registering large fluctuations, although the patterns of the SP2 are sequencing the predictor.

Our results prove a relatively weak efficiency form of the market, which is consistent with part of the literature review presented and to the possible assumptions of asset market determination in the literature review.

When applying the estimation formula example mentioned in the methodology at 3.2.4, one can notice that it provides results that show 'traits' of unbiased predictor, yet the fluctuations of the predictor versus the actual spot rate are too large to sustain the estimator efficiency, especially in two important market changes (January- March 2008 and January-March 2009). Another reason could be that once following a certain trend, the bank will also adjust its pricing accordingly and provide FWD rates that are more effective in the market, which if followed by all banks and players in the market will push the price at within its estimations bands, but not necessarily in an opposite direction.

Research Data Analysis Results

Based on data analysis it appears that FEC is proved to be ineffective as a derivative tool for offsetting GBP exposures during this period or when the risky currency depreciates continuously and FWD rates look more volatile than the actual rates. Hence, in this particular case all Sharpe ratios show positive returns for the level of risk taken for the non-FEC (SP2).

In the analysis of Euro against USD portfolio challenges results. Although non-hedging proved to be the better solution of offsetting exposures in USD currency, the difference between S1 and S2 is very small in favour of S1, but difficult to interpret. Yet, the non-hedge strategy's risks (Stdev) all through each year and overall proved to be lower, while both strategies' returns showed alternative conflicting results. In brief, the USD hedging proved inefficient due to the incurred losses, yet under conditions of high volatility of SP2 rates compared to the FWD ones.

All through our analysis it is proved that the Rf plays also a very important role in sustaining or demising the actual average in the long run, but also the currency depreciating and appreciating movements.

Finally, the results of our survey from the portfolio analysis of Euro against JPY showed that FECs are definitely effective derivative tool for mitigating exposures in JPY currency as the rewards gained through them are much higher than from not hedging at all. Again, this may be correlated to the fact that the JPY, the currency aimed for hedging, had continuously appreciated against the Euro, while overall the FWD price for JPY was less volatile than the SP2. At the same time, although annual Sharpe ratios

have also mixed results, overall the Sharpe ratio for FEC for the 36-month period is superior despite registering a higher risk (Stdev) for SP2 compared to FWD and SP1.

Synthetically, the results of our research can be condensed as in the table of Appendix 5.

Following the line of investigation done by Eun and Resnick (1997), we came to the same result that is improvements in the risk-returns outcomes when hedging against the USD and JPY currency. This result is also consistent with the study of Gien and Jorion (1993) that proved improvements in the performance of diversified portfolios when FECs are used.

In terms of proving if the FWD rate is an unbiased predictor, our analysis shows a weak form of this theory, followed by a weak form of market efficiency, especially because in the market it proves that all relevant information is not reflected immediately in the spot and forward exchange rates, but it takes time until the rates are adapting, meanwhile the importer being exposed to high risk and eventual losses.

Again, to sustain further the unbiased hypothesis a longer period of time may be suggested and information gaps and market imperfections may be needed to be further improved.

Also due to inexistent transaction costs, other issues related to this topic become irrelevant.

However, contrary to Shapiro (1975), Hobber (1982), Levi (1994) and Marston (2001) who argued that, exchange rate fluctuations are an important source of macroeconomic uncertainty, this study shows that if persisting on a certain type of strategy may prove to be profitable or not depending on the currency trend, strength, and not necessary on the industry.

Also, from our study the results showed consistency with the argument of Howard and D'Antonio (1984,1987), as the Sharpe ratio model proved to be an effective tool providing sensitive interpretations of our study.

Eventually, the results in absolute values could have been completely different if the amounts exchanged would have fluctuated also, which is consistent to the literature review.

Conclusions

Pursuing an extensive critical analysis of well-established literature review regarding currency price volatility, hedging through derivatives, EMH, this study considered two financial success strategies for foreign trade companies going concern.

The two strategies are opposing, but not self-exclusive: always hedge and not hedge at all the FX payables exposure in GBP/USD/JPY against receivables in Euro of an importer operating from Cyprus, during the financial crisis of 2007-2010.

More explicitly, our literature review provided mixed and conflicting support to EMH theory, hedging prices predictability, their link to asset type dependency, despite the increasingly high usage of derivatives as hedging tools.

For not forcing out our results and for locking our study to the FEC tool, we have not compared the efficiency of various existing derivative tools also due to the lack of such products available with the Cypriot banks, but we would recommend it for other research types. Also we have not used combined strategies due to potential arguments regarding the weight of each hedging technique, although such approach is worth testing, as many importers partially hedge their FX risk also on various maturities and amounts, this impacting directly on their discounted cash flows.

Other motives such as regulation and trust were also not approached for the same reason of testing FEC efficiency versus non-FEC, although if recognised such interventions, result in consistent results changes.

We have analysed the limitations of several results on forward as a hedging technique, as well as those of not hedging and in relation to research time horizon. Literature review shows those longer periods of time are more relevant than short term ones, while various regions react differently depending on the dynamics of their currency strength; therefore it will be advisable to correlate for future research the impact of optimum currency areas.

Finally the data analysis, supported by secondary data obtained from official sources of a Cypriot Bank as well as publicly accessible professional websites, was able to give responses to the three main set of research questions set during the literature review process, which consider the impact on firm's annual profitability, the effectiveness of FECs and results' reflections on EMH and spot price predictability.

In detail, our empirical results showed total loss registered in GBP portfolio returns when using FECs compared to significant profits while un-hedged all through the analysed periods. Subsequently the Cypriot importer should not hedge its GBP currency exposures at all with FECs, especially when the currency registered continuous depreciation against the Euro, despite any immediate reduction of the representative risk free. These findings came into contrast with the Eun and Resnick (1997) surveys that showed improvements of the risk-return outcomes, when the international investments were hedged through FECs. This study results also conflict with those of Edwards (1982), who argued that unanticipated changes of some exchange rate determinant might not always be important as in some nations it may take people more time to find out the news. Hence, this study shows a sign that during financial crisis information asymmetry issue escalates rather than prompting for enhanced decision making, which is contrary to Giggy and Dufey (1992) suggestion that prices reflect all available information.

Contradictorily, the results of Bartov and Bodnar (1994) found that one period lagged-change had significant impact on the abnormal returns; as it is shown in our GBP portfolio negative returns outcomes lead to catastrophic money deficits and increased probabilities for a firm's financial distress or damage.

Ultimately, we can argue that current GBP spot rates provide weak support for the unbiased predictor as the FWD rate, although closely quoted to the estimator deviates substantially from the future actual spot rate, although in time it readjusts to the market. This is only because the forward quotations are rather based on the present spot rate, but not necessarily estimators of future spot rates.

Moreover, from the USD portfolio analysis the results lead to differing outcomes and to simultaneous divergent answers to our main research questions. This is due to the differences between the rewards obtained under hedge and not hedge strategy, with the later being overall superior, despite its relative lower risk. One can argue that despite the small difference in the Sharpe ratios, hedging proved inefficient, although in the second year of the financial crisis, the high SP2 volatility brought profits. Additionally, one can sustain that while results show higher total returns generated through non-FEC, Stdev measures are good enough evaluators of an investment portfolio as the modern portfolio theory assumes.

Lastly, for JPY we obtained overall better Sharpe ratios under FEC, while non-FEC at all incurred large losses and registered a higher volatility on SP2 as well as during the 36-month period. Therefore, the JPY/Euro hedging, FEC proved to be effective, not because of continuous reduction of R_f , but rather due to a continuous appreciation of the JPY against the Euro.

We can conclude that the methodological tools employed the Sharpe ratio and standard deviation of returns proved to be useful and easy to apply, especially for the GBP and the JPY, despite using the averages of portfolio returns and risk free rates over the standard deviations of the portfolio returns. It also proved useful a breakdown of the entire period in three main annual periods, which managed to identify the periods with the highest price volatility.

However, for the USD, the close results of the Sharpe could not provide a clear decision, thus the absolute returns, the average returns and standard deviations made a better delimitation, as presented in the last synthetic Box 4.5.1.

The risk free rate utilised showed to have a relative impact in the study, by being a catalyst in the movements of the SP prices in the market in one direction or another, but also in supporting currency depreciation or appreciation

The general conclusion emerging from our results is that over the periods considered, always hedging is preferable to remaining un-hedged for the Cypriot importer for JPY exposures, remaining un-hedged is a better solution to GBP currency exposures, while the decision to hedge or not to hedge against the USD depends on the firm's perspective of data analysis and especially cash flow changes. Last, but not least, we proved that the spot rates are a weak form of an unbiased predictor for the actual future spot rate (as it can be shown in the Appendices 1-4) where the predictor follows the FWD, but not the SP2 and where over or under estimations of future spot rates occurred in equal frequencies, but did not approach zero. This means that our exercise's results reflect also a weak form EMH as the current rates already reflect

past rates and volume information; while FWD rates are the most publicly and easily accessible 'prices' of information.

One can support that there is a need for analysis for longer time periods, as the financial crisis affected importantly our results, not only with the sharp depreciations/appreciations of foreign currencies but also to the reduction of risk-free rates and sudden shifts in portfolio returns.

**DOES FREEDOM LEAD TO HAPPINESS?
ECONOMIC GROWTH AND QUALITY OF LIFE**

Zenios, Stavros A.¹; Gorovaia, Nina²

ABSTRACT

The preoccupation with economic growth has not led to increase in happiness in the developed world. While it has increased the standards of living, by some measures, it has also increased crime and incarceration, substance abuse and the erosion of social capital, it fuelled the fast food and sex industries, and led to the largest financial and economic crisis since the beginning of the previous century. The current crisis has also revealed another problem: the developing world is financing the developed world, than the other way around, through investments in government bonds of the developed economies. Modern technologies and contemporary organizational structures have created a unique capacity for increasing consumption power through economic growth. However, we do not seem to be concerned with producing those things worth consuming with the economic power so created.

The work of Nobel Laureate Amartya Sen on Development as Freedom showed us a positive way for economic growth through the expansion of instrumental freedoms. However, the economics of happiness have also shown us that people cannot always choose what will make them happy, at least in the long run. Is there a paradox? And if not how is this apparent paradox resolved? These two questions are addressed in this paper.

NINJA Lessons

In his ironic novel *Blindness*, Jose' Saramago tells the story of a man who succumbs to white blindness while waiting in his car for the traffic light to change. He visits an ophthalmologist who does not know what to make of the case – and goes blind himself as he is studying his textbooks. This marks the beginning of a white blindness epidemic. The government interns the blind and those who came in contact with them in a lunatic asylum to contain the epidemic, but to no avail. A utopian organization of the community of blind is developed where all hitherto known norms of behavior break down --- until people start to see again, as suddenly and unexpectedly as they went blind. Life returns back to normal – but does it really?

An epidemic of white blindness might as well explain the financial crises of 2008 and the worst economic crisis it provoked since World War II. How could nobody see the dangers

lurking when something as noble as a mortgage-backed security --- a financial instrument that allowed banks to raise capital and give out mortgage loans so people could put a house over their heads --- mutated into NINJA loans and caused a housing bubble to grow and then to burst.

NINJA, in this case, is not the team of anthropomorphic mutated teenage turtles of Mirage Studios and Nickelodyon. NINJA stands for “No Income, No Job, No Assets” and refers to mortgage loans given to individuals that had no income, were unemployed and had no assets to put as collateral. These loans were highly risky of course, and when issued in large quantities provided cheap credit that fueled a housing market bubble. When the bubble burst the banks found themselves with a large portfolio of “sub-prime” loans: loans for a house worth much less than the value of the loan itself. Several prominent institutions worldwide were driven into bankruptcy or were bailed out using taxpayers money. The magnitude of the bailout taxed several national economies and increasing budget deficits or national debts to unsustainable levels. In the most severe case of national distress, Iceland saw all three of its major commercial banks going into bankruptcy, the stock market index dropping by 76%, and the krona declining more than 35% against the euro. An extensive account of the crisis is given in (Krugman, 2009; Roubini and Mihm, 2010).

What are the mechanisms at work that could lead to such catastrophes? The process starts with a set of loans given out to individual homeowners. A prudent bank will ask for collateral of, typically, 20% of the value of the property. A homeowner who wants to purchase a 100,000USD apartment has to put down 20,000USD and get a loan for the remaining 80,000USD. The down payment serves several purposes. First, it holds the borrower responsible for the property as the house is bought in part by his or her savings. Second, it provides a security cushion for the bank. That is, if the market prices drop and the homeowner stops paying the mortgage loan and walks away from the house, there is still enough value in the property to recover the amount of the loan. Only if prices drop by more than 20% the bank will lose its own money.

But the story does not stop here. Banks do not hold these loans on their balance sheet. They pool loans together, securitize them in what are known as *mortgage-backed securities* and sell these securities to investors, such as pension funds, insurance companies, investment banks and so on. The investors receive interest on these securities equal to the interest paid by the homeowner on the loan (minus the banker’s service fee) and also benefit from any market price appreciation in the value of the security. By selling the loans the bank now raises more capital and can give out more loans. These noble ideas originated in the US, especially from agencies such as FannieMae and FreddieMac and financed successfully the American dream of home-ownership (Zenios, 2007; Fabozzi, 1988).

But the story does not stop here either. Investment banks, who bought some of these mortgage backed securities, realized they could extract more profits out of them by first

pooling several securities together and then slicing them up into tranches of different riskiness: a low-risk tranche receives priority payments from all the mortgages in all the pools, while a high-risk tranche has low priority. There is usually a tranche of intermediate riskiness, known aptly as *mezzanine*. Hence, if a few mortgage owners default the low-risk tranche will still receive all its payments. Of course the risky tranche will lose every time a homeowner defaults and hence it is more risky than the average mortgage backed security. These tranches are known as *toxic products*. With this slicing the investment banks would allow investors in mortgages to assume more or less risk than the average mortgage in the pool --- based on their risk appetite --- by buying the high-risk, mezzanine or low-risk tranches, respectively.

Nothing wrong so far. These financial innovations fueled a significant growth in the mortgage market and allowed home ownership in the United States (and other countries who adopted similar innovations) to be much higher than countries where no such facilities were available. These are noble goals indeed. They were made possible using advanced models from financial engineering to design these products, such as those described in Zenios, successful marketing from the banks, and absence of government regulation to restrict such innovations (Allen and Gale, 1994).

But then things did go wrong. The thinking was that banks would keep the toxic products on their own balance sheet, hence having an incentive for close monitoring the underlying mortgage loans for their riskiness. However, the banks found out that they could offload these products to investors as well, simply by offering a high enough rate of return. Once this was done all the risk from the originated mortgage loans was passed on to investors outside the bank. The banks lost any incentives for careful monitoring the risks, and focused on maximizing the revenues from loan origination. How do you do this? By giving out more loans: if the loans pay back you win, if they default someone else loses. Voila---recipe for unlimited profits! The alchemists of Wall Street discovered the philosopher's stone. The banks started going after every possible borrower, giving NINJA loans and offering a no-payment start up period conveniently known as *teaser* to overcome the resistance of even the most hesitant borrower. (There were other innovations involved in bringing about a crisis of such magnitude, such as excessive leverage, unregulated shadow banking and unsuitable CEO compensation policies, but the essence is captured by what we described so far. A detailed account can be found in (Roubini and Mihm, 2010).

Table 1 tells the story in numbers. In the period from 2001 to 2006 origination of subprime loans grew to 20.1% of the total mortgage origination; 80.5% of these loans were securitized. The result of loose credit in the mortgage market was the bubble in housing prices, as reflected in the S&P/Case-Schiller US National Home Price index in Figure 1.

	<i>Total mortgage Originations (Billions)</i>	<i>Subprime Originations (Billions)</i>	<i>Subprime Share in Total Originations (% dollar value)</i>	<i>Subprime Mortgage Backed Securities (Billions)</i>	<i>Percent Subprime Securitized (% dollar value)</i>
2001	\$2,215	\$190	8.6%	\$95	50.4%
2002	\$2,885	\$231	8.0%	\$121	52.7%
2003	\$3,945	\$335	8.5%	\$202	60.5%
2004	\$2,920	\$540	18.5%	\$401	74.3%
2005	\$3,120	\$625	20.0%	\$507	81.2%
2006	\$2,980	\$600	20.1%	\$483	80.5%

Table 1. Mortgage originations and the growth of the subprime loan market from 2001 to 2006. (Data quoted in Franke & Krahen, 2008.)

Figure 1: S&P/Case-Schiller Home Price Index. (Dotted line indicates the estimated path of the index without the 263 billion USD subprime mortgages that were eventually written off.)

Note the bubble inflating after 2000 and the burst starting at 2007. If we calculate the growth in subprime mortgages from 2001 to 2006 by about 300%, using the data of Table 1, and notice the growth of the 20-city composite index during the same period by 190% we infer a growth of 0.6% in the housing index per 1% increase in the subprime loans. What happens when these risky loans start defaulting? During the period 2007–2008 there was a write-off of 263 billion USD in bad subprime loans, which is about 45% of the originated

loans. A 45% default of subprime loans would then translate to $45 \times 0.6 = 27\%$ drop of the housing index from its peak of 206 to 150. The 20-city index stabilized to almost 150 by 2010. That is where it should have been without the bubble caused by the subprime loose credit policy. The lesson from this simple calculation is this: the value added of the subprime loans eroded with the default of the loans, and the subprime loans appear to have been the major factor explaining the growth and decline of the housing market.

After the fact of course everything is clear. Saramago's blind all of a sudden recover their vision. But while the market may have stabilized, the burst of the bubble did cause considerable harm as manifested by the global financial crisis that it provoked through contagion effects on the worldwide economy. Iceland, a country at the top of the UN Human Development Index in 2007, and ranked by the Organization for Economic Cooperation and Development as the fifth richest nation on earth per capita, was facing bankruptcy.

How come nobody saw it coming? And why nothing was done to prevent the bubble from growing and bursting?

Some authors did see it. Still others, with a history of crying wolf, at last saw themselves vindicated. We refrain commenting on who was right and who was a crybaby and stay on the fact that nothing was done to prevent the crisis. Perhaps nothing could be done. Major bubbles have a remarkable ability of reappearing in different forms, as soon as the collective memory forgets the traumatic experience of the previous bubble. This is about once every 50 years, i.e., once every two generations (Perez, 2002). The fascinating book by Charles Mackay, *Extraordinary Popular Delusions and the Madness of Crowds* (MacKay, 1841) records many such bubbles: the Mississippi Scheme, the South Sea bubble, the Year of Panic 1825, the Great Railway Mania, the Tulipomania, and of course the Great Crash of 1929. And while some notable authors did see it coming, and warned extensively about it (Gray, 1998) and Paul Krugman in many editorials, see (Krugman, 2009)), no mechanisms were in place to protect the market from going astray. Whether the bubble was fuelled by foolish investors or whether people followed foolishly the bubble over the abyss is a question that economists are still trying to understand.

While all the facts may be obvious ex post, there is a disturbing lesson to be drawn. The increased "freedom of transaction" brought about by the financial innovation of mortgage securities, only temporarily brought increased prosperity and happiness through the ownership of a home. In the long run it caused a financial crisis, a global economic crisis, high unemployment levels and increased unhappiness. Should these freedoms have been curtailed? And is there a flaw in Amartya Sen's famous arguments that instrumental freedoms are both the primary ends and the principal means of development? (Sen, 1999)

Knowledgeable students of Sen's work will point out that the NINJA example violates one of Sen's instrumental freedoms: There were no transparency guarantees in the process of securitization and re-securitization. Hence, we emphasize at the outset that this paper does

not set out the goal of arguing against freedom. Instead, we will argue, as the NINJA lessons taught us, that freedom does not always lead to happiness. Care must be taken to understand the conditions under which adverse effects of free choice may be manifested. Whether we would opt for a “dictator” to impose these conditions by curtailing some freedoms or we take other steps to ensure that the right conditions exist so freedom does lead to happiness is up to us.

The kingdom of Butan opted in part for the former approach in pursuing a policy of improving Gross National Happiness (Bok, 2010: 3). This paper expects to assist with the later approach. We start from the beginning, and the next section outlines our argument.

Introduction

The question of the title is an old one. John Stuart Mill, in his 1859 treatise *On Liberty* devoted a chapter on individuality as one of the elements of well-being. Mill’s inspiration came from the utilitarian theories of Jeremy Bentham. Bentham articulated the opinion that liberty is a good that --- even though it is not something that is a fundamental value --- reflects the greatest happiness principle: that is, freedom produces the greatest amount of happiness for the greatest number of people.

Our paper offers to this long-standing debate a novel narrative. We link research carried out over the last couple of decades on freedom as the primary end and the principal means for development (Sen, 1999) with the findings of research on economics of happiness (Bok, 2010). We use the economy --- within which freedom is practiced and where happiness is experienced --- as the medium to link the two concepts of the title. Our narrative is constructive. Not only it identifies cases, such as the NINJA example above, where freedom does not lead to happiness, but it also offers suggestions on what needs to be done, so this (apparent) paradox is avoided.

This paper is a dialogue between two contemporary ideas of broad impact: Development as Freedom and Economics of Happiness. When the ranges of reach of these two powerful ideas (their “horizons”) intersect, a potential conflict, arises. This paper contributes to “broadening the horizons” of these two ideas --- to use Gadamer’s famous phrase. This broadening of the horizons is a purpose of dialogue (Gadamer, 1975), and this is pursued by the narrative of this paper.

At the same time, the tension created between these two ideas needs to be managed, that is diverted towards useful ends. We need to give meaning to the area of overlap of the two horizons, and this is the constructive part of the paper. Giving meaning to the world, and creating something new in order to bridge any gap or conflict arising at the borders, is Freire’s main thesis in *Pedagogy of the Oppressed* (Freire, 1972), and this is pursued by the prescriptive part of the paper.

A summary of our argument is as follows:

Sen's "development as freedom" argues that the main end and the primary means of development is the expansion of instrumental freedoms and the ability of individuals to act as free agents. A summary of these arguments will be given in the next Section 3: Freedoms and Happiness. At the same time, recent studies of the economics of happiness have shown that people cannot always choose what makes them happy in the long run, and that the increase in economic prosperity of the last several decades has not led to improvements of well being and of happiness. A summary of this line of inquiry is also given in the next section. When we put these two arguments together --- and study some examples, where the expansion of economic freedoms has not increased happiness, and even caused unhappiness -- then one could make a case against freedom, and this is addressed in Section 4: Some evidence against freedom. This is where the narrative part ends, but it is not the conclusion of this paper. This must be clear from the outset: we are not arguing against freedom. Section 5: What needs to be done, is the prescriptive part of the paper and addresses the question raised in Section 4. Can we avoid the conflicts suggested by Section 4, without curtailing freedoms while at the same time following Bentham's greatest-happiness principle?

Before we proceed to the next section we need to inquire on the relevant contemporary context of our discussion. What is today, in the context of current economic development, the relevance of these issues?

First, the currently prevailing system of liberal democracy and free markets has increased substantially people's freedoms. In addition, the model of economic development through consumption urges consumers to use their expanded economic freedoms. Production and consumption together create a "virtuous" cycle of economic growth, whereby production leads to increased employment, increased employment provides income and expands the consumers' capability for consumption, increased consumption leads to increase demand for production and therefore employment, and the process goes on (Galbraith, 1996). And just in case a consumer is reluctant to run the treadmill of consumption, the art of marketing will take care of it. As Galbraith (1958: 124-125) put it, "a man on arising each morning [is] assailed by demons which instill in him a passion sometime for silk shirts, sometimes for kitchenware, sometimes for chamber pots and sometimes for orange juice...". And he reaches the incisive conclusion: "Production only fills a void that it has itself created".

Second, technology has empowered the individual agent for action. In all walks of economic life new technology-enabled institutions or instruments, or the technological innovations per se, expand our freedoms and our capabilities. We can get loans with convenient terms or invest the surplus of our labor in any activity we choose through the international markets. (A relevant example for our discussion is the capabilities offered through "vice investing", that is the investment strategy that targets companies selling products related to human vices, such as alcohol, tobacco, gambling, and weapons.) At the same time globalization has made the impact of our free-will choices felt wider and deeper

than in times past. A characteristic comment on the power of technology is that of Jody Williams --- the 1997 Nobel Peace Prize laureate for her work against anti-personnel mines --- when asked how she managed to coordinate 1000 NGOs for her fight. Her one-word reply is revealing: "Email".

Third, and this is relevant to the happiness side of the debate, the current state of economic growth of the developed world placed most of us beyond the need to satisfy some basic physical needs and the needs for safety. Modern economies, as a result of automation mainly, produce in abundance some basic consumer products such as food, clothing and shelter. Hence, individuals seek to satisfy emotional needs, and the quest for happiness is becoming dominant.

It is within this general state of affairs that we now develop our arguments.

Freedoms and Happiness

Freedoms

We will focus on the concept of freedom as articulated in *Development as Freedom* (Sen, 1999). All references to his work, unless specified otherwise, are from the First Anchor Books Edition, August 2000.

First, what does he mean by development? The word "development" seems to be taken for granted in this work. After all, the book was a byproduct of a series of lectures given as a Presidential Fellow at the World Bank in 1996, and "development" is part of the World Bank set of core values that has been ingrained in everybody in the audience. The word does not even appear in the book's "index by subject". Nevertheless, the preface talks about the "persistence of poverty and unfulfilled elementary needs, occurrence of famines and widespread hunger, violation of elementary political freedoms as well as basic liberties, extensive neglect of the interests and agency of women, and worsening threats to our environment and to the sustainability of our economic and social lives. [...] Overcoming these problems is a central part of the exercise of development." (Sen, 1999:xi). We take this to be his definition of development.

Second, what is the main argument in the book? There are two tightly interlinked lines of reasoning.

- *Development is a process of expanding the real freedoms that people enjoy.* The narrower view of identifying development with the growth of GNP or with rising personal incomes, or with industrialization, or with technological advance, or with social modernization, is ignoring the point that all these are nothing but the means to expanding the freedoms enjoyed by the members of the society. Important as they may be, growth in GNP or personal income is nothing but the means to an end, and the end of expanding freedoms depends on other determinants, such as social and economic arrangements, as well as political and civil rights. Access to facilities for

education and health are used as examples here, together with the freedom to participate in public discussion and scrutiny. Clearly, in the author's view, an increase of personal incomes that does not come with improved access to healthcare or education, is not contributing much to the exercise of development. (Sen, 1999: 3-4). This is one of the two reasons why freedom is central to the process of development, and the author calls this the *evaluative reason*. That is, progress has to be assessed primarily in terms of whether the freedoms that people have are enhanced. This line of reasoning views freedom as the *primary end* of development, and is the "constitutive role" of freedom in development.

- *Freedom is the principal means of development.* Freedoms have an "instrumental role" in development, since development is thoroughly dependent on the free agency of the people (Sen, 1999: 36). When people are deprived of some freedoms then their capabilities are restricted, and their effectiveness in the exercise of development is curtailed. The author calls this the *effectiveness reason* (Sen, 1999:4), and a good part of the book (especially chapter 1) is devoted to providing empirical support for this argument. Seen from this perspective, freedoms not only contribute to the process of development, but they also contribute to the strength of free agencies of other kinds, thus creating positive multiplier effects on the development process.

What are the instrumental freedoms that contribute to the success of development? Instrumental freedoms contribute directly or indirectly to the overall freedom people have to live the way they would like to live. The instruments involved are quite diverse, but Sen finds it convenient to identify five distinct types of freedom that are particularly worth emphasizing and appear in the empirical part of the analysis. These are: (1) political freedoms, (2) economic facilities, (3) social opportunities, (4) transparency guarantees, and (5) protective security (Sen, 1999: 38). One particular type of freedom is of interest to our work, that of market transactions, falls under the category of economic facilities, and we turn our attention to what the author has to say on this.

What is the role of markets? Sen argues that markets should be valued not only for their contribution to economic growth --- for which they are already acknowledged in the literature. Quoting Adam Smith, he argues further that markets should be valued for providing freedom of exchange and transaction that is itself part and parcel of the basic liberties that people have reason to value (Sen, 1999: 6). He also argues that the freedom to participate in the labour market is one of the ways of avoiding keeping people in bondage and captivity. Hence, the freedom to enter markets can be in itself a significant contribution to development, aside from whatever the market mechanism may or may not do to promote economic growth or industrialization (Sen, 1999: 7). In chapter 5 "Markets, State and Social Opportunities" the author examines the results that markets ultimately generate, but also makes the more immediate case for the freedom of the market transactions as an important

freedom itself. In this paper we examine the effect on happiness of economic facilities and the freedoms provided by the markets.

One final argument is needed before we can use Sen's work as the building block for our own arguments on happiness. In particular, we need to expand his definition of development to include the pursuit of happiness. Maslow's theory of human motivation of (Maslow, 1943) provides the missing link. The basis of Maslow's theory is that human beings are motivated by unsatisfied needs, and that certain lower physiological needs need to be satisfied before higher needs can be addressed (Figure 2). According to this theory there are general needs which have to be fulfilled before a person is able to act unselfishly. These are the so called "deficiency needs". While people are motivated to fulfil these basal desires, they continue to move toward growth and eventually self-actualization. We note now that Sen's definition of development, as outlined above, refers to the base of Maslow's hierarchy of human needs. Indeed, Sen refers to "unfulfilled elementary needs" independently from Maslow's hierarchy (If Sen was aware of Maslow's work, it does not seem to have played any role in his arguments and Maslow is not cited in the book.)

Can we apply Sen's arguments to the pursuit of other needs as part of the development exercise? Or is his work restricted to overcoming only those problems described in his definition of development? Nowhere in his argument is the evaluative aspect of freedom is restricted to the freedom to satisfy specifically safety needs or any needs for that matter. It is a main end of development, and hence we can deduce that Sen's arguments apply independently of any hierarchy of needs, Maslow's or anybody else's. The instrumental aspect of freedom contributes "to the expansion of the "capabilities" of persons to lead the kind of lives they value --- and have reason to value" (Sen, 1999: 18). Indeed, the notion of "capabilities" and the "agency aspect" of the individuals to help themselves and influence the world are central to Sen's work. Freedom is seen as the instrument of expanding capabilities and strengthening the agent. There is no reason we know to restrict the application of capabilities only to the satisfaction of the lower level needs and hence we take it that Sen's development process applies to an incremental satisfaction of a hierarchy of needs. (Seeing no reason is not a proof that no such reason exists. To be rigorous, one would have to work out the details of Sen's thesis within a broader definition of development.)

Figure 2: Maslow's hierarchy of needs.

Happiness

In his ethical work Aristotle addressed the issue of living a successful life. The notions of *eudaimonia* or *makariotita* --- translated as “happiness” or “blessedness”, respectively (Barnes, 1995: 199-205) --- feature in his works. Buddha, in his earliest known work ascribed to him, the Dhammapada, expresses the view that what we are is the result of what we have thought, concludes that “If one speaks or acts with a pure thought, happiness follows one, like a shadow that never leaves”. These seem to be the earliest references to happiness and influenced significantly the development of both eastern and western thought. But it was the enlightenment in the eighteenth century, and Jeremy Bentham's work on felicific calculus --- the algorithm that allows one to calculate the amount of pleasure that a specific action is likely to cause --- that moved happiness from the abstract realm of philosophical ideas to the pragmatic domain of policy-making. Felicific calculus would allow a society to pursue the greatest-happiness principle to produce the greatest amount of happiness for the greatest number of people. Bentham pronounced this as the overriding aim of government (Burns and Hart, 1996).

The writings of political philosophers of the Benthamite school, like John Stuart Mill, influenced political actions. Paraphrasing a phrase by Locke the Declaration of Independence of July 5, 1776, proclaimed “life, liberty and the pursuit of happiness” as part of the unalienable rights bestowed upon all men by their Creator. The French constitution of June 24, 1793, declared the goal of society to be general happiness. Thus happiness acquired the status of a real good that can be identified, measured and accumulated. It became a constitutional right, and a government's obligation to guarantee. (While Bentham (1748--1832) gained enduring fame for the creation of the utilitarian school, it was when Bentham was one year old that Ludovico Antonio Muratori published a book titled *Della Publica Felicità*, and introduced the word “public happiness”; quoted in (Dixon, 1997: 1812)).

Readers interested in the history of happiness may consult McMahon (2006). In our work we are concerned with the contemporary issues relating to happiness and in particular the research findings of the last decades on the “economics of happiness”; for an extensive book

treatment see (Bok, 2010). We turn our attention to the major findings of the last thirty years of research that are relevant to our thesis.

Research on this topic, virtually non-existent before 1970, grew rapidly since then. While some authors talk about “happiness”, others talk of “well-being” or “life satisfaction”. The following comprehensive definition seems to cover the essence of what all authors mean: “a person is said to have high [well-being or happiness] if she experiences life satisfaction and frequent joy, and only infrequently experiences unpleasant emotions such as sadness or anger. Contrariwise, a person is said to have low [well-being or happiness] if he or she is dissatisfied with life, experiences little joy and affection, and frequently feels unpleasant emotions such as anger or anxiety”. (Diener et al., as quoted in (Bok, 2010: 9-10).

Can happiness or well-being, thus defined, be measured? Psychologists and social and political scientists answer affirmatively. Lately economists have joined the group. Psychologists find it natural to ask people how they feel. “Not too happy”, “pretty happy” or “very happy” are the available choices in the General Social Surveys in the US. The Eurobarometer asks respondents to rate their life-satisfaction with answers ranging from “not at all satisfied” to “very satisfied”. An alternative approach followed by some researchers is to ask individuals about their feelings at different times during the day. One issue raised in the psychology literature is whether such measures are reliable and valid. The consensus is affirmative, and self-reported measures have been demonstrated to be correlated with objective characteristics such as unemployment, recall of positive or negative life experiences, assessment of one’s happiness by friends and family members, physiological responses to stress and psychosomatic illnesses such as headaches and digestive disorders, electroencephalogram measures of prefrontal brain activity, and duration of so called Duchene smiles --- the smiles that occur when two sets of facial muscles fire simultaneously, and are considered genuine smiles. An overview of the psychology literature on the reliability and validity of happiness measures is given in Blanchflower and Oswald (2004).

The findings of numerous research investigations address a wide range of diverse questions. Researchers look not only for categorizations, but also for trends in the data as well as linking happiness measures with objective characteristics or event’s in one’s life.

For instance, surveys rate nations by the average satisfaction with life of their citizens, or by “quality life years”, which is a composite index of quality of life times life expectancy (Bok, 2010:24-25). The distribution of life satisfaction on scale of a 1 (unhappy) to 7 (very happy) shows an “optimistic” bias with the majority of the population and their average being above the midpoint. Figure 3 summarizes the data for Britain, but similar findings hold in almost all advanced industrial nations (Bok, 2010: 25-26).

Figure 3: The distribution of life satisfaction in Britain, where 7 is completely satisfied (adopted from Oswald, 2009: 4)

Happiness for different age cohorts has a U-shape, with happiness levels declining from our teenage years until our mid thirties, but after that people tend to grow happier well into old age. Tracking events such as marriages, employment, child bearing etc reveals that married people tend to be happier than unmarried people, divorce causes unhappiness for three years before and after the event but people eventually bounce back, children do not appear to be causing any significant increase in happiness and unemployment makes people very unhappy. Experience sampling has allowed Kahneman and his colleagues (Kahneman et al, 2004) to study the effect of specific activities on happiness. Table 2 is interesting in its own right and will be useful to our arguments later on.

Trends analyses show how the happiness levels of various groups change with time. The major finding was the so called *Easterlin Paradox*. In a seminal paper (Easterlin, 1974) studied time series on the happiness level in the United States since 1946. His conclusion that “higher income was not systematically accompanied by greater happiness” (Easterlin, 1974: 118) sparked a controversy, as it seemed paradoxical that increased prosperity would not make a nation happier on the average. Many explanations have been offered to the paradox. Perhaps the most notable is that growing GDP does not make one better off relative to all his neighbors, and as people are comparison animals, the increased prosperity of all increases the happiness of none. Inconsistencies in the time-series data were also used to explain the paradox, with (Oswald, 1997) pointing out that the longest consistent set in Easterlin’s data shows a marked increase of the percentages of Americans reported as very happy, with a comparable decrease in the percentages of those reporting as not very happy. Oswald’s finding in the same paper (1997: 1818) that “happiness with life appears to be increasing in the United States, but the rise is so small that it seems that extra income is not contributing dramatically to the quality of people’s life” gives us a weak version of the Easterlin Paradox.

	<i>Hours spent per day</i>	<i>Effect of activity on happiness (on a scale from 1 to 5)</i>
<i>Intimate relations</i>	0.2	4.74
<i>Socializing after work</i>	1.2	4.12
<i>Dinner</i>	0.8	3.96
<i>Relaxing</i>	2.2	3.91
<i>Lunch</i>	0.5	3.91
<i>Exercising</i>	0.2	3.82
<i>Praying</i>	0.5	3.76
<i>Socializing at work</i>	1.1	3.75
<i>Watching TV</i>	2.2	3.62
<i>Phone at home</i>	0.9	3.49
<i>Napping</i>	0.9	3.27
<i>Cooking</i>	1.1	3.24
<i>Shopping</i>	0.4	3.21
<i>Housework</i>	1.1	2.96
<i>Child care</i>	1.1	2.95
<i>Evening commute</i>	0.6	2.78
<i>Working</i>	6.9	2.65
<i>Morning commute</i>	0.4	2.03

Table 2: The effect of specific activities on happiness.

(adopted from Kahneman et al 2004: 429).

Some evidence against freedom

Given the current state of knowledge on happiness as outlined above, can we infer that freedom leads to happiness or is there evidence to the contrary? If we identify cases where freedoms have been expanded while happiness has decreased, that would be an argument for not answering positively to our question. We use one type of instrumental freedom, that referred to by Sen as “economic facilities” and in particular the freedoms afforded by the markets, and use economic indicators as proxies for market freedoms. If we identify cases where economic indicators have improved while happiness has decreased, that would be an argument for not answering positively to our question.

Note that a non-positive answer is not the same as a negative answer. While some statistics may show that a freedom has been expanded while happiness has decreased, there may be other reasons depressing the happiness levels: some freedoms curtailed as others were increased, the increased freedom had an inadvertent negative effect on other freedoms, the expanded freedoms did not improve the capabilities of all the population, the population did not make use of the expanded capabilities they acquired with the expanded freedoms. These are some potential explanations. Nevertheless, any evidence against freedom questions whether we can pursue freedom and happiness simultaneously.

Some may already see the Easterlin paradox as evidence against freedom. This would be true if increased in prosperity was accompanied by a decrease in happiness, instead of non-increasing happiness. But this is not the case. The strong version of the Easterlin paradox would lead to the conclusion that freedom is irrelevant to happiness. The weaker version of the paradox, as articulated by Oswald and quoted above, suggests that freedom has a marginally positive impact on happiness. However, more recent work --- using more reliable and extensive time-series of data and more refined mathematical regressions --- found a significant negative time trend of happiness over time. According to Blanchflower and Oswald (2004) "America is becoming systematically less happy (in the eyes of the Americans themselves)" with a negative time trend estimated at -0.0027 with a sufficiently large t-statistic to reject that hypothesis that the time trend is zero. Hence, the increased in prosperity brought about by increased freedoms in the US over the last quarter of the twentieth century brought about a decline in happiness.

Hence, expanded economic facilities and market freedoms reduced happiness levels and this would be evidence that freedom does not lead to happiness. However, other evidence than time-series analysis tells a different story: richer people tend to be happier than poor people. Some evidence to this is found in the table 3.

	<i>Lowest-income quartile people</i>	<i>Highest-income quartile people</i>
<i>Very happy (%)</i>	18.8	28.4
<i>Pretty happy (%)</i>	54.5	58.5
<i>Not too happy (%)</i>	26.7	13.1

*Table 3: The microeconomics of happiness in Europe 1975-86.
(adopted from Oswald 1997: 1822).*

This table does not provide rigorous evidence, however, that higher income implies higher levels of happiness. To test the hypothesis that money buys happiness we compare the average happiness of the population of two sets of countries: the EU-27 countries with per capita GDP above the median (wealthy) and those with per capita GDP below the median (not so wealthy). We use Eurostat data measuring GDP per capita in Purchasing Power Standards (PPS). USA, Japan, Turkey, Norway, Iceland and Switzerland are also included in the sample. Happiness data were obtained from the ASEP/JDS databank. The level of happiness is measured using the 'Happiness Index' that is defined as the rate of those declaring themselves as 'Very happy' or 'Quite happy' less the rate of those declaring themselves as 'Not very happy' or 'Not at all happy', plus 100. This index ranges from 0 to 200, with the happiest countries going to 200 and the less happy countries going to 0. 100 is the mid-point value for countries that have a similar rate of persons quite or very happy and persons not very or not at all happy. Our regression analysis of happiness index as a function of GDP found a statistically significant positive coefficient 0.367. The same story is confirmed when we compare the mean happiness of the wealthy with the not-so-wealthy group. The

not-so-wealthy group has a mean happiness index of 151.97 while the wealthy group has a mean 184.07 and the difference is significant using t-test.

Hence, GDP data do not paint a conclusive picture. While having the freedom and capabilities to place oneself in the group of wealthy countries improves happiness, the improvement of GDP of a country across time does not improve happiness and was even found to reduce it. The best explanation offered to this is that happiness is driven by comparisons, and a tide that raises all the boats does not make anyone relatively happier. But overall it seems that wealth and happiness live happily together.

Exhibit 1. Problems seem to be lurking below the surface of a happy symbiosis between GDP and happiness. We compare the use of drugs in the two sets of wealthy and not-so-wealthy EU countries. (Data on the use of drugs is taken from European Monitoring Centre for Drugs and Drug addiction). When it comes to lifetime prevalence in the percentage of the population who use either cannabis or cocaine the wealthy countries had more users on the average than the not-so-wealthy countries. At the 95% confidence level, usage of cannabis by citizens of wealthy countries is between 3.8% and 18.1% higher than the usage by citizens of not-so-wealthy countries. When it comes to the use of cocaine the difference is between 0.4% and 4.0%, again at the 95% confidence level.

Hence, expanded freedoms for these countries may have led to increases in GDP and the purchasing power of its citizens, but part of this power has been used on activities that only in the very short run make one feel happy.

Exhibit 2. Blanchflower and Oswald analysis (2004) includes some interesting findings for subgroups of the US population. While the population at large is becoming marginally unhappier with economic growth from 1972 to 1998 (coefficient -0.0027), there are stronger trends for subgroups. The coefficient of their regression model for women is -.0062, and this is statistically significant. Over the period of testing, the percentage of American women considering themselves as very happy dropped from 36% of the population to 29%. Similar evidence is provided with the British data. The authors' conclusion (2004: 1381) is a direct answer to our question: "Whatever the consequences of anti-female discrimination policy elsewhere in society, it has apparently not been successful in either country in creating a feeling of rising well-being among women." We hasten to add, though, that evidence in the same paper shows that differences in well-being of racial groups in the United States has narrowed over time. Blacks have made up ground, and became happier during the period of Blanchflower and Oswald's study.

Exhibit No. 3. Some compelling evidence that people can not choose themselves what makes them happy is provided when we study how Americans spent their free time, as reported in (Bok, 2010: 76). From 1965 to 2003 both men and women saw their leisure time increase. Depending on the definition of leisure used in the studies this increase ranged from 5.6 to 8 hours for men, and 3.7 to 6.8 hours for women. How was this extra time used? Watching

television increased by 7.4 hours per week while the number of hours devoted to reading dropped by 3.1 hours and the time spent socializing with friends by 3.9 hours. If we refer now to the data in table 2, we observe that people did not use the extra free time on those activities that according to *them* bring them more happiness. While their self-reported data show that socializing brings them the most happiness, they reduced their socializing time to watch television which gives them much less happiness. No surprise then that Blanchflower and Oswald find the population becoming less happy during most of Bok's period: while their income may have grown and so did their free time, they spent their expanded freedoms in front of the television.

Exhibit. 4. The report of the Commission on the Measurement of Economic Performance and Social Progress setup by President Sarkozy is full of statements that point to underlying problems even as freedoms are expanded (Stiglitz et al, 2010). We quote a few:

"In Russia, declining life expectancy suggests there are underlying problems, even if GDP per capita is increasing." (p. xix). This observation is coming at a period where Russia has seen its freedoms significantly expanded through democratic reforms in the post-communist era.

"There may be an increasing disparity between average income and median income (the income of the representative individual); one may be increasing while the other is declining." (p. xxi). Hence, while the average freedoms are expanded, the capabilities of the average Joe and Jane are restricted.

"A developing country that sells a polluting mining concession with low royalties and inadequate environmental regulation may see GDP increase but well-being decrease." (p. xxii). This is a real situation in many developing countries, and the freedom to manage their own natural resources does not always leave them better off.

"For a poor developing country to be told that its GDP has gone up may be of little relevance. It wants to know whether its citizens are better off." (page 29). The report provides data for Ireland, showing that the Irish disposable income declines relative to the country's GDP, as a result of profits that are repatriated by foreign investors. Interestingly, according to an OECD study Ireland is one of the few countries that reduced its expenditures on education during this period.

What is the overall conclusion from the evidence we have provided? If there is evidence that freedom sometimes leads to decrease in happiness, are we to conclude that freedom does not lead to happiness? And hence, if we value the pursuit of happiness as the paramount value, then should freedom be curtailed? The first question can be answered with logical inferences, the second requires value judgment.

On the first question: The evidence shows that expanded freedoms do not *necessarily* lead to happiness. Hence, it is not enough to expand freedoms and then expect a society to

develop up on Maslow's hierarchy in pursuit of happiness. Something more seems to be needed.

On the second question: If we subscribe to Bentham's opinion that liberty is a good that is not of fundamental value itself, but that its value is that it reflects the greatest-happiness principle, and if our evidence has shown that freedom does not always reflect the greatest happiness principle, then we should be ready to make freedoms subordinate to happiness. This route is pursued by regimes that suppress democratic liberties until such times that the economic development of the country could afford it. However, if we value freedom as something of fundamental value --- which is the evaluative part of Sen's arguments, contrary to Bentham's statement --- then we are faced with the difficult question of what to do when the expansion of freedom and the pursuit of happiness are at odds with each other. Recognizing that conflict is unavoidable part of human affairs, we turn in the next section to a search for ways to minimize the conflict.

Recognizing that the proof by example we have given so far is not a rigorous one, we provide a final argument to strengthen this section:

Exhibit 5. We point out that the exhibits we have presented so far are examples of the dilemma of a "paretian liberal" as analyzed in Sen's impossibility theorem (Sen, 1970). Without going into the technicalities of the weak and strong forms of the impossibility theorems, Sen has shown that it is impossible for a society to make social choices that satisfy simultaneously Pareto efficiency of the final state and conditions of individual liberty. If we consider, in our case, social choices that relate to happiness then Sen's theorem would state that it is impossible to find a state of society where nobody could be happier unless someone else is made less happy, while respecting the liberty of individuals. We would have to accept suboptimal happiness conditions if we guarantee the individual liberties for some. Interestingly, in his definition of "some" Sen requires that at least two people should have their liberties guaranteed, for if only one person is left in this set then we would have a dictatorship. Even with this definition of minimal liberalism --- which is an oligarchy --- we have an impossibility. Obviously the impossibility theorem holds true in the more general case discussed here, where we do not guarantee the freedoms of only a chosen few.

What needs to be done?

Are there any solutions to resolving the conflict between freedom and happiness we have outlined in the previous section?

Education. One answer can be obtained from Sen's own conclusion on what to do with the impossibility of the Paretian liberal: "The ultimate guarantee for individual liberty may rest not on rules for social choice but on developing individual values that respect each other's personal choices" (Sen, 1970:155). Hence, education has to play an important role. But education should not be restricted in developing values that respect each other's personal

choices, following Sen's conclusion. In addition, we argue that education should be board enough so that individuals are capable of judging the impact of their choices on their happiness. We do not expand here upon the kind of education that is needed but two concrete points can be made:

The analysis of Blanchflower and Oswald shows that education enters with a positive coefficient in the happiness equations. What is even more important though is that this positive effect is independent of the earnings effect. That is, while education contributes positively to one's earnings, and wealthy individuals are happier than not-so-wealthy individuals, the positive effect of education on happiness remains even when we control for increased earnings. Education is playing a role independently of income. We surmise that the role it plays is in guiding people to use their expanded freedoms in ways that improves their happiness -for instance, by deciding to use any bonus free time they may receive to spend it socializing with family and friends or relaxing with a good book, rather than watching more television.

Education must be broad, as narrow focus on specialized skills that assist one in improving their income are not sufficient to increase happiness. Thus the arguments that people of the humanities have been making for their disciplines over the years gain renewed gravity (see Nussbaum, 2010). To participate efficiently in the production-consumption cycle, it is not sufficient merely to have an educated population. The population must be in a position to reflect effectively on "producing" those things worth "consuming", such as a functioning, efficient and compassionate democracy, critical thinking, and a creative imagination for the arts and literature.

Well-being Audits. A second answer can be obtained by looking at the way society has been dealing with the environmental consequences of our economic activity. Once it was recognized that our free-will choices had an inadvertent impact on the environment, regulations were enacted, and procedures were put in place to carry out environmental audits for major new projects.

A similar approach is needed in dealing with a society's well-being and happiness. Regulatory discussions on specific activities should take into account the effect of these activities on happiness. To this effect, standards must be developed for well-being audits, in the same way the professions gave us standards for environmental audits. It is only through proactive audits that we can discover the inadvertent effects of some free-will choices we make in instituting major projects.

Susan George uses the term "boomerang" to describe how the third world debt is harming the developed nations (George, 1992). Policies that we thought were positive for us had a negative effect on others and eventually worked as a boomerang. In a globalized world we cannot expect to dump our waste on our neighbor's back yard and expect that the filth will

not touch us. Happiness audits should search in advance for such boomerang effects so that informed decisions can be made.

Well-being Metrics. The third answer comes from the report of the Stiglitz Commission: the need to develop the appropriate metrics for measuring our lives. The metrics we use dictate our actions. The commission makes four recommendations that, if adopted, will give a more balanced view of what we measure when we seek to measure material well-being. But, most importantly, it makes a fifth recommendation that income measures should be broadened to include nonmarket activities.

It is through the realization that well-being is multidimensional, coupled with metrics and regulations to monitor these dimensions, and improved knowledge on the multiple dimensions and their interactions, that we can exercise the capabilities freedom gives us in the pursuit of happiness. For as long as we fail to do this effectively, the tension between freedom and happiness we have described will remain a paradox.

THE REALIZATION OF THE IMPACT OF STRUCTURAL DESIGN ON EXPORTS.**Afxentiou, Georgios¹**¹DBA student, University of Gloucestershire. Email: gafxentiou@gmail.com**Abstract**

The research concentrates on the functionality of the organization, departments, managers, employees and their working areas. Also there will be an investigation and match of the employees' skills and experiences with their performed duties. An attempt to identify the customer needs and their financial capabilities will also be key factors to understand the impact of a well designed structure to exports. An analysis of these factors along with the evaluation of business cases will form the outcomes of this research. This project also aims to exploit the validity and adaptability of the factors to cater management to promote products overseas.

The industry includes many small, medium and large size entities. The investigation is expected to yield a diversity of results and side effects of problematic organizational structures. Most of the businesses especially the small and medium size are family oriented. The factors that affect the structure are the way of thinking of these families and their management skills and experiences in the local market.

The outcomes of this research will provide new approaches to a more dynamic and creative way to export local products to the international market. It is a study of organizational structures that influence management and their decisions about exportation based on the new international economic environment.

Abstract

The decision made by the European Union to promote CSR - Corporate Social Responsibility principles among firms has two main drivers: on one hand the necessity to safeguard local communities and workers from social and environmental point of views; on the other hand the will to revive the European industrial system through a differentiation of services and goods offered toeing the sustainability line, in other words a new possible way to be competitive. The enterprises could indeed decide to invest in CSR for different reasons: philanthropy and moral obligation, safeguard of local communities, but also advantage to operate, good market reputation, saving and optimization of resources, development of human resources, effective management of stakeholders. Moreover, lately and increasingly, European markets encounter an extension beyond local supply chain boundaries in favor of an international scenario. In this sense, the opportunity given by CSR, through co-operation among firms, fair competition, equal treatment of labor force, and safeguard of local community and environment, represents one of the main motive which lead the European Union in the promotion of CSR. Spreading ethics among companies has relevant consequences both for the competitiveness of single firms and for the competitiveness of regions of productions and local communities. For these reasons, the European Union has arisen activities to promoting and supporting CSR at a multi-stakeholder level, and its action represented the stimulus to promotion of CSR by different Local Authorities.

In particular, the role of Local Authorities becomes relevant when the promotion is addressed to Small and Medium Enterprises. SMEs are characterized by lack of human, technical and organizational resources. This condition makes the implementation of formalized CSR policies very difficult, both because of the perceived costs and the complexity of the operation. An investment in CSR is often considered hard and uncertain.

That being stated, what kind of CSR strategies can Local Authorities promote in favor of SMEs? Can these initiatives increase the competitiveness of SMEs? Which

initiatives can be promoted by Local Authorities to increase the competitiveness of socially responsible SMEs?

The present contribution shows some evidences referred to two co-financed EU projects carried out in the Tuscany Region since 2005.

The first project was COOPERATE Project, co-financed within the Mainstreaming CSR among SMEs EU Programme. The aim of the research was to promote and to spread CSR concepts, practices, and tools among SMEs operating in industrial clusters in the Tuscany region (Italy). The research involved three Tuscan industrial clusters. Within the project more than 100 SMEs were interviewed and a lot of local intermediary institutions (representing Local Authorities, local trade associations, local trade unions, agencies for environmental protection, and so on) were involved in the project.

The second project is the Responsible MED project (in progress), co-financed within the MED 2007-2013 Programme. The aim is the evaluation of the connection existing between CSR and levels of innovation and competitiveness in the MED SMEs. This is achieved evaluating the concrete impacts of CSR actions and policies on competitiveness, with a focus on the role that can be played by Local Authorities. Within this project 22 SMEs and 6 Local Authorities were interviewed.

Our analysis aimed at summarizing the results emerged from interviews addressed to SMEs and Local Authorities with respect to:

- the perception of usefulness of CSR practices and strategies adoption in a competitive perspective
- the role of Local Authorities into the improvement of competitiveness of responsible SMEs

Main common results can be summarized:

- general perception (both from enterprises and intermediary institutions) of usefulness of CSR strategies also in terms of competitiveness, but low capability in measuring the real advantages associated to these CSR practices adoption
- large diffusion of informal CSR practices (in particular amongst SMEs operating in industrial clusters) based on existence of social and relational capital that characterizes these productive systems
- identification of Local Authorities as important partner in the start up processes of implementation of CSR practices
- insufficient evaluation (from SMEs) of actions carried out by Local Authorities in order to reward (with positive effects on competitiveness) the

socially responsible SMEs (in particular referring to actions of simplification into administrative and control fulfillments, or to promotion amongst customers and big retailers of socially responsible enterprises).

TRUST, THE LUBRICANT FOR INTERCULTURAL KNOWLEDGE TRANSFER AND KNOWLEDGE SHARING

Bengoa, Dolores¹

¹Director, Bengoa Consulting, Ltd. Email: sanchezl@cytanet.com.cy

Abstract

The incalculable value of knowledge is identified by many companies and, therefore, treasured and protected by them to a great extent. This knowledge protection attitude often represents a considerable obstacle for international business co-operations. For knowledge to be smoothly transferred across cultures, an open and trustful knowledge sharing attitude is required.

It is becoming very prominent in the social capital theory (SCT) the importance of relationship and trust as facilitators for knowledge sharing. Trust, is regarded as the cornerstone when developing a learning culture, a key element in an individual's decision to share, disseminate and enlarged upon knowledge, a guarantor for achieving successful knowledge transfer objectives and for influencing relationships' commitment, Morgan and Hunt (1994) Dirk and Ferrin (2001); Gardener (2003); Fiol (2003); Sharkie (2005); Leyland (2005) Dignum and Eijk (2007), Michailova and Sidorova (2010). On the other hand, they perceived that in low trust environments, co-operation partners are gripped by worries and uncertainties, conversation and knowledge sharing suffers, levels of competitive individual behaviour increases and personal energies are used for protectionism limiting the personal and the co-operation growth. Additionally, the increase on misunderstandings, disagreement and suspicious behaviour might be triggered, an additional proof of lack trustworthiness (Schneider and Barsoux 2003).

In cross cultural environments, trust perceptions are affected by different societal rules, norms and values which are not commonly shared. These different perceptions have an impact on the trust level turning them on a more vulnerable and uncertain. Ideally, the development of a trustful business relationship might lead to create a newly common identity. This new identity and meaningfulness are regarded as the wellspring of creativity and fertile ground where knowledge sharing occurs in a natural way as a result of belonging (Denham, 2005). In practical terms, the climaxes of this trustful environment are: the quick exchange and absorption of knowledge leading to higher innovation rates, flexibility, customer satisfaction and finally to profitability.

Methodology

The paper aims to present part of the empirical research findings focusing on the importance of trust in knowledge transfer and sharing between Eastern and Western European co-operation partners.

The qualitative research has been conducted using a phenomenological approach to better understand social realities. The grounded theory method of constant comparative analysis based on Glasser and Strauss (1967) and Strauss and Corbin (1998) was used to analyze the gathered data. The research was designed in three stages. In the first stage, prior to the data collection, secondary research was conducted by an extensive literature review. This research was intended to increase the researchers' familiarity with the research setting rather than to develop any theoretical framework. The second stage was dedicated to the empirical research and the third part, was dedicated to the findings' analysis and conclusions. Two case studies were explored, Russia and German speaking countries, using focus groups and 23 in depth interviews for data gathering. The findings contributed to elicit the positive and negative attitudes and behaviours influencing trust development. Additionally, the creation of a model highlighting the positive consequences of developing trust and commitment between Eastern and Western European co-operation partner was introduced.

Key findings

Due to its importance and positive implications for intercultural co-operations, trust must be taking care for and nurture. Ignoring this care or abusing from it represents a high risk and an immediate detriment of both business relationship and profitability.

For Eastern European respondents, to develop trust among the international partners is a pre-condition to listen and to believe on them. This trust will be the basis to solve problems or to overcome difficulties in adverse times. Furthermore, Westerners regarded trust on a person as well as, on a company level, as facilitator for knowledge flows. It was underlined that this trust development will take time to reach its full potential. Therefore, in order to develop trust companies must be committed to provide the ground in terms of having opportunities for people to meet and interact. Emotional intelligence was especially mentioned to be in place at the beginning of the relationship, otherwise, irreversible damages e.g. being suspicious, having fear of the partners' hidden agendas will finish with a relationship that may be concludes before it really starts. On the other hand, Westerns European respondents claimed to be cautious in terms of providing lots of trust and being abuse regarding stealing knowledge. For this reason, keeping a balance between knowledge provided and

outcomes received should be strictly observed, striving for a balance of giving and receiving policy.

MANAGING INTERCULTURAL RESEARCH PROJECTS: THE INTERWEAVING OF LANGUAGE, CONTENT, AND METHODOLOGY

Buber, Renate¹; Chudzikowski, Katharina²

¹Nonprofit Management Group, Department of Management, WU Vienna University of Economics and Business. Email: renae.buber@wu.ac.at

²Interdisciplinary Group of Management and Organizational Behavior, Department of Management, WU Vienna University of Economics and Business. Email: katharina.chudzikowski@wu.ac.at

Abstract

The conduct of intercultural, multi-lingual large-scale research projects (e.g. EU grants) puts particular demands on their process management and decision-making. Despite the big variety of project types, in all cases, project managers need to direct their attention to cultural and language issues consistently as it can be assumed that they relate to all phases of a research process and affect content, methodology as well as project management.

The authors are involved in two intercultural business research projects on the European and international level; taking on different roles as partners or project leaders. The projects' topics range from "career concepts in different cultures" via "diversity in organizations" to "European consumption behavior". Despite the cases' heterogeneity, the authors' experiences unanimously indicate that language does not only impact on the decision about the data collection method (e.g. qualitative interviews versus questionnaire) and the related quality of the collected data, but also touches on the selection of useful literature (national and international), the definition of the research question, the discussion of methodological issues; the collection, the analysis, and the interpretation of data as well as patterns of documentation and reporting.

Based on a typical procedure of a research project this contribution discusses different decision fields, decision making processes and consequences for resources and vice versa. Furthermore the authors focus on content-related and empirical opportunities for and restrictions of data interpretation. The discussion is illustrated with selected experiences from the case studies along the following questions:

- What are the characteristics of the development of research designs in the intercultural context?
- How can the decision-making process in intercultural research projects be characterized?
- Which are possible organizational structures in international, intercultural projects and how do they influence the decision-making?

- What are the consequences of multilingualism for the decision about data collection methods?
- How do multilingualism and interculturality influence the project management?
- Which characteristics result from multilingualism and interculturality of team members and respondents for the data analysis and data interpretation?

The aim of this discussion is to offer insights into the interplay and consequences of decisions about the content and methodology as well as the management of intercultural large-scale research projects.

The contribution is organized as follows: At the beginning, the characteristics of large-scale intercultural research projects are introduced. In particular, application frames and procedures, rules for the composition of project consortiums and partners, unique patterns of team formation, etc. are outlined.

Subsequently, a theoretical examination of the embedding of project management principles in intercultural research processes and the particular role of multilingualism in terms of team formation and content-related questions lays the cornerstone for a deeper discussion of the impact of multilingualism on decisions within the different phases of a multicultural research process.

First, along with research phases “application and start of the project”, “development of the research question”, “design”, “methodology”, “data collection”, “data analysis and interpretation”, and “reporting”, the procedure of an intercultural project is outlined theoretically.

Second, the discussion of particular impact of language on the particular topics within the different phases is based on the experiences from the case studies and illustrated with selected examples.

Finally, the authors conclude based on a reflexive discourse of the case studies for managing intercultural research projects. The data basis for the reflexive discourse consists of individually prepared written memory minutes of typical occurrences in the projects along with theoretical descriptions of the research phases. Additionally, documents like regular minutes from the meetings or preliminary reports were considered. For the summary and résumé of the discourse, the authors strived after concordance of the interpretations. Overarching themes are identified that need to be considered when working in intercultural research project and influence the research process.

**CSR AND PERFORMANCE IN SPANISH SMES:
EXPLORING THE CAUSAL EFFECTS**

Abstract

Motivation and background: The present paper explores the relationship between CSR uptake and performance in SMEs. It builds on and extends the goals and activities carried out in the Responsible Med project, a European project involving 9 institutions of 6 different countries in the Mediterranean Area. The goals and components of the project have led us to carry out a parallel research based on the analysis of the visualization of CSR activities made by a statistically-defined sample of SMEs. Learning more about the particular corporate culture and the framework of the relationships that condition the economic and social functioning of SMEs is an important issue, especially if we bear in mind the relevance of SMEs in the Mediterranean economies.

Research Questions: The main research questions of this article are: What is the perceived effect of CSR in SMEs performance? And what is the statistical relationship between CSR practices and SMEs financial performance?

Theoretical Framework: The usual reasoning to incorporate CSR programs is either to reduce externalized costs or to avoid distributional conflicts (Heal, 2004). Recently, different strands of literature have been concerned with the effects of CSR on firm behaviour. Some authors emphasise that CSR practices divert firm resources, increase agency problems and affect negatively firm performance (Hellwig, 2000; Tirole, 2001). Others, on the contrary, show that CSR improves firm performance and firm value (Freeman, 1984; Small and Graf Zivin, 2005; Cespa and Cestone, 2007). This latter idea implies that markets must have the ability to transmit ethical demands to firms, put it in another way, individuals with ethical concern must take part in the market (Brickley et al. 2002). Provided markets are competitive and can punish inefficient behaviour, firms would be pushed to exercise in a socially responsible way to achieve a competitive advantage (Jones, 1995).

Together with this theoretical debate, existing empirical results are not conclusive either. Some studies find a positive impact on firm performance and valuation (Mahoney and Roberts, 2002; Chen, 2004) and others the opposite relationship (Wright

and Ferris, 1997). However, many of these results address CSR in large businesses rather than in small- and medium-sized enterprises (SMEs), because it is too often considered a prerogative of large businesses only (Perrini et al., 2007). Yet, the idiosyncrasies of large firms and SMEs could explain the different observed approaches to CSR (Russo and Perrini, 2010). In particular, Murillo and Lozano (2006) suggest taking a deeper look at: (i) the specific practices carried out in these companies; (ii) these companies' own views and conception of CSR; (iii) their ability to communicate both internally and externally, both with regard to the practices and to the results. This paper focuses mainly on the third point.

Methodology: To answer to the former research questions we studied a sample of 100 SMEs in the province of Girona, in the North East of Spain, chosen from the SABI database prepared by Bureau Van Dijk, which gathers descriptive, financial and legal information on companies in Spain and Portugal. We draw a random sample of SMEs, stratified by the number of workers, following the exact distribution of SMEs in the province. The SME is characterized using the number of workers to be below 250 as the operational European definition of SMEs.

We use a double methodological approach using a qualitative and a quantitative approach with the same number of companies, which is not frequent in academic research.

To answer to the first research question, we analyze the discourse of SMEs in their website, and how they connect CSR to performance. For the second question, we will rely on panel data analysis to test the possible causal relationships between CSR and performance.

Results: The qualitative analysis reveals the perceived performance effects of CSR actions on key success factors, such as quality, innovation and productivity. We find a differential association of the main types of CSR (namely, workplace, marketplace, environment and society) with the three former mentioned key success factors. This analysis helps to understand how companies perceive that CSR is enhancing their competitiveness, or at least how they decide to communicate these effects.

The quantitative analysis is still under construction and we cannot anticipate the results.

Contribution / Highlights of the paper: Combination of qualitative and quantitative research methods. Analysis of effects that SMEs perceive that are associated to their CSR practices. Longitudinal analysis of the causal relationship between CSR and performance, which allows for a better understanding of the direction of causality.

RESTORE TUNISIAN TOURISM POST REVOLUTION

Chemli, Samiha¹

¹Tourism Lecturer at the 'Ecole Supérieure de Commerce de Tunis', University of La Manouba.
E-mail: s.chemli@ucb.ac.uk

Abstract

Purpose – The actual research study aims to identify the negative impact of the Tunisian revolution on tourism to the country and the strategies implemented to overcome the crisis.

Design/methodology/approach – The empirical research consists of the use of qualitative methods. The first stage was based on observation, and the second on interviews carried out with tourism professional bodies during the crisis.

Findings – The findings suggest that the revolution has both, a negative and a positive impact on the image of Tunisia and on the tourism products. Besides, diverse strategies were implemented by the Tunisian Tourism Ministry, the Tunisian Tourism Board and the private sector to restore the destination, most of which are based on the country's new positioning as 'the place to be now'.

Originality/value – This study was undertaken by the time of the crisis, and the qualitative data collected was based on real facts, which could be used as a starting point for future research on the post-crisis stage.

GREEK BANKS' ENTRY INTO THE CENTRAL AND SOUTH EASTERN EUROPE

Chimonaki, Christianna¹; Kesidou, Eleni²

¹Technological Education Institute (T.E.I.) of Crete, Department of Finance and Insurance, School of Management & Economics, Agios Nikolaos Branch, P.O Box 128, 72100 Agios Nikolaos, Greece. E-mail: xristianna79@yahoo.gr

²National Bank of Greece, Assistant Manager, Nikolaou Plastira 1, 72100 Agios Nikolaos, Greece. E-mail: elekesidou@yahoo.gr

Abstract

The last two decades banks all over the world have started to expand their activities into the challenging markets of the developing countries. The transitions countries, specifically, present, nearly, the largest level of banking internationalization in the world. The Greek banking industry has adopted this tendency. This study attempts to find the determinants that influence the Greek banks in their decision to engage in international activities. The interest of the study is centered in the countries of the south eastern and central Europe. We selected a group of thirteen countries of this area and explore the presence and activity if any of Greek banks there. Our investigation revealed that FDI is a strong factor that pushes Greek banks to operate in a foreign country. We, also, found that the distance plays an important role in the same process while trade activity between the countries involved does not matter at all.

Keywords: expand Greek banks, south eastern and central Europe mergers and acquisitions, globalization, financial markets

FINANCIAL REPORTING AND PERFORMANCE MEASUREMENT OF ITALIAN UNIVERSITIES

Abstract:

Purpose: There is an increasing trend and pressure on public sector entities (PSE) to broaden the scope of their financial responsibilities from accounting to accountability. To demonstrate accountability, PSE must provide clear, understandable and reliable information to citizens and taxpayers, which are entitled to high quality information about the financial performance. In more specific terms, there are two main reasons in order to expect high quality reporting from PSE:

- the first reason is accountability: taxpayers and citizens need information which allow them to hold PSE accountable for use of public resources;
- secondly, PSE, just like private organizations, need timely and accurate financial information to monitor and manage their performance.

The paper examines these aspects focusing on a specific PSE: Italian public universities with the aim to investigate their financial reporting and performance measurement.

The current accounting system of all Italian Universities is largely cash- or commitment-based budgetary accounting. So, the aim of this research is to evaluate the characteristics of the present accounting system, to understand the role of budget and financial reporting in decision-making process, to assess the measure of performance used and to investigate the possibility of the implementation of accrual accounting.

In the literature, the introduction of accruals accounting has been the subject of significant debate: some scholars have emphasized its ability to better meet user needs and its consistency with the general movement from ex-ante constraints to ex-post accountability. Critics have raised both theoretical and practical objections.

The hypothesis of the paper is that universities (as well as other PSE) need a “dual system” (cash-based budgetary accounting and accrual accounting), because neither the budgetary accounting nor the accrual accounting produces all the information that managers and stakeholders require for their decision-making: the problem is not only to decide whether a public university should adopt or not accrual accounting, but also

if an accounting system accrual based could coexist with a cash-based budgetary accounting.

The paper analyzes these different points of view in connection with the specificity of public Universities, highlighting some important differences in respect of other PSE. These aspects will be investigated within the framework of the International Public Sector Accounting Standards, which represent a benchmark.

Design/methodology/approach: The paper adopts a quantitative research method. It analyses accounting system, financial reporting and performance measurement methods of all Italian public Universities. The empirical analysis is based on the contents of the “Internal accounting rules” of the Italian public Universities limited to “budget and accounting system”. It tries to identify some significant variables that allow understanding the role of budget and financial reporting in decision-making process and to assess the measurement method of performance used.

Findings: The main findings of this research are:

1. The accounting system is largely commitment-based, producing information that concern only the financial aspects of operations; as a consequence, it doesn't produce information about costs of higher education and research.

2. Most Universities adopts the old model of budget suggested by the Decree n. 371/1982; only few universities adopts the structure suggested by the Law n. 94/1997. This means that there haven't been any significant innovations in the last two decades and, also, there is a lack of harmonization.

3. Only few Universities adopts an accounting system accrual-based. Moreover, there is a sort of implicit equivalence between budgetary accounting's establishments of accounts receivable and commitments on the one hand, and accrual accounting's revenues and expenses on the other. In substance, the basic conceptual framework remained unchanged, despite the different objectives assigned to Universities accounting over time.

4. A partial uselessness of the performance results produced by cash or commitment based accounting system currently adopted by Italian Universities. This results need to be integrated with economic results and other indicators, coherently with parameters and criteria to be required from the main stakeholder.

5. If we compare the Italian University accounting system with the approach suggested by the International Public Sector Accounting Standards Board, we can notice a considerable distance and a substantial lack of harmonization.

Originality/value: The aim of this research is to evaluate the characteristics of the present accounting system, to understand the role of budget and financial reporting in

decision-making process. It represents a starting point for future investigations about the improvement of performance results produced by accounting system adopted by Italian Universities.

Abstract

The goal of this paper is to identify the key financial distress performance indicators of local governments by using published financial data. Thus, using proper financial ratios the financial performance of municipalities is assessed through a multicriteria methodology that combines simulation analysis approach (stochastic multicriteria acceptability analysis) with a disaggregation technique. In particular, an evaluation model is developed on the basis of accrual financial data from 360 Greek municipalities for 2007. A set of customised to the local government context financial ratios is defined that rate municipalities and distinguish those with good financial condition from those experiencing financial problems. The model is validated by testing its outputs on a subsample of 100 local governments assessed in two time periods, 2007 and 2009. The model succeeded in correctly classifying distressed municipalities according to a benchmark set by the central government in 2010. Such a model and methodology could be particularly useful for performance assessment in the context of several European Union countries that have a similar local government framework to the Greek one and apply accrual accounting techniques.

Abstract

Some critics of the traditional hospital's organization argue that hospitals are dominated by doctors, who decide clinical issues often unaware of economic dimension of their actions.

Hospitals have been exposed to great pressure in order to reduce costs. Consequently, hospital administrators have responded by becoming more aware of the need for management control tools.

Accounting systems are implicated in the relationship between professionals and organizations as these systems are designed and implemented to achieve bureaucratic criteria of efficiency and accountability. (Abernethy and Stoelwinder, 1995)

Methods

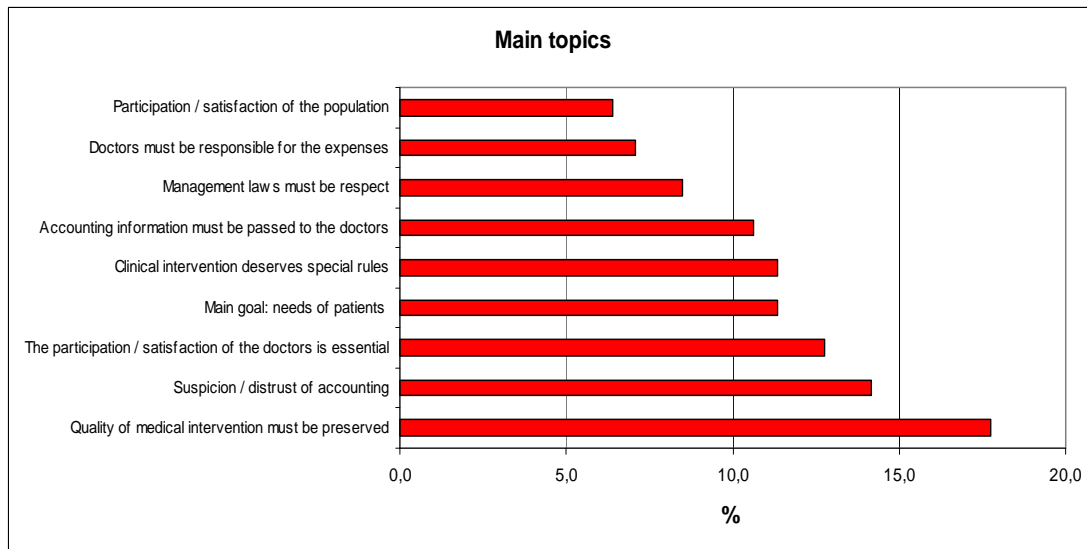

In order to understand how and why management accounting systems is involved on this process, we present an exploratory case study. Case study is the appropriated research method for studying contemporary and complex phenomena (Yin, 1994).

We collected data from: (i) informal meetings with key informants; (ii) documental support; (iii) questionnaire to clinical staff; (iv) "open-ended" interviews to 21 physicians of the health unit.

Data analysis of the interviews corresponds, essentially, to what is known as a "content analysis" The objective was to convert the original texts into significant units, by reading several times the original text and using a software program, whenever indicated.

Results

In the next figure, the main topics which resulted from the qualitative analysis are presented graphically, according to their frequency.

Discussion

This work demonstrates that the medical speech frequently recaptures the underlying conflict in current medicine, a result from the confrontation between the physicians' personal, high and old expectations and management practices. Doctors, probably strengthened by previous competitive training experience and great personal demands (Foster and Anderson, 1978), tend to disagree with practices that transform clinical acts into simple numbers, uniform procedures using low standards and convert “noble art” into a repetitive and monotonous task.

It seems reasonable to think that the aversion to Accounting only appears when it is associated to a “third person” that is easily seen as an uninformed intruder on the contours of clinical situations and that powerfully withstands between “doctor-patient”. Generally, doctors seem to be clearly available and open to develop strategies for the appropriation of the basic accounting knowledge and techniques so they could interpret and use the accounting information.

CROSS-GENERATIONAL ORGANIZATIONAL COMMITMENT: EVIDENCE FROM A FIELD STUDY IN GREECE

Dimitriades, Zoe¹; Papalexandris, Nancy²

¹University of Macedonia, Thessaloniki, Greece. E-mail: zd@uom.gr

²Athens University of Economics and Business. E-mail: papalexandris@aueb.gr

Abstract

We are in the midst of a well-documented world-wide shortage of young employees. This shortage is expected to worsen in coming years. Efforts to recruit employees at a young age, while retaining older employees, have resulted in, at least, three generations in the workforce. As recruiting and retention efforts continue, the concept of organizational commitment across generations is important to consider – since research has demonstrated that enhanced organizational commitment leads to positive outcomes both at the individual and organizational level of analysis. The current study investigated whether generational differences impact the level of organizational commitment experienced by younger vis-à-vis older Greek employees.

In line with expectations, and previous findings, results demonstrate that significant differences do exist between generations regarding exchange-based commitment – particularly, continuance commitment and the social obligation aspect of normative commitment. Yet, contrary to previous findings, no differences were identified with respect to affective commitment – highlighting, perhaps, the particularities of the Greek cultural context.

Recommendations for practice are discussed, along with suggestions for further research.

**THE IMPACT OF OIL PRICE INNOVATIONS ON THE RELATIONSHIP BETWEEN
TOURISM AND ECONOMIC GROWTH: A STRUCTURAL VECTOR AUTO-
REGRESSIVE APPROACH FOR EUROMED COUNTRIES**

Filis, George¹; Chatziantoniou, Ioannis²

¹Department of Economics, University of Portsmouth, Portsmouth Business School, Portsmouth, Portland Street, PO1 3DE, United Kingdom. Email: George.Filis@port.ac.uk

²Department of Economics, University of Portsmouth, Portsmouth Business School, Portsmouth, Portland Street, PO1 3DE, United Kingdom.

Abstract

There is a wealth of literature on the interrelationship between tourism income and economic growth. This relationship, however, is rarely examined under the prism of an exogenous shock. As such, the current study is focused on the effects of oil price innovations on the tourism-led-economic-growth hypothesis (economic growth is approximated by industrial production). Furthermore, these effects are filtered through inflation and stock market volatility. The latter is used as an approximation of economic uncertainty which is caused by oil price turbulence.

To this end, we develop a Structural Vector Auto-Regressive (SVAR) model using monthly data from 1995 until 2010 for five Mediterranean countries, namely, France, Greece, Italy, Portugal and Spain.

Our results indicate that tourism income is having a significant effect on industrial production; although, the reverse is not true. Finally, both tourism income and industrial production are affected by oil price innovations and economic uncertainty.

Keywords: Oil price innovations, SVAR, tourism-led-economic-growth hypothesis

PRIVATE BANKING CONSUMER PERCEPTION AND THE INFLUENCE OF AN ACQUISITION

Finken, Stefan¹

¹University of Gloucestershire, UK. Email: Stefan.Finken@gmail.com

Abstract

The aim of this paper is to present the methods and methodology used to gather empirical data about private banking consumer perception and the influence of acquisition on this perception. This is a very important topic in today's economy as the numbers of mergers and acquisition increases due to the ongoing globalization.

At the first stage of the research process, a systematic literature review of qualitative and quantitative literature on private banking consumer perception was conducted. Determinants of client consumer perceptions based on the literature were elicited. These determinants were transferred to the model of determinants of perceived service quality developed by Parasuraman, Zeithaml & Berry (1985). Limitations of this model in terms of private banking consumer perceptions are discussed. Further, the research paper highlights the reasonable assumption that acquisition might have an impact on the private banking consumer perceptions. The gathered data has been used to create a hypothesized model of private banking consumer perception which will be validated by empirical research.

In the next step, the researcher used a case study method to gather primary data. One aim of the case study is to explore phenomena and to understand them within a particular context (Yin, 1984). The researcher analyzes changes of private banking consumer perception in context of an acquisition. Bryman and Bell (2007) described a case study as a vehicle in which several qualitative methods can be combined and by doing so it avoids too great reliance on a single approach. The researcher's case study vehicle consists of observations and semi structured interviews.

Perception is defined as a process by which an individual receives, selects, organizes and interprets information to create a meaningful picture of the world (Creamer, 2007). It depends on internal factors such as beliefs, experiences, needs, moods and expectations and is influenced by the context in which it is seen or heard (Belch & Belch, 2009). There are many parties involved in the process of an acquisition and these parties have an influence on the perceptions of the private banking consumers as they form the context and influence the internal factors. Thus, all parties which have an influence on the topic under investigation like private banking consumers and client advisors as well as consulting companies will be observed and interviewed. Due to the consideration of relevant groups of actors and discovering interactions and relations between them, case studies are a multi-perspective analysis and allow the researcher to

understand the perception from the viewpoint of the “elite” (Feagin, Orum, & Sojberg, 1991) who have the biggest influence on the topic at hand. This offers the researcher a holistic view (Patton, 1990) on the present subject. The holistic case study is shaped by the principles of qualitative research and serves for the evaluation of complex procedures that were not treated effectively with quantitative designs (Scholz & Tietje, 2002). Hence, the researcher is collecting qualitative data which captures the richness of details and nuances of the phenomena being studied (Collis & Hussey, 2003) and as well uses small samples (Varkevisser, Pathmanathan, & Brownlee, 2003). Due to discretion and banking secrecy, the author will not be able to address or contact a high number of private banking clients and, thus, the sample number will be compared to quantitative approaches, small. Snowball sampling is used to locate interviewees. The researcher asked individuals to provide the information needed to locate other members of that population (Babbie, 2008). This method is useful when access or to locate appropriate subjects for interviewing is difficult (Gray, Williamson, & Karp, 2007; Babbie, 2008). In the present research clients are difficult to locate due to discretion and the banking secrecy.

The researcher will use the philosophical standpoint of a critical realist who has the skills to construct theory about mechanisms and to discover their effects. These mechanisms are real but not directly accessible and produce social phenomena (Bryman & Bell, 2007). This allows the researcher to discover the mechanisms (determinants and factors) that form and influence private banking consumer perception.

It is assumed that further determinants will be found by collecting primary data in addition to the ones gathered by the systematic literature review and that the empirical data proves that acquisition has an influence on perception. Further, the initial conceptual model of private banking consumer perception will be validated, too. With the knowledge gained by this research private banks are able to recognize bank consumers’ expectations and perceptions. This increases the competitiveness of banks as customers needs can be fulfilled and client movements during an acquisition process will be reduced.

ARE FUTURES HEDGE RATIOS STATIONARY?

Floros, Christos¹

¹Department of Finance and Insurance, Agios Nikolaos Branch, Crete, Greece. Email: cfloros@staff.teicrete.gr

Abstract

There are techniques available for reducing and managing financial risk; the most widely used is hedging with futures contracts. A considerable amount of research has focused on modelling the distribution of spot and futures prices and applies the results to estimate the optimal hedge ratio (HR) using OLS, GARCH, ECM and VECM (Floros and Vougas, 2004; Degiannakis and Floros, 2010). Several studies have investigated the optimal HR using stock index futures estimating a constant and a time-varying HR. According to Sutcliffe (2003), stock index futures can be used to hedge market risk caused by spot price fluctuations. Optimal HRs are estimated by modelling the distribution of stock index and futures price changes within the GARCH methodology which allows for time-dependent conditional variances in the unconditional distribution of price changes (Park and Switzer, 1995). Estimation of optimal HRs has also been approached with time-dependent conditional variance models. To estimate a HR, early works used the slope of an OLS regression of stock on futures prices, while an improvement has been made by adopting a bivariate GARCH framework (see Floros and Vougas, 2004). Although these studies are successful in capturing the time-varying covariance-variances, almost all of them focus on the HR estimation only. The main purpose of this paper is to examine if HR is stationary over time, as we know little about the stationarity of HRs. Previous studies such as Ederington (1979) and Anderson and Dathine (1981) assume that optimal HR is constant when it can be obtained as a slope coefficient of an OLS regression. When optimal HRs depend on the conditional distributions of stock index futures price movements, then HRs vary over time as this distribution changes. Previous studies show the variability of hedge returns over time, and support the hypothesis that optimal HRs of commodities are time-varying and nonstationary, see Baillie and Myers (1991). They report that the HR for each of the six commodities contains a unit root and therefore behaves much like a random walk. Grammatikos and Saunders (1983) were the first to examine HR stability. They considered three different tests and found that the null hypothesis of HR stability in five currencies could not be rejected. Furthermore, Malliaris and Urrutia (1991) examined the random walk hypothesis and concluded that futures HRs follow a random walk. However, Ferguson and Leistikow (1998) prove that regression approach futures HRs are stationary. Furthermore, Lien et al. (2002) use the ADF test and show that the null hypothesis that the optimal GARCH HRs have a unit root is rejected. The result is in contrast with Baillie and Myers (1991) who reported that the

GARCH HRs are nonstationary. The main purpose of this paper is to examine if daily HR in DAX futures market is stationary over time. Our work employs stationarity methods to test if German HR, as well as the covariance and variances of spot-futures prices, are stationary. We apply a bivariate GARCH(1,1) approach to estimate HR and six unit root tests (ADF, PP, DF-GLS, ERS, KK, NG) to examine its stationarity. The results show that the HR is integrated of order zero, i.e. it is stationary (even though the logarithmic values of DAX futures and spot prices are non-stationary). These findings are recommended to financial managers dealing with stock index futures.

Keywords: hedge ratio; BGARCH; stationarity; futures; DAX

CREDIT RATING ANNOUNCEMENTS AND STOCK MARKET RETURNS: THE CASE OF GREECE

Floros, Christos¹

¹Department of Finance and Insurance, Agios Nikolaos Branch, Crete, Greece. Email: cfloros@staff.teicrete.gr

Abstract

Credit rating announcements or rating news may have significant impact on the stock market returns (Azerki et al., 2011; Ferreira and Gama, 2007; Norden and Weber, 2004). The present paper examines the impact of rating news on the Greek General index of the Athens Stock Exchange (ASE) using GARCH-family models under several distributional assumptions (Normal, Student's-t and GED) for the errors. We focus on the three major credit rating agencies, i.e. Fitch, Moody's and S&P; our analysis considers announcements over the period 2009-2011. In particular, there are 15 rating announcements for Greece between January 2009 and May 2011, as follows Fitch (5 announcements) – Moody's (5 announcements) – S&P (5 announcements), all of which are downgrades. Our results show that negative rating news does seem to have an economically and statistically significant (negative) impact on the Greek stock market only at the day of the announcement (event). We find that the dummy coefficients for pre- and after- the credit rating announcements are insignificant, which suggests that rating history does not matter (Ferreira and Gama, 2007); hence, the stock market in Greece understands downgrades as surprises. Further, market participants recognize downgrades as a wake-up call, especially during bad times of Greek economy or financial crises (Ferreira and Gama, 2007). Further research should examine the spillover effects of rating news on International financial markets using a GARCH methodology.

Abstract

The objective of this work is to reconstruct the role of agricultural lobbyist and the national alliances, in determining the outcome of the process of the latest wine common market (CMO) regulations entered into force on 1st August 2009 (Reg. 479/2008), and how these have changed the Commission's initial proposals. Four example of public decisions have been discussed: grubbing up vineyards and liberalization of replanting rights; the abolition of market measures (the case of distillation measures); quality policies (designations of origin) and new rules of wine labels. The approach to the models of Public Choice, included for the first time in a specific context such as the wine sector, has served to focus attention on the processes and the interactions between the politicians and the agricultural associations. The most important innovation in this work is the inclusion of different organizational forms of political interests and wine business representation. It covers not only traditional collective action but also individual action and third party representation. This is fundamentally different from the usual focus on collective action in isolation from other organizational form (Coen, 1997). Public Choice theory has identified as pressure groups or lobby stakeholders, of different size, who participating in the political process. This is often referred to in the honorific terms as doing "public service," which is contrary to widespread impression, because they are motivated by self-interest the same as the people in the market place (Buchanan, 2003; Downs, 1957; Rausser, et al., 2009). Politicians find themselves in front of a trade off in choosing a policy in the general interest of the community that would lose the support of the lobby or encourage the latter and unleash the electorate: they choose the policy that best maximizes their objective function and generated the condition of win set between pressure groups and public decisions (Olson, 1965; Putman, 1988). This positive sum game view of governmental intervention also presumes a political economy which improves the allocation of resources.

The focus of the paper is characterizes by two steps. The first one has studied the structure and behavior of the main actors involved in the genesis of the policy of regulation (from "white papers in 2006"). Then have been identified several sources of

pressure groups working at different levels: European actors (Agriculture Commission; European Parliament; Producer Organizations as COPA, COGECA, Comité Vins CEEV; CEJA; and the relationship of political position between the agricultural Ministers of Italy, France, Spanish and Portugal); Italian actors (Agriculture – Distillation unions; Regions; Italian Agriculture Minister and Young farmers unions); each with a range of different interests. In the second step, are analyzed the effects that individual lobbyist actions have generated on the main themes of the Regulation: the Commission proposal, the activities of lobbyists and political agreement reached in December 2007. The wine sector reform, riding on two key moments (Fischler 2003, and Health Check 2007), determined the configuration of a CMO more conservative than the original proposal from the EU Commission (EUC), despite the many new features and some important items that break with the past (Gaeta, 2009). The great and true expectation was based on the budget that the OCM would have generated: this was to be the main turning point, also gives the right signal to the role that the wine sector has acquired in recent years. In front of this objective it can be said that CMO has failed. The impact of government support on the income of the vigneron is not only most limited, but highly unbalanced in respect to other sectors (such as cereals with more than 70%). Looking at the debates of the Member States (MS) with the EUC, the position taken by MS within the negotiations is determined by the win set adopted by government representatives of each country. The Commission has taken the direction of moving the orientation of the win set, depending on the willingness to “meet “ the interests of the MS and Producers organizations. The EU Commission geared towards promoting common EU interests, as well as promoting its own position. According to the theory of Olson and Downs, the reasons for this lobbyist action are partly attributable to the fragmented action that the agriculture and lobbying system has always expressed its inability to act with appropriate means of pressure, if not for individual corporate battles aimed more to justify the existence of different organization (small or large), rather than worrying about the overall effects of the new economic policy and the future wine sector post 2013.

TERROR IN THE WORKPLACE: DOES ORGANIZATIONAL CULTURE FOSTER WORKPLACE BULLYING?

Galanaki, Eleanna¹

¹Athens University of Economics and Business, Greece

Abstract

This paper focuses on workplace bullying and the relation of its occurrence with the organisational culture and values. Although a significant amount and level of research has been realised on workplace bullying, it mostly focuses on the incidence and implications of the phenomenon for the individual experiencing it (victim), or the one exercising it (bully). Based on a 300- respondents survey, we explore the relation of the incidence of workplace bullying with the 9 dimensions of organisational culture, as developed for the Globe research project.

The terms “workplace bullying” or “workplace mobbing”, which are used interchangeably, were introduced in the early 1990’s, to represent a rather common, with very serious repercussions, yet overlooked phenomenon.

To give a definition, “*Bullying takes place when one or more persons systematically and over time feel that they have been subjected to negative treatment on the part of one or more persons, in a situation which the person(s) exposed to the treatment have difficulty in defending themselves against them. It is not bullying when two equally strong opponents are in conflict with each other*” (Einarsen et al., 1994; Nielsen et al., 2009).

Many studies have indicated that workplace bullying is a reality and its incidence has been repeatedly documented in the past. Indicatively, a recently presented study in Greece has indicated that workplace bullying in 800 white-collar workers occurs at 13% of the sample, with the use of a very conservative measurement technique of the phenomenon (Galanaki & Papalexandris, 2011).

Workplace bullying has multiple implications, obviously to the victim- target (ex. anxiety, irritability, feelings of depression, paranoia, mood swings, feelings of helplessness, lowered self-esteem, physical symptoms, social isolation and maladjustment, psychosomatic illnesses, depressions, helplessness, anger, anxiety, despair, burnout, lowered job satisfaction and wellbeing), but also to the organisation in which it takes effect. Organizations are seen as both responsible for the incidence of bullying (Coleman Gallagher et al., 2008; Hauge et al., 2007; Hoel & Cooper, 2000; Salin, 2003) and the key to reducing the frequency of the phenomenon or the severity of its impact (Bulutlar & Oz, 2009; Coyne et al., 2003; Hodson et al., 2006; Namie, 2007; Salin, 2009). So, organisations, being responsible for a safe working environment for their employees, have an interest in reducing to the minimum the incidence of bullying

phenomena. This does not simply emanate from a social responsibility and ethical stance of the employer. It is a pragmatic requirement, in order to provide the necessary conditions for good performance and excellence to occur.

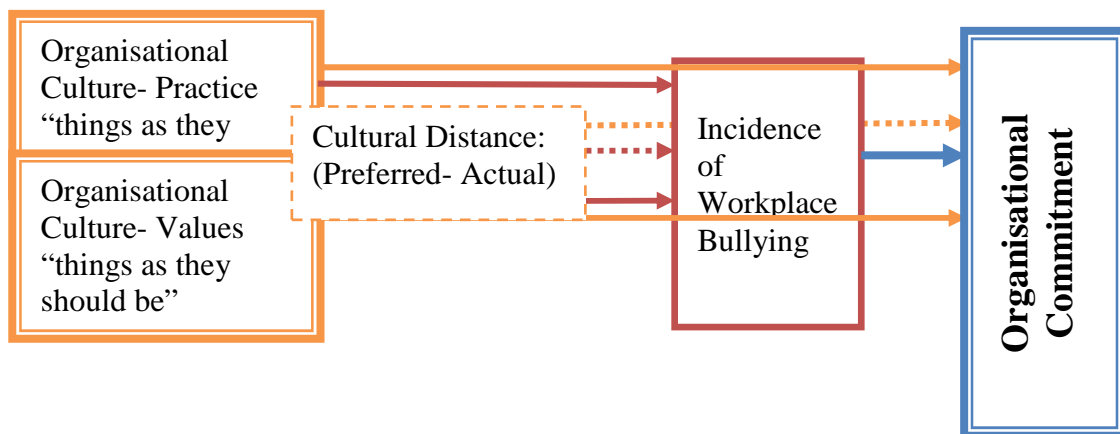

The current research tackles with two questions:

Does organisational culture and values have an impact on the frequency of occurrence or intensity of workplace bullying? Which culture dimensions are mostly related with the incidence of bullying and how organisations could shield themselves from its occurrence?

How does workplace bullying affect the overall organisational commitment?

The relations that we will test can be graphically depicted, in Graph 1:

Graph 1: Research relations to be tested

Methodologically wise, the authors have conducted a survey in spring 2011 to 350 white-collar workers from different companies of diverse sectors.

Organisational culture was measured and assessed with the use of the Globe questionnaire on Organisational culture. This instrument has been used extensively as a way to evaluate 9 major cultural dimensions of an organisation and is considered as one of the most reliable scales for the measurement of organisational culture, globally (Chhokar et al., 2007; House et al., 2003).

The researchers also measured the occurrence of bullying with the Negative Acts Questionnaire (NAQ), with 21 types of Negative Acts, which may arise within the working environment. This instrument is one of the most widely recognised and accepted ways of measuring workplace bullying (Einarsen et al., 2009).

Organisational Commitment was measured with the Meyer and Allen commitment questionnaire (Allen & Meyer, 1990). This questionnaire measures 3 dimensions of organisational commitment, i.e. affective, normative and continuance commitment

through 27 questions (9 for each dimension) and is most probably the most well-known instrument for the measurement of organisational commitment.

The study will be useful to a varied audience of academics, researchers and practitioners, mostly in the field of organisational behaviour and psychology, as it tackles with an issue that can have deep and severe implications for organisations, if left unattended. The identification of the roots of workplace bullying at the organisational culture or value system is a first step towards tackling with the phenomenon at the organisational level.

INFLUENCE OF THE SAMPLING METHOD ON BUSINESS FAILURE PREDICTION MODELS

Garcia-Gallego, Ana¹; Mures-Quintana, Maria-Jesus²

Abstract

Since Beaver's and Altman's work, business failure prediction has become an important topic in corporate finance literature and numerous studies have been developed, using a variety of statistical methodologies for predictive purposes.

Most previous models have used a paired sample with the same number of failed and non-failed firms, achieving good prediction results. Nevertheless, this kind of sample has the drawback of not being representative of the population from which it is chosen, since this sampling method does not respect the population proportions on the sample.

In order to prove if the predictive power of the previously developed models is due to the kind of sample they have used, we develop a failure prediction model on the small and medium-sized firms with head offices located in the region of Castilla y León (Spain), using both a paired sample and a random sample based on the population size and composition. Applying a logistic regression analysis, we try to identify the financial ratios, used as independent variables in the respective models, which best explain and predict failure in the two samples.

The obtained results show that there are differences in the variables which become significant in each sample, as well as in the classification results. They are not as high in the random sample as those achieved in the paired one, especially with regard to failed firms, due to its low proportion compared to the non-failed ones.

Business Failure: Definition and Explanatory Variables

Due to the variety of situations with a negative influence on firms' activity, as well as the diversity of parties involved in a firm, different definitions of failure have been used in the previously developed models, depending on the aim of each one. Nevertheless, the most used definition of failure has been a juridical or legal one (Balcaen and Ooghe, 2006), as it has the advantage of being a highly visible event that can be objectively dated.

These are also the reasons why we consider failure as the firm's formal declaration of one of the three possible proceedings in the Spanish law, which are included under the general terminology of bankruptcy.

Secondly, it is necessary to choose a set of variables to explain and predict business failure. As information extracted from financial statements reflects the firm's activity, most models have included a lot of financial ratios selected on the basis of their popularity in literature and their predictive success in previous research as independent variables to predict failure, as Beaver (1966) did.

Taking into account these criteria, as well as the information availability for the firms in our sample, we finally selected a total of 27 financial ratios classified in the categories of liquidity, profitability, leverage and solvency, turnover and activity, cash-flow, and economic structure.

Sample Selection

The next step forward in the development of prediction models is sample selection.

The most common sampling method has been to derive the sample of failed firms and next to select the same number of non-failed firms by matching them to the failed ones devoted to the same industry and being of the same size.

However, this state-based sample leads to an overstatement of the model's ability to predict, since parameter estimates are inconsistent and biased (Palepu, 1986). In order to prove this statement, we decided to compare both sampling methods regarding prediction results.

First of all, we identified the failed firms in the database SABI, used to collect the information, with the requirement of availability of financial statements for three consecutive economic years. Taking into account our criterion for business failure, there were 59 failed firms, which were chosen to derive the failed sample.

Regarding the non-failed firms, the database included a total of 41,525 companies, and using the formulae appropriate to calculate the size for this group, it resulted in a sample size of 396 firms, which were selected from the same industry in which failed companies developed its activity, attending each industry population size, so as to respect characteristics and peculiarities of different industries. Moreover, each failed firm was matched with a non-failed one randomly selected from the same industry, in order to derive the paired sample.

Empirical Results

The first step in our empirical study consisted of the application of a Principal Components Analysis (PCA) on the initial list of 27 financial ratios, to reduce the number of variables chosen as potentially explanatory of business failure.

In both samples, six factors were extracted, which were correlated to 15 ratios in the random sample and to 20 ratios in the paired one. Some factors were common to both samples: liquidity, liability structure, cash-flow, economic profitability and current position. However, there were some differences: a specific factor describing turnover, in the first sample, and two important factors measuring equity and working capital issues in the paired one.

The ratios correlated to the factors extracted by PCA referred to the three-year period were considered as independent variables in the models estimated by logistic regression, where some differences were observed.

In the random sample, seven variables became significant, which basically measured different liquidity and current issues, as well as the ability of the firm to generate resources internally. In the paired sample, however, the most important issues in order to avoid failure are some related to equity.

The classification results achieved in both samples are shown in table 1, where it can be observed that the total hit rate is quite similar, although slightly higher in the random one. Nevertheless, the most outstanding difference is observed regarding the classification in each group, since the increase in the proportion of failed firms in the paired sample has involved a large improvement in the correct classification percentage for these firms, while the corresponding to non-failed firms remains quite high. Therefore, the percentage of correctly classified failed firms seems to be higher when a paired sample is used, as the proportion of this group of firms in the sample increases in comparison with a random sample based on the population size.

Table 1. Classification results.

Firms	Sample	
	Random	Paired
Failed	43.48%	91.11%
Non-failed	99.59%	75%
Total	90.69%	83.95%

Keywords: business failure, financial ratios, sampling, logistic regression, prediction

DEFINING CORPORATE REPUTATION

Giambona, Genoveffa (Jeni)¹; Younger, Rupert²

¹Deputy Director, Oxford University Centre for Corporate Reputation, Saïd Business School, University of Oxford, Park End Street, Oxford, UK, OX1 1 HP, jeni.giambona@sbs.ox.ac.uk

²Director, Oxford University Centre for Corporate Reputation, Saïd Business School, University of Oxford, Park End Street, Oxford, UK, OX1 1 HP, rupert.younger@sbs.ox.ac.uk

Abstract

Corporate reputation is a relatively new construct in management research. While in the past businesses were almost exclusively driven by what is referred to as the 'marketing model', in recent years, also due to the emergence of knowledge-intensive products and to the rise of the knowledge economy, a 30-second advert cannot easily communicate the inherent value of such products – hence, reputation has become more important in creating value for a business (Scott and Walsham, 2005). Moreover, due to the spread of social media, improved geographical connectivity has made it easier for events happening in one part of the world to be almost instantly known all around the globe, thus making the reputational risk more difficult to manage for corporations (Qualman, 2009). Although it can be suspected that people tend to sacrifice values for price when in a situation of economic depression and so things like corporate social responsibility issues might seem to get ignored, according to Page and Fearn (2005) it has become commonly accepted that consumers' buying decisions are affected by organisations' reputation.

It is not just the literature that provides evidence of the fact that, although an intangible, reputation has value. A big business in reputation analysis is emerging. Reputation surveys have multiplied - from *Fortune Magazine's Global Most Admired Companies* to the annual *Delahaye Best US Corporate Reputations Index*. And reputation has become a major buzz word within corporate publications – not just in corporate responsibility and sustainability reports, but in mainstream corporate annual reviews. There can be little doubt that corporate reputation is in the spotlight. But despite all this attention, reputation is a term too often loosely applied and too often confused solely with media relations or CSR.

Although being quite recent as a concept, 'The study of corporate reputation has intensified over the last few years' also resulting in a multitude of definitions (Barnett et al., 2006). Or, as MacMillan et al. (2005) say: 'Reputation is about how a company is perceived by key stakeholders. These perceptions are not built on spin... rather they depend upon stakeholder experiences of a business'. These stakeholders are both internal and external to the organization and include employees, customers, suppliers, even the media and government bodies, although, understandably, customers are the most important group of stakeholders. However, if a corporation's reputation consists of perceptions held by others, who owns that reputation? It seems clear that reputation cannot be 'owned' by the corporation if it consists of perceptions held by others. And if organisations do not own their reputation, how can they manage it?

However, when considering how to manage your reputation – as an individual or as a corporation – one first needs to understand the concept of reputation as distinct from other related concepts.

This paper will set out to answer the above questions. It will start by defining reputation. However, this definition would not be complete without a distinction being made between reputation and other related constructs such as image, identity, brand and legitimacy, too often mistaken for reputation (Brown et al., 2006).

The paper will then discuss the challenges in measuring reputation, the role played by high status reputation intermediaries such as the media and present a case in support of the idea that companies in fact have multiple different reputations and that addressing this concept is a key task for leaders.

The paper will conclude with some implications for management.

ORGANIZATIONAL CULTURE, HOSPITALITY AND SUSTAINABILITY: THE DILEMMA OF THE MOUNTAIN HUT

Imboden, Alain¹

¹Les Roches Gruyère University of Applied Sciences Switzerland (Bluche campus)

Les Roches International School of Hotel Management. Email: alain.imboden@lesroches.edu

Abstract

In alpine regions, mountain huts have been built and managed since late 19th century to offer hospitality to people that want to experience wilderness. These huts have provided during all this time a simple form of accommodation in the most remote places, offering all year round some comfort and security to mountaineers, hikers and skiers.

Traditionally, mountains huts have been operated by institutions such as alpine clubs or tourist associations and are, depending on the season and the type of hut, guarded or non-guarded.

This study explores the organizational culture of two of these membership-based organizations: the Swiss Alpine Club (CAS) regrouping 153 huts located in the Swiss Alps and the Swedish Tourist Association (STF) regrouping 53 huts located in North Sweden.

The analysis explores a dilemma that these two institutions are facing: preserving as much as possible mountain wilderness while operating an infrastructure, the mountain hut, which could potentially threaten all the efforts they both make in terms of preservation. Embracing this dilemma, both CAS and STF have developed a unique organizational culture that attempt to achieve a balance between protecting nature from people's abuse and offering it for people's pleasure.

Reviewing the public discourse of the CAS and STF reveals a culture where not only the organization but also their members and all other users of their mountain huts are together represented as a community sharing a set of assumptions, norms and values that have for main purpose to protect the mountains and regulate their "usage". Using Schein's 3 levels of culture (Schein, 2010), these two organizations are compared, revealing a very similar approach towards hospitality, wilderness as well as a unique sustainable management of these two assets once combined.

The study shows that the approach elaborated by CAS and STF corresponds closely to the concept of "servicescape" developed by Arnould, Price and Tierney (Arnould, Price, & Tierney, 1988). Indeed, and each in their own way, they consciously promote limited managerial control over the staging of the site, they privilege a preservation of the site over customer needs and wants, and they support the idea that providers and

customers enter the “servicescape” together, rather than the customer enters an environment controlled by the provider.

Moreover, both CAS and STF’s emphasize a cult of nature in which the host and the guest should together embrace the same organizational culture in order to preserve it and respect its fragility. The way the mountains are represented through this communion of culture is also discussed using the concepts of “pleasure ground” and “amenity landscape” as proposed by Nepal and Chipeniuk in their work on Mountain Tourism (Nepal & Chipeniuk, 2005). As well, Nyaupan’s discussion on the relationship between ecotourism and nature-based tourism is adopted as a foundation to review CAS and STF’s criteria in defining their core activities (Nyaupan, 2007).

The main conclusions of the study are that CAS and STF have progressively developed a very similar organizational culture that is centered on the respect and preservation of the unique geographical environment they operate into and that paradoxically attempt to take advantage of its fragility, its relative isolation and difficult access to promote their own existence as organizations. In doing so, the culture they propose is in itself fragile as it seeks to maintain a delicate balance between protecting the pristine nature of the mountains and at the same time promoting activities and operating infrastructures that constantly threaten it. The study also shows that these two organizations created a culture of sustainable management long before it became a field of study, a role of pioneer that they both still claim to play today.

Keywords: organizational culture, corporate social responsibility, sustainable management, mountain tourism.

INTERNATIONAL HUMAN RESOURCE MANAGEMENT: GENERATION Y, RETENTION AND COMMUNICATION

Juskiw, Peter¹; Modena, Ivana²

¹Les Roches Gruyère University of Applied Sciences, Rue de l'Ondine, 20, 1630 Bulle, Switzerland, Email: peter.juskiw@glion.edu

Abstract

Human Resource experts working in international settings have to overcome the lack of loyalty in the workplace for young managers. These belong to the so-called generation Y.

It is especially in the hospitality industry that the problem of retention is significant. Increased employment availability in the global marketplace, redefined work life balance and biggest generational shift from the baby boomers to generation Y are the main workforce trends today.

Our work aims to define a plan of action for our client, HotelCo., a Hotel Industry operating with 60 properties around the globe which is being expanding in the next four years causing the workforce to grow by 50%. This requires an intense recruitment activity focused on hiring young people, approximately 22,500 managers.

According to the "Employee Satisfaction Survey" (2010) of HotelCo 55% of managers based in all the Hotel properties are younger than 30 years. 64% of the interviewees declare that they would consider an offer from a competitor and 75% assume that they would accept an offer from another property of HotelCo.

It is necessary to understand the reasons why generation Y does not develop a sense of belonging to the work environment and desire to commit. What are the main work values and expectations of generation Y in comparison to the past generations? What are the HR actions to be taken in order to create loyalty? Answering these questions is useful to understand how to improve retention in international work environments and motivate the new hired staff.

The value of work is a concept that changes in time and space. For example, in the 60's there has been a refusal of the concept of work and political conflicts took to an important student revolution based on the denial of the values of industrial society. In the 80' the youth were called "yuppies", whose work values were oriented on career, earning and promotion. Today, the so-called "generation Y" or the "Millenials" are born between 1980 and 2000 in rich countries. These young people grew up in small families and in a social environment that helped them build a strong self-esteem. They lived an extremely busy childhood full of educational and recreational activities.

Millennials are global citizens with a sense of tolerance towards diversity and skilled users of all kinds of telecommunication devices such as cell phones, iPods, iPads or laptops, they are multi-tasking, e-communicators and bloggers. They are also aware of the risks of technology and of environmental issues. Finally, generation Y expects to keep a balance between work and personal life.

It is clear that it is hard work for the employer to motivate such skilled communicators and confident global citizens. They are fresh thinkers and quick learners, exceptional technological savvy and effective team workers especially in multicultural environments. It is here suggested to improve communication strategies to deal with generation Y. In order to develop a sense of commitment in the long term generation Y need constant constructive feedback and development of its full potential through trainings and a clearly defined career path.

We have elaborated a development program based on communication strategies to be applied according to individual needs and expectations. Standardized applications do not work well with high skilled communicators as is the case of generation Y. Consequently their mentors and trainers have to be good listeners and practice an "open door" policy. HR managers and top managers can take advantage of this program in order to improve retention of the young workforce. Our communication plan aims to facilitate constant interaction with the new hired managers. Firstly, an induction phase has to provide in-depth information of the corporate core values in order to implement a sense of belonging to the organisational culture. Secondly, the assignment of a mentor would help them to be accustomed with the basic work practices and norms. In general mentors are responsible of controlling that accurate feedback and performance appraisal are regularly communicated. Finally, trainings and informative seminars have to be organised both collectively for general issues and planned according to individual needs.

The challenge of motivating young managers to commit and stay in their workplace can be faced with the application of a rigorous communication plan that is institutionalized in the everyday practice of managerial activities.

Abstract

To earn competitive edge as well as for ensuring the sustainable market access in the global trade regime under WTO, due to three major Agreements: TBT, SPS and TRIPS, the economies as well as the industries are facing severe challenges to have access to the technical services from science, technology, innovation, quality and conformity assessment infrastructure of any economies. The key institutions responsible for providing these services are: national-regional-international standards bodies, technical regulation organizations, market surveillance operators, metrology organizations, testing-calibration service providers, certification-inspection bodies, quality and environmental management system certifiers, accreditation bodies, scientific-innovation and R&D organizations. These organizations both in public and private are to be operated under certain legal and regulatory regime to cater the needs of the economy as well as to ensure the level play ground for all in the market. Historically in many cases, especially within the technical organizations operating under public sector have been mandated by laws to perform a number of competing functions: both technical as well as regulatory policing, leaving these bodies with a number potential conflict of interests. In most cases, these are the origins of non-transparency and corruption as such leading these organizations to be ultimately dysfunctional ones facing constraints in delivering the reliable and acceptable services to the clients. These have been identified as the major challenges especially in the developing economies not having sufficient and efficient capacity, competency and competitiveness to take part to the global trade effectively. This technical infrastructure are absolutely critical for sustainable industrial-economic growth facilitating trade, protecting the consumer's rights and environment, ensuring the quality and safety of the products, meeting the

customers as well as compliance requirements and underpinning scientific-innovation-technological and industrial advancement.

Identifying the needs and demand, formulating the suitable strategy, developing these national, regional and international technical infrastructure, devising the business plan for efficient-transparent management of these kind of organization through leadership, earning technical competency, developing human capital, evaluating, monitoring and controlling these technical businesses are major challenges not only for developed economies also for developing, least developed and transition economies. Various tools and techniques are to be developed, applied, verified and disseminated. The global views, options and knowledge realms are to be built, shared, and applied through continuous research and communications among the communities.

Unlike all other scientific and technical fields this rapidly expanding field of knowledge has not been built, shared and communicated in a systematic manner globally. Being an interdisciplinary nature, this subject in business management indeed should be fashioned and shared by the people from almost all disciplines. It has been envisioned that practitioners and visionaries in Standards, Metrology, Testing, Calibration, Quality and Conformity Assessment and Accreditation bodies, Scientific-Industrial QAQC-Technology- R&D Organizations, academia, the policy makers, regulators, legal practitioners, standards users/consumer and market surveillance operators would be the main contributors in developing the global views in this field. People involved in analyzing the impact of these technical services on the national, regional and global economy would also be participating in this process in augmenting further these knowledge realms. Scientific, empirical as well as all other methodologies commonly practiced in search of knowledge in the other fields are also to be applied and shared in search of the knowledge in this field to build better understanding for the further advancement of the civilization. This networking through knowledge management will in turn build the knowledge as the commonwealth for the benefit of all human being.

Abstract

The “valid, acceptable and reliable measurement” is the fundamental to science, innovation and technological development for sustainable industrialization, protection of consumers’ rights and protection of safety of human being as well as plant, animal and environment. “Chemical measurements” for certification underpinning the trade in this era of fierce competition under WTO trade regime are indeed essential tools to overcome the major barriers due to WTO Agreements on TBT and SPS.

Thousands of Bangladeshi laboratories are providing chemical measurement services with out acceptable, reliable, valid, traceable and internationally recognized quality. It is impossible to attain the confidence and reliability in chemical measurements without having access to traceable chemical calibration system as well as without practicing the “Science of Chemical Measurement” within a national framework for chemical metrology. The “science of chemical measurement” is known as the “Chemical Metrology”. The study has indeed identified this huge “gap” in Bangladeshi chemical measurement system as this essential element is absent.

Assessing the needs and demands in chemical measurements the study has come up with the national strategy and implementation roadmap for establishing the chemical metrology infrastructure of Bangladesh for the year 2009-2021 meeting essential international technical requirements. This ‘national chemical metrology strategy’, endorsed on 12 January 2011 by the Ministry of Science & Information & Communication Technology, Government of Bangladesh is the outcome of an exploratory research consists of thorough investigations, brainstorming, working group consultations, inter-ministerial meetings, and extensive process of strategic thinking. Standards, testing, metrology, quality and conformity assessment practices of many other countries/economies have been investigated. Numerous reports, laws and regulations, literature, publications, opinions, national-international experts' views,

communications with export promotion authorities, chamber and trade associations have been consulted. The recommendations from industry-civil-consumers societies, development partners, UN agencies and private-public stakeholders' active in developing the quality and conformity assessment infrastructure have been incorporated during the consultation process. Internal and external (SWOT) analysis has been done. The strategic options, goals, objectives, mission, visions and activities and implementation pathway for setting up the national chemical metrology services in Bangladesh have been elaborated.

It has identified 07 most important and priority fields in Bangladesh in which more than 90% of the chemical analysis are required. This exercise identified the most suitable option for Bangladesh would be to establishing a Decentralized Partnership Based National Chemical Metrology Infrastructure consists of a number of designated national reference laboratories having required expertise in the selected fields and would be lead by a coordinating designated national reference laboratory, namely, the National Reference Institute for Chemical Metrology (NRICM). This strategic analysis has identified 04 Key Success Factors (KSF) and 25 Key Performance Indicators (KPIs) to evaluate/monitor and control the implementation of this strategy as well as to oversee the performance of the designated national reference laboratories embodying the network of the reference laboratory services.

The strategy has clearly defined 08 packages of services from this national system. Through building partnership with other regional and international reference laboratories in chemistry, the designated reference laboratories would be producing, qualifying, quantifying, storing and disseminating Standard Reference Materials, Certified Matrix Matched Reference Materials (CRMs), would be assigning reference values to the candidate reference materials as well as the working calibration standards, would be running periodic inter-laboratory comparison or proficiency testing programs nationwide to check the national testing status as well as competency. These designated national reference laboratories would be participating to the key, pilot and supplementary comparisons hosted by the regional or international metrology communities under the aegis of APMP, BIPM CCQM and other. This infrastructure will also ensure and promote the training and education in analytical sciences as well would be providing the national think tank for laboratory quality management system establishing effective interactions among academia, industries and scientific communities. To ensure the metrological traceability in chemistry up to international system of measurements (SI) hosted by BIPM globally as well as to earn international recognition, these designated reference laboratories must be accredited by the ILAC MRA signatories as per applicable international standards. Within the partnership based decentralized system the coordinating designated National Reference Institute for Chemical Metrology (NRICM) would ultimately be representing

Bangladesh to BIPM via entering into CIPM MRA for Chemistry (MiC) as such would be participating to the regional and international activities hosted by Asia Pacific Metrology Programme (APMP) and BIPM. To reach these goals, Bangladesh should go through a number of political decisions, legal and institutional reforms, technical and financial challenges. This strategy has clearly identified the key challenges and the way forward to overcome them.

THE NON ECONOMICAL CRITICAL SUCCESS FACTORS THAT INFLUENCE THE SUCCESS OF A SPORT EVENT

Kokolakis, Spiros¹; Robinson, Leigh², Henry, Ian³

S.Kokolakis@lboro.ac.uk

²University of Stirling School of Sport

³Loughborough University School of Sport Exercise and Health Sciences

Abstract

Traditional management systems that evaluate and measure performance entirely on financial measures, are insufficient in modern performance measurement systems, where one has to evaluate more specific tangible and intangible factors that influence the success of an organisation. Through this study we try to investigate how the different sport organisations perceive the importance of the NON ECONOMICAL CRITICAL SUCCESS FACTORS (NECSFs). The objective is to identify how NECSFs are implemented in the various organisations' sport events and also to recognise the similarities and differences in characteristics and dimensions according to how they perceive and implement the NECSFs.

Literature Review

Allen et al. (2005) address the positive and negative aspects of events via measurable outcomes that assign a high importance on financial impacts. In contradiction they provide little exploration of impacts -that are less clearly measurable- and the non economical factors. However, the need to assess the contribution that events make in this less tangible area is recognised (Hall, 1997; Allen et al., 2005) but to develop such an analysis requires a narrative as opposed to a statistical approach (Allen et al., 2005). It is accepted that sport event successful organisation involves more than economical parameters. As Ittner et al (1998) and Hemmer (1996) also suggest, non-financial measures of performance are useful to help refocus managers on the long-term aspects of their actions.

Methodology (Research Design and Data analysis)

Semi-structured interviews (Yin 2009) with key personnel at each sport organisation were conducted as a fundamental part of data collection. The research took place in 2009 in the six sport organizations: FIBA, FINA, UEFA, Lausanne Triathlon, Vardinoyannia International Track Field Meeting, and Cyprus Aphrodite Semi Marathon. Five members from each organisation committee have participated in the study. The interviews were recorded, transcribed and then imported into the software NVivo 8 which was then used to structure and manage the data. Taking into account

the responses, a guide of key indicators was developed. With the help of the NVivo 8, these indicators were encoded, transcribed and analysed.

Results

Part of the research analysis, identified as NECSFs the factors that affect the effective organisation performance plan to ensure harmonious relationships with all stakeholders in the framework of the event organisation. The interviewees also consider factors of organisational structure that support collaboration between different departments and promote good working relationships while ensuring the participation of knowledgeable staff at all levels. Amongst these factors one may find the sport event evaluation through surveys, feedback from the various stakeholders, the comparison with previous events and the evaluation of the strategic alignment according to the goals set at the beginning. A remarkable importance has been assigned to factors that support safety and security. In addition, a special category of factors involve volunteerism along with responsibilities and actions that are essential for the successful completion of the event. Last, data analysis at the grassroots level showed the importance of factors that help the organisation develop sport and in parallel promote its values while educating the population. In this category, plans, goals and tasks set by the organisers for the specific event are included.

Conclusion

In order to support the sport organisations to shift towards including also the non economical critical success factors in their organisational plans, a clear and coherent framework is needed which will support the identification, monitoring and the evaluation of their promoting learning and performance assessment.

The framework of the non economical critical success factors must be simple and sufficiently user friendly for a sport event. However, because it is very difficult to organise and plan a universal framework for action and an instrument for evaluation for all types of sport events and all stakeholders, it might be useful to organise a general framework. This framework could follow a personalised process based on the characteristics and dimensions of each sport event so as to use it in a flexible way that ultimately enhances the development effectiveness of the sport event organisation as a whole.

**THE KNOWLEDGE EFFECTS OF PRIOR ALLIANCES ON ACQUISITION
PERFORMANCE: AN EMPIRICAL STUDY**

Kwan, Ian P.L.¹

¹University of Navarra, School of Economics and Bus. Admin. Email: ikwan@alumni.unav.es

Abstract

Motivation: This paper provides further empirical evidence that prior strategic alliances made with firms similar to or in the same industry as the acquisition target positively affect the focal acquisition's performance. In doing so, the paper aims to fill a gap in the literature on how prior strategic alliances affect acquisition performance.

Earlier research: Earlier empirical studies such as Porrini (2004a) show that a prior partner-specific alliance, between a US manufacturing acquirer and target, positively relates to post-acquisition performance. Porrini (2004b), using the same dataset of US manufacturing acquirers and targets, shows that prior general alliance experience is able to positively explain differences in low-tech and high-tech acquisitions. Zollo & Reuer (2010) do an empirical study of US commercial bank mergers and show that prior general alliance experience of the acquirer with any other partner can positively explain acquisition performance provided that there is a lower requirement for post-merger integration and the quality of the acquirer-target relationship is good.

These three published papers are the only ones known to this researcher that study the relationship between prior strategic alliances and post-acquisition performance. This is surprising given the immensity of literature in both these areas. Taking a closer look at the nature of the prior alliance experience studied in these three papers, there seems to be neglect of a middle ground between prior partner-specific alliance experience and prior general alliance experience, namely similar technology or industry alliance experience. This paper tries to fill this gap in the literature by providing empirical evidence that shows how prior industry alliance experience can also positively explain post-acquisition performance.

Theoretical basis: Drawing from the concepts of organizational learning theory (Levitt and March, 1988) and learning transfer theory in acquisitions (Haleblian and Finkelstein, 1999), firms that engage in alliance activity will have a stronger propensity to transfer their alliance learning to acquisition activity rather than vice versa (Wang and Zajac, 2007). Also drawing on the concept of absorptive capacity (Cohen & Levinthal, 1990), firms unfamiliar with new technology or new markets engage in strategic alliances to learn from their partners and from the environment that the alliance is exposed to. As they do so, they become more sensitive to this environment and develop a deeper sense of what is important. The more they repeat or engage in this activity, the more they develop absorptive capacity for this new market or

environment. If the timing and opportunity is right, one partner firm may exercise its (real) option invested in the alliance and buy out the other alliance partner (Kogut, 1991). However, as this paper argues, the choice to exercise or not its option to acquire its partner is not the only one firms have. They can also use their newly gained absorptive capacity from their alliance to search for other more suitable targets within the same industry or with a similar technology base and acquire them instead. The value of this alternative option may often far exceed the option value of acquiring an existing partner. Taken together, this paper hypothesizes that the extent to which a firm has engaged in prior strategic alliances that are similar to the target will be positively related to the performance of the acquisition.

Results: The results of this paper provide further empirical evidence that strategic alliances can increase performance of a future acquisition (intended or not), and hence increase firm value. It also has consequences for how firms can use flexible strategic alliances relationships to learn and then cross from their traditional markets and industry into new markets and technological environments before making much longer commitments such as market entry by acquisition.

Limitations: One of the limitations of the paper is its use of a US manufacturing dataset which has a wide range of industries as the conclusions drawn from this paper may not be the same as those from a dataset of firms that come from a more restricted range of industries. This study also uses the same dataset as Porrini (2004a and 2004b), which is beneficial for the sake of comparison between the results, however for the sake of extending the literature, it may be even more interesting to try the hypothesis testing on another set of data.

A HABITUS OF EARLY RETIREMENT IN THE AGE OF AUSTERITY: LESSONS FOR HUMAN RESOURCE MANAGEMENT

Lamprianou, Iasonas¹

¹Department of Social and Political Sciences, University of Cyprus. Email: iasonas@ucy.ac.cy

Abstract

Early retirement must be distinguished from retirement. The former may be defined as the situation at which people do not work, do not seek work and also consider themselves retired, although their age is below the official (depending on the situation and the country) retirement age. OECD (2005) has defined early retirement (*retraite anticipée*) as *“a situation when an individual decides to retire earlier and draw the pension benefits earlier than their normal retirement age”*.

Economic as well as health reasons frequently make people decide to go on early retirement (Bazzoli, 1985). Bould (1980) and Strandh (2000) found that unemployment encourages people to proceed to early retirement - as an exit strategy from unemployment.

However, it is frequently the case that the employers – or the labour legal framework of some countries – may accidentally encourage people to retire early. Fasang (2010) suggested that there are a number of institutional early retirement pathways which people can follow in order to retire early. Higgs et al. (2003) suggested that organizational restructuring, financial offers, opportunities for leisure and self-fulfillment are some of the factors affecting people’s decision for early retirement. Blekesaune and Solem (2005) suggested that men may find it easier to obtain an early-retirement disability pension because men usually have more physically demanding jobs.

It has been frequently argued that people in the age group of 55-64 should be encouraged to stay in employment for longer. For example, Euwals et al. (2009) explained that the goal of the Dutch government is to retain 60% of the people of this age group in employment by 2020. The EU has been investing for years on research projects to retain people in the labour market for longer (Ketsetzopoulou, 2007).

An important report by OECD (2006) suggests that the percentage of people in employment in the age range of 50-64 varies significantly between countries and between men and women (also see Phillipson and Smith, 2005).

Human Resource managers do not, normally, want their most talented or experienced personnel to retire early. Experienced personnel at the age of 54 or 60, are still very young and able to work productively. Business needs them in order to train younger personnel and pass the organizational culture to the younger generations. For

example, Brooke (2003) suggested that “*findings refute the proposition that older workers are more expensive to employ than younger employees ...*” (p. 279).

The aims of the study

We principally aim to investigate the factors that make people retire early. Secondly, we aim to suggest initiatives to reduce the burden of early retirement on the modern societies and on business.

The data

Data from all 28 participating countries of the 4th round (third edition of the dataset) of the 2008 European Social Survey were used. Only the respondents in the age group 55-64 (including ages 55 and 64) were selected for the analyses. Overall, there were 7011 respondents in this age group. From those, 3940 respondents were classified as active (employment-wise) whereas 3071 were classified as early retired, with an average sample size of 250 persons per country.

Results

Multilevel logistic regressions were used in order to identify the factors that explain the decision of people to go on early retirement. Financial, demographic and other personal reasons can explain the decision of employees to go on early retirement. Education and well as attitudes towards society and political issues are also reasons to take into account. Big differences were also identified between countries but also between regions within the same country.

Discussion

It is important to know which are the employees who are more likely to decide to go to early retirement. Such a knowledge can help governments as well as Human Resource managers to prepare the succession of important employees, or to give to other employees the appropriate motives to stay in employment for longer.

INTERNAL AUDIT CONTROL IN THE HOTEL INDUSTRY IN GREECE

Lemonakis, Christos¹; Sifakis, Emmanuel²; Voulgaris, Fotini³

¹Technical University of Crete.

²Hellenic Open University.

³Tech. Educ. Inst. of Crete

Abstract

Purpose: The Internal Audit Department provides management with sufficient information to determine whether operations are functioning efficiently, effectively and in accordance with management's intent. The study intends to investigate how a well organized Internal Audit Department in the hotel industry will result in lower operating costs and higher quality of services offered.

Design/Methodology/approach: The research is based on qualitative data derived through questionnaires addressed towards 28 large luxury hotels in Greece. Each questionnaire contains 24 questions covering the main areas of internal audit measured on a 1-5 rating Likert scale. The sample, although small, represents almost 67% of the total population for this type of hotels in Greece. The data were treated with the SPSS package. Besides descriptive statistics, the Pearson correlation coefficients were used to investigate the major factors contributing to the efficient operation of a hotel internal audit department.

Findings: The findings suggest that there is a significant relationship between hotel size and size and efficiency of the audit department. Large hotels with well organized Internal Audit, are found to face lower risks in terms of false information and non-compliance with the rules and legislation. This results in a decrease of operational risks in large hotels vs. the smaller ones. The size of the internal audit department is found to correlate with lower operating costs and risks.

Practical implications: The results of the study can be used by hotel management in establishing a well organized Internal Audit Department, or in improving an already existing one, thus providing management with constructive criticism and positive recommendations designed to strengthen and improve performance results and cost effectiveness. This way they can achieve lower operating costs and higher level of services, upgrading the image of the hotel

Originality/Value: To the best of our knowledge, no such research has been done so far for Greek hotel industry. Most of the studies focus on economic analysis and profitability aspects. The internal control is a crucial function in the firm and especially in the hotel industry contributing to both the good reputation and the effectiveness of the hotel.

HOW DO REVERSE LOGISTICS REACT TO A GREEN SUPPLY CHAIN? A CASE STUDY

Lo, Sonia M.¹

¹National Chengchi University, Taipei, Taiwan. Email: Sonia.Lo@nccu.edu.tw

Abstract

Following changes brought on by globalization, the establishment of regulatory bodies (such as WEEE, RoHS) in the EU economic market has had a dramatic influence on the supply chain of entire information technology industry. This has driven the development of Green Supply Chain. From the perspective of green operations, Srivastava (2007) believes that a product can generate significant added value, or be used again for other useful purposes, after it is recovered at the end of its life cycle, and taken through re-manufacturing, updating, re-use, or other processes. Carter and Ellram (1998) believe that green supply chains go through this reverse logistics process to reach their final objective of reducing their use of resources. In view of the important role reverse logistics system plays in the management of green supply chains, this study has chosen reverse logistics as its main focus of research.

This study aims to learn how reverse logistics systems can extend product life cycle and how increased added value can be generated, through the process of reconditioning. The research problem is stated as: "What factors drive the construction of reverse logistics system under the wave of Green Supply Chain? How does the system react to these factors in terms of its players and activities?"

In order to answer this question, a well-known computer manufacturing company in Taiwan is used as the subject for research into reverse logistics systems, as an extension of the back-end operation of that company. We firstly examine the potential drivers from both internal and external as suggested by Carter and Ellram (1998). The resource dependency theory (RDT) is then adopted as a starting point for an investigation into the impact of how these motivational factors have had on the system. The "As-Is" and "To-Be" models of the system are observed, focusing particularly on the "players" of and their "activities" in the system. The overall concept of this study is depicted as below.

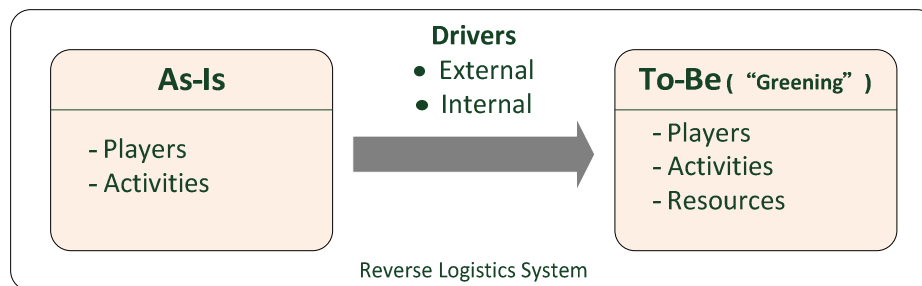

Figure 1. Overall concept for the study

This study uses a case study method to approach the collection and validation of qualitative data. Focusing on the selected case company, we adopted the multiple data collection method as the way to collect our data. These methods include in-depth interviews, plant tours, documentation, and archival records.

Regarding the forces that compel businesses to transform their original reverse logistics systems into one based on green supply chain management, we found that external pressure was due mainly to outside regulations and pressure from competition, as a tactical shift in their strategic dimension. Internally, the main driving force came from support and policy implementation of top management, forcing the business, (within the scope of its operational dimension), to establish communication and procedures internally from the top down.

Product recovery supply chains include four major players: consumers, distributors, manufacturers, and suppliers. The roles of these players are repositioned or renewed following the transformation. Manufacturers move from the original system of disposing recycled products as scrap to extract precious metal from the recycled products that can no longer be repaired. By increasing the exchange of information, manufacturers can gain valuable information regarding the amount of precious metal available for extraction from recycled products or the proportion of original raw materials that could be recovered. This information can then be fed back to the front-end of the product design stage. Where once there was no role for distributors to play, the roles of third party logistics operators and volunteer groups have opened up during the overall implementation of product recovery systems.

The activities involved in the implementation of reverse logistics include five stages: collection, transportation, sorting / inspection, remanufacture, redistribution and sales. After the original recycled products from the internal departments of the business are recovered, they are handled all at once in accordance with the follow-up procedures of processing operators in dealing with recycled products. During the subsequent product recovery process, recycled products are recovered externally from government agencies and general business. The goal of recycling products is to convert them into regenerated products such as computers that are destined for donation in remote areas.

This is accomplished through a two-stage process of additional inspection and disassembly, with redistribution sales. Product recovery activities in shipping and re-processing vary, according to different recovery sources, the quality of the recycled products, and the objectives involved. With regard to the effects they have on the delivery process, third-party logistics operators are commissioned for outsourcing the delivery of recycled products, with assistance provided for the planning of shipping routes. The quality of recycled products for external recycling can only be determined by repair and maintenance operators, while recycled products that cannot be repaired will be handled by third party logistics operators. Products from within the business that are unsuitable for repair are taken away by the processing operator. After passing through repair or maintenance, they have regenerated value and are donated to others for use, rather than having the original recycled products disposed of as scrap by the processing operators. This is accomplished through reprocessing procedures progressing from original product recovery, to added repair and maintenance, to added re-manufacturing.

The take-back method was employed in the research background. Based on this conceptual structure, further development could be made in the reverse logistics system of product buy back. Further, an increase in the sample size could more comprehensively encapsulate the operational criteria of the reverse logistics model.

This study investigates how the reverse logistics system reacts to the internal and external drivers for the "Greening" purpose. It discusses both the "players" and "activities" in the relevant process, and proposes a realistic To-Be model. This model is expected to serve as the basis of a general reference for the computer-related industry.

This study collects practical evidence to investigate the relationship among drivers, players, and activities of a reverse logistics system. By analyzing the As-Is and To-Be models, the roles of "players" and "activities" are re-defines. This study further extends the application of Resource Dependency Theory in the supply chain management area.

EVALUATING THE TENDENCY FOR ENTREPRENEURSHIP AMONG UNIVERSITY GRADUATING STUDENTS IN CYPRUS

Matsangides, Christos¹; Kriemadis, Thanos²

¹Department of Sports Management, University of Peloponnese. E-mail: matsagidis_c@yahoo.gr

²Department of Sports Management, University of Peloponnese. E-mail: thanosk@uop.gr

Abstract

This study was carried out for the purpose of understanding the tendency for entrepreneurship among university graduating students in Cyprus. Specifically, this study expects to identify the factors that tend be more influential on entrepreneurship as well as the extent to which those factors influence this tendency.

The primary purpose of this study is to understand the tendency for entrepreneurship among university students in Cyprus. Specifically, this study is sought to identify the factors that tend be more influential on entrepreneurship as well as the extent to which those factors influence this tendency. It is crucial to investigate the importance of those certain factors and the extent to which they influence the tendency for entrepreneurship of those who finish their university degrees since these are the type of entrepreneurs that could be more able to generate high value entrepreneurship. A secondary purpose is to compare the results of this study with the study results from other populations.

The data used in this study was gathered from graduating students in the University of Cyprus, University of Nicosia Cyprus, and the Technological University of Cyprus. A self-fulfillment questionnaire will be administered on a personal basis, that is, data will be collected through use of a written questionnaire hand-delivered to participants. In-office research was employed, which allowed high flexibility of data collection. Administering the questionnaire on a personal basis, allows the researcher to explain and clarify questions that were complex in nature (e.g. lengthy and complex scales).

A number of statistical techniques were utilized for analyzing the data. These were ranging from simple descriptive tests such as frequencies, descriptives, crosstabs and multiple response analysis, to more complex tests such as chi-square tests, a one-way Analysis of Variance (ANOVA) tests, and correlation analysis.

This study tested whether the tendency for new ventures among university graduating students depends on socio-demographic, contextual, and psychological features, using a survey questionnaire administered on a personal basis. It identified that the tendency for entrepreneurship depends on such factors as, age, gender, nationality, family background, income level (social-demographical characteristics); university attended, undergraduate program, number of disciplines on

entrepreneurship, oriented incentives programs (contextual characteristics); and associativism, team sports, fortune games, openness (psychological characteristics).

This study was carried out for the purpose of identifying the main factors that influence the tendency toward entrepreneurship.

The first objective of the study was to assess the factors that influence the tendency for entrepreneurship among university students. The current study identified that students tend to assign high importance to motives such as seize the opportunities, to develop the region/country, self-fulfillment, security in terms of income, and be innovative. The current study also identified the most important discouraging factors which are, lack of financing, lack of information, economic instability, lack of knowledge in entrepreneurship issues, and lack of experience.

The second objective was to identify the factors that tend be more influential on entrepreneurship. It was verified that age, university attended, university program, gender, student's nationality, father's education, household income, father's professional activity, mother's professional activity, sports, sports preference, student belonging to sports association, student belonging to social solidarity association, gambling, risk taking, and traveling abroad, are the main variables that influence the tendency toward entrepreneurship.

The third objective was to test whether the tendency for new ventures among university graduating students depends on socio-demographic aspects. The fifth one was to test whether the tendency for new ventures among university graduating students depends on contextual features. Finally, the sixth objective was to test whether the tendency for new ventures among university graduating students depends on psychological features. The analysis of students' responses showed that the tendency for entrepreneurship depends on such factors as, age, gender, nationality, family background, income level (social-demographical characteristics); university attended, undergraduate program, number of disciplines on entrepreneurship, oriented incentives programs (contextual characteristics); and associativism, team sports, fortune games, openness (psychological characteristics).

**VOCATIONAL EDUCATIONAL TRAINING (VET) IN EMERGING MARKETS:
THE MARKET-ORIENTED AND INNOVATIVE APPROACH TO
INTERNATIONALIZATION OF EDUCATION SERVICES**

Mewaldt, Andrea¹

¹University of Latvia, Germany. Email: mewaldt@open-europe-consulting.de

Abstract

In Europe, the theme “Export of educational services” is rather new, but currently politically and economically en vogue. It finds interest in industries, as well as in SMEs, and in the scientific sector.

With view to globalization industries and their suppliers need to invest in emerging markets like Central and Eastern Europe, Russia, South Africa, China or India. There, they face a tremendous lack of well-trained workers below the management level, mainly in technical or commercial vocations.

Internationally unique is that in the German speaking countries (Austria, Switzerland and Germany) the vocational training is provided by the public-private co-management of employers and public training institutions (Dual System).

Abroad, the quality of this co-management system is highly acknowledged, but often the local situations differ so much that the Dual System cannot be installed in the same manner as in the home market.

On top, education in emerging markets is the profit-making and non-profit making good at the same time. Without contributing to the population education on the whole the export of education is politically less accepted, neither in the home country, nor in the emerging markets.

The German educational system is very heterogeneous due to the fact, that the education is ruled by the 16 Federal States and it makes defining common standards and a joint marketing in target markets very difficult. As we can see by the newest studies the export of German education services is underdeveloped compared to the Anglo-Saxon educational systems.

In 2009 the Federal Ministry of Education and Research in Bonn / Berlin announced the strategic goal that Germany should become world champion in the field of education export until 2015. For common marketing and quality standard supervision the label “EDVANCE” (education advanced) as an international brand for German export of education was launched, but it is not executed, yet.

The main focus of this research is to explore the best practice for the export of education services with regard to vocational education training (VET). Based on the

requirements of strategic management, export management, international marketing, business development and other related knowledge fields requirements for the export of education will be compiled to the comprehensive strategic model for the export of education. The market-oriented and innovative model will consist of three stages: Strategic planning, market entry and market penetration.

The research follows the method of “Market-Oriented Innovation Management” based on Kellner (2007: 41). This research method consists of seven steps:

(1) Definition of the specific kind of innovation: the innovative prototype model for the export of VET services to emerging markets is presented; (2) Enquiry about the requirements of the respective users regarding the innovation with the contribution from the literature review including market studies and pilot projects’ reports from Germany, Austria, Russia and Vietnam. And, in the following research stages with the knowledge input from five case studies conducted for the export of VET services in Central and Eastern Europe, Russia, South Africa, China and the Middle East; (3) Description of the characteristics gained from various fields of knowledge co-operation between with Germany and the outcome of the reflected experiences; (4) Development of the innovation: the combination of suitable characteristics to meet the requirements, and to create new features is developed; (5) Innovation’s application and test with view to the required features; (6) Critical reflection of the innovation to improve future operations; (7) Critical reflection of the innovation application to improve the innovation itself. In a shorter form the steps 5 and 7 may be left out and offered to further research.

In this first paper the three stages of the innovative prototype models for the export of VET services are presented. There are based on researcher’s field experience and the described requirements and characteristics drawn from the literature review.

Keywords: Globalization, strategic management, export, vocational educational training (VET)

EXPLORING LOCUS OF CONTROL IN THE REPUBLIC OF CYPRUS

Michael, Andrew¹

¹Intercollege, Larnaca. Cyprus. Email: mandy@cytanet.com.cy

Abstract

Purpose: The proposed study is concerned with the cognitive-based construct locus of control. It aims to determine whether citizens in the Republic of Cyprus tend to be more internal or external while also investigating potential differences across gender, age, race and ethnicity. A secondary objective is to determine if college students' locus of control is related to their academic achievement. Although this particular study is cross-sectional in nature, this research is also part of a wider, longitudinal study that aims to determine if an individual's locus of control significantly changes over time.

Theoretical background and selected relevant literature : Locus of control refers to people's beliefs about how much control they have over their lives (Lefcourt, 1966; Rotter, 1966). Individuals with a more internal locus of control, called internals, believe that they are in control of their lives. Externals, believe that they have less direct control of what happens to them, attributing their life experiences to external factors or luck that are beyond their control.

Locus of control is a psychological construct derived from social learning theory (Rotter, 1954). It is theoretically linked to the notion of control beliefs (Averill, 1973; Skinner, 1996) which has been associated with various affective, behavioral, cognitive and physiological outcomes (NG et al., 2006). Although control beliefs may be dispositional in nature, unaffected by external reinforcements (Lefcourt, 1976; Phares, 1976), they may also be affected by social experiences (Langer, 1983; Lefcourt, 1976). Locus of control has been studied considerably due to its theoretical importance and practical implications.

Studies conducted on locus of control extend the work on the role that personality has on work behavior. Empirical evidence has shown internal locus of control to be positively related to desirable outcomes such as better academic achievement, mental well-being, life satisfaction, job satisfaction, intrinsic task motivation, job involvement, organizational commitment, higher earnings, transformational leadership, and job performance (Findley & Cooper, 1983; Judge & Bono, 2001; NG et al., 2006; Njus & Brockway, 1999; Spector, 1982; van Praag et al., 2004); and negatively related to job stress, turnover intentions, work-family conflict, overall burnout and depression (Benassi et al., 1988; Howell & Avolio, 1993; HG et al., 2006).

Other studies have investigated whether there are gender differences with respect to locus of control. Parson and Schneider (1974) found female university students to be

less internals than males. Similarly, Khanna, Molinari and Khanna (1977) also found liberal arts college female students to be more externals than males. However, Lee and Dengerink (1992) did not find any statistically significant differences in gender among state university students, both sexes being internals. This finding was similar to those of three other studies in which college students tended to report an internal locus of control (Knoop, 1981; Pascarella et al., 1996; Rotter, 1966).

Originality/value : Although numerous studies have been conducted on locus of control in other countries, research on this construct in the Republic of Cyprus seems to be very limited. This research aims to fill this gap by contributing to the paucity of studies carried out on the construct in Cyprus. The findings may provide empirical evidence on whether Cypriots in general are internals or externals, and whether locus of control differs across age and gender. Moreover, due to the racial and ethnic diversity of the residents of the Republic of Cyprus, subject responses may help to identify statistically significant differences with respect to race and ethnicity thus further contributing to our theoretical understanding of the construct while permitting comparisons with studies carried out in other countries.

Design/methodology/approach : A quantitative research approach involving a random sample of adults and a non-probabilistic convenience sample of undergraduate students will be used for the purposes of this study. Rotter's I-E Scale (1966) will be used to measure individuals' locus of control. This scale has repeatedly shown high validity and reliability. Statistical tests will be used to determine any significant differences in locus of control across age, gender, race and ethnicity thus permitting for comparisons with the extant literature. Bivariate correlations will also be estimated to determine any statistically significant relations between undergraduate students' locus of control and their overall Grade Point Average (GPA) as a proxy for academic achievement.

Findings : Similar to other studies, the results obtained so far suggest that undergraduate college students tend to have an internal locus of control. The complete findings will be presented at the conference after the collection of all questionnaire responses and their analysis.

Managerial implications/Research limitations : The findings of this study along with conclusions of the planned longitudinal research should be of practical use to managers. Given the desirable attitudinal and behavioral outcomes associated with an internal locus of control, managers may be able to improve the performance of their organization through better selection and retention of workers that may be achieved by using an appropriate instrument to measure job applicants' locus of control. Additionally, if a statistically significant relationship between internality and GPAs is found, organizations may benefit from management selection practices that seriously

consider job applicants' academic achievement. However, if an individual's locus of control changes over time becoming less internal (more external) with age, then the appropriateness of using locus of control measures to improve selection decisions will need to be reconsidered. One of the limitations of this study is the inherent bias in the non-probabilistic sampling procedure used to obtain responses from undergraduate college students.

WASTE MANAGEMENT AND SUSTAINABILITY: A NEW BUSINESS MODEL

Modena, Ivana¹

¹International University of Geneva, ICC, Route de Pré-Bois, 1215 Geneva 15, Switzerland, Email: imodena@iun.ch, <http://iun-ch.academia.edu/IvanaModena>

Abstract

We are entering an era of renewed environmental consciousness. Innovative waste management practices are becoming more and more important in socially responsible enterprises. The trend towards corporate responsible behaviours is increasing and the issue about ecological awareness is absolutely relevant today. Producers and retailers are concerned with implementing their environmental efficiencies to act for the good and to improve their image upon their stakeholders. It is necessary to rethink the way that enterprises reduce the production of waste material to achieve sustainability and the way that technological advances can help collect, recycle and reuse waste. Many stakeholders are involved in this process; producers, retailers, citizens and municipalities.

The theoretical framework of systems thinking will be applied to understand the crucial stakeholders' linkages. In practice, there is the necessity to raise awareness on the shared goal of acting in a sustainable way. Producers and retailers need to reduce energy and packaging, citizens have to separate waste and municipalities should organize and control the collection and recycling of dry/wet waste and guarantee their separation.

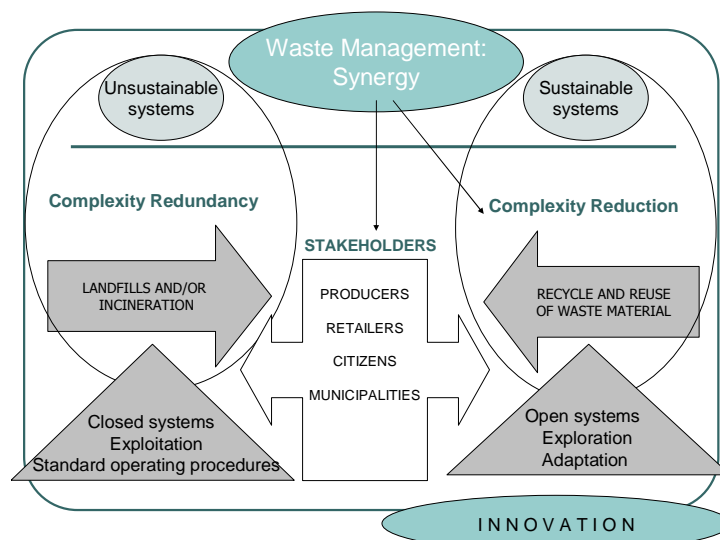

The most influential European and American supporters of the systems theory are Niklas Luhmann, Daniel Katz, Robert Kahn, Russell L. Ackoff, Peter Senge John Seddon and Peter Checkland. A systems theory approach applied to practice helps understand how to solve complex problems by seeing how actions and events influence one another as a whole. Using the language of systems thinking exploration of new forms of waste management or adaptation to environmental threats is the best practice to reduce complexity. Open systems, as opposed to closed systems, have the capability to anticipate change and gain competitive advantage. Indeed, systems thinking competence is needed to manage the complexity of new events and forms of interactions. All independent parts of a whole have to collaborate to reach the common goal of the long lasting survival of our planet. For example, producers, retailers, citizens and municipalities are both independent parts of the same system and connected to one another to accomplish the duty of respecting the environment and anticipating a predictable crisis. The complexity of today's globalizing world combined with the rapid changes must be challenged through new ways of thinking to explore

both innovative technological advances and organizational practices or to adapt to environmental threats.

The new model proposes to collect, recycle and reuse the dry waste that has not yet been recycled. This is crucial to avoid that solid waste will still lie in landfill sites or will be burnt out causing significant damage to the environment. Wet waste refers to organic wastes such as vegetable peels and left-over food. Dry waste is in general mixed waste that does not contain food or other organics. Specifically, contaminated recyclables such as waste paper, metal cans, plastic bottles, floppy disks, batteries, glass bottles, old clothes, baskets, pens and shoes are at present materials for recycling. What remains is still a significant amount of total waste – even in countries with the highest level of recycling, this could be around 15-30%. Right now the solutions are landfill and/or incineration. A potential alternative is to develop an industrial process that could clean and sterilize the waste and to make new raw material for low grade industrial use, like plastic pellets. This innovative industrial process cannot be put into action without the synergy of stakeholders who have to collaborate to fit into a mechanism of coordinated action. Producers and retailers should support this initiative by promoting environmentally friendly behaviours in their advertising campaigns, slogans and packaging. Citizens should separate dry/wet waste and conduct an adequate separate waste collection. Finally, municipalities and even governments should fund new forms of collection to allow innovative ways of managing waste.

This new business model based on the theoretical framework of systems thinking is an important contribution to sustainability because the synergy between stakeholders with diverse needs and expectations is crucial to the long-term survival of our societies.

WINE TOURISM MODEL IN ALENTEJO, PORTUGAL – TOWARDS A CONCEPTUAL FRAMEWORK

Neves, Joana Maria de Oliveira¹; Silva, Sarah Feilman Quina²

¹Associate Professor of Marketing and Tourism at the Universidade Lusófona de Humanidades e Tecnologias de Lisboa. Universidade Lusófona de Humanidades e Tecnologias de Lisboa, Departamento de Turismo. E-mail: jn.turismo@gmail.com

²Escola Superior Turismo e Hotelaria do Estoril (ESHTE), Departamento de Mestrado em Turismo. E-mail: sarah.quina.silva@gmail.com

Abstract

Alentejo has a long tradition in wine production. However, it's only in the past decade that investors, tourism industry professionals and other regional strategic players began recognising the link between the tourism industry and wine as a relevant factor of regional development and sustainability of its economy. In fact, at global level, wine tourism is an economic activity of rising importance with several potential positive impacts and this explains why countries and regions with a strategic vision of the future integrate it in their tourism strategies. On the other hand, the fierce competition among international destinations, unthinkable until very recently, highlights the need for their differentiation and strategic (re) positioning, based on their endogenous and really distinctive resources. In this context, it is essential to understand the structural dimensions of wine tourism, its dynamics and interactions, in order to develop an appropriate model for the Alentejo region. The literature review on this field of research has revealed gaps in what regards the possible approaches to the development of this tourism product. This paper aims to develop and discuss a wine tourism framework appropriate to the specificities of the Alentejo, a south region of Portugal.

The methodological approach to be followed is based on the following steps: (1) review of the literature on wine tourism, on regional development, on governance and on marketing of tourism products; (2) secondary data collection based on existing studies, reports and statistics on the region's economy, tourism and wine tourism; (3) inventory and assessment of Alentejo's existing wine tourism resources as well as other tourism resources which contribute to increasing the value of wine tourism; (4) primary data collection and analysis, to develop a qualitative study. This should be achieved through interviews with various players somehow involved in wine tourism, public (Municipalities, Tourism regional and Tourism promotion agency and the Alentejo Regional Wine Producers Association - CVRA) and private (owners/managers of wine tourism facilities, wine producers, restaurants and hotels in the region and people in charge of other tourism facilities); and (5) development of a benchmark study about other wine tourism destinations. With these results it is possible to present and

discuss a conceptual framework for an adequate wine tourism model in Alentejo, mainly supported on seven structural pillars: Core wine product, Core destinations appeal, Cultural product, Tourist motivations, Governance, Branding and Distribution.

The wine tourism model identified in this study gives many relevant clues to the owners of tourism facilities and tourism professionals as well as to the destinations managers on the appropriate ways to develop the wine tourism product in this particular region, on levels of accountability among players and on ways to market the product. Specifically, we must take into account the current trend of international tourism demand motivated by “things” related to wine and its degree of knowledge and expertise. The governance model to be adopted is critical to this product success. In terms of requirements linked to its distribution, the importance of focusing on specialized channels should be stressed although mass channels should not be overlooked since we need to take into account the increasing demand by visitors and tourists whose primary motivation is not wine.

Keywords: Wine Tourism, Tourism Product Development, Tourist Experiences, Regional Players Dynamics, Wine Tourists, Wine Tourism Models.

THE NEGOTIATING CULTURE IN FRANCE: A QUALITATIVE STUDY

Ogliastri, Enrique¹; Rendón, María Isabel²; Rivera, Mauricio³; Fosse, Sébastien⁴

¹INCAE (Costa Rica), IE Business School (Madrid). Email: Enrique.Ogliastri@ie.edu

²Universidad de los Andes (Bogotá)

³INCAE Business School (Costa Rica)

⁴IE Business School

Abstract

We are making four contributions. First, a mix of academic as well as practitioner approaches. Second, our study builds on previous studies about French culture by using an in-depth qualitative approach. Third, our study aims to contribute to the academic debate on methodologies used for qualitative research. Our study uses both ethnographic primary materials (interviews) and secondary data (historical accounts). Fourth, our paper contributes to advance the field of cross-cultural management studies.

The predominant negotiating culture in France is characterized by the effective achievement of objectives through confrontation and logical debate to obtain an advantageous position over the other party. Highly competitive and untrusting, this culture tends to see negotiation as a win/lose situation. It is a formal culture that follows protocol. Extreme and carefully justified opening demands are common. Negotiation is a slow bargaining process in which sometimes threats and rudeness are mixed with charm to pressure the other party. The negotiator is the most senior person in charge, with a supportive team. It is expected that the chief negotiator will take few risks, will manage his time well and will leave the agreements in writing. We found differences between commercial and political negotiations and personal conflict resolution. We used a qualitative research methodology based on 251 structured interviews with open questions on specific experiences with intercultural negotiations. This report includes three studies carried out independently but using the same methodology.

Keywords: Intercultural negotiation, France, qualitative methods, French culture.

EMERGING ISSUES IN HUMAN RESOURCE ACCOUNTING: A CASE STUDY OF INFOSYS TECHNOLOGIES LIMITED

Ojha, Sandeep¹

¹Assistant Professor, International Business Department, College of Applied Sciences, Salalah, Sultanate of Oman. Email: sandeepojha555@gmail.com

Abstract

Now the day's businesses have reached at its developed stage. In any type of business two types of resources are used; active resources and inactive resources. A business cannot be operated unless there is human resource. There are different compositions of the human resource. Human resource is called as active resource as it uses the other non active resource and makes it possible to the best utilization of that inactive resource. We also know that in modern manufacturing environment the quantity of human resource has been reduced up to a great extent but still without a minimum quantity and quality of human resource, a business cannot be operated. Hence, the human resource will always have an upper hand over the other inactive resources.

As the HRA is compulsory neither under the Companies Act, 1956 nor under the Accounting Standards, this paper is an attempt to explore prevailing practices of HRA in Infosys Technology Ltd by applying Lev & Schwartz model.

Keywords: HRA, Active Resources, Inactive Resources, Infosys, Human Capital.

OBJECTIVES OF THE STUDY

The present study has been taken up with the following objectives:

- (i). To investigate current practices in Infosys Technology Ltd.
- (ii). To analyze the current human resource valuation practices.
- (iii). To highlight the challenges confronted by the organization in adopting human resources accounting.
- (iv). To provide information regarding costs and benefits associated with investment in human assets.
- (v). To ascertain whether human resources valuation is worthwhile for internal management purposes as well as for decision making by investors, financiers and creditors.

- (vi). To ascertain the viewpoint of executives professional accountants and shareholders about the desirability of public disclosure of human resource data by corporate enterprises.
- (vii). To suggest effective human resources accounting model for Indian corporate companies.

RESEARCH METHODOLOGY

1. Sample Area: The present study is a resource approach to manpower. To make the study more concrete and meaningful, the researcher has selected Infosys Technology Ltd
2. Period of the Study: 2003-2004 to 2007-2008
3. Methods of Data Collection
 - a) Primary Sources: The primary data for the purposes of the study have been collected from the corporate office, zonal office and divisional office and branches of Infosys Technology Ltd. Personal interviews were held at various levels of the enterprises viz. managers, executives, supervisors, technical staff, clerical and office staff, etc. to collect primary data.
 - b) Secondary Sources: These include annual reports, journal and magazines, standard books, newspapers and other literature.
4. Sampling Technique: Sampling technique used in the study is deliberate sampling technique.
5. Statistical Tools: To test the given hypothesis and presentation survey findings, the appropriate statistical tools, wherever necessary, have been used.

IMPACT OF TORISUM IN OMAN ECONOMY

Ojha, Sandeep¹

¹Assistant Professor, International Business Department, College of Applied Sciences, Salalah, Sultanate of Oman. Email: sandeepojha555@gmail.com

Abstract

Oman economy is one of the fast growing economies in the world. The contribution of the tourism sector in the economy is also note worthy. So the government must give more focus on the promotion for this sector this will lead to increase its contribution towards Omani economy.

The Main objective of this research was to find out the impact of tourism sector towards the GDP of the country Oman, along with how can we increase this impact and generate more income from the tourism sector. The study reflects some insight on how to work further in the direction of making tourism sector a backbone of the economic system of Oman.

I use statistical package for social science (SPSS) software to analysis the data. Two variables have taken, number of tourists visit Oman and real GDP, where number of tourists has considered as independent variable and real GDP as dependant variable. Regression analysis will be used to test relation between tourism sector and GDP in Oman.

Keywords: Economy, Tourism, GDP, Oman, Variables.

Introduction;-

Tourism has become a flourishing business around the world. Oman has considered both politically stable and physically safe for tourists, for that it has a medium-term plan, Vision 2020, to develop areas of its economy away from their present dependency on oil and gas production. Information related to contribution of tourism sector on the economy of other countries is introduced in the research scenery data from ministry of tourism are used to study the effect of tourism sector on Oman economy.

Research Questions and Objectives;-

Research questions

- a. Will the tourism industry contribute to Oman economy?
- b. What are the policies that can be used to how increase the revenue from the Tourism industry?
- c. How we can make tourism industry more effective?

The objective

This research is value addition to researches conducted in this area. So, how can we increase impacts and generate more income from the tourism sector .In Oman there is a few research study this area especially the relationship between GDP and tourism. For that we expect to have positive relation between GDP and Tourism in Oman.

Research Methods Adopted

The research includes secondary data for the period (1998-2007), collected from ministry of tourism, chamber of commerce in Salalah and have referred many books like -National accounts bulletin book/ ninth issue 2009, Statistical year book / thirty second issue 2004, Statistical year book / thirty fifth issue 2007, Book the sixth development plan (2001-2005)/ third book in 2001, Book the seven development plan (2006-2010)/ the first document and analyze collected data with the help of statistical package for social science (SPSS) software.

Concluding observation

Research indicates the positive relation between GDP and Tourism sector .Oman on an average has earned around 0.6% to 0.7 % from the tourism sector. This contribution is praiseworthy and worth noticing.

**MARKETING AND COMMUNICATIONS IN ITALIAN UNIVERSITY HOSPITAL:
THE CASE OF PIEDMONT REGION**

Passarani, Diana Anna¹

¹Department of Business Studies, Faculty of Economics, University of Eastern Piedmont, Via Perrone n.18, 28100 Novara (Italy). Email: diana.passarani@eco.unipmn.it

Abstract

Italian university hospitals are a kind of “teaching hospital” that are covered by specific agreements between health institutions and universities, contained in Legislative Decree no. 571/1999 and Decree of the President of the Council of Minister May 24, 2001.

University hospitals are custodian of a triple mission:

- a) delivering specialized and innovative medical care to patients (health care function);
- b) providing clinical education and training to future and current doctors, nurses, and other health professionals (teaching function);
- c) carrying forward scientific research (research function).

This paper aims to contribute to the literature about communication’ methods of services provided and their relevance to users' needs of Italian university hospital – through the instrument of case studies.

The structure of our paper is as follows:

- a) introduction: the concepts of marketing and communications in health care;
- b) selection of the Italian university hospital located in Piedmont Region, as the sample of the research;
- c) analysis of the characteristics and methods of marketing and communication adopted.

Introduction: the concepts of marketing and communications in health care

In the case of marketing for health care, you make a mistake to associate the concept of target marketing to "sell" the image of the company or the services it provides. In healthcare, marketing aims (Caldesi, 2008) not to increase demand, but to increase the relevance of the service provided to citizens' demands with the ultimate aim of:

- maintaining and strengthening the relationship of trust between the company and the patient, and

- improving the quality of performance from a technical point of view.

Marketing in healthcare (Achard, 1999) assumes, therefore, particular connotations that arise:

- the performance characteristics, and
- the specific rules of law and ethical conduct of providers as protection of (i) health, (ii) process of choice for users, (iii) principles of customization and confidence which is based on the doctor-patient relationship.

Marketing appears to be strictly related to the role of communication in healthcare. Therefore, the latter plays an important role in three major areas of the healthcare setting: prevention, health care services provided and access to them.

Selection of the Italian university hospital located in Piedmont Region, as the sample of the research

In Piedmont Region, three university hospital (AOU – “Aziende Ospedaliere-Universitarie”) has been established. They constitute the sample to be examined as described in section c).

Analysis of characteristics and methods of marketing and communication adopted

The analysis was conducted through observation of the marketing mix variables, listed below and briefly discussed.

1. Services provided: they have four distinctive characteristics (Kotler et al., 2010), which influence marketing programs: intangibility (unlike physical goods cannot be seen, touched, heard, etc. before to be bought), inseparability (services are produced and consumed simultaneously), variable (depending on the person providing them, where and when) and perishability (cannot be stored); in particular, the analysis focuses on the marketing methods adopted on the following services:

- prevention service: as the realization of information campaigns on issues of health with the goal of educating citizens;

- care services: not only as the type of care services offered, but also as formality of access to care;

- teaching activities.

2. Payment of services:

- care service: the Legislative Decree 502/1992 has introduced the system of charging of the National Health Service. The rates are fixed according to the type of performance and they are uniform throughout the country. The health agencies are therefore

considered price-taker for the limited autonomy in the determination of prices of services (except for those provided under professional services). Following measures: DM 15/04/1994 sets out criteria for determining tariffs; DM 14/12/1994 defines the maximum rates for types of services. In this context, Regions must adopt its own tariff in accordance with the guidelines above and DM 1/1995 of the Ministry of Health. Rates are updated and supplemented with DM 30/06/1997. Finally, DM 31/07/1997 containing guidelines for the signing of Memoranda of Understanding (“*Protocolli d’Intesa*”) University-Region, as stated in art. 6, law no. 502/92, provides for Regions recognizing the higher costs induced in the care services of the functions of teaching and research and paying university hospital concerned an integration from 5 to 8% of the value of care;

- educational activities.

3. Promotion: what about advertising techniques for the above mentioned services?

Keywords: Marketing of health care, health care services, university hospital, teaching activities, research, promotion, advertising techniques.

Abstract

Purpose – The aim of this study was focussed on an investigation of the tourist behavior who make a cultural journey for the purpose of attending an event, both at the stage of taking decisions about the journey, that is, before undertaking it, and once at the destination, as a function of the dimensions of national culture proposed by Hofstede et al. (2010). From a review of the literature it is possible to observe growing interest in analysing culture within the tourism sector (Reisinger and Turner, 2003). Culture is seen as an effective tool allowing a better understanding of tourists and the identification of similarities and differences among them, this permitting the development of products more suited to their needs and more appropriate and efficacious communication campaigns. There are various theories on culture, but Hofstede's cross-cultural investigation (1980) is one of the most widely accepted and tested of these.

Design/methodology/approach – In carrying out this investigation, use was made of data from the international survey performed by the Association for Tourism and Leisure Education (ATLAS). Discriminant analysis was applied to identify the cultural tourist behavior patterns that most strongly distinguished between the cultures that developed, with countries being classified in accordance with Hofstede's cultural dimensions.

Findings - On these lines, the study demonstrated that certain tourist behavior patterns are more often by given cultures than by others, with significant differences existing between them.

Research limitations – This study was limited to the analysis of a relatively small sample, concentrating on just four European countries (France, Germany, Spain and United Kingdom) and the United States. An investigation including a larger number of countries would permit more interesting and complete results on cultural differences to be obtained.

Practical implications – The ultimate objective was to provide information relevant to the development of products and communication strategies by destination managers, tourism enterprises and public institutions that are being aimed at the various markets from which cultural tourists come.

Originality / value – In a review of the literature, few references are found to research into the influence of cultural dimensions upon the tourist behavior, and these, moreover, refer to travel in general, not specifically to cultural tourism. This makes it necessary for more exhaustive work to be done on the topic.

Keywords - National Culture, Hofstede, Cross-cultural behavior, Cultural Tourist, Information search, Tourist behavior pattern

BRANDING FAMILY BUSINESSES IN THE TOURISM SECTOR**Presas, Pilar¹; Guia, Jaume²; Muñoz, Maria Dolors³**¹Universitat de Girona, pilar.presas@udg.edu²Universitat de Girona, jaume.guia@udg.edu³Universitat de Girona, dolors.munoz@udg.edu**Abstract**

Motivation and background: We are in front of a society where there is a hard competition between companies to get a higher market share. It is a race against time through different sorts of strategies to avoid running out of the market place. The strategies of the businesses have to be oriented to the differentiation of the business itself, not just a product differentiation, because that one is easily imitable for competitors.

This paper takes a closer look at how family businesses, which mostly are small or medium companies, can build and manage a brand. We argue that family firms have unique resources and capabilities, called familiness, which affect their competitive position. This supports recent research that has shown the importance for family businesses of developing their own brand. The aim of the present paper is focused on finding out which brand strategy a family business should opt for building a strong and differentiating brand.

Research Questions: The main research questions of this article are:

- How a SMEs family business can build a differentiating brand?
- Which brand strategy should they follow?

Theoretical framework :The brand is the main mechanism for companies to gain competitive advantage through differentiation on competition through intangible elements of the business, since there are increasingly more products and services to market with the same characteristics (Velilla, 2010). So the key of success is not to be the best, but in fact be different. Building and managing strong brands guarantee a series of benefits to firms, for example customer loyalty, higher profit margins, market value (O'Neil and Xio, 2006), acceptable price changing, brand extension opportunities (Keller, 2001), and lower risk perception by customers (Yesawich, 1996).

Although all companies since their beginning have an innate brand, there is a lack of knowledge about the use of differentiation strategies because of the lack of resources and knowledge. In addition, there is a preconceived idea that the development of a brand is only available to large companies. SMEs have an advantage over large companies which is the proximity between the company and the customer, especially those in service sector where there is direct contact between both parts.

A family business can use the brand as a strategy to communicate the soul of the company to the customers and connect with them emotionally (Berry, 2000), taking advantage of the inseparability of production and consumption. The distinctiveness is achieved through building and communicating a brand well defined, through both internal and external communication (Berry, 2000). The results of the internal communication are the motivation of employees to offer a better service to consumers, which will be a distinctive element. The external brand communication is the information that customer receives about the company and its service, which is not fully controlled by the company, as it is disseminated by the same consumers through for example word-of mouth communication (Berry, 2000).

The traditional communication strategy for family businesses is the use of stories drawn from the history of the family and family business and stress the family business origin, their culture, traditions and other unique characteristics. Storytelling makes an organization more human (Gabriel, 2000). Family businesses should then use storytelling as a management communication tool to create a strong and differentiating corporate brand.

Methodology: An empirical study has done using a qualitative research. The sector chosen to perform our analysis is the wine sector which is family-owned in Catalonia, Spain. The data was collected both through interviews with the businesses and from their websites. On one hand we want to characterize the role of the family in the business. And on the other hand, we would like to observe the presence or absence of the family in the brand strategy, and analyse the family business communication strategy.

Results: Family firms can uses storytelling as a mechanism for family businesses to develop a differentiating brand. The research is still in process, and we do not have results on the differences between family and non-family firms in this respect.

Contribution / Research highlights: The analysis of storytelling as an strategy to build a differentiating brand for SMEs family businesses.

Keywords: family businesses, tourism, branding, storytelling

BRANDING THROUGH CSR: A COMPARISON OF FAMILY VERSUS NON-FAMILY FIRMS

Presas, Pilar¹; Marquès, Pilar²

¹Universitat de Girona, pilar.presas@udg.edu

²Universitat de Girona, pilar.marques@udg.edu

Abstract

Motivation and background: The present paper explores the relationship between CSR uptake and branding in SMEs. It builds on and extends the goals and activities carried out in the Responsible Med project, a European project involving 9 institutions of 6 different countries in the Mediterranean Area.

One of the effects of CSR on competitiveness has been connected to their marketing effect, which includes its contribution to corporate branding. Although SMEs are in real need of optimizing their processes and investing on differentiation, their lack of scale is a common hindrance to capitalizing on their CSR actions, including its branding possibilities. An additional problem is that many SMEs do not consider the strategic importance of CSR. These circumstances make it relevant to understand better the current state of CSR and its use as part of SMEs branding. A better knowledge can help design policies or support for SMEs to streamline CSR into their competitive strategy.

To tackle this topic, the research questions of this article are: how do firms use CSR as a branding strategy, why do firms engage in CSR, and whether there are differences between family and non-family business in their branding through CSR.

Theoretical framework: According to the American Marketing Association (AMA) a brand is a name, term, sign, symbol, or design to identify the goods or services of a seller. But it is something else, a bundle of tangible and intangible elements, which can bring wealth and added value to the business, because it can create a certain amount of awareness, reputation, prominence and others in the marketplace (Keller, 2008). Anisimova (2007) said that the corporate branding represents an opportunity for organizations to enhance and sustain their distinctiveness through linking corporate characteristics to products and services, thereby, allowing unique synergies to be developed.

The strategies of family businesses have to be oriented to the differentiation of the business itself, not just a product differentiation because it is easily imitable for competitors. A brand strategy can serve as an effective way to distinguish a corporate brand from another (Siguaw, et al., 1999), and especially for SMEs family businesses which cannot compete with the same strategies as large businesses.

Some empirical evidence demonstrates that excess levels of CSR investment can be destructive to financial performance (Wang et al. 2008), but that successful brands will be the ones that use CSR activities to provide incremental consumer value matched to product category salience of those values. Yet, CSR has been proved useful as a means of differentiation. For example, Du et al. (2007) find evidence that when a brand positions itself as a “CSR” brand (as opposed to a brand that just engages in CSR activities), consumers’ awareness levels increase, and they further suggest that product-related CSR activities are related to higher levels of awareness.

Methodology: To answer to the former research questions of how and why firms use CSR as a branding strategy, a qualitative approach is recommended. In particular, we use a discourse analysis (e.g. Fletcher, 2007) to gauge the nature of CSR branding and the reasons for such branding.

Since branding refers to the visible part of company’s image and culture, we propose an analysis of websites to carry out this research. We study a sample of 100 SMEs in the province of Girona, in the North East of Spain, chosen from the SABI (System for the Analysis of Iberian Balance Sheets) database, which gathers descriptive, financial and legal information on companies in Spain and Portugal. We defined a random sample of SMEs, stratified by the number of workers, following the exact distribution of SMEs in the province, and using the number of workers to be below 250 as the operational definition of SMEs.

We study the website of these SMEs tabulating information on their CSR activities and their connection with company competitiveness and performance, capturing the exact wording of their discourse. To analyse the possible differential branding strategy of family versus non-family firms, we use chi-square analysis/matrix to test the hypothesized different branding strategies of the two groups.

Results: Our results up to now point that SMEs make a significant different use of the types of CSR for branding, namely workplace, marketplace, environment and society, focussing more on marketplace and environmental values, as recommended in relevant literature. The differences between family and non-family firms are still under exploration.

Contribution / Research highlights:

- Understanding better how and why SMEs use CSR as a branding strategy.
- Measure the nuances between CSR branding in family and non-family firms.

FAMILINESS IN TOURISM CONSUMPTION: A CONSUMERS' PERSPECTIVE**Presas, Pilar¹; Guia, Jaume²; Muñoz, Maria Dolors³**¹Universitat de Girona. Email: pilar.presas@udg.edu²Universitat de Girona. Email: jaume.guia@udg.edu³Universitat de Girona. Email: dolors.munoz@udg.edu**Abstract**

Motivation and background: The present paper explores the relationship between familiness and tourism family firms which was initially researched by Getz, Carlsen and Morisson (2004). We take as a reference the concept 'familiness' which has so far only been approached from the perspective of the firm. Our purpose in this paper is to observe and analyze the concept from the standpoint of the consumers, get a better understanding of how familiness is by them perceived and see to what extent the firm and the costumer's interpretation of familiness differ. Then, we explore how this concept can help to better understand tourism consumption and tourist experiences in family firms.

Research Questions: The main research questions of this article are:

- What and how familiness is perceived by consumers?
- How does familiness applies to define tourism experiences in family firms?

Theoretical framework: Familiness has first been defined as the unique bundle of resources that a family business has (Habbershon and Williams, 1999) because of the interaction between the family, individual members and the business as a whole (Habbershon, Williams, and MacMillan, 2003). A recent definition of the term was provided by Zellweger, Eddleston, and Kellermanns (2010) identifying three relevant dimensions: the implication of the family in the business, the essence of the family conduct, and the relevance of the family in the identity of the firm.

The simultaneous production and consumption of the tourism product make people be a main factor for the successful delivery of the service and to supply a satisfactory experience to the customer (Jones, and Haven-Tang, 2005). Wanhill (1997) suggests that the family may be part of a tourism product, and therefore opens the door to take seriously the analysis of what familiness mean to customers and how they perceive or observe the influence of the family in family businesses.

Methodology: To give an answer to the former research questions we have used a qualitative method using the technique of focus group (Catterall and Maclaran, 2006). In particular we conducted 3 focus groups comprising people with different backgrounds and perspectives of travelling. The number of participants in each focus group was 6. The moderator introduced a list of open questions to generate discussion, and additionally during each focus group session was taken notes. The discussions were

then tape-recorded and transcribed for later analyses. The length of the discussions in the focus groups ranged from one hour and thirty minutes to approximately two hours. In the discussions participants talked about multiple stories and narratives depicting how they have experienced what they understand by familiness in multiple situations concerning travel and tourism consumption. The range of experiences explained by the focus group participants included hotels, airports, restaurants, cellars, tourism guides, etc.

Results: The results show that customers experience and interpret 'familiness' as a bundle of four dimensions: (1) feeling the hospitality and hospitableness of the firm; (2) perceiving 'authenticity' in the consumption in terms of 'slow' values; (3) experiencing story-telling through narratives that report on the history, traditions and values of the company, the product and/or the owners; and (4) getting to know and having direct interaction with the owners/family or the employees of the firm. In turn, we found that at least some of the dimensions can be found to a higher or lesser extent in both family and non-family businesses. Finally we found that customers value familiness as a distinctive a differentiating element of the products and therefore becomes a relevant element in their buying decision-making behaviour.

Contribution / Research highlights: A new perspective of familiness from the consumer point of view.

A better understanding of how firms can incorporate familiness in the tourism consumption experiences of their clientes

Keywords: family businesses, tourism, familiness, focus group

FACILITATING ONLINE COLLABORATION IN ORGANIZATIONS: THE ROLE OF E-MODERATOR SUPPORT IN VIRTUAL TEAMS

Reinfjord, Kristine Evensen¹

¹PhD Research Fellow, Faculty of Economics and Social Sciences, University of Agder, Kristiansand, Norway. Email: kristine.reinfjord@uia.no

Abstract

The purpose of this paper is to introduce the concept of e-moderating from online pedagogy to organizational theory and to propose a model that links the role of the e-moderator to the functioning of virtual teams in organizations. The following questions are addressed; how can the concept of e-moderator support be extended to theories on virtual teams and organizational behaviour, and how does online support and facilitation affect outcomes of virtual teams?

Background and rationale

Virtual teams represent a new organizational form that provides firms with new levels of flexibility and responsiveness (Powell et al, 2004: 6). The growing prevalence of virtual teams is being attributed to a combination of technological and organizational developments and several business benefits associated with using such teams (Solomon, 2001). As noted by Martins et al (2004), virtual teams provide “an effective structural mechanism for handling the increased travel, time, coordination, and costs associated with bringing together geographically, temporally and functionally dispersed employees to work on a common task” (Martins et al, 2004: 806). While the issue of *leadership* in virtual environments has received some attention (e.g. Kayworth and Leidner, 2000, 2001-2002, Tyran et al, 2003, Hertel et al, 2005), previous research has mainly focused on self-directed teams, with limited focus on the role of managerial structures (Powell et al, 2004: 15). The existing literature suggests that an effective leader in a virtual team has to lead in ways that are different from established practices designed for the traditional team environment (e.g. Jarvenpaa and Leidner, 1999). Most importantly, according to Kayworth and Leidner (2001-2002) a virtual team leader must be able to “facilitate communication among teammates, create clear structures, foster role clarity, and improve socio-emotional relationships with limited access to FtF meetings” (Powell et al, 2004: 18). According to Powell et al, the lack of attention to virtual team structures is surprising “given the substantial research on team structure in the traditional environment and can probably be ascribed to the relative novelty of virtual team research (Powell et al, 2004: 16). The authors further hold that “investigation of team structure in the virtual environment holds significant promise

for research and practice because it represents perhaps the most controllable and influential aspect of virtual team design" (Powell et al, 2004: 16).

Purpose

The purpose of this paper is to introduce the concept of *e-moderating* from online pedagogy to organizational theory and to propose a model that links the role of the e-moderator to the functioning of virtual teams. The e-moderator concept is originally used in the context of teaching and learning online, referring to a person that presides over an electronic online meeting or conference (Salmon, 2004). According to Salmon, "the essential role of the e-moderator is promoting human interaction and communication through the modelling, conveying and building of knowledge and skills (...) through using the mediation of online environments designed for interaction and collaboration" (Salmon, 2004: 4). Core research questions in this paper are; how can the concept of e-moderator support be extended to theories on virtual teams and organizational behaviour, and how does online support and facilitation by an e-moderator affect outcomes of virtual teams? In this context, team outcome is understood as the degree to which a team has completed its tasks. Drawing on insights from previous research on virtual teams in general (e.g. Powell et al, 2004, Martins et al, 2004, Dixon and Panteli, 2010) and on global student teams (e.g. Jarvenpaa and Leidner, 1999, Rye and Støkken, 2009), this paper seeks to develop a conceptual framework for investigating the role of leadership in virtual teams.

CHALLENGES AND OPPORTUNITIES OF THE NEW GLOBAL FINANCIAL PLAYERS

Rios-Morales, Ruth¹; Brennan, Louis

¹Les Roches-Gruyère, University of Applied Sciences Switzerland, Rue de l'Ondine 20, CH 1630 Bulle, Switzerland Email: ruth.riosmorales@glion.edu

Abstract

Purpose – Since the advent of the recent global financial crisis, Sovereign Wealth Funds (SWFs) have emerged as important global financial players. Although the contribution of these funds has been widely recognized, speculation about the motives and objectives of these large funds has remained a source of controversy. While global conditions continue to hinder the availability of capital resources, SWFs continue to increase their role as global sophisticated investors, altering the conventional flow of capital in the global financial market and thus challenging the market model. The purpose of this paper is to evaluate the implications of SWFs in the global economy as well as the opportunities and challenges of these large funds.

Design/methodology/approach – This is a research paper based on secondary data analysis. Data is obtained from various official entities. The evaluation incorporates aspects related to investment motivators and the strategic vision of these funds. It also includes an appraisal of the international institutional initiatives in response to the controversy surrounding these funds.

Findings – The emergence of SWFs has transformed the traditional flow of capital in the global financial market; there is a significant shift from the dominance of the Western world to the surging importance of the emerging and developing economies. This transformation has also involved public capital financing private investment.

Originality/value – Since the phenomenon of the role of SWFs in the global financial system is novel, scholarly research on the topic of SWFs is limited. As the opportunities and challenges associated with SWFs have yet to be finely discerned, this paper addresses some of the current gaps in scholarly research in this area.

Keywords – Sovereign Wealth Funds, International Financial System, International Investment, Emerging Economies

REDEFINING ORGANIC PRODUCTS

Rosca, Mihai Ioan¹

¹The Bucharest Academy of Economic Studies. Email: miroasca@ase.ro

Abstract

To define organic products we can identify three ways. The first view is from the scientific perspective, the second is a legislative perspective and the third view is that from commercial perspective, the customer perception. When science, law and the market have different views on an issue, it must be research and propose a solution. After the analyses of that ideas and a research based on some in-depth interviews we put the results in a graphic design: This graphic present diferent type of organic products . Before this picture we must ask which of these products are truly green.

Keywords: green marketing, marketing for organic products, consumer behaviour research.

Acknowledgements

Introduction

To define organic products we can identify three ways.

The first view is from the scientific perspective, the second is a legislative perspective and the third view is that from commercial perspective, the customer perception. The idea behind this article arose during the development of more data analysis research on organic products. Was noticed that what the respondents comprehension on organic products is quite different from what is contained in scientific papers and existing legislation. And as long as science, law and the market have different views on an issue, it must be indicated and resolved in order to better meet the consumption needs as the marketing theory says, to put science in the market service and to legislate what is important for consumers. In view of marketing, organic products are defined focusing on the product life cycle. (Coddington, 1993; Ottman, 1993; Polanski and Mintu-Wimsatt, 1995)

If we talk from scientific point of view should also be mentioned views of some authors who say they can not talk about green product but about grenner products (Smith, 1989). From legal point of view the most comprehensive effort in this direction is given by the European legislation (Regulation (EC) NR.834/2007)

Even if the regulations require compliance with established rules there are exceptions that lead to loss of confidence in using eco products.

For example, sustainable production should be made wherever possible using biological and mechanical processes of production through land and related production without using genetically modified organisms.

Food can be labeled as "organic" unless at least 95% of their agricultural ingredients are organic.

For manufactured goods legislation refers only to labeling. Until now, eco-label - "EU flower" was given for 26 product groups, including 3,000 products and services.

The objective is to guide consumers towards products with low environmental impact during the entire life cycle of products.

However, there are important classes of products that speaks as organic market but they are treated from a legal perspective.

Cars and houses are examples with the greatest impact. Regulated pollution rules exist, attempts to refer to types of fuel, but we can not talk about a law to define an ecological car or a house.

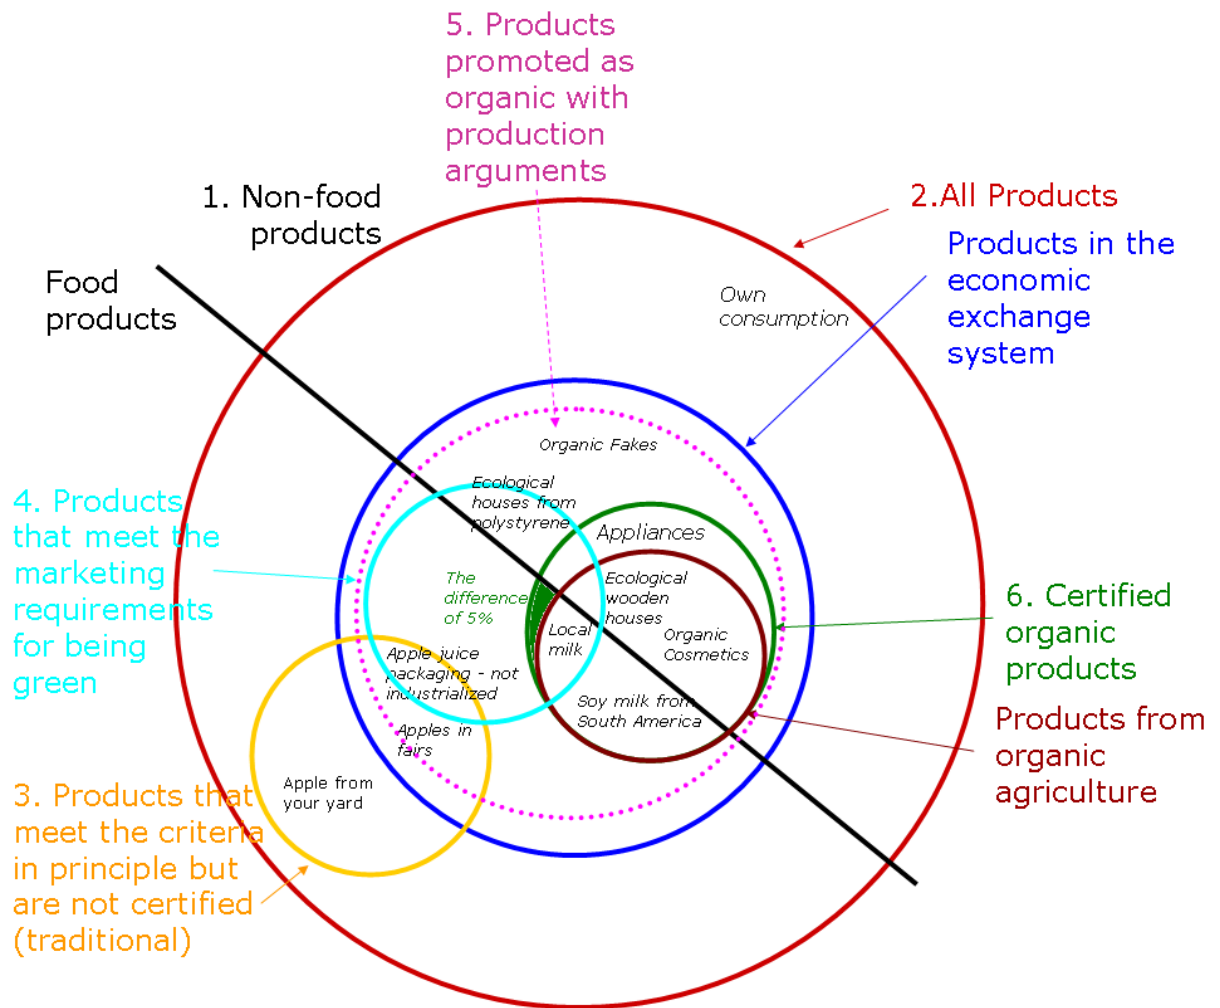

Even so, where legislation exists, there is a control system that certifies whether the product meets all legal requirements and may receive organic certification.

However, some consumers say that these certified organic products are not really green because they are not met other conditions which they consider important.

Such conclusions were drawn after some in-depth interviews about organic products made by people who buy weekly food for their families and who said they buy environmentally friendly products. Following research carried out to see an ignorance of terms like organic products are portrayed in literature or in legislation. Opinion denying the problem exists even for organic products.

After the analyses we put the results in a graphic design:

Fig.1 Different meanings of the term organic

1. The food products are separated from the non-food by a line mostly because the respondents often think about ecological products only as food.

2. Considering the fact that not all production enters the economic system but a part is for own consumption. In many parts of the world there is still subsistence agriculture due to a large number of population living in rural areas and dealing with agriculture.

3. Some of these products reach the market still having all the qualities of an environmentally friendly product but no one is pointing that out.

4. Some manufacturers realize they can exploit the ecological niche and aim to sell products but not certified organic but with references to natural, no preservatives, traditional, etc..

5. Some of these products do not meet the organic principles but are started on packages such information only to sell more easily, this category I placed it in the organic fakes therein.

6. There are known certified organic products but still have flaws in that it can be declared organic but do not meet a certain criteria or be in an acceptable law.

And since this picture we must ask which of these products are truly green and which ones are you looking for the consumer.

Each of the above cases were identified in the market behind them there are some buyers more or less informed that spend to come into their possession.

Abstract

Entrepreneurs are important for national labour markets and economies in that they contribute significantly to economic growth as well as provide the majority of jobs and create new ones (OECD, 2000; van Praag & Versloot, 2007).

According to the Global Entrepreneurship Monitor's "Report on Women and Entrepreneurship" (Allen, Elam, Langowitz and Dean, 2007), investment in women's entrepreneurship is an important way to exponentially increase the impact of new venture creation. Finding ways to empower women's participation and success in entrepreneurship are critical for more sustainable and successful economic development.

Our results confirm that there are strong differences between men and women entrepreneurs. The reasons for this male preponderance seem to be the lack of specific business skills, the less extensive social network, and the lack of identification patterns among women. Those differences can be explained by the fact that women still have fewer opportunities to make a career. If this is correct, we can predict an increasing proportion of women among entrepreneurs in the next years.

Concerning the development of a favorable environment for developing and enhancing women entrepreneurship activities, our results show the insertion in a network and the role of a model doubtless represent elements determining in the choice to launch an entrepreneurship activity, as well as a precious resource for the success of her company.

Keywords: Women entrepreneurship, GEM data, entrepreneurship motivation, entrepreneurial behavior.

Introduction

Entrepreneurs are important for national labour markets and economies in that they contribute significantly to economic growth as well as provide the majority of jobs and create new ones (OECD, 2000; van Praag & Versloot, 2007).

According to the Global Entrepreneurship Monitor's "Report on Women and Entrepreneurship" (Allen, Elam, Langowitz and Dean, 2007), investment in women's entrepreneurship is an important way to exponentially increase the impact of new venture creation. Finding ways to empower women's participation and success in entrepreneurship are critical for more sustainable and successful economic development.

Objectives

Female entrepreneurship is undoubtedly a topic rising in awareness. In the same time, we do not know much about women entrepreneurship in Switzerland, especially concerning entrepreneurship behavior, perception of entrepreneurship, motivation, and growth orientation.

The first objective is therefore to provide an analysis of the key characteristics and context of female entrepreneurial activity and how that may differ from that of their male counterparts.

The second objective of this paper is to provide a comprehensive and up-to-date study of the role played by women involved in entrepreneurial activity in Switzerland.

We also would like to advance the understanding of the needs of aspiring and existing female entrepreneurs, and will help to provide some policy insights useful to develop and enhance a favorable environment for women's entrepreneurship.

Our main hypotheses are that female and male entrepreneurs differ with respect to their personal and business profile: they start and run businesses in different sectors, develop different products, pursue slightly different goals and structure their businesses in a different fashion (Fischer et al., 1993; Brush, 1992).

Methodology and data

For this research, we proceeded to a secondary analysis of the Swiss GEM datasets (Global Entrepreneurship Monitor) of 2005, 2007, 2008, 2009 and 2010.

The GEM project is one of the largest survey-based studies of entrepreneurship in the world. It consists mainly on a phone survey with a representative sample of the population, at least 2000 persons for each edition. It aims to measure annually the entrepreneurship activity in a large number of countries.

Definition of entrepreneurship in the present study

A wide range of definitions of entrepreneurship exists (Davidsson, 2005). For instance, Hebert and Link (1989) describe an entrepreneur as 'someone who specializes

in taking responsibility for and making judgemental decisions that affect the location, form, and the use of goods, resources, or institutions'. In a broader sense, selfemployment and business ownership are understood to be equivalent to entrepreneurship. This occupational definition of entrepreneurship, which is congruent with the Gem's one (Baldegger, Rossi, Schüffel, 2009), i.e., entrepreneurs are people working for their own account and risk, is adopted in the present research.

Main results

First, we can point out that, regarding women's participation in entrepreneurship, Switzerland reaches an excellent position, compared to neighboring or similar European countries, with 4.5% of women entrepreneurs, just after France.

The men woman ratio is also to be noticed. If in innovation driven economies the ratio is generally of 2 men for 1 woman, in Switzerland this ratio reaches 3 men for 2 women. These results have to be balanced with a relative low level of entrepreneurial activities in Switzerland, under the mean of comparable countries, but regarding our neighbors, still better than Germany and Italy.

Without any surprise regarding our hypothesis, there is a gender effect on women entrepreneurship behavior, activity (sector and industry), perception, motivation and growth orientation.

Sector and industry, organization: Women entrepreneurs are widely active in consumer oriented and service (tertiary) activities, for examples, activities related to health, social, or education. These activities take mostly place at the local level and therefore need generally relatively less resources. Women entrepreneurs are therefore under-represented in the transformational industry and in business-to-business activities. Women entrepreneurs can be found in rather smaller (in number of employees) organization than men.

Motivation, behavior, growth orientation: The results of the annual GEM report (Bosma, 2009) show that women can enter into entrepreneurship for many of the same reasons as men: to support themselves and their families, to enrich their lives with careers and financial independence and so on. Nevertheless, there are some differences. For the women of our sample, the main motivation is the independence, as their male colleagues, but in a proportion appreciably higher. Women also express less than men their ambition to grow their level of income or to develop their business. As we know (Baldegger, Rossi, Schüffel, 2006), in Switzerland, business growth often requires an internationalization of its activities. It appears that women have much less the intention to internationalize their business than men. Regarding that, it is logical that they are much less numerous than the men (four times less numerous) saying they intend to create 20 jobs or more within their organization.

Finally, companies with high growth potential often find themselves in areas technologically innovative. Women entrepreneurs use relatively less new technologies in their supply, products and services than men.

Conclusion

Our results confirm that there are strong differences between men and women entrepreneurs. The reasons for this male preponderance seem to be the lack of specific business skills, the less extensive social network, and the lack of identification patterns among women. Those differences can be explained by the fact that women still have fewer opportunities to make a career. If this is correct, we can predict an increasing proportion of women among entrepreneurs in the next years.

Concerning the development of a favorable environment for developing and enhancing women entrepreneurship activities, our results show that the insertion in a network and the role of a model doubtless represent elements determining in the choice to launch an entrepreneurship activity, as well as a precious resource for success.

THE NEW INCOTERMS® 2010

Schackmar, Rainer¹

¹Professor, Dr, Betriebswirt (VWA), University of Applied Sciences Schmalkalden, Germany. E-mail address: r.schackmar@fh-sm.de

Significance of INCOTERMS®

Parties to international contracts of sale very often use international commercial terms – so-called INCOTERMS® – in order to define their obligations. INCOTERMS® regulate major obligations of the seller and the buyer for all international contracts of sale, irrespective of the business sector. The terms are characterized by their abbreviations consisting of three letters such as “FOB” (“Free On Board”) and “CIF” (“Costs Insurance and Freight”).

Since 1936 the International Chamber of Commerce (ICC) has published several versions with a set of international rules for the interpretation of trade terms. The present version “INCOTERMS® 2010” names 11 terms and has been in force since 1st January, 2011.

Application of INCOTERMS®

Although INCOTERMS® have been used for decades, their basis of application has not yet been totally clarified. In order to understand when INCOTERMS® apply, it is necessary to distinguish between the single 11 terms and the rules for the interpretation of these terms as published by the ICC.

The first step is that parties to a contract have expressly to agree on one of the 11 terms. In a second step the single term which the parties agreed on has to be interpreted because the single term does not describe the parties’ obligations. This interpretation is supplied by the ICC’s rules for the interpretation of the terms.

Structure of INCOTERMS®

The new INCOTERMS® 2010 are grouped in two distinct categories which differ from each other by the fact for which mode of transport the INCOTERMS® are suitable.

(i) First category

The first category names the following seven INCOTERMS® which can be used for any mode or modes of transport:

- EXW Ex Works
- FCA Free Carrier

- CPT Carriage paid to
- CIP Carriage and Insurance paid to
- DAT Delivered at Terminal
- DAP Delivered at Place
- DDP Delivered Duty paid

These seven terms can be agreed between the parties even when one or more than one mode of transport shall be used for the carriage of the goods. Under the term “EXW” the seller must make the goods available to the buyer at his own premises. When the parties to the contract agree on “FCA”, the seller must deliver the goods free carrier at the named place or at the named port of shipment. However, the seller is not responsible for the main carriage of the goods.

When one of the terms “CPT” or “CIP” applies, the seller must contract for carriage, but without assuming the risk of loss of or damage to the goods or additional costs due to events occurring after shipment and dispatch.

The terms “DAT” and “DAP” are new under the INCOTERMS® 2010. When the parties to the contract agree on “DAT”, the seller must unload the goods from the arriving vehicle and place them at the buyer’s disposal at a named terminal at the named port or place of destination. Under the term “DAP” it is sufficient that the seller places the goods at the buyer’s disposal at the named place of destination on the arriving means of transport in such a way that the goods are ready for unloading.

The term “DDP” establishes the maximum obligations for the seller and thus rules that the seller also has to clear the goods for import, to pay all import duties and to take care of all customs formalities.

(ii) Second category

The second category lists up the following four INCOTERMS® which can be used for sea and inland waterway transport, only:

- FAS Free alongside Ship
- FOB Free on Board
- CFR Cost and Freight
- CIF Cost, Insurance and Freight

Under these terms the place of delivery and the place to which the goods shall be carried both have to be ports. When the parties agree on the term “FAS” or “FOB”, the seller fulfils his obligation to deliver by placing the goods alongside the ship (“FAS”) or on board the ship (“FOB”) nominated by the buyer at the named port of shipment.

Although under the terms “CFR” and “CIF” the seller must contract for and pay the costs and freight that are necessary to bring the goods to the port of destination, he does not bear the risk of loss of or damage to the goods during the transport.

Conclusion

INCOTERMS® 2010 have effected relevant changes in comparison to the previous versions and bring the rules in line with current international trade practices.

Keywords: INCOTERMS®, ICC, international contracts, transport, shipment, risks

DUNDU – THE PHILOSOPHY THAT CHANGES A GROUP

Seewald, Fabian¹

¹Cooperative Student at DH Stuttgart, IBM Deutschland GmbH - Dundu Teambuilding. Email: fabian@dundu.eu Group Contact: www.dundu-teambuilding.eu

Abstract

On the Lotusphere 2011 in Orlando, IBM presented the new strategy for the Lotus Collaboration Software: Get Social, Do Business.

Social Business is the introduction of new Web 2.0 collaboration tools in order to revolutionize the way a company works (IBM, 2011). Especially, the social platform category is an emerging market and is predicted to grow at an annual rate of nearly 40% according to a recent IDC white paper (Traudt and Vancil, 2011). Despite this huge growth potential, a deeper look reveals that the success factors for Social Business and its major goal to transform the company into a more collaborative “Enterprise 2.0” go beyond mere implementation (Pitt, 2011). IDC sees social software as “an enabler to the cultural shift and business process changes that need to take place in order to transform a company into a Social Business.” (Traudt and Vancil, 2011, p.1).

But that also means, in consequence, that the success of the implementation mainly depends on the accomplishment of this cultural shift. It is critical for a social business that the employees start to rethink their patterns of their level of collaboration and communication (Pitt, 2011). Effective communication and collaboration still starts on the personal level, one level below this technological platform, and this will be the critical success factor (Richter, 2010). The employees have to live the change and as early adapters lead by example.

The goal of the paper is to introduce a new concept to communicate and implement Social Software more efficiently in a creative and easy way and to evaluate the results. As stated in the introduction, the level of interaction of the people matters most, and it is not so much about the technology that just indicates where the collaboration takes place (Richter, 2010).

The core part of the paper refers to the adoption of a new team-building instrument called Dundu. Dundu is a puppet that is handled and steered simultaneously by a group of persons (Husemann, 2011). Every member of the group is responsible for handling a part of the body. In consequence, every team member is very important for the team success, and the focus on one common goal leaves personal disputes unconsciously behind.

The main idea of the team-building with Dundu is that social software depends to a great extent on the communication and sharing good will within a company. Dundu

changes groups and individuals through transmitting to them an emotional connectivity. It is exactly this emotional connectivity that makes them collaborate better. Only if this higher level of communication is granted on a personal level, it will be leveraging the positive impacts on the social platform as well and transform a business to a “Social Business”.

Dundu will be used in an activity-based team-building with different scenarios. Every scenario represents a problem or a requirement of a real project in a model environment. The solution of the specific task in the model environment will enable the group to reflect together on the right steps and processes in the real project life.

The research will be designed in stages. In a first step, the theoretical part sums up the development of social software and the importance responding to recent trends towards social networks and an assessment of the key success factors of social software. Furthermore, the literature review will cover the current mainstream approaches for team-building and its importance for change management which is needed for a social business network implementation.

Based on use-cases from current client requirements towards social software, specific scenarios with the puppet Dundu will be developed to accomplish the client requirements. Dundu will represent a simplified model and collaboration platform, and the aim is that Dundu enables the group to solve the problems themselves afterwards. This kind of solution development and gathering from within the group will have higher long-term effects.

The stage three will be the evaluation of the executed implementation workshops both via a quantitative and qualitative methodology. The possible effects of Dundu will be measured with questionnaires. In total, there will be at least three implementation workshops in comparable environments with the client. For the analysis of the quantitative findings, SPSS will be used and through the number of three different implementation workshops with 10 to 15 participants respectively, a reasonable amount of respondents is given as well to underline the positive impact that Dundu has.

THE ROLE OF BRAND COMMITMENT IN CUSTOMER-BASED BRAND EQUITY

Shuv-Ami, Avichai¹

¹The College of Management, Israel

Abstract

This paper discusses the important but neglected role of brand commitment in evaluating customer-based brand equity.

In academic research, there are four different perspectives regarding brand equity. Following Russell and Bick (2005) and Keller and Lehmann (2006) these four perspectives are: (a) *accountancy* – dealing with problems related to the uncertainty and intangible aspects of the future benefits and value of brands, (b) *financial* – the financial worth of a brand based on the brand assets (like plant, equipment and sales) that can be frequently bought and sold, (c) *marketing* - a strong brand facilitates growth of demand; more power and control in the marketing channels; more effective advertising and promotion; and the ability to sell at a higher/premium price (d) *customer* -- representing the total or the sum of the perceptions and feelings toward a brand, including brand loyalty, brand image etc., which are translated into purchasing behavior.

The current paper deals with the customer perspective of brand equity, termed "customer-based brand equity" (CBBE). There are several models or methods that deal with measuring CBBE. The leading models in the academic literature were developed by Aaker (1996) and Keller (1993, 2008).

Aaker's "Brand Equity Ten" model utilizes five categories with a total of ten measures to assess brand equity (Aaker, 1996). The first category, Loyalty is measured by (1) price premium and (2) customer satisfaction or loyalty. The second category perceived quality or leadership is measured by (3) perceived quality and (4) leadership or popularity. The third category other customer-oriented associations or differentiation measured by (5) perceived value, (6) brand personality and (7) organizational associations. The fourth category awareness measured (8) brand awareness. The fifth category market behavior measured by (9) market share and (10) market price and distribution coverage.

Keller's CBBE model (Keller 1993, 2008) is built by "sequentially establishing six 'brand building blocks' with customers" (Keller 2008. p. --). These building blocks include: (1) brand *salience*, which relates to the awareness of the brand (category identification and needs satisfied); (2) brand *performance*, concerned with the satisfaction of customer functional needs underlined by the characteristics and features of the product (reliability, durability, service availability, effectiveness, efficiency,

empathy, style, design and price); (3) brand *imagery*, which relates to the satisfaction of the customer's psychological needs (user profiles, purchase and usage situations, personality and value history, heritage and experiences); (4) brand *judgments* focus on customer opinions based on performance and imagery (quality, credibility consideration and superiority); (5) brand *feelings* are customer emotional responses and reactions to the brand (warmth, fun, excitement, security, social approval and self respect); and (6) brand *resonance*, the relationship and level of identification of the customer with a brand (loyalty, attachment, and community engagement).

The current study argues that these two models have complementary dimensions and that *brand commitment* has a major role in evaluating brand equity.

Both models use loyalty, performance and quality, need satisfaction, differentiation etc., factors that are argued to be a part of brand commitment and thus have a major effect on the measurement of CBBE. *Brand commitment* is defined (Shuv-Ami 2010) as *the degree of attachment and readiness consumers have towards a preferred brand that they use and re-buy or re-patronize*. Shuv-Ami (2010) argued that brand commitment has four components: brand satisfaction, brand loyalty, brand involvement and relative brand performance. Based on both Aaker's "Brand Equity Ten model, Keller's CBBE model and others, the current research suggests eight dimensions for measuring CBBE: (1) category, brand knowledge and usage; (2) brand image; (3) brand personality; (4) brand overall attitude; (5) brand commitment; (6) brand recommendation; (7) market share (at the moment of measurement, it is not a variable); and (8) potential or future market share (future intentions to buy the brand). This research shows that brand commitment has a positive impact on the other dimensions of brand equity.

Based on data collected from an Internet panel of 1004 consumers from the financial industry, it was found that brand commitment has a strong relationship with most of the dimensions of brand equity. Commitment was highly correlated with overall attitude, brand image, brand personality (the positive aspects) and brand recommendation. However, low correlations were found in the relationship of commitment and usage and brand knowledge.

**MOVING ON FROM THE BEACH: MEDITERRANEAN DESTINATION
DEVELOPMENT FOR TWENTY-FIRST CENTURY MARKETS**

Stone, Chris¹

¹Senior Lecturer - BA & Masters Tourism Management programmes, The Manchester Metropolitan University, Department of Food and Tourism, Management, Hollings Faculty, Old Hall Lane, Manchester M14 6HR UK. Email: chris.stone@mmu.ac.uk; christone@onetel.com

Abstract

This paper contends that significant changes in the values and expectations of northern European leisure markets mean that the nature and characteristics of conventional resort destinations in the Mediterranean region are becoming less well-attuned to tourists' needs and wants. After an assessment of the present situation, consideration of changing twenty-first century market preferences indicates an increasingly apparent product: market divergence, and particularly in relation to the lack of provision for holiday activities and 'soft adventure'. Destination product development needs are identified, and proposals made for the provision of new attractions based around biophysical and cultural resources by Destination Management Organisations and others. Drawing upon experience from central and northern Europe, proposed developments will complement existing products at relatively low cost, offer opportunities for entrepreneurial activity, and address elements of destination sustainability.

**THE DYNAMICS AND PATTERNS OF PARTICIPATION IN TOP MANAGEMENT
TEAMS: GENDER PERSPECTIVE**

Syna, Helena Desivilya¹

¹Max Stern Academic College of Emek Yezreel

Abstract

The proposed research program aims to elucidate the dynamics of involvement and participation of women and men in top management teams (TMT), focusing on conflict management and decision-making processes. Specifically, the investigation attempts to discern the subtle and hidden aspects of gender construction in such senior teams and their effects on power relations between women and men as reflected in decision-making and conflict management processes.

The emphasis of research program is on group dynamics in teams characterized by diverse membership, due to the mounting prevalence of these structures in organizations and the organizational reality of highly heterogeneous workforce. Notwithstanding the burgeoning research on diversity in work teams, studies highlighting this feature in the dynamics of TMTs, especially gender diversity have been scarce. The importance and potential impact of strategic decisions made in such groups and the fact that women are more likely to be involved in these processes warrant in depth examination of the internal dynamics of TMTs, particularly patterns of participation and influence exerted by women in comparison to men.

The research is based on integration of two corpuses of knowledge: the role of conflict and diversity (notably gender) in the processes of decision making and conflict management in teams and gender perspective on management. Based on these bodies of literature, we study women's formative experiences as members of TMTs; namely, how women, in comparison to men, engage in negotiating authority (or legitimacy), value (in recognition and reward), support (developing networks) and commitment (definition of "successful" TMT member).

MAIN DEMOGRAPHIC CHARACTERISTICS INFLUENCING CONSUMER BEHAVIOR ON EMERGING FINANCIAL MARKETS

Tanase, (Rosca) Laura Daniela¹; Boboc, Stefan²

¹The Bucharest Academy of Economic Studies, lora.rosca@gmail.com

²The Bucharest Academy of Economic Studies, stefanboboc@yahoo.com

Abstract

This article aims to provide a picture of the main demographic characteristics influencing consumer behavior on emerging financial markets. Financial products consumer has a different behavior in some ways, both because of financial products and their characteristics and attributes and also because of the individuals' intrinsic influences, most commonly including demographic characteristics. Financial products mean money and money means an extended emotional baggage. The research method is a survey based on a sample chosen with the "snowball" method undertaken in 2010. There were gathered 500 questionnaires and only 478 were analyzed. Research is not a statistical nationwide representative because of the lack of the financial and human capabilities. The research was conducted on the Romanian financial market, which meets the characteristics of an emerging financial market. The study objective was to determine the most important factors that are influencing the decision to invest. From the research resulted that different financial products are preferred by individuals with specific demographic characteristics like income or family structure.

Keywords: marketing, consumer behavior research, demographic characteristics, emerging financial markets

Introduction

Financial products consumer has a different behavior in some ways, both because of financial products and their characteristics and attributes and also because of the individuals' intrinsic influences, most commonly including demographic characteristics. As Erlich and Fanelli say, financial means money and money means an extended emotional baggage (Erlich and Fanelli, 2004). Individual attitude toward money is an extremely emotional one. Unlike consumer goods when taking the decision to purchase a financial product they do not buy one brand but rather rely on the advice of financial intermediaries in the final decision (Lewis, 2008).

Thus, on international financial markets purchase decision models appear being extremely complex may be because of the inviolability of financial products on the one hand, or because of the uncertainty of profit generating and also because of the

financial risk, not insignificantly, which may precede a wrong decision. Marketing literature presents a complex five-step model of decision making (Assael, 1995; Kotler, 2008). The need to model the purchasing behavior based on demographic and psychographic criteria such as gender, age, financial situation, social situation, adaptability, risk, etc. is also very strong. (Tang et al., 2007).

On emerging financial markets, like the one in Romania, such initiatives are limited. For the financial market in Romania, specially, the initiative in this direction are sporadic taking place only in recent years (Olteanu and Vlad, 2007; Dragotă and Șerbănescu 2010). Thus, the need to start a research based on the finding the main demographic characteristics that might influence the consume behavior for different financial products.

Methodology

Right from the beginning we state that the research is not a conclusive one, but an exploratory research. The questions were introduced in an omnibus-type research carried out in summer 2010. The research carried out in 2010 was based on the results of another research driven in 2009 and the research tool has been improved based on its' results analysis. 500 questionnaires were applied and 478 among of them entered in the analysis.

Sampling was done using the "snowball" method (Cătoiș et al, 2009). The research was conducted on the financial market in Romania, which has the characteristics of an emerging financial market. Main purpose of this study is to determine the demographic characteristics of individuals to those with a greater appetite for savings and investment.

Results

We present here only the main findings. For each financial product investigated a consumer profile emerge, but because is not a conclusive research the emerged profiles are only informative ones. The results are to be tested in a larger research that is taking place this year. Because of the fact that the analyzed questions are part of an omnibus research, which included a series of questions on the ecological conduct, a new idea emerge that the profile of the person with high appetite for investing is the same with the one that also consume ecological products, a modern consumer. This idea is to be further tested.

If we take a description of each type of investment instrument after the socio-demographic characteristics of the main consumer, it would be said that certificates of deposit are chosen mainly by women, over the age of 64, with middle or very advanced studies, being persons either with management responsibilities or

technicians and operational workers, rather high income, married, having children and being rather provincial.

Government bonds in exchange are chosen especially by men, between 36 and 55 years old, highly educated, middle income, married with children, as specialists or technicians, and being rather provincial.

Investment funds are chosen mainly by men, 36-45 years, post-graduate studies, with medium to high incomes, divorced or widowed, childless, specialists with intellectual and scientific occupations, from the province.

Shares and bonds might be preferred rather by male, 18-45 of age, with school or college education, not married or living with a partner, no children, holding management positions or technicians.

Term investments are rather to be chosen by people between 18 and 35 years with secondary or university education, high income, who are single or living with a partner, no children and being rather from the capital.

Alternative investments are chosen rather by women aged between 46 and 65, high school, with medium incomes, officers or operatives workers.

INNOVATIVE STRATEGIES OF ELECTRONIC COMMUNICATION IN THE GREEK BANKING SECTOR

Terzides, Konstantinos¹; Papadopoulou, Eva²; Kosmidis, Kosmas³

¹Department of Information Management, Kavala Institute of Technology, Greece. Email: kter@teikav.edu.gr

²Department of Information Management, Kavala Institute of Technology, Greece. Email: peva2@yahoo.gr

³Department of Information Management, Kavala Institute of Technology, Greece. Email: kosmidis@teikav.edu.gr

Abstract

In an attempt to remain effective, flexible and competitive in today's rapidly developing technological environment, banks increasingly recognize the benefits of the Internet to meet the needs of the modern consumer. Bank management aim and develop their customer base by implementing strategies that achieves an equilibrium between physical and virtual presence. While online banking (e-banking, mobile banking) has increased immensely in Greece there is insufficient evidence concerning its acceptance by consumers.

The purpose of the present study is to examine the impact of the implementation of innovative electronic communication strategies to attract new customers and to satisfy the existing ones. Another objective of this paper is to investigate the impact on quality of online banking services on customer behavior. Finally, the diagnosis of online risks and whether these risks are associated with the adoption of new technologies or not by customers, is the corner stone of this study.

The research sample is consisted of 153 customers of various banks in the region of Central and Eastern Macedonia in Greece. The formulated questionnaire was administered personally and through the Internet between February and April of 2011.

The results of this study, indicate that there is a statistically significant relationship between implementation of innovative technological applications, easy understanding, transaction security, quality of service and the development of online banking. Furthermore the delivery of online services is the key element that leads to increased customer capacity and meets the needs of the existing.

AN ANALYSIS OF STRATEGIC PLANNING ACTIVITIES APPLIED IN FOOTBALL SECTOR

Theakou, Elena¹; Kriemadis, Thanos²

¹Ph.D. Candidate. Department of Sport Management, University of Peloponnese, Greece. Email: eltheakou@yahoo.gr

²Professor. Department of Sport Management, University of Peloponnese, Greece. Email: thanosk@uop.gr

Abstract

Purpose: One of the most common sets of activities in strategic management is planning. All strategic planning deals with at least one of three key questions (Bradford and Duncan, 2000): 1. What we do? 2. For whom do we do it? 3. How do we excel? As research has pointed out, strategic planning is widely used by organizations in order to confront with a great number of changes, and respond effectively to their new situations (Kriemadis, 1997; Kriemadis & Theakou, 2007; Mintzberg, 1994; Wit & Meyer, 1998). Strategic planning refers to the process of determining the mission, major objectives, strategies, and policies that govern the acquisition and allocation of resources to achieve organizational aims (Johnson & Scholes, 1999). However, strategic planning is not a static product (Stopford, 2001). This study aims at partly contributing to the theoretical discussion concerning the ability of football clubs to integrate and employ strategic planning. The primary purposes of this research were: a) to determine whether strategic planning activities exist in Greek football sector, (b) to identify the extent to which the strategic plan is applied in real terms, (c) to identify the differences in strategic planning activities between under research football clubs.

Design/methodology/approach: The study was a quantitative design and the analysis was exploratory in nature. The methodology session includes secondary research as well, meaning literature review in due of collecting theoretical and practical elements relative to the variation of strategic planning activities. Descriptive statistics and one way analysis of variance were used to answer the research questions derived by objectives of this research, using SPSS software. A sample of 48 managers of the upper administrative levels of all 16 Football Clubs in Super League (Greek Championship) during the period 2010-2011 were surveyed using a 17-item management style survey, developed by researchers and selected experts, in order to collect data regarding the following steps of strategic planning process: (a) mission statement and objectives setting, (b) action plans and planning level, and (c) assessment of strategic planning activities. The survey instrument included strategic planning factors as well as demographic characteristics. The questions were answered using a five point scale. Each point of the scale represented different extent level that question items were considered when formulating plans (from "considered to a very little

extent" to "considered to a very great extent") and depicted the respondent's perceptions and behaviour. The reliability of the scale was found to be: $\alpha = .82$.

Findings: According to the survey findings, 90% of the football clubs managers have developed a vision of the club's future direction and aspirations. 88% have also developed a mission statement that describes the club's purpose and philosophy. The managers considered to a very great or great extent (91%) the factors that are related to the external environment of the football club, such as political trends, economic/tax considerations, social trends, local businesses, media, and sponsors. Managers considered to a very great or great extent (87%) the factors that are related to the internal environment of the football club, such as financial performance, adequacy of facilities, financial resources, There were no factors considered to a "very little" or "little" extent by 66% of the football clubs managers when formulating their plans. Furthermore, the football clubs utilize short-range plans which cover approximately 1 year, and long-range plans which cover approximately 3 years. When managers were asked about the key factors that discourage them from engaging in strategic planning activities, 57% identified to a "very great" or "great" extent insufficient financial resources and lack of time. Interestingly, 60% indicated that insufficient training and experience was a factor that discouraged them to "some" extent from engaging in strategic planning activities. Finally, the results revealed that only 18% of the football clubs have formalized written, long-range plans.

Research limitations: Data for this study were collected from all 16 Football Clubs in Super League (Greek Championship) during the period 2010-2011 and there was no attempt to generalize this information to all football clubs during other time periods in Greece. The study was also delimited to a questionnaire designed to collect data regarding strategic planning activities. The following were acknowledged as the limitations of the study: (a) the honesty, accuracy, and objectivity of the respondents when completing the questionnaire, (b) the respondent's level of understanding of the planning vocabulary. A useful research might be undertaken to assess the relationship between the extent of planning activities used by Greek football clubs and performance.

Originality/value: This study is useful in extending the concept of strategic planning to football sector and the authors proposed that football clubs should think and act strategically. The study will be useful in helping football managers/administrators to further their understanding of the strategic planning process in their respective football club. Finally, this study will yield information which may serve as the basis for further research in the area of football.

BRAND AND HUMAN PERSONALITY CONGRUENCE: DOES CULTURE MATTER?

Tunca, Burak¹; Shneor, Rotem²; Eryigit, Canan³

¹University of Agder, Norway. Email: burak.tunca@uia.no

²Univeristy of Agder, Norway. Email: rotem.shneor@uia.no

³Hacettepe University, Turkey. Email: canand@hacettepe.edu.tr

Abstract

The paper explores whether culture influences human and brand personality congruence. It evaluates differences between preference levels of consumers from Norway and Turkey with respect to brand personality dimensions across human personality proxy types. The study finds that consumers with same personality types have statistically significant different brand personality preferences across cultures. Linking these findings with Hofstede's cultural dimensions, the paper concludes with a list of propositions for future larger scale studies. Finally, conclusions are outlined, contributions and limitations acknowledged, and suggestions for further research are provided.

Keywords: Personality, Brand Personality, Culture, Consumer Behavior, Brand Preferences

Extended Abstract

Brand personality is defined by Aaker (1997) as "the set of human characteristics associated with a brand". From a consumer behavior viewpoint, the basic assumption has been that consumers prefer products and brands that possess characteristics consistent with their own personality and self-concept (e.g., Dolich, 1969, Sirgy, 1982, Kassarjian, 1971). Moreover, empirical research showed a fit between human and brand personality (e.g., Maehle and Shneor, 2010). However, previous studies overlooked the potential differences across cultures in human and brand personality congruence. Consequently, the objective of this paper is to study and compare brand and human personality relationships in two different cultural contexts, namely Norway and Turkey. To reach this objective, we extended an earlier study from Norway (i.e., Maehle and Shneor, 2010) to the Turkish context.

A two-stage methodology was followed. At the first stage, 50 Turkish university students majoring in business administration studies evaluated chosen brands with respect to Aaker's (1997) framework. The first stage results classified brands in each of the five dimensions. At the second stage, 173 Turkish university students with the same background filled the DI human personality survey and indicated their preference levels for brands in the study. The results from the Norwegian sample was

attained from an existing study (i.e., Maehle and Shneor, 2010) Overall, the samples from two countries were deemed equivalent. We compared the average brand preference scores for each brand personality dimension among each of the three human personality groups (Red DI, Blue DI, and Green DI). The results are presented in table 1.

The findings show statistical significance of the difference between preference scores for each brand personality dimension in the two cultures. More specifically, we observe that Norwegian respondents have a significantly higher preference for sincere, competent and exciting brands, while Turkish respondents have a significantly higher preference for rugged brands. These preferences are consistent across all DI human personality proxy groups. Alternatively put, consumers with same personality in different cultures have different preference levels for particular brand personality dimensions. However, respondents do not seem to differ in their preference levels for sophisticated brands in both cultures. Hence, at least with respect to four of Aaker's (1997) five brand personality dimensions, our findings show that culture indeed influences relationships between brand and human personalities.

		TURKEY			NORWAY			df	t

	<i>Preference for Competence</i>	80	3.48	0.88	69	3.68	1.07	147	-1.25
	<i>Preference for Excitement</i>	80	3.40	0.83	69	3.68	1.07	147	-1.80*
	<i>Preference for Sophistication</i>	80	3.40	0.83	69	3.24	0.70	147	1.26
	<i>Preference for Ruggedness</i>	80	3.43	0.89	69	3.05	0.88	147	2.61**

Table 1: Comparison between Turkey and Norway among different personality types for brand personality dimension preferences. Significance levels (one-tailed): * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

Linking our findings to Hofstede's (2001) cultural dimensions' framework, one can outline the following propositions, which may be suitable for future large scale studies, involving multiple cultures.

- P (a): the more individualistic the culture the greater the preference for competent brands across different human personality types.
- P (b): the more feminine the culture the greater the preference for sincere brands across different human personality types.
- P (c): the more uncertainty avoiding the culture the lower the preference for exciting brands across different human personality types.
- P (d): the more masculine the culture the greater the preference for rugged brands across different human personality types.
- P (e): the more individualistic the culture the greater the preference for sophisticated brands across different human personality types.
- P (f): the more power distance tolerant the culture the greater the preference for sophisticated brands across different human personality types.
- P (g): the more masculine the culture the greater the preference for sophisticated brands across different human personality types.

The findings of the current study allow us to map potential influences culture may have in consumer behavior, while particularly suggesting that it affects brand and human personality congruence. Accordingly, the study shows that regardless of human personality types, consumers from different cultural contexts exhibit significantly different preferences for certain brand personality dimensions. Future studies should incorporate multiple cultures. Alternative brand personality frameworks emerging in different cultural contexts may also be relevant for testing and challenging the propositions suggested in the current study.

THE PRIVATE-SECTOR INVESTOR'S PERSPECTIVE IN THE FRAME OF PPP

Turhani, Ali¹

¹Lector of Public Administration, Economic Faculty, University « Aleksander Xhuvani » Elbasan,
Email : alturhani@yahoo.com

Abstract

The main objective of this paper is to help the investors of the private-sectors to understand the procedures they must go through to take a decision for taking part in a PPP. The actors of the private sector can be different investors, financial lending institutions, as well as companies that offer the construction and the operational service. The actors of the public sector are the public authorities that design and implement the policies of a PPP, as well as those authorities that procure the funds for the financing of the PPP agreement, while not forgetting the general public who uses the assets that are offered by the PPP.

Each of these parties should have a base good understanding for the policy and financial problems, and each of those parties should have clear the role that it should play in the PPP project, as well as the benefits that they will have from this project.

Considering that the Public Authority goes through the process of developing and signing up to a PPP Contract, this paper considers the parallel process on the part of the private-sector investors, i.e.:

- The investment pool for PPP projects
- The financial basis for the investment decision
- Bidding and project development
- Joint-venture issues
- Formation and management of the Project Company
- The use of external advisers

Abstract

One of the major concerns of health care management (HCM) is to optimise the health care operations processes while working within imposed constraints of the management system. One of the major operations is bed capacity planning and control that aims to satisfy patients' needs, optimise ward efficiency and increase the utilisation of the provided service. Often, bed capacity planning is considered as a long-term strategic decision due to the lack of flexibility in managing the capacity. However, in realistic settings such as seasonal demand fluctuations, staff absences, emergency requirements for resources and beds, short-term and temporary maintenance, repair or renewal works, capacity decisions have to be made to improve the flexibility in management. To satisfy the need for flexibility in HCM decision makers need quantitative tools to organise short-term changes in operations and to review periodically tactical and strategic plans for anticipated bed capacity to reorganise department resources.

Several methods such as the ratio method, discrete event simulation, queuing models and stochastic simulation have been suggested to solve the bed capacity planning problem in the literature (Kokangul, 2008) for long-term strategic decisions. The ratio-based method which uses the average length of stays has been applied extensively to determine the size of the required bed capacity (Nguyen et al, 2005). The size of the required bed capacity is determined using the length of stay (LOS) ratio (Nguyen et al, 2005). Capacity decisions have also been made based on target occupancy levels. However, these methods do not take into account the variation of requested admissions over time. These variations arise due to the unpredictable nature of hospital admission rates and patients length of stays. Stochastic simulation models used to determine the size of the required bed capacity based on the number of patients in the hospital (El- Darzi et al, 1998). A combination of simulation, queuing theory, statistical analysis and mathematical modelling are used to determine the bed requirements and to predict the probability that patients needing admission will be turned away (Hershley et al, 1981). Stochastic methodologies that combined queuing network analysis with integer programming model and discrete event simulation are

used to balancing bed utilisation with associated benefits of reduced waiting, reduced patient blocking and reduced poor bed assignment (Cochran and Bharti, 2006). A network flow model, that incorporates facility performance and budget constraints, is developed to determine the optimum size of bed capacity (Akcali et al, 2006). But most of the studies mentioned above are quite theoretical and hard to apply in a real life cases for a hospital manager and they do not provide solutions for short-term tactical decisions. In this study, our motivation is to propose a simple decision making tool that can be used easily without an expertise to the decision makers (hospital managers). The proposed decision making tool implements a modified network model and Dijkstra algorithm is used in order to solve the short-term tactical bed capacity problem raised in an oncology department of a hospital.

The results show that the department can increase their bed capacity using its own resources. This leads to an increase in the service quality and a decrease in expected waiting time of the patients which is very vital for this department since the patients who come to this department have to be treated urgently. Moreover, the proposed decision tool enables the health care decision makers to have an applicable solution for bed capacity planning within the context of flexibility. The impact of implementing the proposed quantitative tools to the flexibility in health care operations management has been discussed. As further work, the study can be continued for different departments of the same hospital or other hospitals which have larger bed capacity and more constraints for the planning.

IT IN HELTHCARE (DENTISTRY) AS ONE OF MAIN FACTORS IN IMPROVING QUALITY OF LIFE: BALANCED SCORECARD APPROACH

Vartanov, Misak Oganosovich¹

¹International Business School, Moscow Institute of Radio Engineering, Electronics, and Automatics (Technical University) (MIREA University), Moscow, Russia. E-Mail: vartanov@mirea.ru

Abstract

The main purpose of this article is to investigate non-evident relationship between IT penetration in medical clinics and patients' quality of life (QOL) improvement. The research was done for private dentistry field of health care industry of Russia, as one of the most saturated with IT and fast growing.

By IT penetration we understand the degree of using the most popular IT in dental clinics: practice management systems (PMS), imaging systems, diagnostic equipment, connected to LANs and WANs, mobile applications, Internet.

Cause-and-effect relations between quality of treatment and IT penetration were first revealed for practice management software, diagnostic equipment and imaging software. The metrics of balanced scorecard (BSC) for dentistry was used to show, how IT helps to manage clinic, and, as a consequence, improve patients' treatment results, their overall satisfaction, oral health indicators.

Clinic's status assessment was accomplished regarding traditional 4 BSC perspectives: financial, patients care, personnel improvement, and business processes justification (Kaplan and Norton, 1996). Statistical data of key performance indicators (KPI), construed in accordance with BSC approach, were obtained from practice management software system "Dental for Windows" (Australian company "Centaur Software" made, and localized for Russian market since 1997) (www.centaursoftware.com, www.d4w.ru).

These data show, that patients quality of life indicators (objective ones) were steadily growing during observed period (2005 – 2010) in Russian clinics. Quality of life of particular patient (as opposed to traditional approach with subjective measures based on questionnaires (McGrath and Rogers , 2010) can be implicitly assessed by following objective criteria: frequency of repeating appointments, time to wait in queues at the clinic, time to wait an appointment, types of services rendered (caries treatment, dentures, etc.), age of patients distribution.

Relationship between some traditional subjective measures and objective ones, derived from statistical data of PMS, was revealed. Subjective measures vary regarding

set of indicators and scales, appropriating specific domains, for example, the most widely used:

- Oral Health Impact Profile (OHIP) (Slade and Spencer, 1994) - functional limitation, pain, psychological discomfort, physical disability, psychological disability, social disability, and handicap.
- General Oral Health Assessment Index: (GOHAI) (Atchison and Dolan, 1990) – assessment of psychosocial impact associated with oral diseases in older populations
- And others (McGrath and Rogers, 2010).

PMS is very effective in preventive and hygienic measures promotion. It is achieved by using Internet and mobile communications with patients. Recalls (through SMS, or Internet) help to cut the risk of interrupting treatment because of patients' forgetfulness, when treatment has to be fulfilled in a few stages.

Our hypothesis, that the more often patient visits the dental clinic the worse is his/her QOL indicators, was proved by statistically significant experimental study and expert judgments.

BSC approach is supposed to provide step-by-step transition from strategic goals, which in our case is QOL improvement, to concrete metrics, which characterize every of 4 BSC perspectives.

So, we included in BSC metrics new KPI, which are responsible for objective assessment of patients' QOL (patients' perspective). We also included new KPI, which characterize IT penetration, in business processes perspective. This allowed us to modify BSC of dental clinic so that relationship between QOL indicators and IT penetration became clear and transparent, when assessing clinic stance regarding BSC.

The next step (future implication) in our investigation is to extend set of subjective and objective indicators of QOL, which relationship should be established, in order to add more KPI to BSC with purpose to get more comprehensive picture of dental clinic status assessment. Then it is supposed to use new BSC, which includes IT penetration metrics, and QOL metrics. As a result, it is will be possible to formulate strategic initiatives in terms of IT initiatives, and assess the consequences quantitatively.

LEAN THINKING IN THE EUROPEAN HOTEL INDUSTRY**Vlachos, Ilias¹**

¹Agricultural University of Athens, Iera Odos 75, Botanikos 11855, Athens, Greece. Email: ivlachos@aua.gr Email: ivlachos@gmail.com

Abstract

The aim of this study was to assess whether lean practices are applied in European hotel industry practices and whether or not their implementation contribute to efficiency and effectiveness of hotel management. Removing all types of waste can prove itself a survival strategy during recessionary times for many small and medium hotels across Europe.

We surveyed small and medium hotels across 19 European member states by sending questionnaires to hotel managers. We evaluated 7 value stream mapping techniques: Process activity mapping, Supply chain response matrix, Production variety funnel, Quality filter mapping, Demand amplification mapping, Decision point analysis, and Physical structure. Initially, we identified two value streams: (a) Reservation value stream: reservation – transportation – check in – housekeeping – check out – transportation; and (b) Procurement value stream: establishment of a need – placing an internal order – order / purchase – delivery to the hotel – delivery to the hotel segment.

Data analysis showed that hotels apply value stream mapping techniques to a varying degree. Results show high level of similarity in hotel operations regardless of the country a hotel is located in. We offer managerial implications and suggestions for further research.

A METHODOICAL APPROACH FOR LEAN TRANSFORMATION FOR FOOD COMPANIES

Vlachos, Ilias¹

¹Agricultural University of Athens, Iera Odos 75, Botanikos 11855, Athens, Greece. Email: ivlachos@aua.gr Email: ivlachos@gmail.com

Abstract

In today's competition, for businesses to survive or supply chains to succeed, they must be sufficiently capable of continuously meeting or exceeding the needs and wants of their customers and also cope with the constant changes in the marketplace. In other words, it is all about staying or converting to lean, the aim of which is to meet customer demand instantaneously, with perfect quality and no waste. By reviewing literature and looking to situation of many businesses, we developed a methodical approach for lean transformation (MALT) having the following characteristics: holistic (inclusive, by addressing all the necessary factors for change and encompasses all relevant aspects of an organization), adaptive to several industries and business scenarios, and also systematic with sufficiently clear and explicit steps for the execution of lean transformation.

The MALT model proposes a way how businesses or supply chains can effectively and efficiently be transformed to lean states in relatively shorter time, with minimum cost and people resistance, better and sustainable change in culture and maximum participation.

A case research was adopted with multiple sources of data: reports, questionnaires, and in-depth interviews as well as participant observation.

The Key Findings of the Research include (a) the HAS features (holistic, adaptive and systematic) of the suggested MALT Model are obviously useful for achieving comprehensive and successful lean transformation. (b) The eight key factors showed significant contributions to lean transformation in a way or another. These can be described as following: (1) Business Strategy (BS): It contributes to ensure a holistic lean transformation while it also used to define value. (2) Cultural Change (CC): The lean transformation involves a remarkable cultural change which is behind the success of the LT. (3) Leadership (L): Leadership was the main influential factor behind the achieved cultural change and also contributed to a holistic transformation. (4) Lean Education (LE): There is evidence of a high impact of LE to the success of LT although results are inconclusive. (5) People Involvement (PI): It was not a critical success factor due to automation of the value stream process. However, its impact was similar to that of Leadership. (6) Marketing Plan: It contributes significantly to define value as a cornerstone of managing value stream. (7) Value Stream Mapping: The application of

Value Stream Mapping was very effective for LT. (8) Performance Measurement and Assessment (PMA): Reports indicate a possible high effect of PMA to the success of LT which is similar to that from Leadership, People Involvement, and Execution of Lean Tools.

Suggestions for future research include the examination of the MALT Model in a wider business case that facilitates a thorough application of whole concepts of the model.

**SIZE, CAPITAL STRUCTURE, FIRM PERFORMANCE AND INDUSTRY SECTOR:
EMPIRICAL EVIDENCE BEFORE AND AFTER THE ECONOMIC CRISIS**

Voulgaris, Fotini¹; Kanzeli, Vaso²

¹Technological Educational Institute of Crete. Email: fvoulgaris@staff.teicrete.gr

²BEFB Portsmouth University

Abstract

Purpose: The main purpose of this paper is to investigate whether the capital structure of Greek firms is influenced by their size, different variables and the sector they are in. The study includes the period before and after the economic crisis, investigating the effect of the crisis on capital structure. The analysis tries to identify also differences in the behavior of small and medium sized firms vs. large firms in the most important exporting industrial sectors in Greece with respect to their capital structure and performance.

Design/Methodology/Approach: Multivariate regression models will be used, along with descriptive statistics, on panel data, to investigate the significant factors affecting capital structure and performance of Greek firms, with size and industry sectors acting as control variables. Data are collected from the data base of ICAP Hellas, a private research and data base firm, based on published financial statements of firms. The random sample will include 200 publicly listed and non listed, small and medium size and large sized firms from major export oriented industry sectors, based on their population distribution, for the time period 2000-2010, in order to include before and after economic crises data.

The models will include as explanatory variables capital structure and relative performance and as independent variables, size, capital expenditures, sales growth, ROA and relative to industry ROA and volatility.

The analysis will be based on different groupings of firms, according to size (SMEs and Large firms) and industry sectors and the OLS models will be applied in order to detect differences in the factors affecting the dependent variables, i.e. long term debt leverage and relative performance (product-market). The stability of factors before and after the crisis, will be also examined.

Findings: Since this is still an undergoing research, a significant effect of leverage is expected on the relative to industry sales growth, but a significant decrease is expected in relative to industry ROA, based on theory and literature. The size and industry sectors are expected to play a significant role in the capital structure of firms and the factors affecting it.

Practical implication: The results of the research will be valuable for both industry and academia, since they will help them develop policies and strategies to make Greek exporting firms more competitive and assure their viability and growth. Investors and managers will be able also to forecast the performance of a firm and act accordingly.

Originality/ value: The issue has not been researched in such depth for the Greek market for the last ten years in Greece, including the after crisis period. The relative to industry variables used in the models will give the dimension of competitiveness in the export oriented firms in Greece, as well as the differences among of SMEs and Large firms.

**EXTENDED PERFORMANCE SATISFACTION INDEX - STANDARDIZED
MEASURE OF COMPANY SUCCESS OR PROSPERITY OF NATIONAL
ECONOMY?**

Vranešević, Tihomir¹

¹Faculty of Economics and Business University of Zagreb, Croatia. Email: tvranesevic@efzg.hr

Abstract

For more than 15 years, in a certain countries exists a several procedure of calculating the satisfaction index so that their comparison is possible – of course, depend on fact of standardized procedure and level of confidence. The national satisfaction index is composed results of the satisfaction indexes of individual industries within the economy, while the indexes of individual industries of the economy are result of the indexes of individual companies (primarily companies that have a significant market share). Of course the indexes of each individual company have a different impact (“ponder”) on the index of the individual branch of the economy. In the same way, the influence of the index of every branch of the economy on the national satisfaction index is different. This fact have to be take in account when considering national satisfaction index.

Well known national satisfaction indexes exist in the USA (ACSI – American Customer Satisfaction Index; established in 1994) and in Sweden (SCSI – Swedish Customer Satisfaction Index or SKI – Svenskt Kund Index, established 1989). The SKI results point to the understandable relationship between the customer satisfaction index and profitability (in which profitability is observed as a return on assets (ROA). A clear and positive relation between customer satisfaction and company profitability was also determined (according to the same source) by using ACSI results in USA. (Eklof et al., 1999). Today, the most popular and recognized model in Europe is EPSI – Extended Performance Satisfaction Index. A European feasibility study for coordinated national studies was conducted in 1997 – 98. In this, a model for customer satisfaction measurement and analysis, based on the Swedish SKI-approach, was proposed. During 1999-2010 EPSI has become a recognized international system of non-financial measurements. The coverage of various countries and common sectors has successively been extended. The basic reasons for the establishment of this index as a new, added indicator of the change in the national economy should be searched for in the desire to stimulate economic growth and higher competition of national economies in general. The main idea of EPSI is to develop a common European standard for measuring stakeholder satisfaction and identifying stakeholder priorities. EPSI is characterized by independence and a scientific background. The network of EPSI national (sub-regional)

platforms (entities) and clients are active in around 25 European countries (including Croatia since 2010).

Currently, EPSI is running multi-national surveys in the following industries/sectors: Banking (consumer and corporate segment), General Insurance (consumer and corporate segment), Life/pension insurance, Retail Trade, Mobile Telecoms and Broadband (consumer and corporate segment) as well as a few other ICT-segments like digital TV and mobile Internet, Utilities (electricity etc.), Health services, Education, Police and public safety, Public transport, Public administration, Logistics (corporate segment), Postal Services, Business Services (IT, auditing, legal) (www.epsi-rating.com).

It worth to point out the relation between market share and customer satisfaction as the performance indicator but it is also possible to pose the question of the relation between customer satisfaction and productivity – what can we expect if the intention exists to simultaneously increase productivity and customer satisfaction? Is it possible to realize their simultaneous growth and till when and up to what point is it possible to increase both performance dimensions or is there an “internal conflict” which suggests that it is necessary to find a strategy which will keep them in balance? Customer satisfaction can simultaneously be observed as a goal, a means and a measurement of the marketing management performance and that as such it is the basic precondition of customer orientation culture.

Economic growth and the competition of the national economy are in the end the result of the good business performance of the companies that act within the framework of this economy. One of the goals of business performance according to the traditionally understood business marketing philosophy was in the beginning the fulfillment of needs and desires of consumers but also achieving their satisfaction. According to this – it is very interest to consider similarities and differences during a time on different national economies in different circumstances and developments. But in general we found and we can expect clear evidence of the positively caused relationship between satisfaction and other measurements of performance.

THE ENCOUNTER BETWEEN SERVICES PROVIDERS AND POOR CUSTOMERS

Yassour-Borochowitz, Dalit¹

¹Head of Human Services Department, Emek Yezreel College, 19300, ISRAEL. Email: dality@yvc.ac.il

Abstract

“Services for the poor are poor services” (Richard Titmuss)

The twenty-first century has been labeled The Service Age. It seems that the traditional role of family and community in meeting human’s needs, has been supplanted by other social structures, mainly service organizations.

The present study aims to describe the encounters of services providers of basic-needs (transportation, food, school, health and banking) with customers who live in poverty. It also aspires to raise a number of ethical questions pertaining to the attitude of service organizations toward their poor customers as a reflection on us as a society.

The “transparent customers”

At the start of the twenty-first century there are, in Israel, approximately 1,774,800 people living in poverty. They constitute close to a quarter of the Israeli population.

Impoverished customers are perceived as people who are not equal participants in the economic-social systems (Doron, 2008). The attitude to people living in poverty as “others” in general and as “customers of a different kind” in particular, originates in age-old images and in the modern-day capitalist economy that glorifies financial success and accelerated consumerism (Doron, 2008; Krumer-Nevo, 2006; Lister, 2004). This is a population whose needs are in effect ignored by society and its agents, such as businesses and service organizations (Andreasen, 1993; Hill, 2008).

They could be called “transparent customers”, since most organizations do not have a policy for dealing with them, and in studies addressing service relations they gain little mention.

Methodology

The present study was conducted in the qualitative tradition (grounded theory) and it is based on half-structured in-depth interviews with fifty services providers: Ten bus drivers, ten supermarket cashiers, ten elementary school teachers, ten family doctors and ten bank tellers. All the participants in this study share two common characteristics – they all have a direct interaction with service recipients, and they all provide services that meet basic needs. It is noteworthy that although service

providers share many skills, the heterogeneity of the services sector means that service providers often come from different backgrounds and possess a variety of different skills (Yagil, 2008).

Two main themes that stood up from the interviews outline the discussion of this study: 1- The difficulties service providers experience identifying poor customers in need of help, and 2 - The informal ways of circumventing the organization's policy and bureaucracy in order to help impoverished customers, and the fact that most organizations do not have a policy for dealing with poor customers. These themes recurred throughout most of the interviews reflecting strong emotions (such as helplessness and frustration), as well as a basic moral intuition that "something basic is very wrong".

Discussion and summary

When speaking about service providers it is customary to include three "participants" in the process: the service recipient, the service provider, and the organization within which the service is provided (Yagil, 2008). I wish to add another central participant –society. As we know, organizations operate within a society that has values, and priorities that reflect it.

Statement #1 of the UN's 1948 Universal Declaration of Human Rights states: "All human beings are born free and equal in **dignity** and **rights**". Consequently, democratic countries have developed a legal approach forbidding discrimination based on things such as race, sex, disability, and "circumstances beyond a person's control". It seems that the common perceptions that view the poor as being "responsible" for their situation (Lister, 2004) preclude them from receiving equal treatment, for according to this perception, these are not "circumstances beyond a person's control".

However, society needs to realize that in The Service Age the ability to receive needs-oriented services is a basic right, which can be easily translated into the term "equal opportunity". As such, it constitutes what philosopher John Rawls (1971) terms "primary social goods", and therefore, the principle of justice should be applied to their distribution.

The present age, which some call the Age of Greed (Brobeck, 1991), raises the need for government intervention and greater regulation in the services marketplace, in order to protect low-income consumers.

On a personal level the findings of this study teach us that human solidarity is common, and so is the desire to extend help and do well by your customers. However, the traditional mechanisms for helping the disadvantaged (such as charity and bending the organizations' rules) cannot serve as a substitute for a services system that is **compelled** by society, its laws, its values and its elected representatives to provide

services not only to customers with financial means, but first and foremost to its weakest customers: impoverished consumers.
