FOREWORD

The Annual Conference of the EuroMed Academy of Business aims to provide a unique international forum to facilitate the exchange of cutting-edge information through multidisciplinary presentations of new challenge in global business with special emphasis on European and Mediterranean countries. This is from an Academic, Research and Professional perspective.

It is acknowledged that the conference has established itself as one of the major conferences of its kind in the EuroMed region, in terms of size, quality of content, and standing of attendees. Many of the papers presented contribute significantly to the business knowledge base.

The conference attracts hundreds of leading scholars from leading universities and principal executives and politicians from all over the world with the participation or intervention of Presidents, Prime Ministers, Ministers, Company CEOs, Presidents of Chambers, and other leading figures.

This year the conference attracted over 200 people from over 45 countries. Academics, practitioners, researchers and Doctoral students throughout the world submitted original papers for conference presentation and for publication in this Book. All papers and abstracts were double blind reviewed. The result of these efforts produced empirical, conceptual and methodological papers and abstracts involving all functional areas of business with a special focus on European and Mediterranean aspects.

ACKNOWLEDGEMENT

Many people and organizations are responsible for the successful outcome of the 4th Annual Conference of the EuroMed Academy of Business.

Special thanks goes to the Conference Chairs (Dr Vagelis Tsoukatos and Professor Fotini Voulgari) and the Faculty of the Agios Nikolaos Campus of TEI of Crete (Dr Christos Floros, Dr Yannis Dimotikalis, Dr Manolis Mavrakis, Dr Stelios Papadakis, Dr Yannis Aikaterinidis, George Arakadakis and Michalis Koutsakis) and the Conference Manager and Master of Ceremony (Dr Manolis Sisamakis) for accomplishing an excellent job. We also express our appreciation and gratitude to Dr Yioula Melanthiou and Yiola Michael (School of Business, University of Nicosia) for their endless support.

It is acknowledged that a successful conference could not be possible without the special co-operation and care of the Track Chairs and Reviewers for reviewing the many papers that were submitted to this conference. Special thanks to the Session Chairs and Paper Discussants for taking the extra time to make this conference a real success.

Further, we would like to thank the local Chamber of Commerce and Industry and the Municipal Community of Elounda, for all their help and support, as well as all our Sponsors and Supporters namely: Agios Nikolaos Campus of TEI of Crete, University of Nicosia in Cyprus, the College of Management Academic Studies in Israel, Les Roches- Gruyere, University of Applied Sciences in Switzerland, the Agricultural Bank of Greece, the National Bank of Greece, MTN, ExpoGlobalOnline.com and Emerald publishing company. Our Sponsors of Communication Mr George Syligardos, Anatoly, Patris and Nea Kriti Newspapers as well as the Creta Channel TV and 104.4 FM are also greatly thanked.

The last but not the least important acknowledgment goes to all those who submitted their work to be considered for presentation at the conference.

Abstract

The fruit and vegetable trade has developed into one of the most dynamic sectors of the international market for agricultural products, due to the globalization of commerce and the changes in the food market all over the world. It is the most important agricultural sector in Greece. The aim of the present paper is to study and evaluate the economic status of the agricultural cooperative organisations (ACO) which are active in the fresh fruit trade sector, and to compare them with relevant private enterprises, which constitute their main competitors. More specifically, the research focuses on two groups of business units, agricultural cooperatives and private enterprises that are involved in the fresh fruit and vegetable sector and are based in Central Macedonia. The results from the presentation and comparison of these two different categories are then used to define the results of the different policies they adopt. Finally, an attempt is made to identify the factors that affect their efficient operation and also the problems they are faced with.

In order to study and evaluate the economic status of the cooperatives in relation to private enterprises, the financial statement analysis method with ratios was used. The results of the comparison between cooperatives and private enterprises can facilitate our understanding of the differing policies applied by each business category; they also provide insight into how the former can best adapt to the new conditions of the market. Based on specific financial parameters, a typological classification -a grouping of the business units in the selected sample- was carried out, which highlighted their level of competitiveness.

Keywords: Fresh fruit and vegetable Sector, Financial Study, Financial Ratios Agricultural Cooperative Organizations, Typological Analysis.

Introduction

Fruit and vegetables have internationally evolved into one of the most dynamic sectors of agricultural production (Diop and Jaffee, 2005). Global production amounts to 500 million

tons and its value is estimated at approximately 50 billion euros per year. The greatest importer of fruit in the world is China, followed by India and the European Union (Kalafati, 2007).

In Greece, the fresh fruit and vegetable sector is the most significant agricultural sector nowadays. The Greek fruit production volume amounts to 3.3 million tons and the gross domestic product value is estimated at 1840 million € (NSSG, 2009). The dynamic presence of the sector is also proven by the fact that in recent years, the value of fruit and vegetables has steadily equalled 30% approximately of the gross value of the total agricultural production of Greece; this is a particularly important percentage that can be compared with the percentage share of the whole stockbreeding sector of Greece (NSSG, 2009; ICAP, 2010). In addition, in recent years, the sector has presented the second highest export volume in agricultural products, and a continuous rise in figures. In 2008, the sector's exports amounted to 258 million euros in value, and 387 thousand tons in volume. The main destination countries are Russia, Germany, Romania, Poland, the Czech Republic and Hungary (Exporters' Association, 2008). A decisive role in this development has been played by the significant progress observed in the production methods, post-collection management, and processing of products, along with the growth in logistics technologies – in combination with the increased investments in the sector (Diop and Jaffee, 2005).

The sector in Greece is characterized by the co-existence of a large number of enterprises and cooperatives, which is mainly due to the fragmentation of primary production, and the relatively low level of investment required for a business to enter the sector (Hamourga, 2010). The production facilities of the sector's businesses are located close to the production area of the products intended for trade. Consequently, a high level of concentration is observed in Central Macedonia, which is the Greek region that presents the highest fresh fruit production volume. This region produces approximately 70% of the total Greek fruit and vegetable production. In addition, after the region of Attica (where Athens is located), the largest number of businesses involved in the wholesale trade of fruit and vegetables are located in the region of Central Macedonia. According to Tables 1 and 2, there are 696 businesses in this region, with total sales that exceed 500 million Euros (22% of the total sales in Greece in wholesale trade), and 747 businesses with total sales of approximately 65 million in retail trade (13.8% of the total sales in Greece) (NSSG, 2006).

Table 1. Geographical distribution of businesses active in the wholesale trade of fruit and vegetables (2005)

REGION	No of businesses	Percentage%	Sales in million €	Percentage %
Eastern Macedonia and Thrace	143	4,7	102.219.794,57	4,4
Attica	704	23,2	737.196.919,23	32,0

Agricultural cooperatives play a substantial role in the trade of fresh fruit, since they gather and distribute major quantities of the domestic production, primarily on behalf of small-scale producers who are their members (Sergaki and Semos, 2006). The most dynamic cooperatives, by using the necessary technological equipment and modern processing and packaging-standardization methods for their production, in accordance with the specifications of the required quality assurance systems, and through their participation in various promotional activities for their products, have managed to expand their presence both in the domestic and the international market, by responding to its demands in a satisfactory manner, despite their organizational weaknesses and the adverse economic conditions.

Table 2. Geographical distribution of businesses active in the retail trade of fruit and vegetables in specialized stores

REGION	No of businesses	Percentage%	Sales in million €	Percentage%
Eastern Macedonia and Thrace	272	5,8	25.120.145,49	5,4
Attica	1.578	33,8	165.949.117,60	35,6
Northern Aegean	101	2,2	11.471.896,56	2,5

TOTAL	4.665	100	466.317.380,20	100

Source: NSSG, Business Register 2005

Based on the dynamic growth expected in this sector over the following years, the competition that exists between agricultural cooperatives and private enterprises involved in the wholesale trade of fruit and vegetables in Central Macedonia, and the importance of this sector for this area, it is interesting to compare the economic status of the businesses involved, in order to arrive at useful conclusions regarding the structure of the sector. Consequently, the main objective of this paper is to evaluate the performance and financial status of these two strategic groups: Agricultural Cooperatives and Private Enterprises that specialize in the trade of fresh fruit (kiwis, pears, apricots, plums, cherries, lemons, mandarins, apples, melons, oranges, peaches and nectarines) and vegetables in Northern Greece. Additionally, this comparison is very important as it shows whether agricultural cooperatives or private enterprises are best positioned in the fresh fruit and vegetable market chain and can also firstly point out valuable conclusions about the different marketing policies followed by each group and, secondly, provide information as to how these businesses can best adapt to the new market conditions.

The aim of the present paper is to study and evaluate the economic status of the agricultural cooperative organisations (ACO), which are active in the fresh fruit trade sector, and to compare them with private enterprises which develop similar activities, and are their primary competitors. More specifically, the study focuses on two groups of business units: agricultural cooperatives of various levels and private enterprises of various forms (S.A., sole proprietorship etc.) which are based in Central Macedonia. From an analysis of the financial profile of the business units belonging to the two different categories, an attempt is made to determine the efficiency of their operations and the problems they are faced with. Finally, we proceed with their typological analysis, irrespectively of their initial classification (as private enterprises or agricultural cooperative organisations), in order to determine their level of competitiveness.

Materials and Methods

In order to collect the data for the implementation of the research, case studies were used from selected businesses in this sector. The case study method – using several cases in particular – is constantly gaining ground, since it allows for an analytical, in-depth approach of the research object, and also leads to richer and more detailed data, which cannot easily be collected using other methods (Miles and Huberman, 1994, Yin, 1994). Although case studies cannot lead to generalizations, they were found to be the most suitable method for this particular study, since they provide “first hand” knowledge of the actual operating conditions of the business units active in the fresh fruit trade sector (Siardos, 2005). More specifically, in order to carry out the research, twelve businesses were selected which are active in the sector under study. Six of these are agricultural cooperatives of various levels and the other six are private enterprises, active in the field of standardization-packaging and trading of fresh fruit: they also hold an important position in the market. More specifically, the research included companies in which the related activity accounts for the majority share of sales (over 50%). The selection of agricultural cooperatives of varying levels and organizational structures, and of private enterprises involved in fresh fruit and vegetable trade in the same region, aims at a comparative analysis of the way in which they operate and of the strategies they apply, given the fact that they are in competition with each other.

The necessary financial data in order to study the cooperatives and enterprises in this research were obtained from their financial statements for the period 2003 to 2008. Then, based on the relevant data, a series of financial ratios were estimated. The use of ratios is one of the most widely disseminated and dynamic methods of financial analysis (Niarchos, 2004). In the present study, ratios were calculated pertaining to the Liquidity, Risk and Efficiency of the units' operation, which are considered by many authors to be suitable when aiming to delineate the course and viability of a business (Oustabasidis et al., 2000). The indicators were initially calculated for each business. Then the mean of the ratios was calculated for the group

of agricultural cooperatives and for the group of private enterprises (for the specific time period). Finally, the means of both groups were compared.

The ratios selected to describe the financial profile of the business units are:

1. *Liquidity ratios*. They are used to determine both the short-term position of a business, and its ability to respond to its short-term liabilities (Dickerson et al., 1995; Weston & Brigham, 1997). More specifically, the a) Current liquidity ratio and b) Quick liquidity ratio were selected.

2. *Activity ratios*. They are used to measure how efficient a business is in making use of its assets (Oustabasidis et al., 2000; Downey and Trocke, 1981; Dickerson *et al.*, 1995; Weston & Brigham, 1997). More specifically, the following ratios were used: a) Inventory Turnover Ratio, b) Receivable turnover ratio, c) Asset Turnover Ratio.

3. *Profitability ratios*. These indicators are used to measure the profitability of a business, its dynamic profits and its administrative capacity (Downey & Trocke, 1981). More specifically, the following were selected: a) Gross Profit Margin, b) Net Profit Margin c) Return on total Assets – ROA and d) Return on net worth.

4. *Financial structure and viability ratios*. These indicators estimate the long-term capacity of a business to respond to its liabilities, and the level of protection enjoyed by its creditors (Penson & Lins, 1980; Tew, 1985). From this group, the following ratios were selected: a) Ratio of owner's equity to total, b) Ratio of owner's equity to fixed assets, c) Solvency or Loan Qualifying Ratio.

Next, a blind segmentation of the enterprises and cooperatives in the study was carried out. More specifically, the initial business grouping of the enterprises and cooperatives in the research was considered to be indifferent. The objective of the research is to perform a classification – grouping of the business units in the selected sample, based on specific financial parameters, that will highlight any similarities and differences between them, irrespectively of their initial classification (private enterprises or cooperatives). For this purpose, the mean of the selected parameters was calculated for each of the 12 business units: fixed assets (Y_1), current assets (Y_2), inventories (Y_3), receivables (Y_4), total assets (Y_5), total net worth (Y_6) and sales (Y_7), for the relevant periods. At a next stage, Hierarchical Cluster Analysis was applied (Aggelopoulos *et al.*, 2009). The formulation of the clusters was carried out based on the Ward criterion, while the square of the Euclidean distance was used to measure the (dis)similarity of the business units (Hair *et al.*, 1995; Sharma, 1996). The analysis was carried out using the statistical package SPSS ver. 15.0. Before entering the analysis, the variables were transformed into z-scores. The constancy of the results, in relation with the order of entry of the financial parameters into the analysis was checked using the software PermuCLUSTER ver.1.0 (Van der Kloot *et al.*, 2003).

Results

The Table 3 presents the values of the Current & Quick Liquidity Ratios for this particular period.

Table 3. Liquidity Ratios

<i>Current Liquidity Ratio</i>	<i>2003</i>	<i>2004</i>	<i>2005</i>	<i>2006</i>	<i>2007</i>	<i>2008</i>
<i>Cooperatives</i>	<i>1,66</i>	<i>1,89</i>	<i>1,66</i>	<i>2,68</i>	<i>1,38</i>	<i>1,36</i>
<i>Private Enterprises</i>	<i>1,03</i>	<i>1,20</i>	<i>1,23</i>	<i>1,13</i>	<i>1,27</i>	<i>1,20</i>
<i>Quick Liquidity Ratio</i>						
<i>Cooperatives</i>	<i>1,33</i>	<i>1,56</i>	<i>1,22</i>	<i>2,08</i>	<i>1,20</i>	<i>1,20</i>
<i>Private Enterprises</i>	<i>0,81</i>	<i>0,75</i>	<i>0,76</i>	<i>0,69</i>	<i>0,69</i>	<i>0,62</i>

Table 3 shows that both the cooperatives and the private enterprises present a satisfactory liquidity; the cooperatives however present better values with a significant difference, compared to the private enterprises for the whole period under study. The predominance of cooperatives shows that, compared to private enterprises, they can respond more easily to their current liabilities, fixed expenses, claimed interest and dividends, and can also better respond to any current losses. As regards the Quick Liquidity indicator, the ACO also present steadily satisfactory values that are higher than one, in contrast to the private sector enterprises that are lagging far behind, presenting values for this indicator that are lower than one, and a downward trend overall. In general, ACO portray a sound current financial status, since their quick assets more than cover their current liabilities. This is not the case for private sector enterprises, for which the relevant indicator presents values lower than one, which shows that these enterprises depend on their future sales in order to ensure adequate liquidity.

The Table 4 presents the Activity ratios.

Table 4. Activity ratios

<i>Inventory Turnover Ratio</i>	2003	2004	2005	2006	2007	2008
<i>Cooperatives</i>	19,44 (19)	22,66 (16)	26,87 (14)	15,19 (24)	24,22 (15)	26,97 (14)
<i>Private Enterprises</i>	18,16 (20)	16,31 (22)	10,24 (36)	7,50 (49)	7,41 (49)	7,20 (51)
<i>Receivable turnover ratio</i>						
<i>Cooperatives</i>	2,66 (137)	2,70 (135)	2,59 (141)	2,83 (129)	2,80 (130)	2,83 (129)
<i>Private Enterprises</i>	5,03 (73)	11,49 (32)	6,10 (60)	7,18 (51)	7,92 (46)	5,58 (65)
<i>Asset Turnover Ratio</i>						
<i>Cooperatives</i>	0,94	1,11	1,05	1,06	1,20	1,32
<i>Private Enterprises</i>	2,17	2,05	1,94	1,54	1,79	1,70

From an analysis of Table 4, we observe that the inventory turnover ratio presents a continuous rise (with the exception of 2006) for the cooperatives, which may potentially not be related to proportionately high profits, since compression may occur, in their effort to increase the volume of sales. On the contrary, for private enterprises, the inventory turnover ratio presents a continuous decrease, and is shaped at lower values, compared to the cooperatives. The lower turnover for private enterprises is potentially linked to a higher gross profit margin (Niarchos, 2004).

The values of the receivable turnover ratio are much higher for cooperatives compared to private enterprises, thus denoting major differences between the two groups as regards their credit policy: private enterprises are in a better position, since they collect their receivables twice as many times per year on average, compared to agricultural cooperatives. Nevertheless, it should be pointed out that this fact is also related to the commercial policy that each enterprise chooses to adopt; that is why their evaluation must also be accompanied by a study of their credit policy. Although private enterprises present better values for the asset turnover ratio compared to agricultural cooperatives, they also portray a continuous drop, in contrast to cooperatives, for which the indicator presents a continuous rise from 2005 onwards. The lower values of the indicator for cooperatives are an indicator of over-investment of funds in relation to sales, which could be related to their high inventories and generally to their other assets, whose use does not lead to a satisfactory level of sales.

Table 5. Financial Structure and Viability Ratios

<i>Ratio of Owner's Equity to Total</i>	2003	2004	2005	2006	2007	2008
<i>Cooperatives</i>	0,55	0,49	0,46	0,51	0,48	0,47
<i>Private Enterprises</i>	0,24	0,38	0,31	0,30	0,34	0,23
<i>Ratio of Owner's Equity to Fixed Assets</i>						
<i>Cooperatives</i>	1,92	1,40	1,15	1,81	0,99	1,26
<i>Private Enterprises</i>	0,46	0,73	0,66	0,55	0,66	0,31
<i>Solvency Ratio</i>						
<i>Cooperatives</i>	0,45	0,51	0,53	0,51	0,60	0,61
<i>Private Enterprises</i>	0,76	0,67	0,68	0,70	0,66	0,77

Following an analysis of the Financial Structure and Viability Ratios (Table 5), we observe that the owner's equity to total ratio for agricultural cooperatives is steadily at around 50%, while for the enterprises in the private sector it is around 30%, thus denoting that the cooperatives are half funded by equity finance, in contrast to private enterprises, which cover about 70% of funding for their assets using debt finance.

The mean for the Owner's Equity to Fixed Assets Ratio is higher for cooperatives, with values that are fixedly higher than one, as opposed to private enterprises, for which the indicator takes on values from 0.3 to 0.7, thus showing that private enterprises are leveraged and provide limited security to their creditors. Both the private enterprises and agricultural cooperatives in this sector are characterized by a Loan Qualifying Ratio, which takes on values lower than one. For the cooperatives, the indicator ranges on average at 54% in recent years, and for private enterprises at 70%, a fact which denotes greater solvency for agricultural cooperatives.

The analysis of the Profitability Ratios is described in Table 6.

The gross profit margin indicator presents better values for private enterprises in relation to cooperatives for the whole period under study. The net profit margin indicator presents better values for the private enterprises in relation to the cooperatives, where the indicator has a negative sign from 2007 onwards. The return on total assets ratio presents intense fluctuations, taking on positive and negative values for the period under study, for the businesses in both groups. The return on net worth indicator is at a low level, with values around zero for the businesses in both groups, which potentially denotes the existence of weaknesses and problems in their operation.

Table 6. Profitability Ratios

<i>Gross Profit Margin</i>	2003	2004	2005	2006	2007	2008
<i>Cooperatives</i>	0,060	0,125	0,103	0,122	0,024	0,082
<i>Private Enterprises</i>	0,093	0,145	0,163	0,151	0,129	0,134
<i>Net Profit Margin</i>						
<i>Cooperatives</i>	-0,007	0,003	0,003	0,003	-0,028	-0,042

<i>Return on total Assets</i>						
<i>Cooperatives</i>	0,011	0,001	0,016	0,016	-0,057	-0,025
<i>Private Enterprises</i>	0,016	-0,005	0,017	0,005	0,036	-0,015
<i>Return on net worth</i>						
<i>Cooperatives</i>	0,014	0,002	0,058	0,062	-0,262	-2,097
<i>Private Enterprises</i>	0,181	0,107	-0,015	0,055	0,001	0,063

Next, after the application of Hierarchical Cluster Analysis on the financial data of the sample, the typology of the business units in the fresh fruit sector is formulated for the region of Central Macedonia. Two clusters of business units emerge for this sector (Table 7). In Table 7, means in columns that are characterized by a different letter in the same column, present a statistically significant difference, at a significance level $\alpha=0,05$, according to the results of the relevant Mann-Whitney tests, that were carried out.

The depiction of the financial parameters for clusters C₁ and C₂ is presented in diagram 1.

Table 7. Typology of the business units in the sample

<i>Clusters</i>	<i>Fixed Assets</i>	<i>Current Assets</i>	<i>Inventories</i>	<i>Receivables</i>	<i>Total Assets</i>	<i>Total Net Worth</i>	<i>Sales</i>
	(Y ₁)	(Y ₂)	(Y ₃)	(Y ₄)	(Y ₅)	(Y ₆)	(Y ₇)
<i>C₁</i>							
<i>Mean</i>	4240291 ^a	5798874 ^a	1743760 ^a	3334801 ^a	10182097 ^a	2876463 ^a	9063737 ^a
<i>Std. Dev/tion</i>	4129678	5927933	1977373.1	3235045.7	9689020	2613061.2	8173408.6
<i>C₂</i>							
<i>Mean</i>	80913456 ^b	15336434 ^b	18090682 ^b	106403626 ^b	245823062 ^b	113829160 ^b	324031285 ^b
<i>Std. Dev/tion</i>	12771850	47007613	19088060	55557914	45316971	18903746	135374487

The Hierarchical Analysis has indicated two clusters of business units involved in the fruit and vegetable trade; the first includes 9 units (75% of the sample) and the second 3 (25% of the sample). The first cluster (C1) consists of enterprises by 66.7% (6 units) and cooperatives by 33.3% (3 units). The total assets of the business units in the first cluster (C1) equal 4.14% of the assets of the units in the second cluster (C2). The units in cluster C1 present a higher rate of investment in illiquid assets and a lower percentage of liquid assets as opposed to the units in cluster C2. Thus, the fixed assets and liquid assets constitute 42% and 3% of the total assets of the units in (C1), and 33% and 4.7% respectively of the assets of the units in (C2).

For the units in cluster C1, inventories cover 17.4% of the assets, while third-party receivables equal 32.8%. Similarly, for the cooperatives in (C2) the percentage of total assets covered by inventories (7.4%) is lower, due to the short period for which inventories remain at cooperatives; on the other hand, the share of third-party receivables in the assets is higher (43.3%), a fact related to the longer period of credit given to cooperatives. The dependence of business units on foreign funds is higher for the first cluster (C1), since 71.8% of their total liabilities are covered by foreign funds, as opposed to 53.7% for the units in the second cluster (C2).

Diagram 1. Projection of financial parameters per cluster in the typology.

Conclusions & Discussion

The dynamic growth of the fresh fruit and vegetable sector, both in Greece and around the world, imposes the need for business units (private enterprises and agricultural cooperatives) to adapt to the new conditions of the globalized market for agricultural products.

In recent years, agricultural cooperatives have developed as businesses, by making use of modern facilities, and new methods for the processing and packaging-standardization of their production. Through their links with various distribution channels and their participation in promotional and marketing programmes, they have managed to broaden their presence both in the domestic market and abroad. In the same sector, private enterprises of various forms also develop their own economic activities, and therefore constitute the main competitors of cooperatives.

In the analysis that has taken place within the framework of this particular paper, 12 (twelve) case studies were used, involving selected businesses from the sector. More specifically, 6 agricultural cooperatives and 6 private enterprises from the fresh fruit and vegetable sector were examined, which are active in Central Macedonia.

Based on their financial profile, which is depicted according to specific ratios, it is observed that agricultural cooperatives (ACO) present satisfactory liquidity. ACO can very easily respond to the payment of their current liabilities, fixed expenses, claimed interest and dividends, and can also better survive any current losses. They present a high inventory turnover ratio, and a high solvency ratio. Half the financing of their investments is provided by equity finance. The ACO aim to utilize their assets in order to strengthen their sales. However, the indicators that measure the efficiency of asset utilization present an upward trend, which is connected to an increase in sales. In addition, ACO present a significant over-investment of funds in relation to sales which, if not directly addressed through the intensification of the sales sector, will eventually lead them to default.

Private enterprises present limited liquidity, which mainly depends on future sales. As regards the period for collecting receivables, private enterprises are in an advantageous position compared to ACO, since they collect their receivables, on average, twice as many times per year. Private enterprises are leveraged and provide limited security to their creditors. Private enterprises also achieve a higher profitability compared to cooperatives. From the profitability ratios, we can observe that private enterprises are in a better economic situation compared to cooperatives. This is largely due to the different trade policy and promotional sales strategy that each enterprise adopts.

The typological analysis carried out on the sample of enterprises and ACO, highlighted two clusters of business units belonging to the fruit and vegetable trade sector. The first cluster includes private enterprises and ACO. It consists of 9 business units (which constitute 75% of the sample). The business units in this cluster present a significant dependence on foreign funds in order to implement their investment plans. The second cluster (C₂) consists of 3 business units (which constitute 25% of the sample). It exclusively consists of ACO, which present an intense export capacity. The ACO in this cluster are mainly dependent on equity finance and their inclusion in financing programmes for the implementation of their investments, and only maintain their inventories for a short period. In addition, they present

a higher share of third-party receivables in their assets, a fact linked to the longer credit period than cooperatives present.

The results from the typological analysis confirm the conclusions of the financial analysis that preceded it. They lead to the conclusion that ACO present a satisfactory financial profile, which allows them to compete on an equal standing with the private enterprises in this sector. An analysis of the ACO data, which exclusively comprise the second cluster (C₂), shows that these are cooperatives with a major export profile, which also carry out significant investments, through their inclusion in operational investment programmes.

This study is a trigger for further research and development of this topic by future researchers, who could examine and define more factors related to the economicity of the businesses in the sector, and conduct a research on a larger sample, so that the resulting data is indicative of the sector for the whole country.

CONCEPTUALIZING ENTREPRENEURSHIP AS CREATIVE SPACE

Ahl, Helene¹; Bjursell, Cecilia²

Abstract

This paper reviews and challenges received conceptualizations of entrepreneurship. We find entrepreneurship too narrowly defined, the business contexts in which it is customarily applied limiting, and the focus of input measured as forms of capital and output measured as economic gain restrictive. It black-boxes what entrepreneurs really do, reveals little about the process or the phenomenon of entrepreneurship, and its application in contexts other than business unnecessarily imposes business values that are not appropriate in such contexts. We further argue for the use of case studies as a fruitful way of unpacking the entrepreneurial process, and offer an example of such a case study. The analysis of the case results in a conceptualization of entrepreneurship as creative space, with three interrelated and co-dependent process movements: conservation, coordination and creation. We suggest entrepreneurship as creative space as a productive metaphor in studying what entrepreneurs really do, and also recommend a return to the original definition of entrepreneurship as *entreprendre*, that is, to undertake something.

Keywords: Entrepreneurship, creativity, space

Received Conceptions of Entrepreneurship and their Problems

The word entrepreneurship comes from French *entreprendre*, and means, literally, to undertake something. It has been used mainly to describe things undertaken in a business context, that is, for profit. Economists have theorized entrepreneurship since the late 1700s (Hébert & Link, 1988), debating whether it is concerned with risk-taking under uncertainty in pursuit of profit, with innovation, with supplying capital for profitable production and trade, or even a function at the heart of the renewal of the economy, as Schumpeter (1934/1983) claimed. Neither people in general nor politicians were much concerned with such musings – businesses were started and closed as a matter of course, and until the 1970s or so an entrepreneur was in many languages just a small business owner, if the word was used at all. A business owner was not in very high regard at that, but seen as a rather selfish and shady figure. Europe was dominated by labor governments who had a social and political agenda focused elsewhere, and which took businesses as suppliers of jobs and tax revenue for granted.

But something changed after the first oil crisis in the 1970s when the world began to understand that the continuous economic growth after the second world war could not be taken for granted anymore. Birch (1979) ignited the interest for entrepreneurship when he convincingly demonstrated the surprising fact that most new jobs were actually created by small businesses, and not by the very large multinational firms that hitherto had completely dominated the debate. The neoliberal political wind, beginning with the Thatcher era in Great Britain but quickly spreading throughout Europe soon caught on, and proclaimed entrepreneurship as the sought-after solution to many problems, the first of which was to refuel economic growth. But also a handy solution to necessary cut downs in public spending with ensuing restructuration, that is, privatization, of the public sector. A long, still on-going campaign followed, with public support for entrepreneurship training programs, entrepreneurship education, entrepreneurship research and support to small businesses, and the explicit stress on entrepreneurship and its latter day cousin innovation in all state and semipublic policy measures undertaken. By the present time, the entrepreneur has come out of the closet and taken center stage as the savior of the economy, an exemplar of morality and a modern day hero. Critics have of course noticed that heroines are largely absent from the debate (Ahl, 2004, 2006). Entrepreneurship as an important phenomenon in the economy and the entrepreneur as its central figure is thus firmly in focus.

The process of entrepreneurship has, however, in most research been black-boxed. Focus has largely been on in-put (money, other material resources, and the human or social capital of the entrepreneur him/herself), or out-put (turnover, profit, growth rate, number of employees). Explanatory studies have focused on the relationships between one or more input factors and one or more output factors, assuming causality. The underlying idea is of course that if one can figure out what makes a successful entrepreneur or a successful business, this knowledge can then be used to stimulate the creation of more of these. But the quest has been rather disappointing. Early research focused largely on the characteristics of the entrepreneur, thinking that entrepreneurs make up a special breed. The focus on profit and growth as a desirable outcome assumes entrepreneurs to be primarily economically motivated, but research on entrepreneurial motivation finds this to be way down the list. The need for independence and to create something ranks higher (e.g. Locke & Baum, 2007).

It has moreover been difficult to find anything that is specific about entrepreneurs as a group, in comparison to people otherwise labeled. Characteristics such as risk-taking propensity, achievement orientation, leadership styles, strategic orientation and so on have been measured, but very little was found to differentiate entrepreneurs from non-entrepreneurs, wherefore the so called trait approach was officially declared dead (Gartner, 1988), but without much success. The idea that the entrepreneur is special keeps coming back. The popular conception at the moment is that entrepreneurship is the recognition of opportunity (Shane & Venkataraman, 2000). Besides assuming the existence of not-yet-recognized opportunities (how research that?), it also claims that some are better at this than

others, which makes it still stuck in the trait approach (Singh, 2001). And it says nothing about what entrepreneurs actually do.

Various other approaches have been used—for example, the stage approach in which different stages are identified from “idea” to “gestation” to “taking action” and so on, but much research so far has basically counted how many people are in each step and what the rate of drop-off is. Then, there are articles on the qualities of the entrepreneurs at the different stages—back to traits, that is. Network research consists mostly of counting types of relationships with types of actors or of identifying “structural holes” in networks (Burt, 1998), but, again, it says nothing about what people actually do in such relationships.

In spite of calls for research on what entrepreneurs do, such studies are still the exception. One reason might be that entrepreneurial action is difficult to study with a survey approach. If entrepreneurship research began to actually study what people do, there would have to be more case studies, with resulting debates about problems of generalizations, which in today’s science landscape is less legitimate. On the other hand, if the field continues on the current road, surface legitimacy may perhaps be had, but little practicality would result. In line with Flyvbjerg (2006, p. 242) we hold that “a discipline without a large number of thoroughly executed case studies is a discipline without systematic production of exemplars, and that a discipline without exemplars is an ineffective one”. Moreover, a case study approach seems necessary in order to open the black box of entrepreneurship. Consequently, we here use a single case study to learn more about what entrepreneurs really do, and as a basis for proposing a theory of entrepreneurship as creative space.

The case of the cheese business

Lena has always been an entrepreneurial person. She is creative, has new ideas and throughout her career, it has become apparent that her ability to find new paths and leverage a business needs space, space as a necessary requirement for creativity.

I was employed as a middle manager in a chain store, and that was great because as a manager I got to decide what to do. At least so I thought, so it came as a big surprise when I went to my boss and said “this is what I would like to do and I think the launch of this product should be done in this way because no one has done it like that before” – but I hit a dead end. My boss, a really nice person, said that because no one had done it before we couldn’t do it either and that we should do it the usual way. I was so sure that it would work but I hit the entrepreneurial glass ceiling in that business and soon after that, I quit. Later on, the idea became a success and today it’s one of the standard way of presenting products in that line of trade.

To create the necessary space for the realization of her ideas, Lena took over the family business. Lena’s family had for two generations owned a deli shop specializing in cheese. Her grandfather started the business in 1931, and her father had managed it for many years. Lena and her brother took over the business with the father remaining in the business for three

years before handing over all the shares to his children. The main motive for taking over was to create a space where she could realize her full potential.

I have always had a strong will and don't want people to tell me what to do and what to think. It has been a valuable lesson to work for other companies. I've learned what not to do and how an organization should NOT work.

Taking over the family business meant moving into something familiar but already from the beginning, everyday practices were questioned. One of the first things Lena did was to start empowering the personnel. Previously, her father and grandfather had always taken care of the cheese, from the arrival and until it was placed in the store. The personnel knew exactly how it should be done and Lena handed over this task to them. The same thing happened with counting money from the cash register at the end of every workday. Counting money had previously been done by family members only. Delegating tasks provided her with extra time for strategic development of the business. At the same time as she changed certain taken-for-granted ways of working, there were many things that she consciously chose to keep, like the idea to always have an old-fashioned corner store that created a certain traditional atmosphere, and to employ people that were service-minded and polite so that they would treat the customers in the right way.

To avoid confrontation with her father, she implemented her ideas when her father was not in the store. The reason was that he would have opposed the changes, but when he was faced with the positive results of her actions, he let Lena continue with the changes. From her previous work experience she had learned how to import products from other EU countries and she and her brother also started to visit the major food exhibitions in the industry. Their father thought that it was a waste of money to visit these exhibitions but by finding small producers in other countries, the company was able to create a market niche. They could offer a selection that the large food stores did not have. Parallel to this, Lena spent her holidays in Southern Europe, and when she visited food stores and found products she liked, she contacted the producers and if possible, started collaborating with them. This was also the start for moving in to business-to-business sales. Lena has continued to visit other countries and frequently visits food stores to find new products and inspiration.

In Spain I found some super-nice olive cans, nicely price and I liked the packaging. I thought they would look good in our stores so I bought some and then at home we tried it out and liked it, mailed the producer and now we have them on our shelves. And this curiosity sometimes takes us to a place where we re-think the way we do things, "Oh my God, why don't we do it like this, why didn't we think about this!" We're a bit crazy at times.

One of those crazy ideas, that later on turned out to be a great success, was to become a wine expert. The idea came when Lena arranged cheese tasting parties, something she did mainly as a marketing event. Around year 2005 people started to ask for cheese and wine combinations, and Lena had the idea to become a sommelier.

Sure, I had a feeling for what kind of wine you should have with the cheese but then I decided to go to school. I didn't want to take just one of those wine courses but I wanted to aim high and become a trained sommelier. I asked around in the restaurant business and got some suggestions for which company to choose for my education and when I contacted them, it turned out that they were going to give the program in the city where I live so things just fell in place. So we became the first cheese deli shop in Sweden to offer this knowledge to our customers. And a funny thing with this diploma is that the ones that used to say "well, sweetheart, I have also taken a wine course so I know wine too" now come and consult me on which wine to choose.

Lena has also taken courses in business, created a close network with two other business owners and brought in an external board member to develop the business. The business philosophy is to have fun at work and fun for Lena seems to be to continue developing and learning. The business has expanded by opening Deli Shops in another city, and by growing with business-to-business sales. When they took over ten years ago, they had 6 employees and a turnover of SEK 6 million and today they have 14 employees and a turnover of SEK 25 million. To be able to freely explore ideas and have fun has paid off in the cheese store.

Entrepreneurship as creative space

This case, short as it is, offers some profound insights into the entrepreneurial process. To begin with, it was clear that the main motivation for Lena to choose entrepreneurship was not the opportunity for economic gain, but rather the fact that her job acted as an impediment to creativity. Her previous job as a manager in a large chain store did not give her room to experiment and try out new things. The organization actually acted as a barrier to creativity, demonstrating how managerialism with its focus on control, order and predictability is actually an obstacle for entrepreneurship – which, by the way, conveys an important message for those who desire to stimulate intrapreneurship, or organizational entrepreneurship. Hjorth (2005) actually proposes the redefinition of organizational entrepreneurship as the creation of spaces for play, and effectively demonstrates how this is the complete reverse of standard operating procedures in organizations.

The case does not give any clue as to whether the obstacles Lena met were due to her gender, but she did indeed hit a glass ceiling which is a common experience for women in organizations. Women have been around in organizations for decades now, but management, leadership (as well as entrepreneurship) are still gendered phenomena, and women are called out as the exceptions (Ahl, 2011). Our language demonstrates this point clearly – why would we otherwise talk about women managers, women leaders and women entrepreneurs. Men are customarily given more leadership responsibility and more room for advancement, and men dominate heavily in top management. Gendered norms as well as homosocial reproduction have been put forward as explanations (Ibarra, 1992; Kanter, 1977; West & Zimmerman, 1987).

A further lesson is that of entrepreneurial motivation. Clearly, Lena chose to take over the family business because she needed a venue for developing her ideas, to make “dreams come true” to use a trite, but perhaps still valid language. The case also shows that this desire to create something new seems to be a primary motive – as soon as Lena had installed one change, she continued with another. As soon as he had develop a new facet of the business she went on to develop another. She does not rest on her laurels. Inherent in this development of new ideas and new ventures is learning. Lena is curious to learn new things. She goes on trips, takes management courses, develops networks and even enrolls in a formal training program to become a sommelier. Learning and entrepreneurship thus seem to be intertwined processes.

The main impression, however, is that the business creates room for play and creativity. Hjorth (2005) claims that in an organization one must first “appropriate a place as one’s own” to create space for play and invention. As an employee, Lena did not succeed at this. The organization was not willing to allow her this space. As a business owner, however, she has indeed occupied the whole enterprise as her space for creativity. Interestingly, it turns out that some facets of managerialism, or in our terms *conservation* are necessary as well. In the development of her business, Lena had to strike a fine balance between renewal and preservation. Striking this balance might actually be interpreted as creativity as well. By opening the black box of the entrepreneurial process in this case study we suggest the following tentative model of three interrelated and co-dependent movements:

Table 1: Movements in the entrepreneurial space

<i>Conservation</i>	<i>Coordination</i>	<i>Creation</i>
<i>Old-fashioned atmosphere in the deli shop</i>	<i>Empowering personnel by handing over assignments</i>	<i>Expanding the market by import</i>
<i>Employing service-minded people</i>		<i>Adding business-to-business sales</i>
		<i>Adding new knowledge area by becoming a sommelier</i>

We call the first movement conservation. This entails capitalizing on existing resources and competitive advantages already present in the business. Lena skillfully realized that the location and the service mindedness of her employees were an absolutely necessary ingredient for the success of the business. She understood that this was a core value in the business. Conservation is thus not just about preserving the old, but the ability to discriminate between old as assets and old as liability. Old-fashioned service mindedness and politeness carry a symbolic value that works well in a traditional cheese store, which nowadays are few and far between, and so does the physical layout of the store. Conservation

in this particular case is *also* drawing on contemporary trends, such as in the slow food movement with its interest in genuine, locally produced food.

The second movement in entrepreneurship as creative space is *coordination*. The division of entrepreneurship, management and leadership is actually more of a rhetorical creation than an actual fact, serving symbolic needs as Czarniawska-Joerges & Wolff (1991) explain. Any person taking on the role of running a business must do all three. This is evident in our case in the many routine management issues that Lena carries out on a daily bases, the handing over of diverse assignments to her personnel being a case in point. But as in the previous movement this one does *also* contain elements of creativity and play. Handing over the assignments was a clear brake with old traditions, particularly acute as this was an old family business in which routines and power relations were taken for granted. Breaking with the old meant not just breaking with old business patterns, but also entailed the challenge of breaking with family patterns and challenging her father.

The third movement in our model is *creation*, by which we in this text mean the creation of something entirely new. Lena acts freely within the creative space and based on her innovativeness, this movement opens up entirely new arenas for her business. Adding new knowledge, the wine expertise, created legitimacy not only for her but also for the business as a whole. The diploma on the wall conveyed expertise, and the employees were always able to suggest wine- and cheese combinations based on the expertise of its sommelier. It also created a unique edge at the beginning, a first mover advantage. As there is a discussion and debate in Sweden whether the State should keep its monopoly on the sale of alcohol or not, her move has also a strategic dimension. As a sommelier she would be able to import and sell wine in her cheese store, and she would, in addition, already have a competitive advantage in comparison to other potential outlets for alcohol. Another interesting observation is her import business. It started by chance. She was on holiday trips in southern Europe and when walking through food stores she discovered items that she liked and that were not available in Sweden and simply decided to try them out in the store back home. Having a store provided her the chance to do this. This is another example of how her business provided space for entrepreneurship. Related to this is the business-to-business sales, that grew out of other business owners in Sweden wanting to carry the same items as Lena did. She capitalized on the opportunity, and then she had another business.

In conclusion, this case indicates that using the metaphor “entrepreneurship as creative space” is a useful and productive device for opening up the black box and study what entrepreneurs really do. This metaphor has also enabled us to conceptualize it as consisting of three different but interrelated movements: conservation, coordination and creation. Our model also challenges the idea that managerialism and entrepreneurship should be two essentially different concepts. The entrepreneurial process seems instead to entail a back-and -forth movement between old and new, regulated and innovative, and

between adjustment and rebellion. Going back to the introduction, this conceptualization of entrepreneurship lends itself better than the regular enterprise centered definition to acts of entrepreneurship and creativity in sectors other than businesses, such as the non-profit, voluntary sector or in education. Putting it simply, we are back to the original definition of entrepreneurship as *entreprendre*, i.e., undertaking something. Going back to the original definition is in our opinion productive, as it makes possible the conceptualization of entrepreneurship in a wider context than business.

In many European countries, entrepreneurship is now part of the curriculum not only in upper secondary education but also in primary and secondary school. All universities with self-respect have an entrepreneurship program or at least a course. Activities that were so far regarded as voluntary, non-profit or part of civil society have been relabeled as *social entrepreneurship*, with an accompanying growing body of research on this phenomenon. This might of course be regarded as a creative move of re-branding, as money and attention is available to anything labeled entrepreneurship, but it also invites problems as measures of success for such activities are not necessarily compatible with received notions of success for business activities. And, as we argue in this article, such received notions may not even be compatible with real and experienced success measures for small business owners. In our case, Lena always had the result sheet in the back of her mind, but the joy of creation was the primary motivator. Further, the emphasis on economic growth and profit as a success measure and the idea of these as the primary motivator for entrepreneurship may actually lead astray, and occlude programs and efforts that would indeed create profit and growth, but as a mere side-effect. For future research, we suggest a reconceptualization of entrepreneurship as creative space as a fruitful metaphor for understanding the organic, learning aspects of *entreprendre*.

Abstract

The primary aim of this research is to offer an overview of the reflections gained from the economic literature on accounting regulation and financial reporting (Jennings, 1973; Thinker, 1984; Laughlin, 1984; Chatterjee, 1996; Bihimani, 1996; Xiang, 1998; Di Pietra, Riccaboni, 2001; Banerje, 2004; Richard, 2005; Allegrini, Quagli, Zattarin, 2006; Maffei, 2007)

In the work, we analyze the relationships of dependence or independence measuring efficiency, productivity of title of electricity on communications to financial markets and the influences on local Public Administration governance (Moe and Gilmour, 1995); in order to check the role and the evolutionary dynamics .

The present research is based on inductive/deductive method that implies a in-depth study of the relevant literature and allows an empirical analysis with regard to planning implementation of TEE., and an adequate dataset, the work aims to point the critical area of the current government system out and it proposes a fair way to improve better the communications to financial markets.

Keywords: Public Administration, efficiency, productivity

First path of conceptualization

The primary aim of this research is to offer an overview of the reflections gained from the economic literature on *accounting regulation* and *financial reporting* (Jennings, 1973; Thinker, 1984; Laughlin, 1984; Chatterjee, 1996; Bihimani, 1996; Xiang, 1998; Di Pietra, Riccaboni, 2001; Banerje, 2004; Richard, 2005; Allegrini, Quagli, Zattarin, 2006; Maffei, 2007). In this work, we analyze the relationships of dependence or independence measuring efficiency, productivity of *title of electricity* on communications to financial markets and the influences on local Public Administration governance (Moe and Gilmour, 1995; Borgonovi, 2005, 2006, 2009); in order to check the role and the evolutionary dynamics (Amatucci, 2009) . The present research is based on inductive/deductive method that implies a in-depth study of the relevant literature and allows an empirical analysis with regard to planning implementation of *TEE.*, - and an adequate dataset, the work aims to point the critical area of the current government system out and it proposes a fair way to improve better the *communications to financial markets*.

Energy costs at the base of the current economic system

The current trend of consumption growth, the sudden and alarming climate change, instability in the market for energy supply, which is accompanied by an increasingly complex geopolitical landscape, represent some of the key factors that have called on the international debate on all 'unsustainable energy model that characterizes modern society. The choices of energy production and consumption in the past have been driven primarily by quality parameters assessed in terms of portability, availability and convertibility, which led to favor the predominant use of fossil fuels such as primary energy sources. However, what has long been overlooked is the environmental impact, an element difficult to internalize the costs of energy production, having to quantify the intangible nature of damage as the greenhouse effect, pollution, depletion of inventories, the tensions economic policies and instability (Bartolazzi, 2006).

The paradigm of the dominant theories of development has long conceived the environment as an externality, "taken as any other factor of production, and how this transformation from a production system tends toward a virtually unlimited growth" (Conti, 1996, p.480). However, as early as the seventies of last century, the myth of unlimited growth - which placed great confidence in the self-regulating mechanism of the market and technological innovation - has in fact clashed with the objective limits of the environment in terms of scarcity of resources and carrying capacity, limits that have resulted in gradually increasing cost to the economy. The oil shock of 1973, the first sign of real alarm about the sustainability of a development model very 'energy-intensive' and has a strong impact on the environment has awakened the public consciousness and attention of national governments of the industrialized world. Until then, the possibility of obtaining cheap energy has led to neglect the problem of depletion of resources, with "sole objective of the energy system to meet demand" (Bologna, 2000, p.124). In addition to technological innovation, rather than reduce energy consumption by increasing the efficiency of production systems, has in fact encouraged the use of not renewable resources, available at lower costs thanks to lower costs of extraction and distribution.

The distinction between renewable and is not related primarily to an assessment of the time needed to regenerate and make them available again for use. According to this usage are considered all those renewable energy sources other than fossil fuels and nuclear, which are characterized by both regeneration times significantly higher than those of consumption in addition to their exhaustion in terms of stock available on the planet.

This distinction is enshrined in legislation in a European art. 2 of Directive 2001/77/EC, which clarifies that for renewable energy sources are "non-fossil energy sources (wind, solar, geothermal, wave, tidal, hydro, biomass, landfill gas, sewage gas sewage treatment and biogas). The same definition and the entire law was implemented in Italy by Legislative Decree No 387/2003, which art. 17 provides a listing of sources is not counted as renewable:

- Assimilated to renewable sources, as provided by Law No. 10 of 9 January 1991/10 (rules for the implementation of the National Energy Plan in the field of rational energy use, energy conservation and developing renewable sources of energy);

- The goods, products and substances derived from processes whose primary purpose is the production of energy carriers or energy;

- Energy products that do not meet the characteristics defined in the PCM March 8, 2002 about the specifications of the fuels that are relevant for the purposes of air pollution and the technological characteristics of combustion plants.

In this regard, you must specify that the EU and national legislation considers electricity from renewable sources:

- Electricity produced by plants using only renewable energy sources;

- The electricity produced in the hybrid plants 'attributable' to renewable sources (whose production is calculated on the basis of guidelines for in art. 11 of Legislative Decree no. 79/1999;

- Electricity produced from renewable sources and used for filling storage systems (without regard to electricity produced by those systems).

The debate over the use of alternative energy sources has been revived recently by a number of factors and events - from commitments made by international agendas alarms resulting from Global Warming and the 'high oil' recorded in 2008 - have been put in light critical issues related to the potential and re-launch of a new energy paradigm, no longer focused on the use of hydrocarbons. It emerged clearly that the higher costs of energy supply, which is closely related to the heavy dependence on fossil fuels, increasingly put at risk the economic stability of both countries, consumers and the delicate balance of the ecosystem on a global scale. This has made it increasingly attractive market for renewable energy sources, stimulating increased investment aimed at increasing the production of heat and electricity, and fuel by:

- The energy of solar thermal and photovoltaic (resulting from the flows of solar radiation),

- Wind power (which uses wind energy to generate electricity);

- Geothermal energy, thermal gradients and movements of the sea .

Renewable energy: opportunities and critical

In accordance with the administrative decentralization process started in Italy, the Legislative Decree 112/98 - which confers on the Regions and Local Authorities administrative functions and duties in the implementation of Chapter I of Law 59/97 - transferred to the Regions and local authorities powers in energy matters, reserving to the State the definition of the general policy and the adoption of measures of national energy

policy and coordination in programming for regional energy . Regions Compete instead the function of control over some incentive mechanisms, and coordination of local authorities in terms of energy savings. Finally, it functions to local authorities to carry out programs for the promotion of renewable sources and energy conservation, monitoring of return on the thermal, authorizing the installation and operation of plants for energy production.

In particular, at the central level, the role of public administration is embodied in the provision of incentives for economic and financial equilibrium in the production of renewable energy and funding for the construction of production facilities, compared to production costs and levels of productivity still comparable with those of energy from fossil fuels.

In compliance with Directive 2001/77, which establishes the obligation for Member States to set national indicative targets for consumption of electricity produced from renewable energy sources consistent with the commitments under the Kyoto Protocol, Italy adopted the d. Decree of 29 December 2003 No 387, which sets national targets for using renewable energy sources, both as regards the production and consumption of electricity, as well as the incentive mechanisms. With regard to the latter, the decree introduces a new element from the past: moving from CIP-6 incentive system to one based on Green Certificates (GC).

Other important changes to the regulatory framework have been made with the financial 2008 (Act No. 244/2007) by introducing tax benefits, simplified bureaucratic obligations installation supplied by renewable sources (Falcione, 2008), including a diversification source of money as an incentive and mandatory quota, the introduction of all-inclusive rate, as a mechanism alternative to the Green Certificate, which is activated on demand producer for power plants not exceeding 1 MW and variable depending on the source (Article 2 , paragraph 145).

In particular, the legislature has provided:

- A new scheme for green certificates;
- The tariff for the micro distributed generation (called feed-in tariff);

The incentive mechanism of green certificates (introduced by Legislative Decree no. 77/99) was amended by providing that, for the period 2007-2012, the fixed fees that the Italian electricity producers and importers are obliged to enter the network, or either to satisfy through the purchase of Green Certificates, increase of 0.75% per annum (previously 0.35%), and, the duration of Green Certificates "sold" by a system of renewable energy is extended to 15 years (previously 12 years).

It was also recognized the feed-in tariff for renewable power plants for distributed micro, with an annual average nominal power less than one MW. Specifically, the system of tariffs that provides the system operator pays the customer for kilowatt hour of electricity generated by solar systems at a guaranteed price, the incentive, then, is commensurate with the energy and the construction of the as is implied by the program 'Photovoltaic Roofs'.

At the regional level it is rather the provision of a regulation that will facilitate the implementation of renewable energy installations. Following the legislative decree 112/98, Chapter V, the regions have enacted laws on energy, defining the areas of regional competence in relation to the guidelines of the State and the mechanisms of regulation of the electricity market and gas.

Currently, almost all regions have made efforts in defining and drafting energy plans and, more recently, the Regional Environmental Energy Plans (PEAR) - provided by art. 5 of Law 10/91 "rules for the implementation of the National Energy Plan in the field of rational use of energy, energy conservation and developing renewable sources of energy" - which, together with the Strategic Environmental Assessment (SEA), are valid and effective tools for a comprehensive analysis of energy policies and future land, especially in light of the provisions of Legislative Decree no. 112/98.

A decisive role in the development of renewable energy is conducted primarily at the local level: municipalities, in fact, lies in the actual development of the local area, according to the guidelines of energy policy drawn at the regional level. The increased attention from municipalities to the energy question is found primarily in the preparation of building regulations aimed at stimulating the reduction of heat loss and self-power generation, for example by introducing new design criteria and the requirement for energy certification of new buildings. In particular, Article 5 of Law 10/91, paragraph 5, states that land-use plan of the municipalities with a population of more than fifty thousand inhabitants must provide for the Municipal Energy Plan (PEC), an instrument operating at the municipal level relating to ' use of renewable sources of energy.

In general, it appears that an important first task is assigned to local public bodies in terms of saving energy, operating according to a new approach aimed at minimizing waste and a more rational use of energy. This is possible using methods appropriate and adequate to reduce energy consumption within acceptable limits, dictated solely by the criterion of the true and fair requirement, as required by the abovementioned Law 10/91. To set a good example, in recent years, it is the local government with the launch of several initiatives aimed to modernize the network of public lighting and heating / cooling of public buildings, thereby reducing costs load of the PA and, therefore, the nationality, due to improved plant performance and quality standards of the same.

In this regard, it is noted that in recent years has witnessed a profound change in the logic of the local development policies, favoring a bottom-up approach that places value on collective synergy of local actors, starting just a growing community involvement in political life and opportunities for indigenous development of the territory.

The economic and financial feasibility of the implementation of renewable energy installations

From the analysis conducted, it's possible to define and to identify the economic and financial feasibility of a renewable energy system in order to provide useful guidance to local authorities interested in making an initiative of project financing. The financial sustainability of renewable energy plants is linked to forms of energy production incentives, which vary for different types of systems. In relation to the survey carried out in the preceding pages, we analyze two particular types of plants:

- a) solar photovoltaic;
- b) wind turbines.

As seen above, in Italy, from September 2005, is on the incentive mechanism "Energy Bill" to promote the production of electricity from photovoltaic systems. The term "Energy Bill" is given an incentive mechanism based on tariffs, which ensure fair remuneration of capital and operating costs for the production of energy by photovoltaic conversion of solar energy in the internal market of electricity .

The mechanism in "energy bill" provides for the provision of a commensurate incentive to electricity produced by the plants. In particular, this incentive applies to photovoltaic power at least 1 kW, connected to the mains, which came into operation after 30.09.2005 as a result of new construction, expansion or renovation total. The tariffs, which have a maturity of 20 years, revenues are added to the grid supply in the event of sale or the savings on the bill in case of consumption (the possibility of "net metering" for a lift up 200 kW).

Incentive recognized energy produced Rates (€ / kWh) for plants in operation as of 1 January 2009 *

Type of photovoltaic system

Rated power (kW) Non-integrated Integrated Partly integrated

A) $1 \leq P \leq 3$ 0.392 0.431 0.48

B) $3 < P \leq 20$ 0.372 0.412 0.451

C) $P > 20$ 0.353 0.392 0.431

* The values were reduced by 2% compared to the rates identified in DM 02/19/2007. further reduction of that percentage is expected for 2010.

Source: GSE

The higher rates are approved for the small household systems of up to 3 kW, which are

architecturally integrated. Rates are provided for a period of 20 years from the date of entry into the facility, and remain constant (not subject to updates ISTAT) for the entire period. For plants that will come into operation from 1 January 2010-31 December 2010, the values in the table above will be reduced by 2% (more than 2% already planned for 2009) and stayed constant for the period of twenty years of disbursement of the incentive. For plants that begin operation in the years after 2010 the fees will be redefined. In addition to the incentive, the person responsible for the system relies on an additional economic advantage, using the energy produced by:

a) the supply network, provides for the sale of energy produced and used immediately. In this case we have:

- income from a dall'incentivo total energy produced, determined by the type of plant;
- a savings equal to the value of the electricity consumed in cars;
- an income from the sale of electricity produced and not self consumed.

For installations up to 200 kW that use the exchange service in place, art. 7 of Ministerial Decree February 19, 2007 provides that the photovoltaic systems that access tariffs, operating under the net metering and intended for food, utilities or partially located within or otherwise coupled to housing units or buildings can be eligible for an additional premium if they are energy efficiency measures made on the building. The prize consists of an increase in the price, half the percentage reduction in energy demand achieved and certified, but may not exceed 30% of the incentive rate.

Particularly interesting is the incentive mechanism for public administrations. It is envisaged that the base rate can be increased by 5% in the following cases:

- For installations where the person responsible is a public school / peer or a public health facility;
- For installations where responsible parties are local authorities with population less than 5,000 inhabitants, as shown by the census ISTAT.

Still, according to innovations introduced by the Finance Act of 2008, photovoltaic systems, whose subjects are responsible for local authorities, fall under the type of integrated system, regardless of the actual architectural features of the installation.

Architectural integration

The DM 19 February 2007 provides for three types of applications, depending on the degree of integration and functional architecture, in buildings or street furniture.

Therefore, the photovoltaic system can be:

- Integrated is the photovoltaic modules which are integrated into street furniture and street, the outer surfaces of the shell of buildings, building structures, whatever their function and destination. The photovoltaic modules replace material coating of buildings, taking on the functions. The modules are in fact installed in place of tiles, glass facades, balustrades elements, sound-absorbing panels in acoustic barriers, etc.
- Partially integrated: it is the system whose modules are placed on elements of urban and street furniture, exterior surfaces of the shell of buildings, building structures, whatever their function and destination. The modules are installed on roofs or facades of buildings so flush with the surface without replacing the materials coating the surface of walls or roofs. Also part of these installations on the roofs, floors and terraces of buildings and buildings and installations in the presence of perimeter balustrade, provided that the maximum share, related to the median axis of photovoltaic modules, showing the minimum height of not more than the same balustrade.
- Not integrated: it is the system with modules located on the ground, or with modules located in different ways from the above, the elements of urban and street furniture, on the outer surfaces of the shell of buildings, buildings and building structures of any feature and destination.
- The energy bill is the main source of revenue for the entity in charge of the PV system, since it involves the provision of an incentive proportional to the generation of electricity. An additional source of income is the value of electricity produced by the plant, which can also be consumed (even with the exchange system in place) or sold to the market.
- The consumption of energy produced is a source of income implicit in that is a savings (reduced electricity bills) because you can not buy electricity from the grid in proportion to the energy consumed in cars. The sale of electricity produced and consumed is a source of revenue rather explicit.

Administrative procedures for access to incentives

The Leg. N 387, 29/12/2003, art. 12, states that the construction and operation of plants using renewable sources are subject to a single authorization to the competent State or delegated to the provinces according to the specific procedures to be issued following a case of a maximum of 180 days, subject to the environmental standards, protection of landscape and historical and artistic heritage. The Legislative Decree no. 387/03 also provided that a Joint Conference, proposed by the Minister of Productive Activities (now the Economic Development) in consultation with the Minister for the Environment, Land and Sea and the Minister for Arts and Cultural Affairs, had approved the guidelines for the conduct of

proceedings only on the authorization. To date, this conference has not yet been convened and thus each region has adopted its deliberations to determine the procedures to be performed.

No authorization is required if the system is installed at sites without constraints of landscape, environmental and others. In any case, industrial plants for the production of energy, before submitting the request for authorization to build and operate a plant shall be subjected to the preliminary procedure for the verification of the need for Environmental Impact Assessment (EIA) procedure is not necessary for plants that produce energy from renewable sources if they consume at least 70% of energy produced. Next, will be submitted to the competent municipality Login Declaration (DIA). For plants that do not require any authorization is sufficient declaration of the start activity (DIA), and finally, for the systems to be implemented in areas classified as agricultural, it is not necessary the change of use of sites.

The economic and financial feasibility

The economic and financial feasibility of the operation and return on invested capital, both for photovoltaic systems is, as we shall see, for wind power plants, depends heavily on investment costs, because the maintenance costs are limited. The main elements of assessment refer to:

Costs

The installation of a photovoltaic system requires above all a high initial investment, while operating costs are very low: the "fuel" (solar radiation) is free and maintenance costs are limited because the system, in most cases, has no moving parts.

Currently in Italy the cost of a plant varies between 4,500 and € 6,500 per kilowatt of installed capacity. The lowest values are for large systems (photovoltaic power plants), for which you can qualify for discounts related to higher order of importance, both for the purchase of components for installation.

In any case, the supply module is the most significant cost item and is generally about often exceed 60% of the cost of the plant.

The annual operating and maintenance costs are usually estimated at about 1-1.5% of the cost of the system. The useful life of the system is calculated in at least 20 years and, starting from the tenth year, there should be major repairs for the replacement of certain electrical components, especially the inverter. It may also be useful to enter into insurance contracts to ensure the plant in the face of events "extraordinary" as the theft or damage due to extreme weather events. In the case of transactions with government, including the costs for the manager also knows the value of annual royalties payable to the City, established in the race, compared to the high return on the transaction.

Revenues

As seen above, revenues for the entity in charge is obtained from:

a) the tariffs approved in all the electricity produced by PV, the tariffs are differentiated according to the size, type of architectural integration and the opportunity to enjoy additional "bonuses" for additional energy savings or other certain conditions;

b) the value from the electricity produced by the plant, which can then be consumed (even with the exchange system in place) or sold to the market.

Consequently, revenues of the person responsible are diverse and vary as a function of several factors depending on the technical characteristics of the photovoltaic system, the type of service performed (on-site exchange or sale of electricity sold to the electricity grid) as well as the ability to take advantage of the additional prizes.

Economic and financial balance

In light of the foregoing, it follows that each individual action, especially if made with commercial purposes, contains unique characteristics that can be properly assessed only through a specific and careful financial analysis that takes into account the investment to be made to achieve the 'PV, anticipated revenues, operating costs and maintenance and insurance system, finance charges and the system of taxation applicable.

With reference to facilities established by local authorities, medium sized, you can have the following assumptions :

Hypothesis of a photovoltaic system

1 MW installed capacity

Annual production 1,300,000

Investment cost

Design € 150,000

Infrastructure installation and € 4,835,000

Bureaucracy € 15,000

Total investment of € 5,000,000

Operating Costs

Routine maintenance € 50,000

Other costs € 20,000

Source: author

As seen above, the facilities established by local authorities have more incentives. By making an approximation of average energy produced and the type of system, we arrive at the following estimates for the basic parameters of the model:

Time of return on invested capital

- Northern Italy: 10-12 years
- central Italy: 8-10 years
- Southern Italy: 6-8 years

The system also allows you to define, roughly, a fair royalty for the City grantor:

- Northern Italy: 5-6% of annual turnover
- Central Italy: 7-8% of annual turnover
- Southern Italy: 9-10% of annual turnover

b) The other types of renewable energy installations. The green certificate system and the all-inclusive price.

A second instrument to promote electricity production from renewable sources has been defined by decree. March 16, 1999, No 79 (so-called Bersani decree) issued in accordance with

Directive 92/97/EEC, which was launched a major restructuring of the electricity sector. The decree has introduced a policy to support renewable sources, based on market mechanisms: in fact, it creates an obligation, since 2002, for those manufacturers or importers of non-renewable electricity, to enter into a national network proportion of energy generated from plants using renewable sources, the requirement may be fulfilled by acquiring third-party energy from renewable sources or its securities (Green Certificates). The status of RES (renewable sources) and is certified by GRTN case of plants came into operation after April 1, 1999.

Initially, the share of energy was set at 2% and thereafter, the Legislative Decree no. 387/2003 has increased by 0.35% per annum and, finally, the Budget Law for 2008 provides for an increase of 0.75% per year for the period 2007-2012. For subsequent years, additional increases will be determined by subsequent ministerial decrees .

GC characteristics

The GCs are securities that evidence of the origin of electricity produced from renewable sources and which may be sold separately from the energy that is natural. Their size, initially set at 100 MWh, the legislation has been progressively lowered: first to 50 MWh from L. 23/08/2004 No 239 and finally to 1 MWh by the Finance Act 2008. From 1 January 2009, therefore, possession of a green certificate attests to the production of 1 MWh.

The period has been increased recognition of CV to:

- twelve years for plants fueled by renewable sources entered service between 1/4/1999 and 31/12/2007;
- fifteen years for plants fueled by renewable sources entered in operation at a later date to 31/12/2007.

The sale price of the CV and energy input are regulated by market mechanisms. Transactions can take place through bilateral contracts or through a trading platform set up at the GME, which is organized through the market. The offer price of such certificates by the GSE, which markets them exclusively via the platform of the GME, is called the reference price. Since 2008, the reference price is equal to the difference between a reference value of 180 € / MWh and the average price of electricity supply for the previous year, defined by 31 January each year by the Authority. The price of HP, so decided in 2008 was € 112.88 per MWh in 2007 was € 137.49 per MWh, in 2006, however, € 125.28 per MWh.

The sources and technologies allowed to resume

Over the years have changed the systems ("RES") who are eligible to receive CVs from the GSE at the request of the producers, after their "status". According to the original definition of Leg. March 16, 1999 No 79, were considered renewable and therefore enjoyed the green certificates, "the sun, wind, water, geothermal resources, tides, waves and converting it into electricity plant products or organic and inorganic waste ". Subsequently, the Legislative

Decree no. December 29, 2003 No 387, adopting the definition of art. 2 of Directive 2001/77/EC excludes from renewable sources "inorganic waste and the Finance Act 2008, excluding non-biodegradable waste from the benefit of private incentives for renewable sources.

The all-inclusive price system

In order to achieve the objectives defined in the Kyoto Protocol, Italy has transposed the European Directive 2001/77 on the subject of promoting the production of electricity from renewable sources, the 2008 Budget Law and the Law November 29, 2007 has introduced, alongside the mechanism to share the system with all-inclusive rate.

These include tariffs, differentiated by source, the incentive is that the revenue from energy sales and is applicable, upon request, to plants using renewable sources, subject to authorization in the case of biomass from short chain, came into operation at a later date to December 31, 2007, are rated for an annual average of no more than 1 MW of electrical power and no more than 0.2 MW wind turbines.

The incentive is granted for fifteen years, while tariffs may be updated every three years by ministerial decree by the Minister of Economic Development.

These costs are highly variable depending on the characteristics of varying complexity of the chosen site, morphology and soil type affect the costs of foundation, the conduit and roads, accessibility impacts on transport costs and the organization of the yard , while the distance from existing transmission system determines the cost of grid connection.

It should be stressed that the infrastructure related to accessibility and connection to the network have a capacity to use more durable than as a reference to amortize a single plant, so they can allocate their profits even further initiatives, if you want to continue using the wind resource.

In economic evaluations, it usually takes into account the costs relating to operation and maintenance of facilities in the two following ways:

- a total annual value, expressed as a percentage of the investment in wind turbines; directly as an estimate of cost per unit of energy (€ / kWh).

Concession fee to the local in relation to this heading, there are a lot of data available. Estimates ENEA data collected by business interests include a percentage that varies from 1, 5% to 3.5% of annual revenues from energy sales. This value, however, depends also on the profitability of the work.

At the end of its useful life, normally due in 20 years, the plant must be dismantled, though this should be deemed to have abandoned the area concerned.

On the contrary, it is reasonable to think that a site with good wind resources and, most importantly, data from long-established operation of the wind itself, can continue to be used by replacing the machines installed with the most technologically advanced wind turbines.

In this scenario, the municipalities will open vast opportunities to exploit the potential in different territories (natural biomass and hydro, solar photovoltaic, wind). The prospect is considered successful only if it is able to combine with speed, courage and sense of responsibility, with the specific energy goals and potential in the different geographical areas. The municipalities are responsible therefore the challenge of creating an innovative energy model, some of which directly uses the electricity generated, in part gives the network.

Of course, for local governments, the challenge is to operate according to a new culture, which combines economic growth, local development and attention to the ecosystem. This translates into policies for the development of alternative sources and energy conservation, integrated by adopting different measures:

- increasing the representation of solar thermal in building municipal facilities (schools, hospitals, offices, libraries)
- endorse or promote building codes that encourage the use of renewable energy, energy efficiency and green building;
- carry out ongoing advocacy to citizens through environmental education policies, aimed at developing a greater sense of personal responsibility that can help promote positive changes in daily behavior of the community;
- provide for appropriation of funds to promote the use of sources;
- set up information points for citizens and businesses;
- directly promote renewable energy plants (solar, photovoltaic, wind).

Especially in this last area, the municipalities can carry out public-private partnerships (project finance transactions, establishment of joint ventures), which, thanks to incentives provided, are very profitable in terms of economic and financial. If realized through appropriate public procurement procedures, aimed at stimulating competition among manufacturers, these operations provide financial income in fact relevant to the coffers of the institution, through royalties (license fees) is also significant (in some cases the concession fees to favor of the municipality reached percentages of 9 and 10% of the turnover produced by the plant).

Of course, in summary, an innovative energy policy requires at least two conditions: firstly, it is essential that this perspective will pass through a full involvement of the regions, which must assume responsibility in pursuing the objectives of disseminating renewable, and second, the government efforts aimed at pulling the market development of renewable

energy need to be matched by private traders, able to invest boldly in sustainable development.

Green Certificates

Green certificates have been introduced by Legislative Decree 79/99 and the Ministerial Decree of 11 November. Based on this legislation, the manufacturers and importers of electricity generated from renewable sources should not be placed on the network electricity produced from renewable sources at a level equal to a percentage share of electricity produced from renewable sources and high-efficiency cogeneration. The requirement can also be achieved by market purchase and subsequent return to the GSE (Energy Services Manager) to set aside a corresponding proportion of green certificates, such certificates are granted to producers of electricity based on electricity production from renewable sources.

As provided by Law December 24, 2007, No 244, the production of electricity from renewable sources or re-powered plants came into operation with effect from 1 April 1999 until December 31, 2007, is entitled to certification of production from renewable sources (green certificates) for the first twelve years of exercise, the production of electricity from renewable sources or re-powered plants started from 1 January 2008, however, entitled to the certification of renewable generation for the first fifteen years of operation. This fee was originally equal to 2% of the electricity produced in or imported from non-renewable source in the previous year, exceeding 100 GWh / year from 2004 to 2006 was increased by 0.35% per annum and the period 2007-2012 has increased by 0.75% per year. the 2% share in 2001 has thus reached 5.3% in 2009 and 6.80% in 2011; in 2012 should amount to 7.55% but subsequent ministerial decrees may provide additional increases in subsequent years to 2012. The producers of energy from renewable sources, owners of qualified plants RES, may apply to the issuance of GSE Green Certificates (GC).

GCs can be obtained from:

- a balance sheet, according to the energy actually produced from the net than in the previous issue;
- estimate, based on the expected net energy capability of the system.

The GSE downstream of verifying the reliability of information from producers, whose plants have been qualified to issue a report, within thirty days of receipt of the request, green certificates earned by rounding the net production of energy in MWh, with trade policy. As the green certificates that are then interpreted as incentives / penalties introduced by the legislature to allow production from renewable sources, hitting the same production / import of energy from renewable sources. Green certificates are framed in different ways depending on the different subjects involved:

- For producers of electricity from renewable sources represent a kind of contribution that can be monetized through the sale to the power exchange.

- For producers from non-renewable and thus subject to the obligation to purchase an additional cost to produce electricity.

The maturation of green certificates is when energy is produced and fed into the grid. Green certificates have a value equal to the fair value determined as the average value deduced from changes in the value of the power exchange. The certificates will therefore be recorded in the balance sheet loans to other working capital with the offsetting other income to the income statement. Then when these certificates are completed and delivered to the producer, receiving the title will be accounted for by a decrease in other receivables and an increase in other securities of financial assets that are not permanent. While those who are obliged to buy green certificates is not to have met the minimum production / import of energy from renewable sources. Once you define the amount of certificates to be purchased, the cost will be accounted for in the budget for the certificates and other charges in the voice production costs and its debt. At the time then when the green certificate is purchased, the output will be accounted for by reduction of its bank debt.

White certificates

More properly defined energy efficiency certificates (TEE) are incentives likely to reduce the energy consumption of electricity, natural gas and other fuels, in relation to well distributed. The Tee's are issued by the Electricity Market Operator - GME for distributors, subsidiaries, distributors, companies operating in the energy services (ESCO or Energy Service Company) and, since 2008, although companies with energy managers in the face the completion of projects for increasing energy efficiency. White certificates, which came into force in January 2005, consist of securities purchased and then resold thereafter, the value of which was originally fixed, but is likely to vary in response to market trends.

White certificates allow you to achieve savings targets able to contain the rate of growth in energy demand with the same energy services enjoyed by consumers, while also contributing to the achievement of targets for reducing greenhouse gas emissions under the Protocol for Italy Kyoto. The Leg 08/02/2007 introduced the possibility for co-generation high-performance, energy-efficient to obtain licenses.

At this point, forced the company to achieve the targets set will carry out measures to improve energy efficiency, earning certificates or white can buy them from other companies. The sale of white certificates is appropriate in a market established by the Manager of the electricity market and introduces a further element of efficiency in the system. On the one hand, therefore there is an obligation established annually by a third Authority, on the other hand, a market where white certificates assume an economic value on the basis of market demand. The mechanism set to prove effective, as it poses several possibilities to achieve the savings targets and energy efficiency.

The certificate market is structured in such a way that:

- The purchase of securities by dealers who, through their projects, receive lower savings compared to its annual target and, therefore, need to buy the securities market deficiencies;
- The sale of securities in case of an annual savings exceeding the target set (so dynamic that generates profits for distributors);
- The sale of shares obtained from independent projects by energy service companies, which, not having to comply with any obligation, the opportunity to make trading.

White certificates have been established in Italy with the DM July 20, 2004 and subsequently modified and integrated with the DM 21 December 2007 determining the national quantitative targets to increase energy efficiency and the Decree. February 8, 2007 has introduced the possibility to obtain energy efficiency certificates for high-efficiency cogeneration. distributors virtuous in terms of energy efficiency achieved a contribution to projects that involve a reduction in final consumption of electricity and natural gas resources needed to finance the subsidies granted are collected through special tariff components. The achievement of the objectives is through energy saving measures assessed by the Authority for Electricity and Gas Authority (Authority) which, in the case of positive evaluation of GME requires the issue to the project implementing body of the Energy Efficiency Certificates corresponding to savings certificates (in number and type).

The price of white certificates is determined annually

The energy efficiency certificates are different depending on the type of intervention which they relate and, consequently, the negotiation is different depending on the different types of securities.

Specifically, the energy efficiency certificates have a market value equal to one tonne of oil equivalent (TOE) and are divided into three types:

- Type I - can testify to the achievement of the primary energy savings through measures to reduce consumption of electricity;
- Type II - can testify to the achievement of the primary energy savings through measures to reduce consumption of natural gas
- Type III - demonstrating the achievement of the primary energy savings through measures other than those quoted above (savings of other fuels).

The system of white certificates, as noted by the Chairperson of the Energy and Gas, Alessandro Ortis, has also produced benefits for consumers in terms of lower costs in the bill. It should be noted, in fact, that the authority shall determine each year a contribution to be paid to distributors for meeting their obligations. This contribution is funded through a levy on distribution tariffs of electricity and gas, for which we, in a nutshell. Faced with this increase in costs (a total of 317 million euro between 2005 and 2009) estimated a total economic return from 6 to 15 times the cost of these incentives for each unit of energy saved. In addition, each certificate issued and every toe white spared our country allows a cost

savings between 118 and 587 €, in relation to the achievement of national obligations under the European Climate Package.

There is no specific accounting principle for white certificates and therefore it would seem appropriate to refer to IAS rules also in the preparation of financial statements under Italian GAAP.

In a budget-oriented ITA GAAP historical cost, setting the fair value is not applicable and it seems feasible based solely on the expected cost-settlement approach.

According to this approach:

- The rights purchased must be accounted for using the purchase price.
- The liability shall be recognized with the maturation of the obligation and on the basis of market value.

In this circumstance, depending on the value of purchase and subsequent resale to the GME, the company will realize a gain or sustain a charge related to the price differential between buying and selling third party title to GME. All this mechanism can then lead operators to realize capital gains or losses on disposal.

Then applying the cost approach-expected settlement, you must make an estimate of the liabilities payable by the company since it is an obligation to relate to increased revenues from customers. Therefore the company should then provide the stationing of a fund equal to the difference between purchase price and the sales value of the GME. For the determination of the purchase price of white certificates to be taken as the basis for the determination of the fund seems reasonable to take account of developments in the market price in the period between the date of the budget and its preparation, if this trend contributes to determine a realistic market value.

Accounting for environmental certificates

Although the substance has been widely covered in the national legal framework, it should be noted that for accounting purposes there is now formally recognized as a reference (in accounting policy, guidelines, explanatory circular, etc..) Framing the problem and evaluating the environmental certificates therefore, it regulates its impact on the balance sheet. Currently, the Italian Accounting (OIC) is working to formulate an accounting standard on specific national environmental certificates (whose publication is expected in the second half of 2011), to apply only to companies that do not adopt the model of balance-IAS IFRS.

In our country, as mentioned above, have not been developed accounting standards or guidelines on the subject, the two most critical issues were identified, on the one hand, the prohibition to capitalize intangible asset acquired at no cost (set forth in Principle OIC 24) and, second, in the historical cost instead of fair value.

In the discussion on the issue at national level should be reported the following documents:

- Working group Confindustria, "accounting and tax aspects of the application in Italy of the European Directive on the trading of greenhouse gas emissions", March 2006;

- National Council of Chartered Accountants (CNDC) - Committee on Economic and Environmental Accounting "-" Rights of greenhouse gas emissions (GHG) - accounting and budgetary aspects ", in April 2007.

The two documents, while addressing both in a critical method of accounting for environmental certificates proposed by the IASB and its representation in the budget come to different solutions.

The working group Confindustria, sharing fully in the intangible nature of environmental certification and also picking out the fungible nature of fertility in simple, which, as such would not be subject to any process of technical and amortization should find entry in a special account that does not reflect the current assets of a financial asset such as a title. From the accounting point of view, compared to free allocation of an activity, is the proposed mechanism of deferred income, then in the income statement opposing the allocations for each year to those making up the cost of operating the same according to the survey of actual consumption.

This approach obviously does not preclude the possibility of including any provisions for risks and charges into a fund for future payments, where the final balance of the beneficiary were to return to the manager a larger number of certificates.

The document prepared by the Commission for Economic and Environmental Accounting "CNDC moves the setting of accounting at the time provided by IFRIC on an international level, and then distinguish between two methods of detection:

1. A method of accounting for "gross" - applicable to those companies that adopt International Accounting Standards with reference to IAS 38 and 20 - which includes, first, accounting for emission rights the same way as intangible assets (to be entered between the intangible assets in a specific Sub CO₂ emissions rights ") and, secondly, the inclusion of public assistance to be reported on an accrual basis according to the mechanism of deferred income;

2. A method of counting "net" - applicable to those companies that adopt International Accounting Standards by following the approach of IAS 37 - which only requires entry of an expense in the year of allocation of rights, cost of emissions related productive activity for the year resulting in excess of quotas assigned and proceed aside the value (the higher cost) should be presumed to support the following year than assigned in terms of value. This method, however, may also be made for those companies that are not required to apply International Accounting Standards by law and that, as a result of Accounting Standard 24 OIC can not capitalize on intangible assets acquired free of charge, as in the case . In this second collection methodology, it is also provision for the registration of emission rights

between the current work, we welcome the provision in the income statement only to a specific fund charges and future risks, to cover the deficit of emission allowances excess CO₂ in terms of value as assigned.

Impatto in the budget.

In the notes, but also as part of the annual report, in light of the provisions of the new wording of art. 2428, co. 2, Civil Code, which provides for the inclusion of "indicators of financial results and, where appropriate, non-financial matters relevant to the specific activity of the company, including information relating to environmental and personal" should be highlighted the following considerations:

1 In accounting terms, the environmental certificates, while presenting legally valid multi (different type of certificate), do not constitute intangible assets - the thesis, the latter also supported by the fact that some of them would be acquired free of charge and not would be subject to any procedure depreciation technical and / or financially - but account for emission rights (in the case of "gray certificates") or atypical securities (in the case of green certificates and white certificates ") having an Substitutability;

2 The cost should be the most technically correct specific cost, which requires the identification and allocation of emission allowances to the individual or the individual certificates, costs incurred specifically for the award of the same. As a fungible assets, instead of the specific cost method, you may refer to the configuration methods of the estimated cost for the 13 OIC fungible, which means the weighted average, FIFO and LIFO (as commodities).The creation of trading activity by the beneficiary, rather than a producer of CO₂ emissions or energy from renewable sources, or even energy efficiency, should not affect in any way the nature of those assets that represent rights / fungible and that as such would not be subject to a different accounting treatment depending on its economic use;

3 Under the principle of substance over form, it would be preferable for the accounting of environmental certificates to happen through a method of counting "net" that provides for its inclusion in the budget deficit arising from the negative difference between the emission allowances (in the case of "gray certificates") or securities issued (in the case of the "green and white certificates") and allowances / securities to be returned (because it accrued, and therefore subject to cancellation by law). It follows that if the date of preparation of the budget deficit were to emerge, certain in amount and in its enforcement notice, it would be possible, on the one hand, the accounts of a debt to be included in a separate entry called "Asset Certificates environment "and, second, all'appostazione a negative component of income. In the event that the date of the financial statements, it proves the uncertain quantity of shares / securities to be repaid, the firm may enter the amount of assumed debt in a specific account of the "Provisions for future risks and charges" against the related provision in the income statement.

4 In the presence of a surplus, ie a positive difference between allowances / securities issued and completed, the difference could be registration, however, the date of preparation of the budget and only where there is reasonable certainty that the related realized capital gains, in 'current assets, as financial assets which are not permanent, under a special item called "environmental certificates" in the income statement would be entered on the positive component of income, you could explain in notes to the effect of the method of accounting "to Gross, explaining to the amount of bonds allocated and corresponding price and the number of shares / securities issued, and the impact their contribution to income of the public;

5 Finally, note that, following the transposition of Directive 2003/51/EC (Directive accounting modernization or Accounts Modernization Directive), national regulatory plant (through the Legislative Decree no. February 2, 2007, n. 32), would be advisable, as part of the annual report, the undertakings specified in the special section "Required information on the environment" or "Voluntary information on the environment" (as appropriate) details of the emissions and other pollutants environmental certificates awarded. The analysis applies with respect to the functioning of emission trading system as regulated at European and national level until December 31, 2012. As for the period 2013-2020, the operational mechanisms of the system (and with them, probably, the nature or interpretation of accounting examined) could change substantially, because of the transposition of Directive 2009/29/EC. This Directive, in order to improve and extend the Community scheme for trading greenhouse gas emissions, significantly alter the Directive 2003/87/EC, in particular with regard to the objectives of reducing pollution, the sectors concerned, to the total quantity of emission permits and, above all, the rules for the allocation of emission allowances (critical dynamics, the latter accounting for the detection of environmental certification).

Abstract

The primary aim of this research is to offer an overview of the reflections gained from the economic literature on business ethics issues (Freeman, 1994; Phillips, Perrini, 2001; Freeman and Wicks 2003), on corporate social responsibility (Ricci, 2004, 2007; Gallino, 2005; Helen, Rusconi, Heros, 2010) and on ethical probity in a narrow managerialist focus (Onida, 1964; Masini, 1979; Kettle, 1993; Moe, 1994; Borgonovi, 1994; Wilson, 1994; Frederickson, 1996; Peters and Savoie, 1996) underlining the role and evolutionary dynamics of public private partnership in the design of social benefits (social card, social housing, social income, social bonds).

The present research is based on inductive/deductive method that implies a in-depth study of the relevant literature concerning the application of different models of corporate social responsibility of public and private partnership (PPP) (Amatucci, 2006) and allows an empirical analysis with regard to planning implementation and welfare systems (Musella, 1998; 2006) in the social policies (Fiorentini, 2006) of Public Administrations in order to improve efficiency measures, social accountability (Ricci, 2007), transparency and ethic culture. Through a case study (social housing, social card, social income) and an adequate dataset, the work aims to point the critical area of the current government system out and it proposes a fair way to implement a participative corporate social responsibility model.

Generally we noticed a loss of government capability and a lack of control by public institutions, with a resulting weakening of administrative structures and responsibilities. This entails in turn a progressive worsening of the image and legitimacy of institutions, and at the same time a credibility gap regarding wealth control and wealth redistribution activities in welfare system (Esposito)

Introduction: the relevance of research topic

The primary aim of this research is to offer an overview of the reflections gained from the economic literature on business ethics issues (Freeman, 1994; Phillips, Perrini, 2001; Freeman and Wicks 2003), on corporate social responsibility (Gallino, 2005; Helen, Rusconi, Heros, 2010) and on ethical probity in a narrow managerialist focus (Onida, 1964; Masini, 1979; Kettle, 1993; Moe, 1994; Wilson, 1994; Frederickson, 1996; Peters and Savoie, 1996). In the work, we analyze the relationships of dependence or independence measuring efficiency,

productivity, social accountability and the ethics infrastructure (Borgonovi and Giavazzi; 1994; Kidder, 1995, Molteni, 2004; Cavalieri, 2008; Ricci, 2009; Rusconi, 2010) of public private partnership (Amatucci, 2005, 2006) in local Public Administration governance (Moe and Gilmour, 1995); in order to check the role and the evolutionary dynamics of public-private partnership in the design of social benefits (Borgonovi, Fattore, Longo, 2009; Meneguzzo, 2005; Fiorentini, 2003, 2004, 2006; Musella, 1998, 2005, 2006, 2008;), reinventing government movement (Kamensky, 1996; Hood, 1990, 1991) to investigate social budgets, social imbalances (Boeri, 2000) to stem the liquefaction PA's (Esposito, 2010). The present research is based on inductive/deductive method that implies a in-depth study of the relevant literature concerning the application of different models of corporate social responsibility of public and private partnership (PPP) and allows an empirical analysis with regard to planning implementation and welfare systems in the social policies of Public Administrations in order to improve efficiency measures, social accountability, transparency and ethic culture. Through a case study (social housing, social card, social income) and an adequate dataset, the work aims to point the critical area of the current government system out and it proposes a fair way to implement a participative corporate social responsibility model. Generally we noticed a loss of government capability and a lack of control by public institutions, with a resulting weakening of administrative structures and responsibilities. This entails in turn a progressive worsening of the image and legitimacy of institutions, and at the same time a credibility gap regarding wealth control and wealth redistribution activities in welfare system. The consequences of these conducts and behaviours advantaged individual interests penalizing the economic integrity of institutions and enterprises from which job and wellbeing of thousands people depend. This research attends to highlighting gaps between rules and conducts and then between elements of delegitimation and contradiction in the social policies of public administrations of Southern Italy; the aim is to prevent and control "welfare distortions " attempts toward the common estate -also characterized by capital rationing- penalizing the present-day community and of the future generations' one. The origin of this research path - which considers social responsibility as a management attribute - can be found - according to Chirieleison (2004) - in Akerman and Bauer (1976), and Frederick's works (1994). The first ones develop an approach to strategic business management designed to anticipate and respond to social demands of the external environment; the second one supports the need to integrate the concept of social responsibility with that of social responsiveness, intended primarily as capacity to respond to social pressures. In this context the environment is no longer the competitive and/or normative system expressed in terms of constraints and incentives, or otherwise of collective goals, but a network of interrelationships, economic, socio-political and institutional factors that interact in turn with the several business functions in contexts defined by its behavior and strategic orientation. From this perspective, companies should consider more deeply the impact of activities they undertake in the reference environment, and since the environment is in constant change, in constant change will also be the constraints and limits set by the social

contract of business and society. In the contribute we analyze the relationships of dependence or independence measuring efficiency, productivity, social accountability and the ethics infrastructure of public private partnership; in order to check the role and the evolutionary dynamics of public-private partnership in the design of social benefits reinventing government movement to investigate asocial budgets, social imbalances to stem the liquefaction PA's .

Analysing the current social distortions in the local Italian Public Administration the contribute demonstrates the existence of a model of PPP corporate social responsibility that allows to achieve political goals and to improve political consensus highlighting the role of the state anti-social replacement by social enterprises, just organizing the consensus on shared awareness of the results, accountability, transparency and ethic culture and on a better quality of citizens' life.

Asocial State and social Enterprise: the role and evolutionary dynamics of public-private partnerships in the design of social benefits.

“This paper is an excerpt from a larger contribution in which they analyzed a variety of social benefits such as social housing and social income. The analysis offered in this paper focuses in particular on social and family card and bonus effects / impact on people in various Italian regions”.

The increased role of private social organizations in defining and delivering of welfare services, coupled with increasing number of institutions and companies working in the field social services and health education, contributed on the one hand to reinforce the value has led many scholars and other social economy to deal with these particular organizational forms: a dynamic world, and complex evolving a number of agents which aims to promote social welfare, aims to strengthen and expand the system of welfare rights, with a strong ethical push in support of the people who they live in conditions of social distress and risk of exclusion and at the same time produces more or less stable employment, even in the modern sense of self employment, through the use of their tools of business economics.

The definition of social enterprise contained in the enabling act in reality leaves many points open to define and deepen, especially in light of the decree of the Government Delegate, D. Legislative Decree No. 155/06, which outlined the hallmarks of the business, reducing considerably for the truth, the pressure towards unification in a single container law in all its forms entrepreneurship, social value, but merely, it seems to describe a further subjects of attorney with entrepreneurial characteristics within the social services sector.

The law on social enterprise, then, appears as an additional measure which adds other laws that already regulate the industry and the people who work there, creating confusion and thereby losing the opportunity to simplify and clarify roles and profiles of the different actors in the social economy, marking the difference with clarity exists between the private

company that focuses on the profit and the company that has a function of social utility. The definition of social enterprise in the Legislative Decree has large pores and opens the door to any company that operates or will operate, so prevalent and not exclusive, in areas where the exchange of goods and services is considered of social utility.

In this perspective the firm is confronted with typical tools of business economics adapting and shaped by their specific social connotations: manufacturing processes, organization of work flow management and processing staff, management of imbalances financial and access to credit. These are just some of the items with which you must compare the strategic planning process of a social enterprise. The cooperation combines the needs and not capital, it maximizes the social expectations of people of the partners in terms of recognition and guarantee of employment opportunities, but also in terms of experimenting with concrete forms of self-government and therefore of democracy and this is especially true when it comes to social cooperation, promotion of job opportunities, combines the maximization of the needs of recipients to whom the subject of intervention become and must become subjects of law with which to build trails emancipation in a process that aims specifically to rethink the social and work processes and services. The economic literature on nonprofit organizations (Fiorentini) has four main interpretations of their existence:

a) identifies the most common interpretation in the bond distribution of useful way to overcome the failures of the contract determined by the existence of information asymmetries between producer and consumer that prevent them to monitor ex post the quality of our product ex-ante. Linking them to not distribute profits, the organization informs the consumer that is not interested parties to make ex-post such asymmetries, reducing the quality of the product in order to maximize profits (Hansmann, 1980).

b) the interpretation that identifies the nonprofit response to the difficulties of the government to tear down a sod-heterogeneous demand for public goods (Weisbrod 1975, 1988);

c) the interpretation that explains how nonprofit institutions that allow consumers control to maximize the output in order to overcome information asymmetries between producers and consumers (Van Hoomissen, 1991);

d) the arguments that explain the nonprofit as the result of particular types of entrepreneur (Young, 1980, 1997, Rose-Ackerman, 1996), groups, religious or not, willing to expand its influence (James, 1989), also funded by the income of non-pooled and redistributed proselytizing activities (Rose-Ackerman, 1987);

A definition focusing only on the prohibition of profit distribution are opposed definitions that restrict and specify the meaning and role.

Italian law enforcement policies in the European context

The distributional effects of the major reforms of the tax-benefit system in the first year of the XVI Italian legislature. During the first year of the term, the Government has introduced changes to the tax-benefit system that will impact on income distribution and poverty. Here we focus on the impact on family incomes of four interventions: the buyer's card, the family bonus, the abolition of the ICI tax on first homes and electricity bonus. Of these facilities, assess the effects on the prevalence and intensity of economic poverty (both relative and absolute), the main beneficiaries and the impact on income distribution. Each measure was first considered and discussed separately. In the final section presents an analysis of the overall effect of the four interventions.

The data

We simulate the revenue and distributional effects of reforms on the standard EU-SILC 2006 for Italy, made up of 21,499 households and 54,512 individuals. For the purposes of the simulations, all monetary values are updated to 2009 prices. This database will be calculated for each individual, the major institutions of our system of tax-benefits. To impute to the families perception of means-tested benefits was necessary to reconstruct the information on the total income, ie before deduction of personal income tax. The EU-SILC survey for Italy, in fact, currently only contains data on income net of direct taxes. Starting from the value of the declared net income, an algorithm produces a rough estimate of gross income. An iterative procedure then simulates the personal income tax and net income. If it differs by more than 20 € from declared net, the value of gross income is modified and subject to a recalculation IRPEF. The process continues until the defendant produces a gross estimate of the net, which differs by less than 20 € from the "true" net income. The unit of analysis chosen for the measurement of indicators of inequality and poverty is represented by the family. The standard of living of each person is measured by the equivalent disposable income received by the family unit. Disposable income is the sum of all forms of family income, net of direct taxes. In what follows we consider the income gross of imputed rents on real estate property. To achieve comparability between the incomes of families of different Numerically, the available family income is divided by the equivalence scale "modified OECD", which assigns a weight to adult weight 0.5 to all other members with at least 14 years and coefficient 0.3 for children under 13 years.

The purchase card

Card purchases (commonly known as social card) was introduced by Decree-Law 112, June 25, 2008, converted by Law No 133 of August 6, 2008 (Article 81, paragraph 32). It is a credit card magnetic, funded by public funds and private donations and distributed by the Italian Post, which gives poor people the right to make purchases at points of acceptance or pay the bills for public services. In building simulation programs related to social card we have also taken account of the Decree of the Ministry of Economy and Ministry of Labour on 27

February 2009, which supplements Article 81 of Law 113 in part by changing some rules for access to benefit. Card purchases, which will be entitled to a monthly charge of 40 €, it is for people with at least 65 years and children under 3 years, living in households with disposable income and Isee very low. The elderly in particular should benefit from pensions of less than EUR 6,000 (8,000 if aged 70 or more years), have a value of less than 6,000 € ISEE, not to own more than one property and have a heritage securities not exceeding € 15,000. Children apply similar selection criteria. From the chart does not include foreign nationals, even if legally resident. Applying the standard Eu-Silc these selection criteria, and the results reported to the universe of Italian families, our simulations show that a regime should benefit from the social card about 815,000 people, 1, 36% of the Italian population (Table 1). This estimate of the potential number of beneficiaries is based on two key assumptions: first, the full representation of the sample used, the second a full take-up, or that all those who have the requirements to obtain the benefit really require it. The total annual expenditure for the card purchases amount to around 390 to 400 million euro.

(Ceis Report, 2009)

Table 1 shows, for each region, the estimated share of individuals who receive the paper, the distribution among regions of the recipients and a comparison with the breakdown of total residents. Finally, it shows the number of subjects who receive a card in each region and that of the corresponding families. The regions with the highest proportion of the total beneficiaries are residents of the Calabria (where 2.55% of residents receiving the paper) and Sicily (2.87% of residents). More than 50% of card purchases should be concentrated in four southern regions (Campania, Puglia, Calabria and Sicily). According to official data available at the website of the Government, to May 20, 2009 567,120 cards had been activated, and 60% of them were attributed to residents in these four regions. Italian families are categorized into ten groups of equal number (deciles), each containing 10% of households, ordered on the basis of equivalent disposable income in the first of them (the poorest) 17.8% of households receiving the paper purchases, compared with 8, 7% in the second. Overall, the social card affects 3% of Italian households. More than half of the beneficiary households belong to the poorest 10% of the population. About 57% of total expenditure goes to households located in the first decile. The bottom of the table shows the proportion of poor families, according to two alternative definitions of poverty, receiving the card. Poverty is measured here both in relative and absolute. In terms relative, is considered poor with a family income equivalent to less than 60% of the national median equivalent income. The only consideration of relative poverty is not enough to test the effects of social card, since it was conceived as an intervention for families in conditions of extreme need. E 'therefore essential to complement the impact of poverty on social card also that the absolute poverty. To this end, we exploited the recent work by Istat (2009) estimated that absolute poverty lines for different household

types (defined on age and number of components), area (North, Central and South) and amplitude of the municipality of residence. To calculate the characteristics of distribution and absolute poverty, Istat has applied this extensive battery of lines to the distribution of consumption. EU-SILC survey, however, does not have information on the overall level of consumption expenditure of households. Then we define as poor in an absolute sense a family that receives a disposable income below the appropriate threshold. It is assumed therefore that the disposable income coincides with consumption, a reasonable assumption in the case of low-income families. We obtain in this way, the EU-SILC survey data on income, an estimate of the prevalence of absolute poverty which is very close to that calculated by Istat survey on micro consumption: according to Istat fact the percentage of households poor in absolute terms in 2007 stands at 4.1%, which corresponds to 4.2% calculated in our sample. Our simulation of the social card shows that only 17% of very poor families, fewer than one in five, should be at least card purchases. This very limited penetration of the social card among poor families in an absolute sense depends primarily on personal selection criteria, which exclude those who have more than three years or less than 65. Are outside its scope, for example, families with small children not in age, between which it is known that the economic malaise is, in Italy, particularly common, or the families of non-elderly adults. The probability of receiving the social card is much higher for the southern regions, as already noted (see table below): it is about three times that on the central and northern regions. To these should be 28% of the total number of cards, 13% in the Centre, South and Islands 59%. 63% of the cards is given to households with reference person aged. The probability of receiving the paper is well above the average for families with small children and families with elderly members, while almost nothing to the families of the fifties. Despite the probability of obtaining the social card is much higher than average only for large families, the vast majority of papers focuses on families for up to three components, being aimed at households with elderly. The figure shows the Lorenz curve of the equivalent disposable income and the concentration curve of the amount transferred with card purchases. On the horizontal axis are the cumulative percentile of households, ordered by the poorest to the richest on the basis of equivalent disposable income before social card. The vertical axis represents the combined quota of social card and equivalent disposable income. The transfer is very pro-poor, since it is highly concentrated at the lower section of the distribution. Being an instrument defined in terms of all relevant, the concentration curve does not tell us anything about the impact of social card on disposable income.

Tab.4 Concentration curve of the social card and equivalent disposable income, by deciles of the latter

(Ceis Report, 2009)

The Family Bonus

The "special bonus for families, workers, retirees and dependents" was required by law November 29, 2008, No 185, with the aim of supporting the income of households made up of employees and retirees at a time of severe economic crisis. In line with this objective, those who request it must hold income from employment or pension (or similar), while income from self-employment by the person seeking the benefit will be excluded. Otherwise, the spouse and other family members may engage in self-employment, as long as this occasionally. The revenues from funds not be denied access, but only if present in conjunction with other income and total less than 2,500 €. The bonus will be entitled to a one-off amount for 2009 alone, which varies depending on the size of the household and the total income of its members (see table below), referring to the year 2007 or into 2008. In the simulation assumes that the applicant always refers to the former. The sum may be paid to a single household member and is exempt for tax purposes. The family of relevance to access to benefits is made by the applicant, the spouse, even if not charged, and other dependents. It is important to note that this definition of family differs from the family as a group of people normally resident in the house. In practice, the family relevant to the bonus rule is people living together, but not linked by ties of kinship or marriage, the family is not dependent. The main consequence is that a family can enjoy the corresponding benefit to a family structure other than the real one. In the simulation, in order to locate the family has had to simplify, built around the reference person or his spouse. However, it is possible that a family, as a set of people who cohabit, correspond in fact more relevant to the private benefit. In this simulation, we chose to exclude this possibility, for reasons of consistency with the module that simulates the personal income tax in our model, also built around the person of reference. As for the analysis of the redistributive effects, as we continue to refer to the following family as a group of people who cohabit, except in the following table (distribution of beneficiaries by type of household). If the group is composed of a single component, will benefit from the bonus only if the recipient of retirement income. The limit of total income is

instead increased to € 35,000, regardless of the number of components, if one is disabled dependents. To think about the components disabled, was used as a proxy for the perception of social assistance or other benefits for disability, which is available in EU-SILC. The requirement in the family bonus instead, ask the certification of disability under the law 104/1992, which is issued by the same committees that evaluate the legal minors, supplemented by other operators and specialists. Nevertheless, no statistical information available on the number of disabled people so identified. Putting these assumptions, the estimated proportion of families receiving equal to 25.75%, for an annual average of 80.7 €. The total number of beneficiary families is thus about 6.18 million, for a total expenditure of approximately 1 billion and 936 million euro, which was less than 2 billion and 400 million expected.

Tab.5 Distribution of households benefiting from the family bonus for each type of family nucleus

<i>Type of household</i>	<i>Bonus amount</i>	<i>Share of total beneficiaries</i>	<i>Access threshold (total household income)</i>	<i>Threshold with respect to such a "pensioner member"</i>
<i>A pensioner member</i>	200	47.5%	15.000	1
<i>Two components</i>	300	28.9%	17.000	1.13
<i>Three components</i>	450	9.8%	17.000	1.13
<i>Four components</i>	500	8.4%	20.000	1.33
<i>Five components</i>	600	2.2%	20.000	1.33
<i>Six or more components</i>	1000	0.6%	22.000	1.47
<i>With disabled component</i>	1000	2.7%	35.000	2.33
<i>Total</i>	-	100%	-	-

(Ceis Report, 2009)

Only the distribution of beneficiaries by the amount of bonus is observed that most of the recipients (about 48%) consists of families consisting of one senior member. Since the definition of household is material to the benefit not coincide with that of family as the nucleus of cohabitation, it is in every way possible that families with higher abundance receive an amount equal to 200 €. This is the case, 0 for example, a retiree who lives with her unmarried partner, or with a child not dependent. In view of this clarification, the families formed by one or two elements represent more than 50% of beneficiary families and their is little more than half of the expenditure. The proportion of households eligible for each class size is decreasing up to four components, and then grow by number higher. This trend reversed bell is partly a consequence of the equivalence scale implicit in the definition of the thresholds for access to the benefit (see tab. later), which differs significantly from the commonly used scales and provides the same limits for families with two or three components and those with four or five components. It should, however, be careful in comparing the distribution of number of family members with the criteria for the thresholds (see table below) and because the presence of a disabled member revised the criteria

regardless of abundance, or because, for the reasons already discussed, the family size does not necessarily coincide with that of the core material.

Tab.6 Share of family beneficiary the bonus and the breakdown of family

			Total	25.8%	100%

(Ceis Report, 2009)

As for other family characteristics, the reference person is retired for more than 50% of beneficiary families, while only 28.6% of cases it is an employee. However, it is almost nothing the percentage of households benefiting from those in which the reference person is self-employed, a predictable result given the stringent constraints in this regard. In the few cases in which these families receive the benefit, the reference person carries out occasional self-employment and the applicant is the spouse, an employee or retiree. On a regional basis, 38.8% of beneficiary families residing in the North, while 44.7% are resident in southern Italy. In terms of the number of beneficiaries, therefore, there seems to be a significant difference between the two areas. The average amounts, however, are higher in southern Italy and the Islands, due to greater diffusion of households applicants other than the type "senior only". From other calculations it is a bonus only for the average beneficiary families of 360 € and 339

€ in the South Island, compared with about € 273 in the northwest, the 276 in the Northeast and 298 in the Centre. The main effect is the breakdown of expenditure that goes to 50.4% in the South, to 34.0% in the North and the remaining 15.7% in the Centre. The effect takes maximum value equivalent to the families belonging to the first two deciles, then decreased, but remained positive for higher deciles of equivalent disposable income. It is noted, in fact, a percentage of beneficiaries other than zero for the families that lived in the last decile. The bonus will then show a degree of inefficiency in directing spending to support families in terms of only 22 low-income families, a feature that we are primarily due to two factors. The first is the definition of the threshold for access to the benefits in terms of total income, the value of one part excludes certain categories of income, including financial income subject to substitute tax, while the other underestimates labor income in because of tax evasion. The second factor that explains this inefficiency is once again the difference between the definition of household in the determination of bonuses and that of family as a group of people who dwell in the house. In particular, there may be people living with incomes that high, but whose total income is irrelevant to the benefit because they do not care and other than the spouse of the applicant. The most typical example is that of unrelated persons living together by kinship, adoption or affinity, or the case of two parents whose son lives in the house, but it is not against them.

Tab.7 Average values bonus amount received by the family and income, by deciles of income equivalent diponibile

Decyl	All the families				Only beneficiary families			
	Share of family beneficiary	Equivalent amount of bonus	Equivalent disposable income	Incidence of bonus on income	Equivalent amount of bonus	Equivalent disposable income	Incidence of bonus on income	Not of the same average amount of bonus
1	48.6%	104	6.716	1.55%	215	7.484	2.87%	406
2	55.6%	115	11.159	1.03%	207	11.101	1.86%	320
3	46.5%	95	13.799	0.68%	203	13.789	1.47%	288
4	36.2%	72	16.226	0.44%	198	16.189	1.22%	273
5	26.5%	52	18.588	0.28%	198	18.544	1.07%	280
6	17.2%	36	21.105	0.17%	207	21.023	0.99%	302
7	12.0%	23	23.947	0.10%	191	23.871	0.80%	278
8	7.9%	14	27.487	0.05%	172	27.116	0.63%	268
9	5.1%	8	32.932	0.02%	161	31.801	0.51%	251
10	1.8%	3	52.926	0.01%	177	46.735	0.38%	245
Total	25.7%	52	22.487	0.23%	203	14.796	1.37%	313

(Ceis Report, 2009)

The bonus-family, so the social card is pro-poor, in other words to the families belonging to the lowest deciles of income it is a more than proportional share of total spending. You can

observe this by noting that in the chart above, the concentration curve dominates the bisector of the bonus equivalent. Unlike card purchases, however, the family has a bonus less concentrated on very low income families, as can be seen in Table 9, noting that the share of beneficiaries and the average amount of equivalent benefit for the second decile are greater than the first. Applicants must in fact be the recipients of an income from employment or retirement to qualify for the bonus, a requirement that it effectively excludes the self-employed poor and families in particularly difficult economic conditions. The requirements also exclude persons with sun-free pensions, such as invalids who receive disability pensions only.

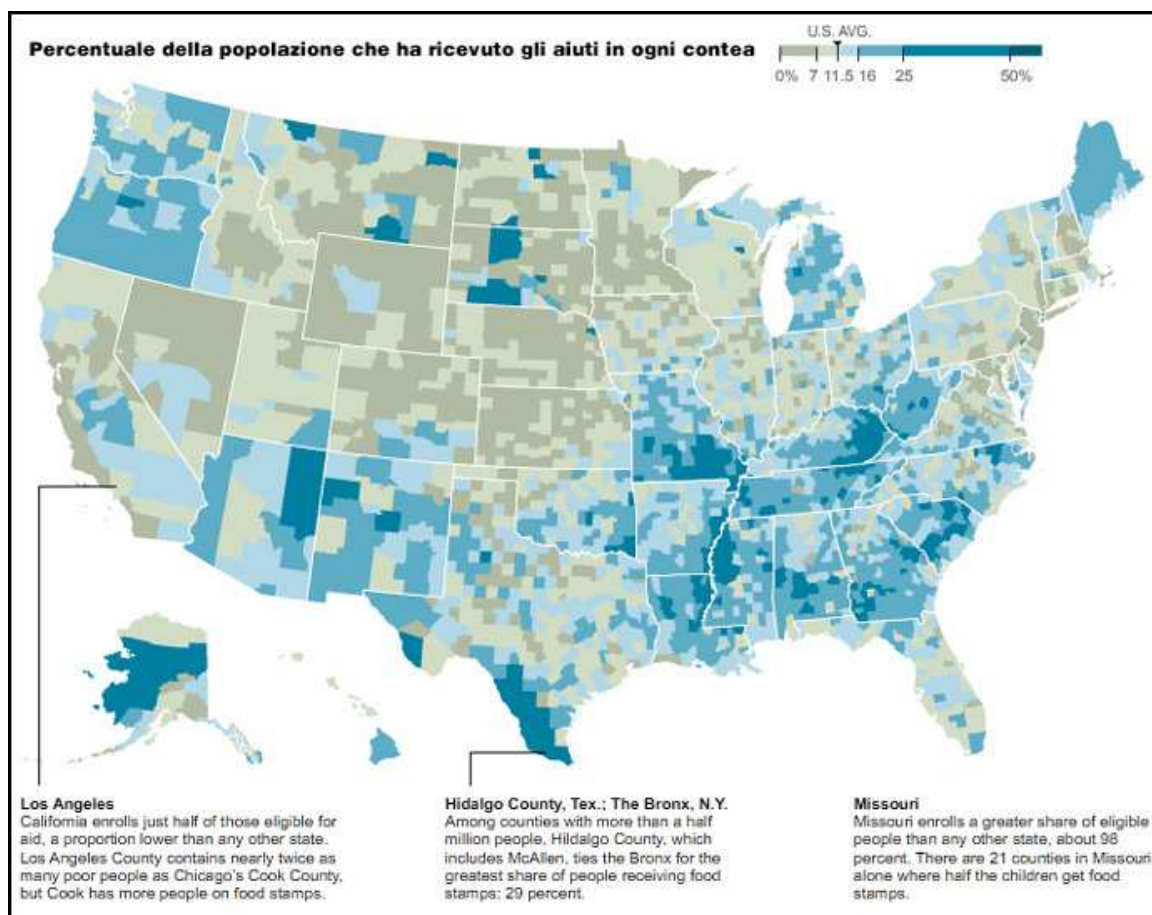

Tab. 8 Lorenz curve and equivalent disposable income concentration curve of equivalent benefit

(Ceis Report, 2009)

The Food Stamps

Born around 1940 to help poor families, the Food Stamp resemble our social card. They are used to buy food and may require low-income families, unemployed and single mothers. Given a stamp of poverty, something to be ashamed of, so far not been widely used. The breakthrough came in October 2008 when the state aid program has changed the name and, in part, the purpose. Today part of a Food Stamp assistance program (SNAP) who wants to help Americans to better feed their children. Credit cards are like in Italy, but only for use in grocery stores. Depending on the components of the family and the income may be increased to \$ 500 per month. In 2009 they have asked for 36 million Americans, that is 12% of the population, in practice, one in four children is nourished by the aid. It is a huge number, but another 15 million Americans who would be entitled not ask for them. At times, recognize their poverty is a psychological threshold crossed.

Although the Food Stamp Act is broadly bipartisan - has been renewed by George Bush - no lack of criticism. The Republicans want to restrict access to aid, encourage guilty of the laziness of the unemployed. But the most interesting discussion is another. Even eating healthy, or more expensive, is a right of the poor? In America, eating organic is considered a luxury reserved for the upper class, especially the rich Democrats sensitive to environmental issues. For the uninformed, there is the junk-food at a good price, see hamburgers sold at a dollar in many fast-food restaurants. If vegetables, pasta, and remember everything the Mediterranean diet is rich stuff, it is also because the meat is cheaper than the Americans. Consequently, the crucial question, one that contains within itself all the contradictions of American becomes this. If the poor can eat (junk food) with little, why force them to spend more on eating healthy? The paradox today is that the father of a family in need to spend money to help other people, or worse, to fight them. America is a nation that has 12 trillion in debt, but continues to behave as if sailing gold.

The International Comparison

The Italian social card comes in the wake of the experiences undertaken abroad. For example, the first U.S. Foods Stamps Program has been operating from 1939 to 1943, only to be restarted in 1961. Currently 99.8% of the grants is provided through electronic system. From 1 October 2008, the program is called Snap (Supplemental Nutrition Assistance

Program). With an electronic card with people with no income or low income level can buy food with nutritional value. For the purpose of issuing the card has the income and resources available, housing is not included. The amount is defined by the number of persons who constitute the household. The card is accepted in most shops that sell food. Here is an overview of the social card use abroad. The card in the aftermath of Katrina, the Disaster Relief Assistance, funded mainly by private donations, was introduced in 2003 by the American Red Cross. This is a prepaid card that has played a key role in the distribution of relief after Hurricane Katrina. To give a figure, before Katrina, the Red Cross ran a stock of 70 thousand cards, after it reached a share of a million cards. The paper, which can not be used for discretionary purchases, but only for necessary goods and services, has proved fast and effective way to help victims of natural disasters. In Georgia, card supports childhood. In the State of Georgia, the government has used an electronic card to manage more efficiently the program of support to children. The initiative has allowed the families without bank accounts to eliminate tariffs collection of checks, to avoid delays in recovery or loss of checks, reducing the time of payment. In 2005 it distributed 596 million dollars. In England a card for teens based on sports and culture. In England the Government has launched a pilot project grants provided through the electronic card. The first author who took part in the project is the Cambridgeshire Country Council, which has a prepaid card distributed to children aged 13 to 17 years of low-income families. A card for a period of 12 months, charged at a rate of € 40 per month be spent only for cultural or sporting activities. In the Netherlands assistance to people in need. In Holland you use a prepaid card in different programs for the provision of subsidies by local governments that use the same platform. You can make emergency payments in special circumstances, assistance to people facing difficult financial conditions. But are also used for the payment of benefits by social security and social assistance to the unemployed. In Poland social benefits via card. In Poland, the prepaid card is used to distribute pensions and social benefits through the municipal offices in over 26 cities. It is recharged by monthly transfers from the municipal authorities and can be used without restrictions for all purchases in the exercises of the Maestro. 7. The Italian Case Poor but excluded from the social card. The poorest of the poor homeless, the poor immigrants because they do not Italian citizens, the new poor, young and insecure. Poor. The social card was the only measure of poverty created by the government but failed the target. He brought a benefit to no more than 3-4 per cent of households, leaving out the vast majority of those who would need. The amendment included in the so-called Milleproroghe, omnibus decree that raised the social card also as a private student with the entry in the field of institutions "charities involved in voluntary work, is the implicit confirmation. We have eight million people in relative poverty and more than three million in absolute poverty. In all, nearly four million poor families. In just over two years were 750 000 people who have used the card purchases. More to the south and the north. But the Ministry of Finance in that number there are those who bought with the card once. So there are less people using it constantly, 400-500 thousand. Why did you change just one of the requirements (age, for example) to not have

more right. Yet the government estimated that 1.3 million potential beneficiaries of the prepaid card. Why did this happen? Why you chose the card instead of a social instrument for direct income support as in Europe? Because the poor are left out? Why, now, it opens the entrance of the private? And as individuals? The social card was not designed for everyone. Meanwhile, cut off aliens as residents and, in many cases, poor. The social card is only for the Italians, while the share of foreigners who have lost their jobs because of the long global crisis is constantly growing. The tables say the latest "Report on the policies against poverty and social exclusion" delivered to the government before the summer in 2007 were foreigners without jobs, 9.3 percent of the total, rose to 13.5 percent in 2008 and 16.6 per cent in 2009. In Turin every hundred new members in mobility lists 37 are foreigners. But they are out of the social card. Out as young people with unstable work and no children under three years. Because apart from the requirements of income (including no more than 6,300 per annum or € 8,300 if age and many other constraints) for the social card you must be 65 or over or under 3. Italy, in fact, not a country for young people. They, however, are getting poorer: those under 34 were 4.6 per cent of the total, now rose to 4.8 percent, and the age group between 35 and 44 years increased from 5 to 5.6 per cent. It is a social metamorphosis, accelerated by the recession, the government appears not to have seen

The Cooperative Puzzle

The social card is the brainchild of a cooperative Matera, whose trademark was patented in Matera in August 2008. In fact the name "Social Card" has been duly registered with the Italian Patent and Trademark Office of the Ministry of Economic Development to work in a cooperative Matera relating to the consortium "The city is essential." The label "Social Card" has been submitted to the Chamber of Commerce of Matera August 20, 2008 by Cooperativa Sociale "The Puzzle" therefore "in very difficult times " since the beginning of the Italian government.

According to state law, the name "Social Card" trademark, can not be used by anyone, including the Italian, to mark a service or object. So much so that.

Officially, the government had to call the card for pensioners' Paper purchases "can not use the words" Social card "which had been publicized in recent months by all the media. "The social card-states the report tabled by the Cooperative Puzzle Patent Office of the Ministry, is a charter of social services for citizens and communities more generally, to improve the quality of life of individu meeting social need, acting through the provision of support services in social life, from early childhood services for the elderly, disabled and better services for family life. " "The brand that we have seen, says the president of the consortium Joseph Bruno, is part of a larger project put together by the Cooperative Matera for the assistance and services to families. The project 'Die Serenity' The Puzzle of the cooperative aims to assist the entire family in everyday life by taking advantage of services and assistance, including through the use of "Social card" that allows you to book shopping at the

nursery, ask the baby sitter at home in case of illness of children and many other services". The Cooperative's Puzzle Matera is therefore the sole proprietor of the "Social Card" while the card issued by the Italian government is called "Purchase Card" even if all continues to improperly call "social card". The Puzzle The cooperative was founded in 1999, thanks to the will of people who believed from the outset in the development of human resources of the territory, the creation of a widespread culture of solidarity, in the implementation of educational services at the same time innovative and high quality. The decision to invest resources to enhance the local professionals, to promote family values, promote integration and social inclusion, to develop the principle of subsidiarity, to promote the practice of active citizenship, promote solidarity and social potential of local communities, has found its right size and has strengthened the motives of the establishment of a social cooperative that aims to pursue the general interest of the community to promote human and social integration of citizens (Article 1, L.381 / 91) and bases its tenets on the principles of mutuality, solidarity and democracy. The persons, cooperative members have begun the path to business / social experiences and activities dedicated to the band pre-adolescent, in fact, the cooperative is inspired and supported by the Blue Tree from which the center is named after childhood and adolescence same name, which houses a kindergarten, nursery school and Matching Game Room in structured environments and distinct.

Puzzle City now operates in Matera and in countries of the Province with the management of kindergartens, nursery schools equal, daycare centers for children, community housing for children, home support thirteen countries in the province. The cooperative also promotes actions of local promotion, awareness and prevention through planning initiatives in certain time in close collaboration with schools and local institutions. The service also provides a path in their supply chain to support the reconciliation of family / work called "The chain of serenity." A wide range of network services based on the concept of the chain, the tool to access services is the "Social Card" (registered trademark), through which, for example, you can access a bank of time baby sitter, or use service "spending ready."

TOURISM SEGMENTATION BASED ON SPIRITUALITY

Abstract

The island of São Miguel, in the Azores (Portugal), is characterized in terms of religious belief by the expressions of faith of its people. No doubt the best known one in the Azores is the Ecce Homo Festivities - Senhor Santo Cristo dos Milagres, which take place in the fifth week after Easter and culminates with the procession on the Sunday before the Ascension.

This paper aims at understanding the tourist movements in the Azores based on religious motivation, as well as the potential and the best strategies for developing religious tourism.

The analysis that follows aims at drawing the profile of tourists who attended the event in 2010, regarding, in particular, the several variables that allowed segmenting them in three different groups named as "Spiritual", "Religious" and "Moderately Religious".

The paper is structured in two main parts: the first explains the methodology generally used in this type of studies, presenting the data collection method that was adopted and the structure of the questionnaire; in the second part, we present the data analysis for each of the three referred segments. Finally, we will present the main conclusions, in which some problems relating to the influence of spirituality in the tourists coming for the Ecce Homo Festivities will be approached.

Keywords: Tourism Segments; Spirituality; Ecce Homo Feast.

Methodology

According to Finn and Elliott-White (2000), there are three research methods for leisure and tourism: the inquiry, the experimental and the ethnographic method. The inquiry method requires a sample that will fulfil the questions previously established as essential for the research development.

Through this method, it is possible to compare individual elements from the same sample by resorting to the same questions. According to Gunn (1994), the inquiry method allows to collect a significant amount of data in a short period of time.

Apart from the advantages and disadvantages of each method, the inquiry is the one method where data dispersion is less significant. Therefore, this method adjusts best to a

quantitative analysis; in this case, one whose goal is to know and draw the profile of the tourists taking part in the Ecce Homo Festivities (EHF).

Following the aim of this research, which is to analyse the spirituality of the tourist visiting São Miguel Island during the EHF, this survey was carried out during the festivities period. The sample is composed of tourists staying at hotels in the city of Ponta Delgada, right before and after the Ecce Homo procession.

The data collection method was the direct and personal interview, since the reply rate is higher and also the interviewers may enlighten the tourists whenever necessary.

The interviews were held by fifteen (15) interviewers; three of them were responsible for the project, therefore they followed and guided the other interviewers throughout the whole training process regarding the application of the inquiry and the data collection.

The data collection was held from May 4th to May 12th in some hotels in Ponta Delgada, São Miguel Island: seven (7) 4-star hotels, two (2) 4-star apartment hotels and seven (7) 3-star hotels.

Inquiry Structure and Methods of Statistical Analysis

The difficult task of drawing an inquiry sometimes leads to a certain kind of question formulating that tempts the interviewed to answer in a particular way, possibly biasing the research result. Hague and Jackson (1990) name these questions as “biased and discriminatory questions”.

In a survey on consumer buying behaviour, the author divides the questions into three categories: (1) questions about behaviour; (2) questions about attitudes and (3) classification questions. The questions about behaviour indicate the “product’s” current position, as well as its possible future position. On the other hand, the perspectives, dimensions and the image the interviewed tourists have about a certain matter are part of the questions about attitudes. The classification questions consist of “cataloguing” the interviewed, being quite important both for the qualitative analysis and the quantitative analysis. Also, there are two types of questions: open and closed – for this last type of questions the answer is previously defined. In this particular case, questions are mostly closed ones. They are organised by scales used in data analysis, namely the Likert scale (for this survey there were five options ranging from “not important/much worse than expected” to “very important/much better than expected”). In fact, this scale is a common denominator to almost every survey on consumer buying behaviour, since it is very efficient on measuring attitudes, on classifying them and easily managed (Yuksel, 2001). Finally, it should be stated that the inquiries carried out in Portuguese were translated into English and German.

The questionnaire’s structure used in this project aimed at knowing and understanding the impact and the importance of religious tourism from the perspective of the tourist that takes part in religious demonstrations in the Azores, especially the Ecce Homo Festivities.

The most delicate questions, such as those related to social and demographic features, were the last ones to be made, in order to win the trust of the interviewed throughout the inquiry.

The questionnaire also took into consideration the literature revision, based both on religious tourism and references to spirituality, allowing the creation of a set of questions on how the tourist outlooks and assesses the event.

The first part of the inquiry aimed at characterising the trip/destination as to realise what motivations are behind it, as well as the means of transportation used, the accommodation, the activities carried out during the stay and also at understanding if these tourists travel in groups.

Through this analysis it was also possible to draw some of the booking characteristics, namely how much time in advance did the tourists buy the tourism services, as well as the information sources they used to buy and organised their trip to the Azores.

The second part of the inquiry focused on psychographic features, as to understand which the religion of the interviewed is, to get to know her/his religious habits and previous trips with religious motivations. This part of the inquiry takes in two of the survey's main goals: to analyse the relation of the interviewed with religion, through variables related to spirituality, and also to understand in which way the interviewed evaluates the Ecce Homo Festivities when comparing them to other religious events and places, as to be aware of the position of this religious event among the religious tourism competitiveness.

The third part of the inquiry aimed at defining the intentions and the degree of knowledge about the EHF, as well as the main motivations that moved the tourists to take part in them.

On the fourth part, there were some questions about expectations and the level of satisfaction regarding not only the EHF, but also the São Miguel Island destination. These aspects were assessed by a 5-point scale (from "Much worse than expected" to "Much better than expected").

Finally, the fifth part included social and demographic variables, such as the tourists' nationality, their relation with emigration, age, etc.

The data collected for the inquiry was analysed and treated through the SPSS statistical software (*Statistical Package for the Social Science*), as it enables a descriptive and diversified statistical analysis and consequently the gauging of the significance level of each variable.

Cluster Analysis

The groups were segmented through hierarchical and non-hierarchical clustering methods (k-means) and then confirmed by discriminant analysis. Segmentation was based on homogeneity (within the groups) and heterogeneity (from group to group).

Literature on segmentation uses mainly hierarchical and non-hierarchical methods. Hierarchical methods are mostly used for small samples. Hair, Anderson, Tatham and Back

(1998) showed that the hierarchical process is not feasible for samples with more than 200 or 300 remarks. The advantage of this method is that is not necessary to previously establish the number of segments, even if the conclusion on the number of groups results both from the dendrogram's interpretation and the researcher's knowledge of the market.

Non-hierarchical methods require the researcher to previously determine the number of groups to be created based on similarity and distance. This process is more feasible for large samples. Hair et.al (1998) concluded that the non-hierarchical method is more useful for large samples when the purpose is to gather remarks in homogeneous groups, admitting there should always be a maximum inter-group variance and a minimum intra-group variance.

Resorting to this method, it was possible to group the interviewed tourists into three clusters: "Spiritual" tourists, "Religious" tourists and "Moderately Religious" tourists.

Result Analysis

From the 420 undertaken inquiries, 409 were considered valid. These 409 inquiries correspond to the designation "Total", thus referring to the total number of tourists interviewed for this analysis, i. e., regarding the EHF, in the Azores.

Concerning structure, the presentation of the results follows the underlying statistical analysis, which respects the purposes outlined in this survey. In that sense, point number one starts by identifying homogeneous groups of tourists (this is the main focus of this paper). The identified segments are then characterised according to the following features: social and demographical – who are these tourists (point number two); psychographic – what are their religious practices? (point three); tripographic – how do they travel? (point four); their relation with the destination (point five); characteristics of their travel bookings (point six); specificities related to their participation in the EHF (point seven); their level of satisfaction regarding the destination and the EHF (point eight); their opinion on the EHF in comparison to other religious events/places (point nine).

Tourist Segments of the EHF by Religious Attitudes/Beliefs – in order to segment the EHF tourists a Principal Component Analysis (PCA) was firstly undertaken, so to reduce the number of variables to be analysed. From there, and resorting to a Cluster Analysis, several segments were defined according to their degree of concordance to different statements of the interviewed on religious attitudes/beliefs.

By resorting to the PCA method, it was possible to reduce the 35 relative variables to the religious attitudes/beliefs and to extract 14 dimensions to the 35 initially taken into consideration. The extracted variables were grouped into three sets, namely: spirituality, religiousness and paranormal beliefs, as showed on table number 2. The elements, described below, stand for 65,8% of the total variance, with a 0,871 KMO and a significant Bartlett's test ($p = 0,000$).

The designation found for the three groups of factors is supported by literature and it is especially concurring with the *ESI - Expressions of Spirituality Inventory*, MacDonald (2000).

According to this author, spirituality is expressed by five distinct dimensions, labelled as follows: 1) “cognitive orientation towards spirituality”, which includes beliefs, attitudes and perceptions related to the nature and the meaning of spirituality; 2) “experiential/phenomenological dimension of spirituality”, related to the meaning and the true value of life; 3) “existential well-being”, associated to the way individuals outlook the meaning and the purpose of their own individual existence; 4) “paranormal beliefs”, standing for the belief in supernatural phenomena, and 5) “religiousness”, i. e., religious behaviour and practices.

Table 1 shows the dimensions of spirituality defined by MacDonald (2000) adopted by and adapted to this survey.

Table 1 – Dimensions of Spirituality

Dimension	Correspondent Variable
Cognitive orientation towards spirituality	<ul style="list-style-type: none"> - I believe that God is present in everything that I do - Religious beliefs mean nothing to me - Spirituality is an essential part of human life - I believe there is a higher, divine power influencing my life - Whenever I have to make a decision I take the spiritual consequences into account
Experiential or phenomenological dimension of spirituality	<ul style="list-style-type: none"> - Spiritual orientation is essential for a serene life - Spirituality has no true value in life - Material prosperity is more important than spiritual growth - Spirituality is not relevant for quality of life - I believe there are many rewards to a spiritual way of life - I trust my life to God
Existential well-being	<ul style="list-style-type: none"> - I am happy - Spirituality has a positive influence on my energy level and on my physical health - Spirituality helps to improve my professional performance - I usually feel stressed out - I constantly feel that I'm doing everything wrong - I consider myself a spiritual being - I do not understand how people are able to have a close relationship with God - Spirituality helps me to deal with difficult social situations
Paranormal beliefs	<ul style="list-style-type: none"> - I believe in life after death - I have experienced situations in which I felt like transcending time and space - It is possible to communicate with dead people - I believe in ghosts and apparitions - I have experienced situations that I cannot explain
Religiousness	<ul style="list-style-type: none"> - I pray on a regular basis - I believe that taking part in religious events is important - Whenever I have a problem I ask God for help - Whenever I have a problem I ask the Virgin Mary for help - Whenever I have a problem I ask the saints for help - I go to religious events on a regular basis - I feel close to God on a regular basis - Thanking God implies physical sacrifices - In order to show my gratefulness to God it is enough to keep my promises - A promise always implies body sacrifices - God forgiveness is not achieved by body sacrifices, but by our own conduct

Source: Adapted from MacDonald (2000)

Therefore, the factors associated to “Spirituality”, which is the first group of variables, are related to attitudes and perceptions regarding the nature and the meaning of spirituality, as well as its importance in intrapersonal terms. This group of factors is the one that best explains total variance (33,0%), while the variables “Spirituality is an essential part of human life” (4,32/5) and “I believe that God is present in everything that I do” (4,29/5) stand out in terms of univariate analysis.

Table 2 – The tourists' attitudes and beliefs

SPIRITUALITY	
	- I believe that God is present in everything that I do (4,29/5)
	- Spirituality is an essential part of human life (4,32/5)
	- I believe there is a higher, divine power influencing my life (4,21/5)
	- Whenever I have to make a decision I take the spiritual consequences into account (3,56/5)
	- Spiritual orientation is essential for a serene life (4,02/5)
	- I believe there are many rewards to a spiritual way of life (3,91/5)
	- I trust my life to God (4,23/5)
RELIGIOUSNESS	
	- Thanking God implies physical sacrifices (2,28/5)
	- In order to show my gratefulness to God it is enough to keep my promises (2,20/5)
	- A promise always implies body sacrifices (2,12/5)
PARANORMAL BELIEFS	
	- I have experienced situations in which I felt like transcending time and space (2,25/5)
	- It is possible to communicate with dead people (2,18/5)
	- I believe in ghosts and apparitions (2,56/5)
	- I have experienced situations that I cannot explain (2,93/5)

The second group of factors, labelled as "Religiousness", stands for 17,1% of the total variance. These dimensions regard religious behaviours and practices. However, the interviewed tourists disagree with the questions about religious sacrifices.

The third group, associated to "Paranormal beliefs", stands for 15,7% of the total variance. In this case, the variable "I have experienced situations that I cannot explain" stands out (2,93/5).

The Cluster Analysis, which was based on hierarchical and non-hierarchical criteria, points out the existence of three groups of tourists from those visiting the EHF. From the 409 cases studied, the Cluster Analysis enabled the grouping of 322 remarks. From all the cases, 97,5% were classified within the correct groups.

The analysis of image number 1 reveals significant differences between the several segments. This allows the designation of each group after their spiritual beliefs.

Image 1 - The average level of concordance between the tourist segments and the defined Attitude/Belief Groups

In general, the tourists who visited São Miguel Island during the EHF do not have a high religiousness level, while in terms of segments their attitudes vary considerably. The average level of concordance with each of the three groups of factors identified by the PCA became the base to designate each segment. Therefore, the first group was labelled "Spiritual", the second "Religious" and the third group of individuals is referred to as "Moderately Religious" (Image 2). The distinction between "spiritual" and "religious" tourists is settled on the notion that religion is not only related to individual aspects, but mainly to institutional ones and also to formal expressions of religious institutions, such as the Catholic Church, while spirituality is associated to the personal and individual side of the religious experience.

Image 2 – Tourist Segments

Spiritual (N = 143)	Religious (N = 118)	Moderately Religious (N = 61)
Spirituality (4,37)	Spirituality (3,14)	Spirituality (1,07)
Religiousness (2,86)	Religiousness (3,87)	Religiousness (3,10)
Paranormal Beliefs (1,94)	Paranormal Beliefs (4,47)	Paranormal Beliefs (2,69)

Most tourists (44,4%) follow under the "Spiritual" category. They are labelled as "Spiritual" because their level of concordance with the group of factors associated to "Spirituality" stands out (4,37/5 average). On the opposite side, these individuals are sceptical about the most enigmatic aspects of faith - "Paranormal Beliefs" (1,94/5 average).

The second group of tourists, "Religious", is the one in which individuals agree the most, in average, with the "Religiousness" aspects (3,87/5 average) and the "Paranormal Beliefs" as well (4,47/5 average). These tourists live their faith more intensely, as it goes beyond their personal issues, associated to "Spirituality", and they abide both by the institutional values of church ("Religiousness") and supernatural elements ("Paranormal Beliefs").

The last segment of tourists, being the smallest one (18,9%), is designated "Moderately Religious", since their average numbers do not overpass 3,10/5 ("I do not agree nor disagree"). This means that these individuals do not value spiritual or religious aspects in their lives.

Social and demographic features - the average age of "Spiritual" and "Religious" tourists is over 55 years old. For the second segment, "Moderately Religious", the average age is 45. In the first two groups there are more women than men (55,9% and 55,2% respectively), while on the other one the opposite situation occurs (39,3%). This shows that women have a larger tendency for religious practices.

Concerning nationality, the "Moderately Religious" group is the only one with a substantial number of different nationalities (44,3%), besides Portuguese and North-American (many of these tourists come from a second generation of emigrants). In the "Spiritual" and "Religious" groups, the percentage of nationalities is reduced to 4,9% and 3,4% respectively.

Most of the tourists staying in Ponta Delgada during the 2010 EHF were married - over 70% in the first two groups and 60% in the "Moderately Religious" group. Furthermore, over half of the tourists in this group have attended higher education studies (60,7%), while in the "Spiritual" tourist group the percentage is 25,2%. Also in the "Moderately Religious" group the largest number of employed people (75,4%) is registered, opposing to the 44,8% of the "Spiritual" group and to the 53,6% of the "Religious" group. This is a tendency also in what regards wages over 2.000,00 € per month: 72,2% for "Moderately Religious", 62,9% for "Spiritual" and 59,3% for "Religious". In general terms, the "Spiritual" and "Religious" groups represent the typical tourist visiting the Azores: older individuals with family bonds to the archipelago, still working or already retired, living in Portugal or in the countries where the Azoreans emigrated to - USA and Canada. Given the age of these individuals, their level of education is not very high and consequently their income pattern is quite varied. The third segment ("Moderately Religious") represents a new "kind" of tourist, one that might come from many countries (but especially from Scandinavia), who is younger, more educated, employed, who has more purchasing power and who is not so connected to spirituality and religiousness.

Psychographic Features (religious practices) - the variables that characterise the religious habits of the tourists that visit São Miguel Island during the EHF include her/his religion, the saints she/he worships, participating in the Sunday mass and her/his action in the parish.

It should be restated that "Spiritual" tourists are the most representative ones (44%), followed by "Religious" (36,7%) and, finally, by "Moderately Religious" (18,9%). In the two first groups, over 90% of the individuals are Catholics, while in the last one Catholics are even under 50%. In general terms, the interviewed tourists are mainly Christians: 83,1% are Catholics and 9,5% are Protestants. Apart from these, 1,2% belong to other religions and 6,2% are agnostic or do not believe in God's existence.

Within Catholics who worship saints and/or the Virgin Mary, Saint Anthony is the most referred to, followed by Our Lady of Fátima and Ecce Homo.

Most of the Catholic tourists are religiously active: 52,7% go to church every Sunday and 14,7% go at least once or twice a month. These percentages are higher for "Spiritual" tourists (57,8% and 18,5%) and "Religious" ones (57,4% and 11,3%), whilst for "Moderately Religious" tourists the percentages are 11,5% and 15,4%.

"Spiritual" and "Religious" tourists admit having an active role in their parishes. "Spiritual" tourists live their religious experiences very intensely, by taking active part in their church as catechists (27,5%) or Eucharist helpers, namely as acolytes or readers. The "Religious" tourists are essentially volunteers (27,7%) or take part in religious associations, such as Scouts, among others (24,1%).

Tripographic Features (how do they travel) - Concerning trip characteristics, tourists travel to the Azores during the EHF for two main reasons: for holidays (42,5%) or to participate in the EHF (39,4%). The "Moderately Religious" tourists are the ones who contribute the most for the "holidays" ratio (62,3%); the "Spiritual" and "Religious" tourists stand out for visiting the Azores with the purpose of participating in the religious festivities (51% and 52,6% respectively). "Spiritual" tourists travel in groups/tours (39,9%) and "Religious" ones travel as a couple (41,6%).

When booking accommodation, all the segments favour 4-star hotels, starting with the "Moderately Religious" (68,9%), the "Religious" (65,3%) and the "Spirituals" (56,6%).

Relation with the destination – as regards the tourism experience in relation to the destination, there is a clear distinction among the segments: the "Moderately Religious" tourists are usually visiting the Azores for the first time (72,1%), as opposed to "Spirituals" and "Religious" (58,7% and 55,1% respectively). From these, the "Spirituals" are the ones with a stronger connection to the destination: on average, they visit the Azores five times (excluding the current visit). This is the group with the highest percentage of emigrants (42,0%).

Most tourists coming to the Azores during the EHF visit only São Miguel Island (80,4%); only 19,6% of the tourists go to other Azorean islands. This conclusion is common to all the tourist segments, even if "Spiritual" tourists are those who usually visit other islands besides São Miguel (22,4%).

Booking features - Most tourists visiting the Azores during the EHF booked their trips approximately one to three months in advance (66,0%). They booked through travel agencies (36,9%), the Internet (21,6%) and by telephone (25,4%).

"Moderately Religious" tourists booked their trip later: one month (34,4%) or even one week before travelling (8,2%). On the opposite side, "Spirituals" were the ones to book earlier: 45,5% booked one to three months in advance and 23,8% booked until six months before travelling.

This is related to the fact that these tourists usually travel in groups/tours and, therefore, resort to travel agencies to book their trips.

However, as regards travel planning, many EHF tourists chose to do it themselves (35,9%). When so, the privileged information source was, apart from travel agencies (3,7/5), friends and family opinions and recommendations (3,7/5). The internet was not so used by "Spiritual" (2,5/5) and "Religious" tourists (2,7/5), but on the other hand, it was one of the "Moderately Religious" tourists' favourite sources (3,3/5).

Regarding the purchase of a tourist package, most tourists (54,3%) did buy one to travel to the Azores. This was more common near "Spiritual" tourists (55,9%) and less common for "Religious" ones (48,3%). Most tourists purchasing a tourist package chose a full package, including flight, accommodation, transfers, meals and, in some cases, tours. For "Moderately Religious" tourists the packages normally included less tourist services, covering only the flight and the accommodation.

In terms of expenses, "Spiritual" tourists spent more with their trips. Those who bought a tourist package spent on average 1600 Euros, while those who did not purchase it spent around 1300 Euros. On the other hand, "Moderately Religious" tourists spent the least in the Azores, as their trip normally did not reach 800 Euros (with or without tourist package).

Taking part in the EHF - Regardless the reason for their trips to São Miguel Island, the respondent tourists unanimously stated they were willing to take part in the EHF: 88.3% were assuredly willing to take part in the festivities.

The "Religious" tourist segment is the most likely to take part in the festivities. In fact, 95.8% intended to take part or actually took part in the festivities. By contrast, "Moderately Religious" tourists had the highest rate of unwillingness to participating in the EHF (27.9%).

There are several underlying reasons to taking part in the EHF: both the "Spiritual" and the "Religious" tourists participate in the festivities due to their religious devotion (67.9% and 61.9% respectively); on the other hand, "Moderately Religious" tourists take part in the festivities mostly out of curiosity (62.2%).

"Religious" tourists are those who take part in the festivities more often, having an average attendance rate of seven times. "Religious" and "Spiritual" tourists consider the EHF to be a cultural reference, and claim to have always known these religious manifestations (40.7% and 46.9% respectively), or through family and friends (22% and 18.2% respectively). By contrast, "Moderately Religious" tourists are those who are less connected to the EHF: only 11.5% think of the festivities as a cultural reference and many of them (18%) only know about this event when they are already on São Miguel Island; most times they are aware of it at the hotel.

Most "Spiritual" and Religious" tourists believe the EHF gives them spiritual comfort/inner peace (4.05/5 and 3.90/5 respectively); a feeling of renewed energy (4.01/5 and 3.92/5 respectively) or an occasion for adoring Christ (3.96/5 and 3.71/5 respectively). However,

none of the items were over 1,95/5 for “Moderately Religious”, showing the little importance they give to the religious and spiritual elements of the EHF.

Satisfaction regarding the chosen destination and the EHF - Tourist satisfaction can be assessed by taking into account two parameters: the first one is related to the chosen destination (São Miguel) in general and the second one is related to several aspects, namely the benefits of taking part in the EHF.

As regards the first parameter, we should bear in mind that both the landscape (4.25/5) and the accommodation (4.05/5) are the two main aspects behind a positive assessment of this tourist destination in particular, since these two features have an average rate by a consensus as “better than expected”. In fact, this is the overall review to the destination (4,02/5). By tourist segments, the “Moderately Religious” tourists are the least happily surprised ones (3,56/5); they even consider some aspects, such as the climate (2,82/5) and the flight connections (2,77/5), to be slightly “worse than expected”. In fact, climate is the less favoured aspect by all the segments (3.25/5), which can be related to the weather conditions during the EHF in 2010.

According to the assessment of tourists taking part in the EHF, we can conclude that the festivities represent a moment for “Spiritual” and “Religious” tourists to reaffirm their values and their faith in Christ. More than physical or psychological renewal, the EHF represent an opportunity for them to get closer to God (4.60/5 and 4.58/5 respectively), to adore him (4.58/5 and 4.56/5 respectively) and to obtain spiritual comfort by doing so (4.59/5 and 4.52/5, respectively). As regards “Moderately Religious” tourists, none of the above mentioned aspects surpass 3.50/5.

The EHF and other religious destinations/events – At this point, we compare the EHF to other religious places/events mentioned by the tourists. The choice to make open questions allowed the interviewed tourists to freely identify the most impressive religious places/events they have visited. Fátima stands out as the most recognised and impressive sacred place for all the EHF tourists, gathering 53,8% of the answers. Apart from the Portuguese sanctuary, also Santiago de Compostela (11,8%), Lourdes (11,8%), Rome/Vatican (6,6%) and the Holy Land (5,9%) are part of the most remarkable places.

The Fátima sanctuary is the most visited one but, when compared to the EHF, its assessment is quite neutral (3,4/5) for the average of the three segments. In fact, Rome/Vatican and the Holy Land bear a more positive assessment by the “Spirituals” (3,7/5 and 3,6/5 respectively), as well as Lourdes for the “Religious” tourists (3,7/5).

However, the Fátima sanctuary stands out again for representing the place the EHF tourists are willing to visit in a three to five year-period: 31,7% (average of the three segments) state their wish to return to Fátima or to visit it for the first time. Rome/Vatican comes second both

for the “Spiritual” tourists (17,9%) and the “Religious” ones (27,5%), followed by Santiago de Compostela for the “Moderately Religious” (25,2%).

Therefore, we come to the conclusion that, on a competitive level, the EHF are in a very favourable position comparing to other events/regions, even if it still exists a tendency to choose destinations with stronger religious features.

Final Considerations

It is possible to identify spirituality as a variable, even if a complex one, as it enables the segmentation of people travelling to a certain destination to attend a particular event.

It is now clear that these tourists have different purposes, other than Religious Tourism, as well as different perspectives to life, which, in turn, lead to distinct interests and behaviours.

In the particular case of the Ecce Home Festivities, which take place in the Azores, Portugal, and taking the proposed segmentation as a base – “Spiritual”, “Religious” and “Moderately Religious” tourists – our advice to the Azorean tourism promoters is to continue resorting to this event, on the short and medium-term, to advertise the region.

Nevertheless, the “Moderately Religious” tourists are expected to take over, throughout the years, the “Spiritual” and the “Religious” tourists. To become more aware of these changes, it is necessary to carry out this survey on a regular basis, as to follow their development and to be able to act accordingly.

Abstract

Different models have been proposed in corporate finance literature for predicting the risk of firm bankruptcy and insolvency. In spite of the large amount of empirical findings, significant issues are still unsolved. In this paper we developed dynamic statistical models for bankruptcy prediction of Italian firms in the industrial sector using financial indicators. The model specification has been obtained via different variable selection techniques and the predictive accuracy of the proposed default risk models has been evaluated at various horizons by means of different accuracy measures. The reached results give evidence that dynamical models have a better performance in any of the scenarios considered.

Keywords: Default risk; Financial ratios; Variable selection; Logistic regression; Hazard model.

Introduction

Business failure is widely studied within corporate finance and different models have been proposed in literature to predict the risk of firms bankruptcy and insolvency. Since the seminal works of Beaver (1966) and Altman (1968), bankruptcy prediction is attracting the attention of both academics and practitioners. Lately, academic researchers have looked for the best corporate failure prediction model (recent reviews are Falkenstein et al., 2000; Altman and Hotchkiss, 2005; Balcaen and Ooghe, 2006; Ravi Kumar and Ravi, 2007). The exponential growth of financial and micro-data availability and the development of computer intensive techniques have recently attracted new attention on the topic, leading to further investigations on some unsolved issues, such as the selection of optimal predictors and the estimate of the dynamical evolution (Sexton et al., 2003; Brabazon and Keenan, 2004; Härdle et al., 2009).

Some authors have studied the role of variables (Keasey and Watson, 1987; Mossman et al., 1998; Amendola et al., 2010) to assess whether some predictors are better than others. Others have compared the performance of static and dynamic models, in order to evaluate the impact and the effect of the time dynamics on both parameters' estimates and model performance (Shumway, 2001; Balcaen and Ooghe, 2004; Chava and Jarrow, 2004; Hillegeist et al., 2004; Dakovic et al., 2007). Few authors have attempted to assess the contribution of variable selection techniques to the performance of a model (Back et al., 1994; Brabazon and Keenan, 2004; Sexton et al., 2003, du Jardin, 2010; Amendola et al., 2011).

The aim of the present paper is to investigate the determinants of corporate failure in the Italian industry sector. In particular we focus on the role of the explanatory variables in static and dynamic approaches. The main purpose in failure risk studies is, in general, to find out the best bankruptcy prediction model, by classifying companies according to their financial variables and ratios. However, the problem which still deserve further investigation is how to choose the best predictors, among the large number of financial indicators, suitable for predicting the bankruptcy and insolvency. For this purpose, following Amendola et al. 2011, we use modern selection techniques in order to define the optimal predictor set and compare the model performance both in static and dynamic framework.

The analysis, carried out on a sample of healthy and failed industrial firms throughout Italy, aims at evaluating the model capability of improving the forecasting performance over different time windows.

The paper is structured as follows. The next section introduces the sample characteristics and the predictors dataset. Section three briefly illustrates the proposed approach. The results of the empirical analysis are reported in Section 4. The final section will give some concluding remarks.

The data base

The sample consists of 1048 limited liability companies, operating in the industrial building sector in Italy, between 2006 and 2009. The information on the legal status and the financial information used for the analysis were collected from the AMADEUS database of Bureau Van Dijk (BVD). In particular, the disease sample is composed of those industrial firms that had entered the juridical procedure of bankruptcy in Italy between 2006 and 2009 for a total of 218 failed firms (Table 2.1). The healthy sample was randomly selected among the Italian industrial firms according to the following criteria: were still active at time $t=2009$; have not incurred in any kind of bankruptcy procedures in the period from 2006 to 2009; had provided full information between 2006 and 2009. For each company, all financial statement information available in the database has been collected.

Table 2.1: Sample of Firms.

	%
<i>Healthy Firms</i>	79.20
<i>Failed Firms</i>	20.80

The sample is divided into two parts: in-sample set, used for estimating the forecasting models; and out-sample set, used for evaluating the predictive power of models. The predictors database for the years of interest (2006-2009) was elaborated starting from the financial statements of each firm included in the sample for a total of 6965 balance sheets. We computed $p=27$ indicators selected as potential bankruptcy predictors among the most relevant in literature (Altman, 2000; Dimitras et al., 1996). They have been chosen on the basis of different criteria: have a relevant financial meaning in a failure context, have been commonly used in failure predictions literature, and finally, the information needed to calculate these ratios is available. The selected indicators reflect different aspects of the

firms' structure: Probability Area (p=12); Operational Area (p=7); Structure Area (p=5); Non-Financial Area (p=3). In this last area, the legal form, the company category and the shareholders' number are included.

A pre-processing procedure was performed on the original data set. In particular we applied a modified logarithmic transformation which is still defined for non-positive argument and mitigated the effects of outliers by "winsorizing" all observations less than 0.01 percentile and greater than 0.99 percentile (Perederiy, 2009). In other words, for each continuous covariate, the values below 1% quantile and above 99% quantile were calculated and firms with financial values outside this range were excluded from further consideration.

The methodology

One of the main problems in risk failure prediction is how to select the optimal predictors subset, and how to single out the best model in terms of prediction accuracy. Selection of the prediction can be based on personal judgment and theoretical evidence or computed through automatic selection techniques. A classical approach in variable selection is the subset regression, which aims to select the set of the most important regressors by removing the noise regressors from the model. Within this class there are different methods: best-subset; backward selection; forward selection; stepwise selection.

Despite the large diffusion in empirical applications, these techniques have some limits and drawbacks. In particular, small changes in the data can lead to very different solutions; they do not work well in presence of multicollinearity; since predictors are included one by one, significant combinations and iterations of variables could be easily missed.

To overcome these limits, shrinkage methods can be applied. They try to find a stable model that fits the data via constrained least squares optimization. This class includes the Ridge Regression and some more recent proposal such as the Lasso, the Least Angle Regression and the Elastic Net (Hastie *et al.*, 2009).

Suppose we have n independent observations $(\underline{x}, \underline{y}) = (x_{i1}, x_{i2}, \dots, x_{ip}; y_i)$ with $i = 1, \dots, n$ from a multiple linear regression model:

$$y_i = \underline{x}_i' \beta + \varepsilon_i, \quad \forall i$$

with \underline{x}_i the p -dimensional vector of covariates and y_i the response variable for the i -th individual, $\beta = (\beta_1, \dots, \beta_p)$ the vector of regression coefficients and the error term ε_i assumed to be i.i.d. with $E(\varepsilon_i) = 0$ and $Var(\varepsilon_i) = \sigma^2 > 0$.

The Least Absolute Shrinkage and Selection Operator, LASSO (Tibshirani, 1996), minimizes the penalized residual sum of squares:

$$\hat{\beta}_{lasso} = \arg \min_{\beta} \sum_{i=1}^n \left(y_i - \beta_0 - \sum_{j=1}^p x_{ij} \beta_j \right)^2$$

$$\text{subject to } \sum_{j=1}^p |\beta_j| \leq \delta$$

with δ a tuning parameter. This is equivalent to:

$$\hat{\beta}_{lasso} = \arg \min_{\beta} \left\{ \sum_{i=1}^n \left(y_i - \beta_0 - \sum_{j=1}^p x_{ij} \beta_j \right)^2 + \lambda \sum_{j=1}^p |\beta_j| \right\}$$

with $\lambda > 0$ the parameter that controls the amount of shrinkage. A small value of the threshold δ or a large value of the penalty term λ will set some coefficients to be zero. Correlated variables have chance to be selected.

A more recent proposal by Efron *et al.* (2004) is the *Last Angle Regression*, LAR. The LAR procedure can be easily modified to efficiently compute the LASSO solutions (LARS algorithm) (Friedman *et al.*, 2009), enlarging the gain in application context. The Lasso linear regression can be generalized to other models, such as GLM, hazards model, etc. (Park and Hastie, 2007; Friedman *et al.*, 2010).

In particular, the Logistic Regression equation,

$$\ln \left(\frac{p(y)}{1-p(y)} \right) \equiv \text{logit}(p(y)) = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_p x_p$$

with

$$\hat{\beta} = \arg \min_{\beta} \sum_{i=1}^n \{ y_i \ln p(y_i) + (1 - y_i) \ln(1 - p(y_i)) \}$$

is modified adding a L_1 norm penalty term in the Regularized Logistic Regression,

$$\hat{\beta}_{lasso} = \arg \min_{\beta} \sum_{i=1}^n \left\{ y_i \ln p(y_i) + (1 - y_i) \ln(1 - p(y_i)) - \lambda \sum_{j=1}^p |\beta_j| \right\}$$

The Logit model is a static model (also called *single-period model*), it uses a single observation per company, ignoring the dynamics of failure process. In fact, static models don't consider that the characteristics of most firms change from year to year. Moreover, they assume a steady state progression of financial distress; they omit the time of failure as an integral factor in corporate distress analysis, and finally they do not allow estimation of survival probabilities or the time of corporate failure.

Recently, in some studies (Shumway, 2001; Chava and Jarrow, 2004; Hillegeist *et al.*, 2004; Dakovic *et al.*, 2007) dynamic models have been developed in order to overcome the limits of static approach, by accounting for the time dimension of company bankruptcy, and by assuming that the failure process

is not constant over time. Moreover, Shumway (2001) says that by ignoring that firms structure change through time, static models produce biased and inconsistent bankruptcy probabilities. These models are shown to be outperformed by dynamical hazard models (Hosmer and Lemeshow, 1999), which explicitly account for time and use all available information of each firm at each time-point.

Let T be the time to failure of a firm. Let \underline{x} be a p -dimensional vector of covariates. The conditional hazard function given by:

$$\lambda(t | \underline{x}) = \lim_{\Delta t \rightarrow 0} \frac{P(t \leq T \leq t + \Delta t | T \geq t, X_o = \underline{x})}{\Delta t}$$

defines the instantaneous risk of an event occurring at time t , given the firm survives to time t .

A hazard model suitable for the analysis of failure risk analysis is the Cox Proportional Hazards Model (Lane *et al.*, 1986; Whalen, 1991; Wheelock and Wilson, 2000), where the conditional hazard rate is of the form:

$$\lambda(t | \underline{x}) = \lambda_0(t) \exp\{\beta' \underline{x}\} \quad (3.1)$$

where λ_0 is the baseline hazard rate, that measures the effect of time on the hazard rate for an individual whose variables all have values of zero; \underline{x} is the vector of those variables that influence the hazard; β is the vector of their coefficients.

Shumway (2001) shows that the hazard model can be reduced to a multi-period logit model, including each firm year as a separate observation. In fact, the multi-period default probability is conditional probability, given by:

$$P(T \leq t | X = \underline{x}) \quad (3.2)$$

can be estimated by:

$$P(T \leq t | X = \underline{x}) = 1 - S(t, \underline{x}) = 1 - \exp\left\{-\int_0^t \lambda(\tau | \underline{x}) d\tau\right\} \quad (3.3)$$

where $S(t, \underline{x})$ is the survival function.

In order to estimate the coefficients β , Cox (1975) proposed a partial likelihood function based on a conditional probability of failure by assuming that there are non tied values in the survival times, without any specification on $\lambda_0(t)$. The partial likelihood is given by:

$$\ln(\beta) = \ln \left[\prod_{r \in D} \frac{\exp\{\beta' x_{j_r}\}}{\sum_{j \in R_j} \exp\{\beta' x_j\}} \right] \quad (3.4)$$

where D is the set of indices of the failures, R_r is the set of indices of the firms at risk at time $t_r - 0$, and j_r is the index of the failure at time t_r . Tibshirani (1997), using the results showed in a previous paper (Tibshirani, 1995), propose to estimate β via the criterion:

$$\hat{\beta} = \arg \min \ln(\beta), \quad \text{subject to } \sum_j |\beta_j| \leq s \quad (3.5)$$

where $s \geq 0$ is a user-specified parameter.

Suppose $\hat{\beta}_j^0$ is the maximizers of the partial likelihood (3.4). Then, if $s \geq \sum_j |\hat{\beta}_j^0|$, the solutions to (3.5) are the partial likelihood estimates. If $s < \sum_j |\hat{\beta}_j^0|$, then the solutions to (3.5) are shrunk towards zero.

The empirical results

Our main interest is in investigating the performance of static and dynamic models, focusing both on the role of the explanatory variables for predicting the bankruptcy risk and on the capability of these models of evaluating the discriminant power of the variables selected as potential predictors. In particular, we selected the optimal set of predictors by means of classical and modern approaches, and we compared them by evaluating their performance in terms of predicting the risk for an industrial enterprise of incurring in legal bankruptcy, at different rolling time windows. Therefore, four models are estimated. The Static Single-period Logistic Regression and the Dynamic Multi-period Logit model, (respectively, *Model 1* and *Model 2*), where the potential predictor have been selected by stepwise variable selection. The Lasso selection have been implemented for the regularized Static Logistic Regression and the regularized dynamic Multi-Logit Regression, (respectively, *Model 3* and *Model 4*). Three time windows (2006-2009; 2006-2008; 2006-2007) have been considered, for estimating and validating the models, and for predicting the failure risk one, two and three years ahead.

The predictive performance of the estimated models has been evaluated by means of appropriate accuracy measures, widely used in bankruptcy prediction study (Engelmann, 2003; Fawcett, 2006), on in-sample and out-of-sample sets. In particular, starting from the classification results summarized in the Confusion matrix (Table 4.1), we computed the Type I error rate (a failing firm is misclassified as a non-failing firm) and the Type II error rate (a non-failing firm is wrongly assigned to the failing group), assuming equal costs of the two errors. These rates are associated with the Receiver Operating Characteristics (ROC) analysis that shows the ability of the classifier to rank the positive instances relative to the negative instances. The classification ability is computed by the Area under the ROC curve (AUC), which is defined as the probability that the classifier will rank a randomly chosen failed firm higher than a randomly chosen solvent company. The area is 0.5 for a random model without discriminative power and it is 1.0 for a perfect model. The last measure calculated is the Correct Classification Rate (CCR), i.e. correct classified instances over total instances.

Table 4.1: Confusion Matrix.

		Predicted Class	
		Failed	Healthy
Actual Class	Failed	True Positive	False Negative
	Healthy	False Positive	True Negative

The Tables 4.2 – 4.3 show the results of the models' performance, displaying the accuracy measures computed for the in-sample and out-of-sample sets, at different time windows.

The performance of the four models for the time window 2006-2009 is summarized in the first block of Tables 4.2 – 4.3. By comparing the results of static and dynamic models (neglecting the variable selection technique considered), we noticed how the CCR and the AUC have different behavior. In fact, while the CCR in static model is higher than in dynamic one, the AUC has opposite direction. In fact, it is higher in dynamic set up. Now, looking at the variable selection methods, there is any significant difference between the lasso technique and the classic stepwise selection, both in static and dynamic frameworks. These considerations are true for all prediction time windows, i.e. when the bankruptcy is predicted one, two and three years ahead. However, it can be noted that the forecasting accuracy in terms of correct classification rate declines when we increase the number of forthcoming years for prediction, while the values of AUC increase. The performance of the models can be considered as stable even when predicting bankruptcies several years into the future. Similar considerations are done for the other two time windows (2006-2008 and 2006-2007).

The results show a better performance of forecasting models based on dynamic models, confirming that the time evolution has to be taken into account for predicting the bankruptcy. Then, there is not a significant difference in the prediction accuracy by using a traditional variable selection procedure and a shrinkage selection method. The overall models' performance, in terms of AUC, increases as the number of forthcoming years for prediction increases.

After analyzing the accuracy and the classification performance of the four models, we investigated the variables selected as predictors and the sign of coefficients' estimates, in order to give an economic interpretation and to check whether some variables appear to be equally selected among the models, according to the forecasting time windows. Table 4 shows the number of times in which every variable has been selected for the different time windows.

It can be noted that some predictors, such as Company Category, Legal Form and ROE, have been selected as predictors in the four models and for all the time windows. Comparing the variables according to the rank of appearance in the four models^[1], we noticed that Company Category and Legal Form have always been selected respectively as the first and the second predictors in all four models and for all time horizons, following by Solvency Ratio, ROE and ROCE.

Finally, the sign and the value of coefficients' estimates^[2] change in different years before failure, confirmed the results by Zavgren (1985) and Laitinen and Luoma (1991).

Conclusion

Dynamic models for corporate failure in the Italian industry sector have been estimated based on different variable selection procedures. The importance of time dimension in the model has been investigated, assessing the usefulness of a dynamic approach, in order to better estimate the risk of bankruptcy. Then, the capability of each model, at different time horizons and for different variable selection procedures, has been evaluated by means of some accuracy measures. Finally, the determinants of failure are further explored via some empirical findings such as the number of variables that appear to be repeated among the models, the frequency of appearance and the sign of coefficients.

From the results obtained it can be noticed that, the lasso procedure and the stepwise method perform equally well, in terms of correct classification rate and AUC, at least when the number of candidate predictors is not so high. Then, the forecasting accuracy of the dynamic approach is greater than the corresponding accuracy of static approach, in any of the considered scenarios. The multi-period model can be a good alternative over logistic regression, generating additional findings even in terms of number of predictors included in the model. In other words, the overall performance depends on the time dynamics. Furthermore, focusing on the selected variables in each model, there are some predictors that appear significant in all four models and for the different time horizons playing an important role in failure risk evaluation.

Therefore, further investigation is needed for taking into account the time dynamics and the evolutionary behavior of the financial variables in order to develop an appropriate multi-state model.

AN ANALYSIS OF E-LEARNING PRACTICES WITHIN CYPRUS UNIVERSITIES

Amirkhanpour, Monaliz¹

¹MBA Programme Graduate, School of Business, University of Nicosia – 46 Makedonitissas Ave., P.O Box 24005, 1700 Nicosia, Cyprus. E-mail: monaliza1983@yahoo.com

Abstract

This paper presents an extensive research study and results on the use of existing open-source Learning Management Systems, or LMS within the public and private universities of Cyprus. The most significant objective of this research is the identification of the different types of E-Learning, i.e. Computer-Based Training (CBT), Technology-Based Learning (TBL), and Web-Based Training (WBT) within Cyprus universities. The paper identifies the benefits and limitations of the main learning approaches used in higher educational institutions, i.e. synchronous and asynchronous learning, investigates the open-source LMS used in the Cypriot universities and compares their features with regards to students' preferences for a collaborative E-Learning environment. The required data for this research study were collected from undergraduate and graduate students, alumni, faculty members, and IT professionals who currently work and/or study at the public and private universities of Cyprus.

The most noteworthy recommendation of this study is the clear indication that most of the undergraduate students that extensively use the specific E-Learning platform of their university do not have a clear picture of the differences between an LMS and a VLE. This gap has to be gradually diminished in order to make optimum use of the different features offered by the specific E-Learning platform.

Keywords: E-Learning, Learning Management Systems (LMS), Virtual Learning Environment (VLE), Open-Source LMS, Cyprus Universities

Introduction

Over the past 15 years, knowledge and information about the utilization of various E-Learning services in Cyprus higher educational institutions is incomplete and limited mainly because there is still insufficient information on the key players offering E-Learning services in Cyprus (Stylianou and Kokkinaki, 2006). Moreover, the E-Learning services which are currently offered have to be systematically categorized and any future potentials of using other open-source learning management systems need to be identified. Therefore, the importance of this research becomes more evident by taking into consideration the fact that there is still very limited and in some cases no relevant information about the perceptions of Cypriots towards the use of E-Learning services within the public and private universities of the island. This research intends to add more information about the learning management systems and E-Learning within Cyprus universities.

Literature Review

E-Learning is defined as encompassing both learning through the use of ICT (Information and Communication Technology) and learning the necessary competences to make use of ICT in the knowledge society (Christodoulou, Germanakos, and Samaras, 2008). E-Learning can be classified into three main categories which are Computer-Based Training (CBT), Technology-Based Learning (TBL), and Web-Based Training (WBT). CBT is a form of education in which the students learn by executing specific training programs on their computers. TBL constitutes learning via electronic technology including the Internet, intranets, audio/video conferencing, satellite broadcasts, chat rooms, and webcasts (Koller, 2001). On the other hand, WBT uses streaming media to create a dynamic learning environment via the Internet. It is an optimal way to deliver E-Learning content to a large group of people scattered around the world provided that there are high-speed Internet connections.

Synchronous and Asynchronous E-Learning

Synchronous E-Learning has the potential to support E-Learners in the development of learning communities as it is commonly supported by media such as audio/video conferencing, Instant Messaging (IM), and chat. On the other hand, asynchronous E-Learning supports work relations among learners and teachers even when the participants cannot be online simultaneously. In simpler terms, asynchronous E-Learning enables the learners to log on to an E-Learning environment at any time in order to download documents, upload projects and assignments, or send messages to teachers and/or peer students. Asynchronous E-Learning is supported by media such as E-mail, blogs, and discussion boards (Hrastinski, 2008). Synchronous E-Learning makes the learners to become more committed and motivated because a quick response from the teacher and/or other peers is expected. It is mainly used for discussing less complicated issues and task-planning communications. Moreover, Kock's media naturalness hypothesis predicts that synchronous communication increases psychological arousal (Kock, 2005).

Learning Management System Fundamentals

A Learning Management System or LMS is a web-based software application that is used to centralize and automate the administration of the E-Learning activities such as managing, tracking, and reporting on training events (Ellis, 2009). The types of learning delivered could be online, traditional with ICT elements, and hybrid (a combination of traditional and online learning). It also helps to deliver the learning contents rapidly, configure and personalize learning contents, and enable knowledge re-use. The main functional characteristics of a learning management system include administration tools, content accessibility, content development, content integration, skills management, assessment capabilities, reporting,

standards adherence, and security (Ellis, 2009). Figure 1 illustrates the learning management system with its typical functionalities.

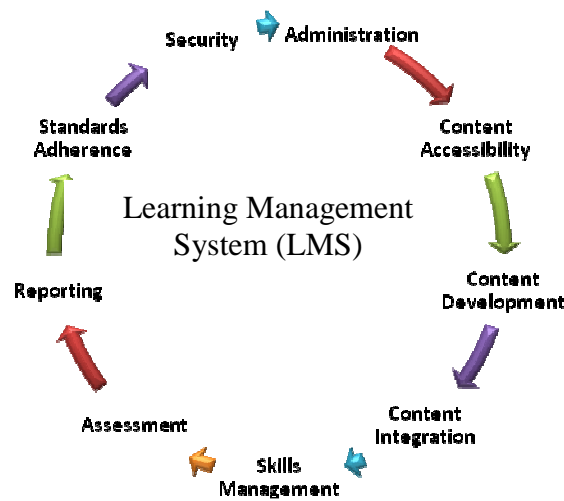

Figure 1: A Typical LMS and its Functional Elements

An effective LMS should enable administrators to manage user registrations and profiles, set curricula, define roles, manage content, author courses, and administer the user payments. Content accessibility involves the medium in which the content is delivered, i.e. online or in-class as well as the methods and languages of the delivered content. The delivery methods can either be instructor-led, self-paced, or blended (a combination of instructor-led and self-paced methods). Content development includes authoring, maintaining, and storing the learning content (Trakakis, 2011). Content integration provides native support to a wide range of external systems such as Content Management Systems (CMS), portals, and registration modules. Skills management revolves around assessing the competency skills of the E-Learners using peer reviews and other feedback tools. Assessment capabilities are based on the evaluation and testing of the delivered learning content to the E-Learners. In simpler terms, a learning management system collects, tracks, and stores the assessment data since it has the capability of assessment creation. One of the most significant functions of a learning management system is the strong and flexible reporting structure which quantifies and evaluates the performance of the specific LMS. In other words, the embedded reporting structure consolidates and tracks all the learning and training efforts within the LMS and creates customized reports based on the courses offered, course completion/incompletion status, etc. Moreover, a learning management system should attempt in supporting standards such as SCORM. SCORM or Shareable Content Object Reference Model is a set of specifications applied to the course contents in order to produce small and re-usable learning objects. It implies that the LMS can import and manage courseware that complies with standards irrespective of the authoring system that has produced the content. In other words, SCORM-compliant course elements can easily be integrated with other compatible elements

which result in having a highly modular E-Learning repository. Finally, a priority in any data system containing personal user information and proprietary content is security in terms of user authorization, authentication, and data protection. Passwords and encryption methods are typical security features of an effective LMS (Ellis, 2009).

Learning Management Systems in Cyprus Universities

The universities in Cyprus can be placed in two categories of public and private. The public universities of Cyprus are the University of Cyprus (UCY), Cyprus University of Technology (CUT), and the Open University of Cyprus (OUC). The private universities of Cyprus are the University of Nicosia (UNic), European University of Cyprus (EUC), the Frederick University, and the Neapolis University of Paphos (NUP). All of the mentioned universities make use of the E-Learning platforms on the basis of their students' and faculty members' essential learning needs. For instance, Moodle is one of the major open-source learning management systems that increase its share in the educational market. It is widely used within Cyprus universities particularly in the UCY, EUC, the Frederick University, and the NUP. On the other hand, UNic makes use of the Learning Activity Management System (LAMS) which is a new tool for designing, managing, and delivering collaborative E-Learning activities. The CUT and the OUC make significant use of the customized open-source LMS called eCourse and eClass, respectively which are both based on the Moodle infrastructure.

Virtual Learning Environment Fundamentals

A Virtual Learning Environment or VLE is a set of teaching and learning tools specifically designed to enhance students' learning experience by incorporating computers as well as the Internet in the learning process (Jeba Kumar and Govindaraju, 2009). Ideally, a VLE should have a collection of learning tools for synchronous/asynchronous communication, assessment, student progress monitoring and reporting, collaboration, conferencing, content authoring, as well as personal productivity tools in order to completely satisfy the E-Learners' educational needs. Nowadays the VLEs are mainly used to complement the traditional learning and traditional learning with ICT elements, commonly known as hybrid (blended) learning. A typical VLE consists of these elements: administrative information, course syllabus and details, notice board, student registration, teaching material, reading material and links to digital libraries across the Internet, self-assessment quizzes and tests, communication and collaboration, and simplified content authoring tools.

Over the past 10 years universities and higher academic institutions including the universities in Cyprus have rapidly adopted VLEs due to the several benefits that they offer such as cutting down the time spent for training the users especially if they belong to the administration or research departments. Moreover, VLEs simplify the integration of traditional and distance learning because most of them are SCORM-compliant and the process of uploading, launching, and monitoring courses is standardized. The VLEs currently

available in the E-Learning industry are either commercial or open-source. The open-source VLE enables the users to have free access to their desired virtual learning software such as Atutor, Chamilo, Claroline, Docebo, Dokeos, ILIAS, Moodle and OLAT. It should be taken into consideration that some of the free open-source VLEs are also viewed as a learning management system (LMS) such as Moodle, Claroline, and Dokeos. On the other hand, there are some other learning platforms which are considered as an LMS only such as LAMS. Similarly, there are learning platforms which are solely considered as a VLE such as Blackboard which is a family of virtual learning software, WebCT which is a subset of Blackboard and it is used to enhance teaching/learning activities within a VLE. Table 1 summarizes the supported features and/or services of the most well-known VLEs available in the E-Learning market.

E-Learning Features and Services

Computers and Internet technologies continue to be more integrated within the professional life of academics and IT experts mainly because the instructional designers have access to a wide range of new flexible and scalable technologies. Therefore, these technologies open gateways for a multitude of different online courses, webinars, discussion forums, and other E-Learning services. Students or the E-Learners use several technology resources for their online course such as VLEs with features that support synchronous/asynchronous communications, web collaboration, content authoring/presentation, and personal productivity tools.

Concurrent and distributed systems use two types of communication methods to exchange information: synchronous and asynchronous. When sending and receiving information between a sender and a receiver are simultaneous events, then the communication is 'synchronous'. On the other hand, when sending and receiving information between a sender and a receiver do not essentially occur at the same time instant, then the communication is 'asynchronous' (Cacciagrano and Corradini, 2006).

The web collaboration focuses on how the shared virtual workspace technologies and the web conferencing provide structured synchronous and asynchronous collaboration instead of physical face-to-face meetings. They simply achieve this goal by enabling the audio-visual interactions across the Internet and shared electronic workspace particularly for developing documents such as surveys and application sharing. Some of the most well-known web collaboration tools are blogging, wiki, RSS feed, surveys, social bookmarking, file/application sharing, collaborative white-boards, collaborative research, and collaborative mindmapping tools. Collaborative mindmapping or concept-mapping is used to create diagrams of the relationship(s) between various concepts, ideas, or other pieces of information; the collaborative mindmapping technique can improve learning and study efficiency in an online learning environment up to 15% as compared with the conventional note-taking (Farrand, Hussain, and Hennessy, 2002).

Content authoring is used to prepare information in order to be presentable and accessible to individuals and groups in all types of learning environments. There are many tasks involved in content authoring such as content manipulation, distribution, and presentation (Sharma and Meenakshi, 2005). The ultimate goal of content authoring is providing an integrated system that will satisfy the concept of “author once, publish to many platforms”.

The personal productivity tools within a learning environment are mainly used for an individual learner’s personal working and learning purposes. Table 2 summarizes some of the top synchronous/asynchronous communication, web collaboration, content authoring/presentation, and personal productivity tools which have been derived from the Center for Learning and Performance Technologies for 2011.

Table 2: Top Features and Examples of an E-Learning Platform

Feature/Tool	Example
<i>Synchronous Communication</i>	
<i>Audio/Video Conferencing</i>	<i>Skype</i>
<i>Web Conferencing</i>	<i>Elluminate/Wimba, Adobe Connect</i>
<i>Chat Rooms</i>	<i>ooVoo, Yahoo Messenger</i>
<i>IM</i>	<i>Skype, Google Talk, Windows Live Messenger</i>
<i>Voice Groups</i>	<i>Voxopop, TalkShoe</i>
<i>Asynchronous Communication</i>	
<i>E-mail</i>	<i>Gmail, Microsoft Outlook</i>
<i>Newsletter</i>	<i>eNewsletter Manager</i>
<i>SMS/Text Messaging</i>	<i>GroupMe, SMSBlaster</i>
<i>Discussion Forums</i>	<i>QuickTopic, Shareflow</i>
<i>Web Collaboration</i>	
<i>Blogging/Wiki</i>	<i>Blogger, Wordpress, Wikispaces, Google Sites</i>
<i>RSS Feed</i>	<i>Google Reader, RSS Feed Reader</i>
<i>Surveys</i>	<i>Google Docs, SurveyMonkey</i>
<i>Social Bookmarking</i>	<i>Delicious</i>
<i>File/Application Sharing</i>	<i>Dropbox, Livebinders</i>
<i>Collaborative White-Boards</i>	<i>Scriblink, GroupBoard</i>
<i>Collaborative Research</i>	<i>Wikipedia, Diigo</i>
<i>Collaborative Mindmapping</i>	<i>Freemind, Mindomo</i>
<i>Content Authoring/Presentation</i>	
<i>Content Authoring</i>	<i>Adobe Captivate, Adobe Flash, eXe</i>
<i>Testing/Quizzing</i>	<i>ClassMarker, Quiz Revolution</i>
<i>Presentation Creation/Hosting</i>	<i>Microsoft PowerPoint, Prezi, Google Docs, Slideshare</i>
<i>Spreadsheets</i>	<i>Edit Grid, Google Docs, OpenOffice</i>
<i>Personal Productivity</i>	
<i>Personal Organizers</i>	<i>Evernote, OneNote</i>
<i>Calendars/Event Schedulers</i>	<i>Google Calendar, Doodle</i>
<i>Calculators</i>	<i>Screen Calculator</i>
<i>Spell Checkers</i>	<i>Spellify, SpellJax</i>
<i>Search Engines</i>	<i>Google Search, Bing</i>
<i>Research Tools</i>	<i>Google Scholar, Zotero</i>
<i>Social Networks/Collaboration Platforms</i>	<i>Facebook, LinkedIn, Twitter</i>

Research Methodology

The quantitative research is the selected research type for conducting the study on learning management systems and E-Learning within Cyprus universities. This clearly implies that empirical data were collected using online questionnaires from all the public and private universities in Cyprus which indicated a relatively large sample. The respondents were asked a set of structured questions and their responses were tabulated. The collected data were then modeled and analyzed using statistical methods and finally the derived

results were carefully evaluated. Software packages such as SPSS ^[1] (Statistical Package for Social Sciences) were typically used for this purpose. The required data for this research study were gathered from the undergraduate/graduate students, alumni, faculty members, and IT professionals who currently work and/or study at the public and private universities of Cyprus using an online questionnaire in Google Docs^[2].

Sampling Technique

The general population for this study contains all the general practitioners, i.e. students (undergraduate, graduate, and alumni) as well as the faculty members and the IT/ICT professionals of the public and private universities of Cyprus. The respondents were asked to express their views regarding the current E-Learning practices in Cyprus as well as their personal perceptions and preferences towards E-Learning services and/or features available in the mentioned universities. Since the size of the population for this study was not clearly known, random sampling technique was used so that every individual in the population of interest, i.e. the students, faculty members, and IT/ICT professionals of all the Cypriot universities have an equal chance of being selected for the specific sample. It should be noted that as the population size increases, the percentage of people needed to achieve a high level of accuracy decreases. In order to determine the correct sample size for this study, the exact size of the population, the desired error level, and the desired confidence level have to be known. The target population size was estimated to be 1,000 people even though the overall academic population of all the Cypriot universities is more than 1,000. This study aims for an error level (confidence interval) of 5% and a confidence level of 95%. The error level indicates that there will be an error margin of plus or minus 5% in the derived results. The confidence level of 95% shows how confident the researcher is towards the error level. With these inputs, the appropriate sample size for this research study is 278 which mean that if the online questionnaire is sent to 1,000 people within the mentioned universities, then at least 278 people have to complete the questionnaire in order to maintain the 95% confidence level and the 5% error margin.

Research Analysis

The descriptive statistics especially the frequencies analysis is one of the first analysis methods used to check the validity of the data and if there are any errors in the collected data. Table 2 illustrates the frequencies analysis performed on the following variables:

- Current academic position
- Current academic institution

[1] SPSS can be downloaded from: <http://www.spss.com>

[2] Google Docs can be accessed from: <http://docs.google.com>.

Taking a careful look at Table 3, it turns out that as the frequency increases the values for Percent and Valid Percent also increase. For instance, in the Current Academic Position table the highest frequency belongs to Faculty Member which implies that from the total number of 280 respondents to the online questionnaire, 93 are faculty members. This number corresponds to 33.1%. Moreover, the Cumulative Percent is calculated by adding the value of Valid Percent, i.e. 33.2% to the previous value of Cumulative Percent, i.e. 58.2% which becomes 91.4%; it simply indicates that 91.4% of the participants in the survey are faculty members.

Table 3: Descriptive Statistics – Frequencies Analysis

Current Academic Position					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Undergraduate Student	82	29.2	29.3	29.3
	Graduate Student	73	26.0	26.1	55.4
	Alumni	8	2.8	2.9	58.2
	Faculty Member	93	33.1	33.2	91.4
	IT Professional / ICT Support	13	4.6	4.6	96.1
	Other	11	3.9	3.9	100.0
	Total	280	99.6	100.0	
Missing	System	1	.4		
	Total	281	100.0		

Current Academic Institution					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	UCY	47	16.7	16.8	16.8
	CUT	2	.7	.7	17.5
	OUC	2	.7	.7	18.2
	UNic	157	55.9	56.1	74.3
	EUC	26	9.3	9.3	83.6
	Frederick	27	9.6	9.6	93.2
	NUP	4	1.4	1.4	94.6
	Other	15	5.3	5.4	100.0
	Total	280	99.6	100.0	
Missing	System	1	.4		
	Total	281	100.0		

Similarly, in the Current Academic Institution table the highest frequency belongs to UNic, i.e. 157 which indicates that 55.9% of the participants are from UNic followed by 16.7% which belong to the UCY.

Cross-tabulation is an efficient method to identify the relationship among certain variables. For this reason, a cross-tabulation test is performed to investigate if there is a relationship between the respondents' current academic position and their level of understanding about different forms of E-Learning, i.e. CBT, TBL, and WBT. The results of the cross-tabulation are shown in Figure 2.

Figure 2: Cross-Tabulation (Academic Position and General E-Learning Understanding)

It turns out that the level of understanding about different forms of E-Learning, i.e. CBT, TBL, and WBT is high (Strong and Very Strong response options) among the faculty members, undergraduate students, and IT professionals mainly because the current undergraduate students incorporate E-Learning into their academic life much more than the graduate students and alumni who studied and graduated a few years ago where E-Learning was not an essential part of their educational life even though there is an average understanding of E-Learning among them. Furthermore, the cross-tabulation analysis is extensively performed on different variables, mainly the E-Learning features and/or services and their use within people with different academic positions. It turns out that the asynchronous communication tools like E-mail and synchronous communication tools like IM are widely used among the people with different academic positions who have participated in this research. Figure 3 illustrates the findings.

Figure 3: Asynchronous/Synchronous Communication Tools (E-mail and IM)

According to the cross-tabulation results shown in Figure 4, blogging tools are quite often used by the undergraduate/graduate students, the faculty members, and the IT professionals. The wiki tools and the survey tools are considered popular web collaboration tools as they are widely used by all the participants. The RSS feed tools are also popular among undergraduate students, IT professionals, and to some extent the graduate students; however, there is less knowledge about the RSS feed tools among the faculty members and alumni who have participated in this research study. According to the results, social bookmarking is a less investigated web collaboration tool by most of the participants mainly because the current E-Learning platforms used within the universities of Cyprus do not have social bookmarking as an embedded feature in the learning platform because some of the currently available E-Learning platforms in Cyprus universities have a feature called 'Glossary' which is sometimes used as a bookmarking service even though social bookmarking and glossary are two different features of an E-Learning platform. Another significant web collaboration feature is collaborative research by using tools such as Wikipedia which seem to be quite popular among most of the participants in the study. Similar to social bookmarking and collaborative whiteboards, collaborative mindmapping is

a new feature embedded in some of the open-source E-Learning platforms such as Dokeos; therefore, it is justifiable that most of the participants in this study have not heard about mindmapping, but they are interested in having this feature added into their learning platforms.

Figure 4: Web Collaboration Tools (Blogging)

One of the important parts of the conducted research was to analyze the utilization of various personal productivity tools by several groups of participants. The personal productivity tools essentially add value to the specific E-Learning platform used by the learners and instructors because they facilitate and speed up the process of E-Learning due to their 24/7 availability. The most popular personal productivity tools used mainly by the students and faculty members were online calculators, spell checkers, and social networks according to Figure 5.

Figure 5: Personal Productivity Tools (Social Networks)

Research Conclusions and Recommendations

The increased utilization of E-Learning has enhanced the amount of self-directed learning among people because of the continuous improvements in the infrastructure, design, content,

and features added to the learning platforms. This has obviously created high competition among several open-source LMS vendors to dominate the E-Learning market. It turned out that adopting E-Learning solutions is beneficial for most businesses because the learning process is self-paced and self-directed, multiple learning styles can be incorporated, geographical barriers are eliminated, accessibility to the learning material is on a 24/7 basis, and the overall study costs are cheaper compared to the traditional learning.

The most noteworthy recommendations of this study based on the analysis of the collected data from the academically-oriented participants are to increase the overall knowledge about E-Learning, especially the different forms of E-Learning platforms, i.e. LMS and VLE among current students of the Cypriot universities. The derived analysis results clearly indicated that most of the undergraduate students that extensively use the specific E-Learning platform of their university do not have a clear picture of the differences between an LMS and a VLE. This gap has to be gradually diminished in order to make optimum use of the different features offered by the specific E-Learning platform.

Future Research

The most feasible areas for future research related to this study include an in-depth analysis of the several features of the open-source LMSs other than those currently used within universities in Cyprus as well as the necessary considerations of converting the current E-Learning platforms into M-Learning platforms within the upcoming years, i.e. the next 5 years.

CONSIDERATIONS OF THE INTERACTIVE DIGITAL TELEVISION AS ADVERTISING MEDIA

Arroyo-Cañada, Francisco-Javier¹; Gil-Lafuente, Jaime²

¹University of Barcelona, Spain. Email: fjarroyo@ub.edu

²University of Barcelona, Spain. Email: j.gil@ub.edu

Abstract

In a context of technological convergence between the television and Internet, the users can access to a multitude of audiovisual contents in the television sets or searching on line. The present work explores the effectiveness of the advertising in the new context. The objective of this research is verifying that the interactive advertising formats in television are more effective than the not interactive formats to inform, persuade and remember.

New techniques derived from multivalent logics come to be today, an interesting alternative for decision making by management compared to classical methods. Therefore, after the treatment of subjective expert input we have obtained results have revealed that the interactive advertising formats add efficacy to the media to inform and remember, highlighting the interactive spot, the TVsite and the microsite.

Keywords: Advertising Effectiveness, Advertising Formats, Convex Weighting, Fuzzy Subset, Relative Hamming Distance, Interactive Advertising Television.

Introduction

The television is the media with major penetration in the population. This reach 88,7% of the people in Spain according to the EGM [1]. Its consumption, according to Kantar Media [2], is 230 minutes per person and day, and it is the main media of advertising investment according to Infoadex [3] with a quota of the 42,1% on the conventional media.

The changes produced in the television due to the spreading out of different technologies of diffusion (cable, satellite, TDT, ADSL, DVB-h, etcetera.), the digitalization of the signal, the arrival of the formats of high definition (HDTV) and 3D, the convergence with Internet, the appearance of technologies like the multimedia hard disks, the PVRs or InOut TV, as well as, the changes produced in the audiovisual sector with the concentration in multimedia groups and the appearance of new operators as Hulu, Netflix and Google TV, have modified the current panorama as for the number of existent canals as the form of access and the consumption of the audiovisual contents.

There are three key factors that have caused changes in the consumption of the users on the audiovisual content and the perception about the advertising. The first of them is the increase of the number of channels resulting from the introduction of new forms of diffusion and the use of the capabilities of compression of the digital signal, that have fragmented the

audiences (Toro, 2006) among a host of free and payment channels, so much generalist as thematic. In second place, the advertising saturation of the generalist channels as reflected in the work of González Lobo and Carreo (2003), Reinares and Reinares (2003), Sainz (2004), that constantly exceed the limits of advertising insertion getting the advertising blocks lengthen to him and disturb to the audiences, besides increasing the advertising noise (Reinares et al, 2003). In third place, the techniques of counter-programming applied by the channels, to combat the attacks from competitors, which cause that the users can't accede to the planning contents or waste time due to the delays of program. In this situation the users adopt technologies (PVRs and services as InOut TV) and habits of consumption (zapping and watching television on Internet), allowing them skip advertising and accede to the contents more interested in the desired moment, that is, each time the consume will be more active and personalized.

The Interactive Digital Television has introduced the concept of interactivity in the television, which is the ability to offer additional contents to the programs, allowing users to customize and view information associated with them, participate in contests and polls, acquire products and even participate in development of the programs with the remote control. The interactivity can be local, with data stored in the decoder, remotely, with a subsequent response through the return channel, or else, in real time by connecting to networks and content servers. This feature has allowed the development of the interactive advertising formats that allow the viewer to participate in the advertising communication process for alter part of the content, expanding the products information or the points of sale, request free samples or product tasting, start the buying process, etcetera.

Given the current context, advertisers and professional of sector rethinking the effectiveness of their advertising insertions in the media, being very questioned so much for organizations like the Asociación Española de Anunciantes (2005), AEDEMO (2005 and 2006), Mediaedge:cia (2006) and Taylor Nelson Sofres A.M (2006) as in the academic environment (Toro, 2006), (González Lobo et al, 2003), (Reinares, 2003), (Sainz, 2004).

Therefore the object of present work is study the efficacy of the advertising formats in the Interactive Digital Television. To resolve it there are two objectives of investigation. In the first place, it decides if the interactive advertising formats in television are more effective than the not interactive formats as for their ability to inform, persuade and remember. In second place, it decides if the Internet formats are effective in Interactive Digital Television or need carry out to him adaptations to the halfback.

Following it review the efficacy measures of the advertising formats in others researches, after it defined the advertising formats that take part in the study, it proposes the methodology for the analysis and it is presented the main obtained results. Finally expose the conclusions and involvements that have for the advertising industry.

Advertising Effectiveness

Along the literature appreciate different measures of advertising effectiveness. Lavidge and Steiner (1961) use the hierarchy effects model to measure the effects of the advertising in every one of the phases of the process of disposition to the purchase: awareness, knowledge, taste, favourable attitude towards the product or feeling, conviction and purchase.

Stewart and Furse (1986) use the measures of efficacy proposed by the Research Systems Corporation: comprehension, persuasion and remember, to measure the efficacy of 1059 television commercials.

Aaker, Batra and Meyers (1992), as well as, Díez de Castro, Martin Armario and Sánchez Franco (2002) it proposes the use of variables related to profitability and the sales to measure the advertising effectiveness, the academic research shows reluctant, keeping in mind the difficulty to insulate the effects of the advertising effort in the sales of the others factors, as well as, the delay of its effects, as like takes Shelter in Clarke (1986) and Farbey (1994).

This research uses, to measure the efficacy of the advertising formats, the basic ends of promotion instruments introduced by Kotler (1989): inform, persuade and remember, similar to the measures used by Stewart and Furse (1986).

The Advertising Formats

There is a great variety of advertising formats definitions, keeping in mind the different professional sources consulted: advertising managers of the main television channels, Infoadex, Kantar Media, AIMC and IAB, as well as, scientific publications: González López (2002), Reinares and Reinares (2003) and Aymerich (2007). For this it have wants to collect the definitions of the different evaluated formats, to avoid any confusion. In this sense, has differentiated between non-interactive formats and interactive formats so much the television formats and Internet derivatives formats.

Table 1. Definition of the non-interactive advertising formats

<i>Format</i>	<i>Definition</i>
<i>Advertorial</i>	<i>Commercials masked of news.</i>
<i>Self-promotion</i>	<i>Commercials of own products of channel.</i>
<i>Bartering</i>	<i>Cession of the emission fees to the channel in exchange for advertising space.</i>
<i>Mask of entrance</i>	<i>Spaces of 5 or 10 second to the start-up, pauses or finalization of the content.</i>
<i>Morphing</i>	<i>Element of program continuity with the logotype of the channel that serves to separate the content of the advertising, and that it can be mix with the elements of image of the advertisers.</i>
<i>Sponsorship</i>	<i>Inserting advertising in a televised show with the objective of reaching to the audience.</i>
<i>Infomercial</i>	<i>Teleshopping space for inform about the product characteristics or benefits by celebrities.</i>
<i>Microprogram</i>	<i>Space dedicated to talk about a particular product or topic related to the product.</i>
<i>Active sponsorship</i>	<i>The product integrates with the content of the program and pays the costs of creation and maintenance.</i>
<i>Passive sponsorship</i>	<i>Presence of the advertiser in a content or simply mentions to it, but the content is not about the product.</i>
<i>Product placement</i>	<i>Product insertion in the development of the content script.</i>
<i>Long-spot</i>	<i>Habitually, space of 1 minute related with informative advertising of the organizations.</i>
<i>Overlay</i>	<i>Advertising message or representative icon of the advertiser that occupies a part of the screen during the emission of a content.</i>
<i>Spot</i>	<i>Space of video where the advertisers send a message to the target. The standard size is 20 seconds.</i>
<i>Telepromotion</i>	<i>Space of video where the series or programs characters develop the communication about the product.</i>
<i>Teleshopping</i>	<i>Channels dedicated to offer infomercials.</i>

Table 2. Definition of the interactive advertising formats

<i>Format</i>	<i>Definition</i>
<i>DAL</i>	<i>Dedicated Advertiser Location. Application that provides access to information of the advertiser or games where the product or the brand is the protagonist.</i>
<i>Impulse Response</i>	<i>Interactive overlay of a advertising message in the screen that allows to request samples or catalogues and provide personal data to participate in a promotion.</i>
<i>SMS messages and calls to 905 lines</i>	<i>Overlay that allow access to crowd of downloads services with other devices, such as cell phones, or interact with the contents by poll, contests, IRC, etcetera.</i>
<i>Microsite</i>	<i>Wallpaper with information about the advertiser for navigate with the remote control without leaving the programming content, which continues in a small screen.</i>
<i>Mini-Dal</i>	<i>Reduced version of DAL with less screens. It doesn't dispose of video and neither navigation menu.</i>
<i>Interactive program sponsorship</i>	<i>Introducing interactive form (banner, button, etc.) in a sponsoring program.</i>
<i>Interactive spot</i>	<i>Similar format to the spot but that has the ability to redirect to a space where viewer can extend information about the product or the points of sale, request free samples, etcetera.</i>
<i>Telescoping ads</i>	<i>Format that requesting users for the interaction through a banner to display out a section that provide more information. The content has been previously downloaded to the flash memory of the decoder or the PVR.</i>
<i>TV Site</i>	<i>Space outside of the contents enabled by the advertiser, where users can obtain more information about products, access to services or initiates a purchase process.</i>

Methodology

In order to analyzing the effectiveness of the advertising formats in interactive digital television, propose the objective:

Determine if the interactive television advertising formats are more effective than the non-interactive formats in their ability to inform, persuade and remember. It wanted to reach this objective contrast to the following hypotheses:

H₁: The interactive formats occupy the first positions of the ranking in the ability to inform.

H₂: The interactive formats occupy the first positions of the ranking in the power of persuasion.

H₃: The interactive formats occupy the first positions of the ranking in the ability to remember.

For the contrast of this hypotheses proposes analyze the efficacy of every advertising formats, keeping in mind, in a side, the importance that has the characteristics that compose them to get inform, persuade and remember; in other, the desirable level of the characteristic that it must have to get it, and finally the degree to which the advertising formats meet those characteristics.

The analysis is based in two basic assumptions: first, overcoming the desirable level of the characteristics does not penalize the effectiveness of the format, and second, there are not characteristics that have a minimum level of compliance.

It has wanted to start the analysis of the formats effectiveness using a fuzzy subset for describing (Kaufmann et al, 1986) formed with a referential composed by 20 features, 9 of those are features related to the format (Images, Texts, Slogan, Video, Animation, Music, Voice in off, Duration, Size); 5 are related with the context of insertion of the format (Timing, Environment affinity, Environment engagement, Display, Ability to customize the message); and 6 are related with its interactive ability (Content manipulation, Linearity, Free navigation, Response delay, Return channel, Giving up the emission).

Keep in mind the 34 formats of Referential set (Kaufmann et al, 1986) F:

$$F = \{F_1, F_2, F_3, \dots, F_{32}, F_{33}, F_{34}\}$$

And the 3 proposal objectives:

$$O = \{O_1, O_2, O_3\}$$

Experts suggest the principal characteristics than configure the advertising formats and value all elements of the referential set for completing the characteristic membership functions (Kaufmann et al, 1986) of everyone of the fuzzy subset, so much of the formats:

$$F_n = \begin{array}{ccccc} C_1 & C_2 & \dots & C_{m-1} & C_m \\ \hline \mu_{C_1}^{(n)} & \mu_{C_2}^{(n)} & \dots & \mu_{C_{m-1}}^{(n)} & \mu_{C_m}^{(n)} \end{array}$$

Being $\mu_{C_i}^{(n)}$ valuations between $[0, 1]$, m the number of characteristics and n number of formats.

As of the proposal objectives:

$$O_p = \begin{array}{ccccc} C_1 & C_2 & \dots & C_{m-1} & C_m \\ \hline \mu_{C_1}^{(p)} & \mu_{C_2}^{(p)} & \dots & \mu_{C_{m-1}}^{(p)} & \mu_{C_m}^{(p)} \end{array}$$

Being $\mu_{C_i}^{(p)}$ valuations (confidence intervals) between $[0, 1]$, m the number of characteristics and p number of formats.

After the description by fuzzy subsets of all formats and the three specific objective (Table 3), experts have decided to weight each characteristic belonging to each objective describes by convex weighting:

$$\omega_n = \frac{v_n}{\sum_{i=1}^n v_i}$$

Obtaining:

$$\omega_1 = \frac{v_1}{\sum_{i=1}^n v_i}, \omega_2 = \frac{v_2}{\sum_{i=1}^n v_i}, \dots, \omega_m = \frac{v_m}{\sum_{i=1}^n v_i}.$$

In this case, it made "subweight" and "sub-subweight" according to characteristics sets analyzed (Table 3).

Obtained the total of the necessary information, find the relative Hamming distance with Convex Weighting that separate each format of the analysis to the three established objectives, because the experts consider that the excess of the features values is so bad like the defect in the effectiveness analysis of the format, the degree of "proximity to the ideal", must being 0.

For this, we calculate the Hamming distance:

$$d(\tilde{F}, \tilde{O}) = \sum_{i=1}^n \omega_i |\mu_O(x_i) - \mu_F(x_i)|$$

where $x \in \forall i = 1, 2, \dots, n; \mu_F(x_i), \mu_O(x_i), \omega_n \in [0, 1]$

Thus, it will obtain the distance between the objective 1 and the format 1:

$$d(\tilde{F}, \tilde{O}) = [0.358, 0.371]$$

and, in the same way, all the remainders (Table 3).

The arithmetic between confidence intervals has for some time allowed us to arrive at satisfactory results. Nevertheless, when we do a subtraction in which the subtrahend confidence interval is partially or totally greater than the minuend, we would be faced with the incongruence that on looking for the absolute value (logical operation if we are speaking about a distance such as the Hamming distance), the negative values would become positive, in this case leading to the fact that the distance instead of being minimum (or 0), would become greater than that corresponding to reality.

A simple easily understood example for this case could be:

For characteristic C_n , the objective considered ideal (**I**) is valued by the experts with: **.5**. If one of the formats has been granted by the experts, for this same characteristic, values included between [**.3**, **.6**], we can see that, in the calculation process for the Hamming distance the result of this partial operation would be:

$$| [.5, .5] (-) [.3, .6] | = | [-.1, .2] | = [.1, .2],$$

a solution which is totally erroneous if the hypothetical value included in the confidence interval [**.3**, **.6**] were **.5**. It is clear that the result: **.5 (-) .5 = 0** would not be found between the minimum **.1** and the maximum **.2** that make up the confidence interval that is the result of the operation.

At this juncture we would like to make a small consideration by pointing out that when the result of the subtraction is a confidence interval in which the lower extreme is negative, we must consider, on doing its absolute value for the calculation of a distance, that the minimum distance (lower extreme) will always be equivalent to zero.

Resolution

The table 4 show the distances [0, 1] obtained for the advertising format in its ability to inform, persuade and remember. 1 means that the format is not allows getting the objective, while 0 indicates that the format allows getting the totality of the objective. There is not any format with maximum proximity to ideal but neither exist a format that allows getting the absolute purpose.

Table 4. Ranking of proximities to the ideal

	Inform				Persuade				Remember		
	Interval	Mean			Interval	Mean			Interval	Mean	
Interactive spot	0,243	0,324	0,284	Interactive spot	0,280	0,290	0,285	Interactive spot	0,243	0,269	0,256
TV Site	0,266	0,319	0,292	Telepromotion	0,271	0,314	0,292	TV Site	0,294	0,313	0,303
Microsite	0,316	0,328	0,322	Spots	0,280	0,336	0,308	Microsite	0,327	0,334	0,331
Long-spot	0,315	0,332	0,323	Long-spot	0,317	0,349	0,333	Telepromotion	0,332	0,339	0,336
Mask of entrance	0,336	0,355	0,345	TV Site	0,306	0,362	0,334	Long-spot	0,334	0,373	0,354
Telepromotion	0,324	0,388	0,356	Infomercial	0,329	0,379	0,354	Spots	0,348	0,360	0,354

Mini-Dal	0,384	0,417	0,401	Passive sponsorship	0,399	0,430	0,414	Passive sponsorship	0,398	0,446	0,422
Impulse Response	0,367	0,465	0,416	DAL	0,423	0,465	0,444	Mini-Dal	0,435	0,458	0,446
Product placement	0,406	0,447	0,426	Morphing	0,430	0,464	0,447	Overlays	0,459	0,464	0,461
Telescoping ads	0,393	0,475	0,434	Impulse Response	0,446	0,537	0,491	Impulse Response	0,416	0,512	0,464
SMS messages & 905 lines	0,414	0,460	0,437	Mini-Dal	0,480	0,514	0,497	Telescoping ads	0,449	0,500	0,475
Morphing	0,445	0,453	0,449	Telescoping ads	0,467	0,530	0,498	SMS messages & 905 lines	0,463	0,494	0,479
Overlays	0,449	0,455	0,452	SMS messages & 905 lines	0,488	0,515	0,501	Morphing	0,471	0,505	0,488

The results of the table 4, allows contrasting of the three hypotheses to reach the objective.

H₁: The interactive formats occupy the firsts positions of the ranking in the ability to inform. The interactive spot (0,284), the TV site (0,292) and the microsite (0,322) are the most effective advertising formats and the three are interactive formats.

H₂: The interactive formats occupy the first positions of the ranking in the power of persuasion. The interactive spot (0,285), telepromotions (0,292) and spots (0,308) are the most effective advertising formats.

H₃: The interactive formats occupy the first positions of the ranking in the ability to remember. The interactive spot (0,256), the TV site (0,303) and the microsite (0,331) are the most effective advertising formats and all three are interactive formats.

Keeping in mind the results the hypothesis H₁ and H₃ can be confirmed but not is possible to confirm the hypothesis H₂. Then is possible conclude that the television interactive advertising formats are more effective than the non-interactive formats in their ability to inform and remember.

Table 5. Ranking of means of the distances to the ideal

<i>Format</i>	<i>Distance to ideal</i>
<i>Interactive spot</i>	<i>0,27</i>
<i>TV Site</i>	<i>0,30</i>
<i>Microsite</i>	<i>0,32</i>
<i>Telepromotion</i>	<i>0,33</i>
<i>Long-spot</i>	<i>0,34</i>
<i>Spots</i>	<i>0,35</i>
<i>Advertorial</i>	<i>0,37</i>
<i>Active sponsorship</i>	<i>0,37</i>
<i>Mask of entrance</i>	<i>0,37</i>
<i>Microprogram</i>	<i>0,38</i>
<i>DAL</i>	<i>0,39</i>
<i>Product placement</i>	<i>0,40</i>
<i>Infomercial</i>	<i>0,41</i>
<i>Passive sponsorship</i>	<i>0,41</i>
<i>Mini-Dal</i>	<i>0,44</i>
<i>Overlays</i>	<i>0,44</i>
<i>Impulse Response</i>	<i>0,46</i>
<i>Telescoping ads</i>	<i>0,47</i>
<i>SMS messages & 905 lines</i>	<i>0,48</i>
<i>Morphing</i>	<i>0,48</i>

In table 5 it observes the mean of the distances to the ideal (inform, persuade and recall) to facilitate the selection of the format in the totality of its objectives, because the consulted experts accept a trade off between objectives. The interactive spot (0,27), TV site (0,30) and the microsite (0,32) are in the top of the ranking of proximity to the ideal. This ideal is a conjoint measure of the objectives (inform, persuade and remember). The formats in the top of the ranking are interactive advertising formats.

Conclusions

The development of the study has confirmed the hypotheses H₁ and H₃ that sustained the objective of the research. Then is possible affirm that the advertising interactive formats are more effective than the non-interactive advertising formats to inform and remember. In a multiobjective decision, usually in the media planning, the interactive spot, the TV site and the microsite are the most effective formats in television. In this sense, the interactivity has certain influence on the advertising effectiveness.

Advertisers and advertising agencies must keep in mind the interactivity formats in their planning of television advertising campaigns. And the television sets must be introducing interactivity in their advertising portfolio to improve the attractive of television as advertising media.

Moreover to the results and their application in the professional field, it is necessary to consider the effort of collect of the different formats as reference for futures works.

The study was conducted for the Spanish market of the television, but could be extended to other markets, resulting a multi-market study that allows comparing their differences.

In the study three measures of advertising efficacy have kept in mind, in future research could be completed adding other measures attending the wellness of obtained results with the proposed methodology. Agreement with the Interactive Advertising Bureau the users refused formats that breaks the flow and theses that produce unexpected effects. Future research can be incorporating an additional effectiveness measure of the advertising formats as the format user's rejection considering their negative effects in the prosecution of the message.

Additionally, the general objective can be decomposing in specific advertising objectives to facilitate to the advertisers an instrument for improving the effectiveness in the television advertising planning.

THE INVOLVEMENT PROCESS THROUGH SOCIAL MEDIA IN 2010 UK ELECTIONS: IS IT A REAL FACEBOOK BASED PARTICIPATION?

Artusi , Marco¹; Maurizzi, Andrea²

¹University of Modena and Reggio Emilia, Faculty of Communication Sciences. E-mail: marco.artusi@unimore.it.

²University of Modena and Reggio Emilia. E-mail: maurizzi.andrea@gmail.com

Abstract

As far as the use of the Internet for election campaigns is concerned, the most interesting experiences seem to draw an evolution from the traditional party organization to a more innovative digital participative organization. On the one hand, the associative dimension of the parties, based on membership and on local rootedness (party on the ground), is deemed to be in crisis by a large number of scholars (Kartz and Mair 1995). This decline is linked to a loss of legitimacy and trust in political parties (Dalton 2002). On the other hand, the evolution of the Internet creates the opportunity for supporters to find the operative and organizational tools necessary to get involved in consensus-developing activities. In this scenario it would be simplistic to consider the Internet a mere means of communication, instead we need to focus on its mobilization, organization and participation potential.

This paper focuses on the way of generating participation on Facebook, by analysing UK General Elections 2010. In particular, the analysis investigates which are the communication strategies used by the three main party that are able to elicit participation of Facebook users.

The study is based on data collected on the Facebook pages of the three main candidates: on this basis, we verify the following research questions.

1. Participation level increases with the number of posts written by the party?
2. Participation level increases by writing call to action posts?
3. Participation level increases by writing posts about the candidate?
4. The issues addressed in the post influence the participation level?

Keywords: Political marketing, Social network, Social media marketing, Facebook, UK 2010 elections, Social media users behaviour.

Introduction

As a political instrument, the Internet is mainly dealt with from two main points of view. On the one hand we focus on the opportunities offered by the Internet to encourage political participation (e.g. see the recent analysis of Coleman and Blumler, 2009; Mayer-Schonberger

and Lazer, 2007; Sunstein, 2009 and Bennet and Wells, 2009). On the other hand, the Internet is considered a means of mass communication, potentially useful to politicians in sustaining TV, radio and newspapers to influence voting behavior during electoral campaigns.

In recent years there have been any studies on the significant experiences of the U.S. (Vaccari, 2007, Haney, Newman & Sylvester 2010, Chadwick, 2006,), France (Vaccari, 2008; Bastien and Greffet 2009), England (Coleman and Ward 2005, Ward, Gibson et al. 2003; Ward, Gibson et al. 2005) and other countries on the use of the Internet for election campaigns. The most interesting experiences seem to draw an evolution from the traditional party organization to a more innovative digital participative organization. The associative size of the parties, based on membership and on local rootedness (party on the ground), is in crisis (Kartz and Mair 1995). This decline (Della Porta 2001; Ranieri 2002; Massari 2004) is linked to a widespread loss of legitimacy and trust in political parties (Dalton 2002). Parties have tried to remedy this trend through the adoption of measures to ensure greater participation of members in decision-making processes, in the selection of candidates and managers, and of the policy choices (Ignazzi 2004). To the model of 'modern' election campaigns, based on mass communication, unidirectional, centralized, televisional, advertising and general, oppose the campaign so-called "postmodern", in which the public can be divided into segments to whom parties can offer more targeted content, up to customized one-to-one targeting (Vaccari 2009).

In this scenario it would be simplistic to consider the Internet a mere means of communication. Instead we need to focus on its mobilization, organization and participation potential. Supporters of a political party can find on the Internet the operative and organizational tools necessary to get involved in consensus-developing activities aimed at the members of their social network. The Internet allows to reach influential voters, creating effective decentralized and flexible political participation activities.

Various researches (Stroud, 2008; Baum and Groeling 2008) have in fact demonstrated that users choose political contents on the web on the basis of their ideology and political preference. In short, a candidate who communicates through the Internet is much more likely to contact a decided voter rather than an undecided one. This is why the Internet has a greater potential as an organizational and mobilization tool rather than as instrument to persuade recipients. Using the Internet as a mere means of mass communication, with the aim of expanding the propagation of the messages conveyed through other media, is a primitive and partial use of the instrument.

Within the studies on how the Internet is used for political and electoral marketing purposes, the literature typically takes into consideration the election campaigns, the characteristics of the voting population and the role that the so-called new media can play in the political marketing strategy. During the 2010 elections in the United Kingdom, the three main parties used the Internet as a communication tool and integrated it into their political

marketing strategy. In this direction of research, this paper focuses on investigating some of the conditions that can promote or not the participation of electors through social network sites.

Social Network Sites as a Political Marketing Tool

Social network sites are web-based services that allow individuals to construct a public or semi-public profile within a limited system, to articulate a list of other people with whom you share a connection, and view and cross their list of connections and links of reports produced by others within the system. The nature and the name of these connections may vary from site to site (Boyd and Ellison 2007).

In other words social networking sites show a set of tools and third-generation Internet applications such as Facebook, Twitter, Youtube, Forsquare that facilitate the involvement and participation of users to an event or action. The diffusion of Social networking sites are the subject of debate and in particular the effect they have on human behavior (Barker 2009, Kolbbitsch and Murer 2006), their potential as a marketing tool and communication (Constantinides and Fountain 2008; Mangold and Faulds 2009) and in politics.

Specifically, in terms of creating political involvement, online social networks prove to be particularly successful. They can be grouped into two macro-types (Haney, Newman, Sylvester, 2010):

Social networking sites designed for general purposes, such as Facebook, MySpace, etc., which allow users to build social networks by using different tools, such as chat, e-mail, sharing photos and videos, status updates, applications, etc. This type of social networking site may also include those sites more oriented towards file sharing (such as YouTube and Flickr). These web tools can enable political parties to connect with potential voters and supporters. In fact, besides being able to get in touch with their supporters, a party or candidate can meet its supporters' friends, and exploit viral marketing mechanisms to communicate with them through the privileged filter represented by the current supporters.

Social networking sites designed by politicians specifically for consensus-building purposes. Typically, a candidate can integrate social networking features on his website, thus creating a network of supporters and providing them with the correct tools to convert their will of involvement and support into tangible actions. Moreover, to broaden the effectiveness of their action, supporters can connect to one another via these website areas.

In this paper, we will focus on Facebook. As a matter of fact, Facebook is the most used social networking sites by UK Internet users (23.9 million UK unique users in 2009, Comscore analysis) and is also the Social networking site designed for general purposes mainly used as a marketing tool by the main candidates during 2010 UK elections.

Empirical Analysis

The analysis of how the three main UK parties used Facebook was conducted according to the following methodological approach.

Research objectives

The research objective is to understand the factors leading to participation on Facebook. In particular, the research investigates:

- What is the degree of use of certain communication strategies by the three main candidates.
- What communication strategies are able to elicit participation of the electors.

The analysis covered both the macro level (all parties) and the micro level (every party individually).

Identification of variables and analysis of research hypotheses

The variables of analysis that will lead to research hypotheses were chosen according to these guidelines.

The dependent variable is the degree of involvement of Facebook users. This level was measured by the average number of comments to posts on Facebook published by the three parties. This is the most reliable quantitative metrics to measure the effective participation of a page, beyond the fan number.

The independent variables were chosen about:

- aspects related to the verbal form of published content;
- issues related to the topics addressed.
- aspects of the role of the candidate.

First, were examined three independent variables, potentially correlated with the degree of participation:

- The number of posts published during the election campaign
- The number of posts published about the candidate during the election campaign. Through this variable, we measure the candidate's charismatic ability to inspire participation in the users.
- The number of posts that include a call to action published during the election campaign. The call to action is an imperative form that invites the viewer to act. Through this variable, we measure the ability of this verb form to inspire greater participation in the users.

With regard to these three variables, the research hypotheses investigated are:

- The number of comments will be positively related to the number of posts published.
- Use of call to action will be positively related to the number of comments. This hypothesis was verified by analyzing the difference between the average number of comments to all the posts and the average number of comments to posts that contain the verb form of the call to action.
- The presence of the candidate's name in the content of the post will be positively correlated with the number of comments. This hypothesis was verified by analyzing the difference between the average number of comments to all the posts and the average number of comments to posts that contain the name of the candidate. Then, research investigates the issue more present in the post of the candidates, and measure for the three main issue the ability to generate participation, comparing the average number of comments to all posts with the average number of comments to that post dealing with one of these issue. In this way, it is possible to reconstruct what are the issues addressed by the politicians, and if these issues are able to elicit participation.

Data collection

All activities on the parties' Facebook pages between March 6th 2010 and May 6th 2010 have been collected, and for each post the following information has been gathered:

date in which the party published the post;

text of the post, with the aim to trace the issues addressed by the message;

name of any politician mentioned in the post;

presence or absence of a verbal call to action, which directly and imperatively calls upon the user to perform an action;

number of comments to the message.

Findings

H1 The number of comments will be positively related to the number of posts published.

Figure 1 shows the number of posts written by each party during the analyzed time frame.

Figure 1: Number of Facebook posts between March 6th 2010 and May 6th 2010

Source: Our elaboration of collected data

The Liberal Democrats achieved a much more intense activity compared to its competitors, producing 345 posts in the 60 days analyzed, with an average of 5.75 posts per day. The Conservative Party published little more than 3 posts a day, and the Labour Party just over 2 posts a day.

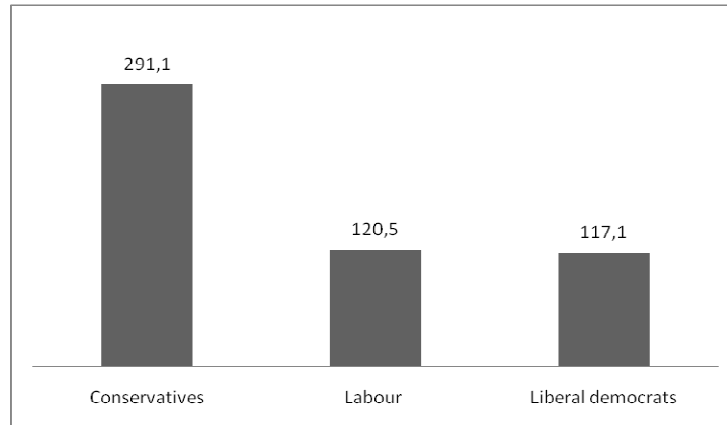

Figure 2: Total number of comments on Facebook between March 6th 2010 and May 6th 2010

Source: Our elaboration of collected data

The comparison changes if we analyze the total number of comments on the Facebook page of the three candidates. The Conservatives' page hosted 52,821 comments, showing an overall trend to a much stronger participation than the pages of the other parties. Of course, the difference becomes even more obvious considering the average number of comments per post.

Figure 3: Average number of comments per post on Facebook between March 6th 2010 and May 6th 2010

Source: Our elaboration of collected data

It appears from this analysis that participation in terms of comments on Facebook is not related to the number of posts.

H2: Use of call to action will be positively related to the number of comments.

Table 1: Number of comments to call to action posts (macro analysis)

	Total	Percentage Variation (%)
Average number of comments to call to action posts	203,43	22,21
Average number of comments	166,46	

Source: Our elaboration of collected data

The hypothesis is tested: the comments to posts increase when using the call to action. We can also perform the same analysis for each party.

Table 2: Number of comments to call to action posts for each party

	Conservatives	Percentage Variation (%)	Liberal-democrats	Percentage Variation (%)	Labour	Percentage Variation (%)
Average number of comments to call to action post	317,89	+ 8,93	115,93	-1,00	125,65	+ 4,31
Average number of comments	291,82		117,1		120,46	

Source: Our elaboration of collected data

Looking at the hypothesis for each party party, this is true for Labor and Conservatives, but not for the Liberal Democrats.

H3. The presence of the candidate's name in the post will be positively correlated with the number of comments.

Table 3: Average number of comments to posts including candidate's name

	Total	Percentage Variation (%)
<i>Average number of comments to posts including candidate's name</i>	171,88	3,26
<i>Average number of comments</i>	166,46	

Source: Our elaboration of collected data

The posts that mention the name of the candidate show a degree of participation higher than the average level of participation.

We can also perform the same analysis for each party.

Table 4: Average number of comments to posts including candidate's name for each party

	Conservatives	Percentage Variation (%)	Liberal-democrats	Percentage Variation (%)	Labour	Percentage Variation (%)
<i>Average number of comments to posts including candidate's name</i>	324,12	+ 11,07	135,7	+ 15,88	171,88	+ 42,69
<i>Average number of comments</i>	291,82		117,1		120,46	

Source: Our elaboration of collected data

In all three cases, the presence of the candidate's name in the post generates a degree of participation than the average. The mention of the candidate is, therefore, an element capable of generating involvement.

Moreover, through the analysis of the content of Facebook posts, we can identify the issues on which the candidates have focused.

The main issues contained in all Facebook post during UK elections are (table...):

- Tv: all posts about Tv Campaign and Tv debates: Facebook is used by all parties as a tool for commenting and spreading tv events.

- Economies and work: all posts about economic issues.
- Other candidates and parties: all posts that contain comments about other parties.

Table 5: Number of post containing the main issues

	<i>Posts number</i>	<i>Percentage Variation (%)</i>
<i>Posts</i>	649	100
<i>Posts about TV</i>	116	17,87
<i>Posts about Economies</i>	94	14,48
<i>Post about other parties</i>	74	11,40

Source: Our elaboration of collected data

The following table illustrates the main issues contained in the posts published by the three candidates.

Table 6: Number of post containing the main issues for each party

<i>Conservatives</i>	<i>Total</i>	<i>Percentage Variation (%)</i>
<i>Totale Posts</i>	181	
<i>Posts about TV</i>	25	13,81
<i>Posts about economy</i>	25	13,81
<i>Post about other parties</i>	23	12,71
<i>Liberal-democrats</i>	<i>Total</i>	<i>Percentage Variation (%)</i>
<i>Posts</i>	345	
<i>Posts about TV</i>	83	24,06
<i>Posts about economy</i>	57	16,52
<i>Post about other parties</i>	14	4,06
<i>Labour</i>	<i>Total</i>	<i>Percentage Variation (%)</i>
<i>Posts</i>	123	100
<i>Posts about TV</i>	8	6,50
<i>Posts about economy</i>	12	9,76
<i>Post about other parties</i>	37	30,08

Source: Our elaboration of collected data

The Liberal Democrats proved to tackle a wide range of issues, and to strongly rely on posts which directly call for votes and involvement, by significantly increasing the number of posts linked to media events such as TV debates. The Labour Party, to a higher extent than the other parties, relies on criticizing competitors: this trend can be considered unusual coming from the governing party. The Conservative Party focuses strongly on economy and jobs, and proves to effectively make online communication interact with the offline one, by using Facebook to support the candidate's TV appearances.

Now, we can test whether the three main issues have been able to inspire participation, comparing the average number of comments to all posts with the average number of comments to posts that deal with one of such issues.

Table 6: Average number of comments on posts about the three main issues

	Total	Percentage Variation (%)
Average number of comments on posts about TV	179,38	7,76
Average number of comments on posts about economy	151,76	-8,83
Average number of comments on posts about other parties	132,57	-20,36
Average number of comments on all posts	166,46	

Source: Our elaboration of collected data

We can also perform the same analysis for each party.

Table 6: Average number of comments on posts about the three main issues for each party

	Cameron	Percentage Variation (%)	Clegg	Percentage Variation (%)	Brown	Percentage Variation (%)
Average number of comments on posts about TV	328,6	12,60	141,84	21,13	125	3,77
Average number of comments on posts about economy	306,88	5,16	92,7	-20,84	109,08	-9,45
Average number of comments on posts about other parties	241,69	-17,18	66,21	-43,46	89,83	-25,43
Average number of comments on all posts	291,82		117,1		120,46	

Source: Our elaboration of collected data

The average number of comments to posts about the issue TV is higher than the overall average of the comments, both at the macro level of all candidates and at the micro level of each candidate individually examined. The theme of the presence of the candidates on TV is the only real issue that can generate a participation degree above the average for all candidates.

The degree of participation in post about economy is below average. Only in the case of the Conservatives, economy is able to generate above-average level of participation. Finally, the average number of comments to posts on the issue "other candidates or parties" is below average at both macro and at the level of all candidates individually examined.

Conclusions

Participation by Facebook users as a result of posts made by parties is not tied to the number of posts: this testifies to the fact that political parties and candidates should focus not only on the frequency of updating the page, but also on content and verbal aspects of posts.

In particular, posts containing the quote of the candidate proved unable to create an above average level of participation, is testing the hypothesis at the macro level, both by analyzing the relationship between two variables within a single party.

With regard to the presence of call-to-action, this proved to be a verbal form generally effective in generating investment, but not for all parties: in effect, the call to action can be used in different ways, calling users to various actions: for instance, a user who is invited to click on the link in the post on Facebook, will probably tend not to comment on the post, despite having taken action. Therefore, the content of the post that includes the call to action should be analyzed with a qualitative technique, and not just a cardinal variable (presence or absence of a call to action) in order to understand the real effectiveness of this verb form. This is one of the possible evolution of research.

The analysis of the issue mainly dealt with by the parties and the assessment of their ability to generate participation showed a strong relationship of dependency with the TV on Facebook. In fact, all parties used Facebook as a tool for boosting the participation of the candidates on TV, and users have become heavily involved and participatory to post about the theme of the TV. If this, on the one hand, can be interpreted as a positive attempt of integration between the different instruments, on the other shows the subordinate role of Facebook compared to other media in the communication mix of candidates. Furthermore, the high average number of comments to post about TV shows that the participation of users on Facebook can be only partially attributed to the activity of the candidates on the Internet, and is also linked to other media. Starting from this consideration, future research will focus on the interactions between different media, online and offline, as well as to identify other metrics for the evaluation of participation on Facebook.

CONSUMER BEHAVIOUR IN THE ARENA: A CLASSIFICATION OF FOOTBALL FANS**Athanasopoulou, Pinelopi¹; Zafeiropoulou, Gioula²; Siomkos, George J.³; Assiouras, Ioannis⁴;
Douvis, John⁵**¹University of Peloponnese, Sport Management Department. Email: apinelopi@hotmail.com²Athens University of Economics and Business. Email: gsiomkos@aueb.gr³Athens University of Economics and Business. Email: gsiomkos@aueb.gr⁴Department of Business Administration in Tourism, Technological Institute of Piraeus. Email: assiouras@gmail.com⁵University of Peloponnese, Sport Management Department. Email: john_douvis@yahoo.com**Abstract**

The purpose of this research is to analyze consumer behaviour in the arena and identify the different segments of football fans.

A survey was done based on a structured questionnaire that was compiled using scales from previous research and personally administered to a purposive sample of 312 respondents from two major cities in Greece. Data analysis was done with SPSS 15 and included cluster analysis; discriminant analysis; crosstabulations; and one-way ANOVA.

Results showed that 95,2% of cases can be classified into 5 segments of fans: occasional fans; football lovers; socialites; loyal fans, and devoted fans. Each segment was described based on their demographic characteristics; their motives to come to the stadium; their usage behaviour in the stadium; the factors that affect their satisfaction in the stadium; their involvement and loyalty to the team, and their future intentions.

This study extends findings in the area of consumer behaviour in the football arena. However, the sample is purposive and is limited to 303 fans from two cities in one country. Future research can validate these results with wider samples or multi-country studies.

The findings of this study present many implications for team management such as customizing offers for different types of fans; enhance the possibilities for socializing in the stadium; customize advertising messages; deal with loyal customers, and manage effectively the service mix (physical evidence and processes).

Keywords: consumer behaviour, sport fans, segmentation, football

Introduction

Today's marketplace is characterised by high competition and rapidly changing customer needs. As a result, sport organizations have started to look closely at the behaviour of their customers. Knowledge of consumer behaviour helps in effective segmentation and in creating successful service offers. So, by studying fan behaviour, sport managers are trying to identify smaller groups of customers within their customer base that have different characteristics or needs. This is done with an aim to select customer groups for long-term, close relationships or for identifying the best targets for

creating loyal customers. The practice of pinpointing groups within the current fan base is necessary for success, because a sport organization cannot gain a strong foothold within the marketplace if these individuals are not identified and managed appropriately through the development of marketing strategies tailored to their needs (Ross, 2007). This process of identifying well-defined clusters of consumers is known as segmentation, and many researchers have tried to segment customers using several bases (e.g. Wedel & Kamakura, 1998). In the sport industry we find specialist segmentation approaches based on attendance commitment; lifestyle, or social class; attitudes towards winning, and loyalty to the team (Quick & Van Leuwen, 1998; Mullin et al., 2000; Tapp & Clowes, 2002). However, results vary according to the context of the studies and there is no universally accepted typology of sport fans. The purpose of this study is to analyse consumer behavior of football fans before, during, and after the game and identify appropriate fan segments.

Literature review

Today's marketplace is characterised by high competition and rapidly changing customer needs. Knowing your customers and being able to provide what satisfies them is a critical issue for today's service providers and at the core of today's marketing paradigm. Knowledge of consumer behaviour helps in effective segmentation and in creating successful service offers. However, consumer behaviour varies across industries and is considered to be multi-dimensional (Zeithaml et al., 1996). Many researchers have investigated the effect of various factors, such as service quality; customer satisfaction; perceived service value, and cost of services on consumer behaviour in different industries including banks; fast-foods; dry cleaning; athletic services; entertainment; thematic parks, and health institutes (Cronin & Taylor, 1992; Kelley et al., 1993; Cronin et al., 2000; Butcher et al., 2002; Bigne et al., 2005). In athletic services, research has focused on service quality and customer satisfaction dimensions and how these affect current and potential behavioural intentions (Parasuraman et al., 1994; Wakefield & Blodgett, 1994; Theodorakis & Kambitsis, 1998; Baker & Crompton, 2000; Kouthouris & Alexandris, 2005).

Furthermore, various studies have tried to analyse consumer behavior and segment customers according to their needs and preferences. During the past few decades of market segmentation research, several bases have been used (Wedel & Kamakura, 1998) including demographic and socioeconomic characteristics; personality, values and lifestyle characteristics (psychographics); product usage patterns; attitudes towards products; benefits sought, and attitudes toward marketing strategies (Beane & Ennis, 1987; Dickson & Ginter, 1987; Tynan & Drayton, 1987; Wind, 1978).

In the sport industry we find specialist segmentation approaches unique to professional sports. Mullin et al. (2000) emphasized the importance of value based segmentation in which supporters are grouped according to their attendance commitment, and other approaches including segmentation by lifestyle or social class. Also, other segmentation bases used in sport include fans' attitude towards winning of the team and their loyalty to the team (Quick & Van Leuwen, 1998; Tapp & Clowes, 2002). As a result of segmentation, researchers have suggested different typologies of fans, recognizing in each segment a particular behaviour. Stewart and Smith (1997) identified various segments of fans

namely, aficionados; theatregoers; passionate partisans; champ followers, and reclusive partners. Hunt et al. (1999) present the concepts of temporary, local, fanatical and dysfunctional fans. Tapp and Clowes (2002) come up with 3 categories of fans, fanatics; regulars (repertoire supporters and glory hunters), and casuals (professional wanderers and carefree casuals) according to their commitment to the club and their interest in entertainment or winning. Tapp (2004) replaces earlier concepts with “regular fans by repertoire” and “season ticket churn” categories. Finally, Ross (2007) segmented fans according to their brand associations and identified two clusters that differ in gender; educational level, and household income.

Although prior research has analysed the different types of sport fans, there is no universally accepted typology. The purpose of this study is to analyse consumer behaviour of football fans before, during, and after the game and identify appropriate fan segments according to their demographic characteristics; their motives for attendance of games; their usage behavior in the arena; the factors that affect their satisfaction during the game; their loyalty and involvement with the team; and their future intentions.

Methodology

The study is descriptive in nature intending to describe the way fans behave in the football arena. A survey was done based on a structured questionnaire that was personally administered to a purposive sample of 312 respondents from two major cities in Greece. The questionnaire contained 6 parts with questions related to the demographic characteristics of fans; their motives for attendance of games; their usage behaviour in the arena; the factors that affect their satisfaction during the game; their loyalty and involvement with the team; and their future intentions. Data collection was done in 2 University campuses; a team’s cafe in the stadium; betting agencies; cafeterias that show football games on TV, and in fitness centres. In total, 303 questionnaires were usable. Data analysis was done with SPSS 15 and included cluster analysis; discriminant analysis; crosstabulations; and one-way ANOVA.

Results

Sample profile

Of 303 respondents, 236 (77,9%) were male and 67 (22,1%) were female. A 3,3 % were aged between 15-18 years, 32,6% were 19-24 years old, 38,5% were 25-34, 12% were 35-44 and 13,6% were 45 or older. Almost half of the sample (45,8%) has a bachelor’s degree whereas 25,8% are secondary education graduates and only 28,5% have a masters or Ph.D degree. 54,2% of the sample has a monthly income of up to €1.000 and only 4,3% make more than €3000. Furthermore, 73,2% of respondents are single; 31,7% are students and 43,6% are free professionals. Finally, only 15,1% of respondents had a season ticket; 71% were from Athens and 29% were from Tripoli.

Clusters identified

Hierarchical Cluster analysis was run first in order to determine the number of clusters identified. The dendogram that resulted from this analysis was combined with discriminant analysis in order

to determine the optimum number of clusters to be used for distributing the observations of this survey. Using k-means cluster analysis different numbers of clusters were tried (2,3,4 and 5) and then discriminant analysis was applied to each case separately in order to define the optimum number of clusters. Results showed that 95,2% of cases can be classified into 5 clusters. The 5 segments of fans identified were analysed with Crosstabulations; one-way ANOVA and the criterion Duncan. Table 1 shows the descriptions of each segment identified.

Managerial Implications

The findings of this study present many implications for team management.

- Football fans differ in many ways and team managers face the difficult task of satisfying all these different people. The emergence of four different types of fans presents a challenge for sports managers. Their different needs and preferences should be taken into account when teams create customized offers for different groups of customers. For example, devoted fans would appreciate better offers in season tickets, premium seats and the discounted prices of team products. On the other hand, socialites would appreciate more a good quality service and facilities; an entertaining show with the game, and a sociable environment.
- The social aspect of going to the game is a very important motive for most segments of fans. The socialites are the biggest of the segments identified in our sample. As a result, stadium design should enhance the possibility for communication between fans and stadium facilities should provide the opportunity for fans to meet before or after the game and have a good time with friends. Also, game and team promotion should emphasize the social aspects of watching games and spending time in stadium facilities so that the socialites will be willing to increase their frequency of attendance.
- The motives for going to the stadium differ between the 5 segments identified. This means that sport managers should carefully segment their market and customize their advertising messages according to the group of customers targeted. Also, it is important for teams to enhance the power of their brand by strengthening associations that relate to the motives of their target market.
- The quality of facilities and of services offered and the avoidance of waiting times are the most important factors affecting fans' satisfaction. Therefore, effective management of the physical evidence of the stadium and the processes of service (entering stadium, toilets etc.) are priorities that should not be neglected by managers.

Table 1: Segments of football fans identified and their profile

	<i>Occasional fans(18,6%)</i>	<i>Football lovers (15,3%)</i>	<i>Socialites (31,9%)</i>	<i>Loyal fans (13,3%)</i>	<i>Devoted fans (20,9%)</i>
<i>Demographics</i>	<i>Men and women 25-34 years old, single, with a bachelor's or masters degree, and an income of up to €1.000.</i>	<i>Men mostly, 25-34 years old, single or married; secondary education graduates, of any income level.</i>	<i>Men mostly (65%) and women, 19-34 years old, single, with a bachelor's degree and an income of up to €3.000.</i>	<i>Men mostly, young, 19 -24 years old, single; secondary education graduates or with a bachelor's degree, and an income of up to €1.000.</i>	<i>Men 19-34 years old, single or married, with a bachelor's degree and any income level.</i>
<i>Motives</i>	<i>Their major motives for coming to the game are their marginal interest in football and to kill some time.</i>	<i>Their major motives for coming to the game are that they feel good in the stadium and that they meet other people.</i>	<i>They go to the stadium to relax and socialize.</i> <i>They are interested in sports; their team, and the show of the game.</i>	<i>They often go to the arena to watch games with friends or family.</i> <i>They don't like sports in general.</i>	<i>They go to the stadium because they like sports; they want to communicate with other fans, and they feel good in the stadium.</i>
<i>Usage behavior</i>	<i>They seldom go to the arena to watch games with friends or family.</i> <i>They spend up to €150 in tickets and up to €30 in products; only 5,4% have</i>	<i>They often go to the arena to watch games with friends or family.</i> <i>They spend from €150-400 in tickets and €30 or more on products; 29% of them have</i>	<i>They go to games rarely. They spend up to €150 in tickets and up to €100 in products. They go to the stadium with their friends. Only 1,1,% of them have season tickets.</i>	<i>They spend from €150-300 in tickets and 10% of them have season tickets</i> <i>They go to the stadium once every two months or less but spend a lot of time in the stadium facilities.</i>	<i>They spend from €150-400 in tickets and 35% of them have season tickets</i> <i>They go to the stadium almost every weekend.</i> <i>They spend a lot of time in the</i>

	<i>season tickets</i>	<i>season tickets</i>			<i>stadium facilities.</i>
<i>Satisfaction factors</i>	<i>They like a clean stadium and well-maintained facilities and can't stand long waiting times.</i>	<i>They don't like ill-maintained facilities; long waiting times, and bad service.</i>	<i>Important factors for them are quality of service; waiting times and quality of facilities.</i>	<i>They don't care about sports or about the facilities and staff. They only care about the progress of the team.</i>	<i>They don't give attention to quality of service and facilities.</i>
<i>Loyalty</i>	<i>Their involvement and loyalty to the team are low</i>	<i>They love sports and their team; They are loyal to their team and talk about it all the time.</i>	<i>Their involvement and loyalty to the team is moderate.</i>	<i>Their involvement and loyalty to the team is high. They say that «it is worth going to the stadium».</i>	<i>They are loyal to their team; They talk about their team all the time and defend it.</i>
<i>Future intentions</i>	<i>They don't particularly want to go to the stadium again in the future.</i>	<i>The leave the stadium happy and are willing to pay more money if necessary to see their team in the future.</i>	<i>They moderately support their team in the stadium and say positive things about their team to others.</i>	<i>They are not willing to pay more if necessary to see their team in the future.</i>	<i>They are willing to pay more if necessary to see their team in the future.</i>
				<i>They say positive things about their team to others</i>	<i>They say positive things about their team to others</i>

- Identification of the groups that are less loyal and more likely to spread negative word of mouth can help in preventing customer defection and enhancing long-term relationships with customers. On the other hand, identification of the most loyal customers that are willing to say good things about the team can help teams to strengthen their bonds with long-term customers and use these customers as advocates to promote the team to less loyal fans.
- Results show that an effective way of segmenting fans is to look at their behavior before consumption (motives); during consumption (usage behavior, factors affecting satisfaction), and after consumption (loyalty, involvement and future intentions). Successful teams must manage effectively all three areas of behavior simultaneously.

In summary, the results of this study will help team managers understand their customers; segment their market appropriately; satisfy all types of customers; and focus on the most profitable customers in order to create long-term relationships with them that lead to higher profits.

Limitations – Suggestions for Further Research

This study extends findings in the area of consumer behaviour in the football arena. However, the sample is purposive and is limited to 303 fans from two cities in one country. Future research can extend the sample; use a random sample from the whole country; do multi-country studies or do longitudinal studies showing changes in consumption or behavioral patterns.

Abstract

The purpose of this research is to identify the types of CSR initiatives employed by sports organisations; their antecedents, and their consequences for the company and society.

This study is exploratory in nature. Two detailed case studies were conducted involving the football team and the basketball team of one professional, premier league club in Greece and their CSR initiatives. Both teams have the same name, they belong to one of the most popular teams in Greece with a large fan population; have both competed in International Competitions (UEFA's Champion League; Final Four of the European Tournament) and have realised many CSR initiatives in the past. The case studies involved in depth, personal interviews of managers responsible for CSR in each team. Case study data was triangulated with documentation and search of published material concerning CSR actions. Data was analysed with content analysis.

Both teams investigated have undertaken various CSR activities the last 5 years, the football team significantly more than the basketball team. Major factors that affect CSR activity include pressure from leagues; sponsors; local community, and global organisations; orientation towards fulfilling their duty to society, and team CSR strategy. Major benefits from CSR include relief of vulnerable groups and philanthropy as well as a better reputation for the firm; increase in fan base; and finding sponsors more easily due to the social profile of the team. However, those benefits are not measured in any way although both teams observe increase in tickets sold; web site traffic and TV viewing statistics after CSR activities. Finally, promotion of CSR is mainly done through web sites; press releases; newspapers, and word-of-mouth communications.

This study involves only two case studies and has limited generalisability. Future research can extend the sample and validate concepts with quantitative methods.

Results indicate that for successful CSR activities team management should deal effectively with the pressure from various entities (community; sponsors; leagues; global organisations); balance the social and corporate benefits of CSR; integrate CSR in their strategy; measure the effects of CSR on major performance indicators such as

brand equity; reputation; attendance figures; and fan loyalty, and create an effective promotional plan for their CSR activities.

Keywords: Corporate social responsibility, sports, football, basketball, case study

Introduction

Corporate social responsibility (CSR) has become an area of increasing importance for many companies and thus, has received considerable attention in the academic literature. Guthey et al., (2006) argue that despite the possibility that CSR might be a management fashion, the CSR concept is of value, because it has real consequences in the business world. The growing influence of CSR policies (Bowd et al., 2003) and the rise of a respective consultancy industry (Fernandez Young, Moon & Young, 2003) provide strong support for this argument.

While the study of CSR has become increasingly prevalent in the management and organizational behavior literature, the concept has only recently entered the sport management area (cf. Babiak & Wolfe, 2006; Bradish, 2006; Brietbarth & Harriss, 2008; Smith & Westerbeek, 2007; Walker, Kent, & Rudd, 2007). On the other hand, virtually all organizations within the sport industry, broadly defined, have adopted CSR programs from Nike and Reebok to the NBA and NASCAR (Wallace, 2004). Also, professional sport teams, are increasingly engaging in socially responsible activities (Irwin, Lachowetz, Cornwell, & Clark, 2003; Kern, 2000; Robinson, 2005). It seems that, from a research perspective, professional sport is a rich context in which to study CSR because all organizations in the industry are involved in such efforts.

However, for many years the focus of academic research has been on identifying the link between financial and social performance (Margolis & Walsh, 2003). While the evidence of this relationship remains unclear, it does point to a positive association. Rather than continuing to focus on the financial-social performance relationship, Margolis and Walsh (2003) argued that researchers should shift their lenses and focus on the context, processes, and outcomes of CSR. A few recent studies have looked at these issues but there is still a paucity of studies on this subject and more specifically in the area of sports. This paper follows the suggestion of Margolis & Walsh (2003) and aims to explore the antecedents and consequences of CSR practices in sports. This paper is organized as follows: first a review of the relevant aspects of the CSR literature is presented; second the design of the study is analysed; third, findings are presented, and fourth managerial implications and suggestions for further research are noted.

Literature Review

Corporate social responsibility

The origins of CSR lie in philanthropy, the oldest social initiative among American private enterprises (Godfrey, 2009). Preston and Post (1975) articulated the “principle of public

responsibility,” which argues that a business should deal with the social issues that are impacted by the normal operating activities of the company. Sethi (1975) suggested that corporate social responsibility contained three logically distinct elements: social obligation (responsibility to obey the law), social responsibility (congruence with prevailing societal norms, values, and expectations), and social responsiveness (development of policies, programs, and capabilities that would minimize adverse consequences of societal demands). Theoretically, Carroll (1999) reviewed and discussed over 25 different ways that CSR can be defined in the academic literature. The general consensus academically would be that CSR represents a set of actions that appear to further some social good, extend beyond the explicit pecuniary interests of the firm, and are not required by law (McWilliams and Siegel, 2000). Definitions among practitioners proliferate as well, with groups such as the World Business Council offering their own definition (World Business Council, 1999, p. 3), which is that “corporate social responsibility is the continuing commitment by business to contribute to economic development while improving the quality of life of the workforce and their families as well as of the community and society at large.”

Organizational scholars have been theorizing about, and investigating, CSR for over three decades (Carroll, 1979; Margolis & Walsh, 2003; McWilliams & Siegel, 2000). The essential components of the phenomenon, as described in the literature, have remained quite constant over time. Ullmann (1985) described CSR as “the extent to which an organization meets the needs, expectations, and demands of certain external constituencies beyond those directly linked to the company’s products/markets” (p. 543). In a similar manner, other CSR definitions address “societal relationships” (Wood, 1991, p. 693) and the “expectations that society has of organizations” (Carroll, 1979, p. 500). CSR thus, “tends to focus on the effects of organizations on external constituencies (e.g., consumers, local communities, charitable organizations)” (Sethi & Steidlemeier, 1995, p. 20). Others describe CSR as a set of actions aimed to further some social good, beyond the explicit pecuniary interests of the firm, that are not required by law (McWilliams & Siegel, 2000) and as “practices that improve the workplace and benefit society in ways that go above and beyond what companies are legally required to do” (Vogel, 2005, p. 2). Finally, Carroll argued that CSR is composed of four elements: economic (the basic responsibility to make a profit and, thus, be viable), legal (the duty to obey the law), ethical (responsibility to act in a manner consistent with societal expectations), and discretionary (activities that go beyond societal expectations).

Despite efforts to formalize and regulate CSR-related evaluations, measurements and reporting (e.g., ISO 14000, AA 1000, GRI), the concept and its application largely remains dynamic, diverse and context specific. It has also been criticized as a modern age branding tool, a “greenwash” of corporate behaviour, boardroom talk, and a public relations invention

(Frankental, 2001), However, CSR is no longer a “fad” or an “extra option” but describes a deeper change in looking at organizations and their relationships to their stakeholders

(Lewis, 2001). However, most of the related research is related to the conceptual understanding of the construct (Carroll, 1999), perhaps due to the relative infancy of CSR scholarship and the general ambiguity of the term.

Antecedents of CSR

A stream of CSR literature has sought to reveal which factors influence organisations in their decision to use CSR initiatives. Paine (2003) found that risk management; institutional relevance; organizational functioning; market positioning, and ethical assumptions are said to be core reasons why businesses get involved in CSR management. Many articles focused on the motives (e.g., managerial and corporate) of corporations to engage in CSR activities (cf. Bucholtz, Amason, & Rutherford, 1999; Fitzpatrick, 2000; Quazi, 2003; Thomas & Simerly, 1994). Brown, et al. (2006) developed a list of motivations for English football clubs to get involved with their communities (ethical/ideological, business, political/legal motivations).

Also, others explored whether CSR initiatives have been adopted as a strategic response to external pressures (Hess, Rogovsky, & Dunfee, 2002; Hess & Warren, 2004; Marquis, Glynn, & Davis, 2007). Belliveau, Cottrill, and O'Neill (1994) proposed a model that predicts an organization's social responsiveness based on external factors such as institutional variables (e.g., CSR behavior in the industry), economic variables (e.g., level of concentration, market share), and managerial variables (e.g., innovation). Furthermore, research has sought to study the effect of external forces such as customers (Lewis, 2003; Vogel, 2005; Yan, 2003), activist groups (Den Hond & De Bakker, 2007), legislation (Dawkins & Lewis, 2003), and members of local communities (Boehm, 2005) on the type and focus of CSR activity in which an organization engages. Far fewer studies, have explored the effect of internal resources and competencies of an organization on their CSR-related activities (Bruch & Walter, 2005; Porter & Kramer, 2006). Also, researchers such as Joyner & Payne (2002) have explored internal forces such as values and ethics as drivers of CSR behavior and highlighted the positive link between these areas and financial performance.

Consequences of CSR

Wood (1991) introduces the concept of Corporate Social Performance as an outcome of two types of CSR, Corporate Social Responsibility (companies' intentions, philosophies, and commitments to social engagement) and Corporate Social Responsiveness (effectiveness of dealing with stakeholder concerns in both calm and stormy times). Furthermore, CSR is being shown to have dual—organizational and social—benefits and is linked to corporate financial performance (Aguilera, Rupp, Williams, & Ganapathi, 2007; Barnett, 2007; Waddock & Post, 1995). Many researchers agree that CSR is good financially for the organization and can lead to greater profits or greater public support which may in turn bolster profits (cf. Burt, 1983; Margolis & Walsh, 2001; Pava & Krausz, 1996; Roman, Hayibor, & Agle, 1999; Stanwick & Stanwick, 1998; Ullman, 1985).

Also, apart from financial benefits there are also intangible strategic assets such as reputational capital (Fombrun, Gardberg, & Barnett, 2000; Lewis, 2003), and employee commitment (Turban & Greening, 1996; Vogel, 2005) as well as acquiescence among key regulatory institutions or legislative bodies (Campbell, 2007; Jenson, 2002; Vogel, 2005); the development of the firm's business and institutional environments (Porter & Kramer, 2002), and/or help mitigate negative media scrutiny (Alsop, 2002).

Furthermore, it has been suggested that CSR actions can influence purchase intentions (cf. Murray & Vogel, 1997; Sen & Bhattachary, 2001), and that these may be related to whether the company's ethical record exceeded consumer expectations (Creyer & Ross, 1997). Brown and Dacin (1997) found that corporate associations, which included corporate ability (CA) and CSR, affected consumers' product and overall corporate evaluations. Klein and Dawar (2004) demonstrated that CSR associations had a strong and direct impact on consumers' attributions, which in turn influenced brand evaluations and purchase intentions. Mohr and Webb (2005) maintained that within the domains of philanthropy and the environment, CSR had a positive impact on company evaluation and purchase intentions. Furthermore, several authors have demonstrated a link between social initiatives and affective, cognitive, and behavioral responses by consumers such as perceived quality, price, and consumer attributions about company motives (e.g., Becker-Olsen, Cudmore, & Hill, 2006; Brown & Dacin, 1997; Creyer & Ross, 1997; Ellen, Mohr, & Webb, 2000; Folkes & Kamins, 1999; Murray & Vogel, 1997).

CSR in the Sport Context

The issue of CSR in sport is a good one. As sport becomes an increasingly prominent economic and social institution across the globe, the question of what social responsibilities athletes, coaches, team owners, league officials, and global sport organizations' personnel have, should constantly be asked (Godfrey, 2009). While as recently as 15 years ago, CSR did not play a significant role in sport (Kott, 2005; Robinson, 2005), professional sport organizations are now entering into socially responsible initiatives at a rapid pace. A variety of factors have led to the growing importance of CSR for sport organizations (Lau, Makhanya, & Trengrouse, 2004). First, the omnipresence of sport has led to the elevation of sport organizations as influential members of the global community, especially as they have become big businesses themselves. Second, sport organizations are facing a consuming public that is increasingly aware of the social aspects of corporate policy, due to the notoriety given to recent corporate misdeeds. As a result virtually all organizations within the sport industry, broadly defined, have adopted CSR programs. From Nike and Reebok to the NBA and NASCAR, examples abound of activities undertaken to bring messages and resources to underprivileged and other members of society who may not otherwise be the targets of socially responsible initiatives.

While the study of CSR has become increasingly prevalent in the management and organizational behavior literature, the concept has only recently entered the sport management area (cf. Babiak & Wolfe, 2006; Bradish, 2006; Brietbarth & Harriss, 2008; Smith & Westerbeek, 2007; Walker, Kent, & Rudd, 2007). From a research perspective, professional sport is a rich context in which to study CSR because all organizations in the industry are involved in such efforts. Some organizations believe that doing good is the right thing to do (Mintzberg, 1984), and are involved in these initiatives for noble reasons. Some organizations, on the other hand, believe that doing good is good business (Mintzberg, 1984), and are motivated by pragmatic matters such as projecting a positive image; generating goodwill among various stakeholders; (e.g., employees, extant and potential customers, the local community (Porter & Kramer, 2002)), countering negative media scrutiny, and/or receiving tax breaks and subsidies from government bodies.

For example, (FIFA) has created a CSR unit and spends more than 40% of its income to support the grassroots of the game; development work, and partnerships with relief organizations" (FIFA, 2004, p. 66). Adidas Group has launched two new corporate responsibility publications which cover working conditions, the environment, community affairs, and employee programs (adidas Group, 2008). Nike's Fair Labor Standards Act promotes sound worldwide labor practices. The NFL and NBA's partnerships with the United Way and Read to Achieve, respectively, are just two of the many humanitarian and educational initiatives that sport leagues are involved with. "We have just two missions at the NBA," says Commissioner David Stern, ". . . the most immediate is to be a successful league. But the other is to use our strength for social responsibility" (Genzale, 2006, p. 34). In football, consulting firm Deloitte and Touche (2005, quoted in Holt, Michie, Oughton, Tacon & Walters, 2005) has recommended that football clubs integrate CSR management to insure healthy relationships with their communities.

Overall, team CSR activities include, but are not limited to: athlete volunteerism, educational initiatives, philanthropic/charitable donations, community development, community initiatives, fan appreciation, health-related initiatives, and community-based environmental programs. Walker & Kent (2009) propose that CSR activities for professional sport teams include four categories: philanthropy; community involvement; youth educational initiatives, and youth health initiatives.

Despite the increase in CSR activities in sports, there has been little empirical work examining the factors that motivate professional sport organizations to become involved in socially responsible activities and on the outcomes of such activities. This paper addresses this gap in the literature and aims to determine the antecedents and consequences of CSR activities in professional sports.

Methodology

This study is exploratory in nature. Two detailed case studies were conducted involving one professional, premier league football club and one first division basketball club in Greece and their CSR practices. Both teams were selected because they are very popular teams in Greece with large fan population, and have competed in UEFA's Champion League and the Euroleague many times in the past. Also, they are frequent practicers of CSR initiatives. The case study approach was selected because it is argued that CSR agendas and policies are influenced by context-specific factors (Roome, 2005). Or putting it in Votaw's (1972) words: CSR "means something, but not always the same to everybody" (p. 25). Therefore, it is a difficult phenomenon to research, with case studies being a suitable approach to attach meaning to the concept in its respective context of appearance. Also, by using case studies, we follow researcher calls for "concrete studies of real case studies" in the industry (Freeman & McVea, 2001, p. 204). Furthermore, the sport industry is very interesting for the study of CSR due to its distinct attributes such as the "star power" of the athletes; the connections sport teams have to the local communities, and the level of affect displayed by its many consumers (Walker & Kent, 2009).

Data collection involved in depth, personal interviews of managers responsible for CSR as well as collection of documentation and search of published material concerning the teams' CSR actions. Documents reviewed included press releases; newsletters; web page descriptions; CSR mission/vision statements; and annual reports. Documents were used to provide background information, to substantiate and illustrate findings, and to supplement information obtained from the interviews. The questions used in interviews served the purpose of the study and included the following: 1) Which CSR activities have you undertaken during the last 5 years? 2) Which factors affected you in deciding to enter into those CSR activities? (internal – external pressures), 3) What are the benefits of these CSR activities for your organization and for society?, 4) Do you measure the effectiveness of CSR activities and if yes how?, and 5) How do you promote CSR activities?

The questions we used are consistent with the suggestion of Margolis and Walsh (2003), that the CSR research agenda move away from the much studied relationship between CSR and financial outcomes to addressing (a) the external pressures to engage in CSR that organizations face; (b) how the internal resources of organizations are used in CSR initiatives, and C) the impacts of CSR on recipients and society at large.

Findings

Results showed that both the football and the basketball teams analysed have undertaken many CSR initiatives in the past 5 years. The football team focused on social character actions related to global days such as that of poverty, peace etc. plus other activities that were more local or donated money to various causes. Specifically, the following activities were realised:

- 8th Global game against poverty with the participation of famous athletes such as Zidane and Ronaldo (December 2010). There was great participation from spectators and big promotion abroad. Money collected was donated to flood victims from Pakistan and Haiti and to a foundation in Piraeus «Argo». All media had positive comments and the event was a success.
- Award to the Paralympic team on the Global day of disabled people (7-11-2008).
- On old-people day (1-10-2008) players visited an old-people's home in Piraeus and gave out presents and clothes.
- On global peace day (21-9-2008) there were a number of events in the arena, posters shown, and players played with a wrist band that had the peace symbol.
- Every year at Christmas players visit the children's hospital «Agia Sofia» and give presents, money, and balls and sign autographs and jerseys.
- Donation of €100.000 to tsunami victims in Japan.
- Donation of €80.000 to «Hope» foundation in 4 Christmas events.
- Donation of clothes to various foundations such as «Onisimos».
- Donations of balls, money, food and clothes to «Children's smile» in an event done in December 2009.

In the basketball team, there was a restructuring effort and as a result from 2008 onwards there was an autonomous CSR programme based on 5 pillars important for the team: education, sports, health, environment and smoking. Specifically, the following activities were realised jointly with sponsors:

- Organised events for protecting the environment by recycling ink cartridges together with sponsor, Cartridge World.
- Joined activity with major sponsor Wind in European Final Four. For every time the team scored in the final four, an amount was donated to the «World's Arc» a foundation for abandoned children, adding up to around €80.000 total.
- Joined activity with PEPSI (sponsor) to place recycling bins with PEPSI's logo at various spots.
- Joined activity with Novo Nordisk , event for informing people about diabetes in Piraeus.

Furthermore, table 1 below summarises the results for both teams regarding the antecedents and consequences of CSR; measurement of CSR success, and the promotional mix used to promote CSR activities. Antecedents are split into external and internal pressures, and consequences are split into social and corporate benefits.

Table 1: CSR antecedents, consequences, measurement and promotion

	Football team	Basketball team
External pressures	<p>Link to the City of Piraeus – all requests from Piraeus's foundations, schools etc are satisfied (players visiting, money, etc.)</p> <p>Pressure from major sponsor to upload all CSR activities on www.goodchannel.gr.</p> <p>Calls for help from philanthropic organisations all over Greece (hospitals or schools etc.)</p> <p>Global organisations such as U.N (asked if team could organise the game on global poverty day)</p>	<p>Smoking problem in the arena</p> <p>Expectations of society</p> <p>Sponsors that request joined activities</p>
Internal pressures	To do our duty to society	<p>The 5 pillars strategy in CSR</p> <p>Giving to society is one of our primary organisational goals</p>
Social benefits	<p>Philanthropy</p> <p>To be loved by people</p>	<p>Relief for society's vulnerable groups</p> <p>Promote a problem that needs attention</p> <p>Philanthropy</p>
Corporate benefits	<p>Reputation building</p> <p>Expand fan base</p> <p>Easier to find sponsors</p>	<p>Positive team image</p> <p>Fans applaud our actions</p>
CSR success measurement	<p>No standard measurement used.</p> <p>A record is kept of any promotional action linked to CSR activities (web sites, newspapers, TV etc.).</p> <p>Observation of increase in tickets sold; web site visits and TV viewing after CSR activities but not in a measurable way</p>	<p>No standard measurement used</p> <p>Observation of interest in CSR activity and web site traffic but not measurement per se</p>
Promotional mix	<p>Web Site of the team – press releases that are presented by journalists in sport-related or general type newspapers & sites.</p> <p>Other Web Sites that support the team</p> <p>Fun clubs' sites</p> <p>TV channel that supports the team</p> <p>The CSR web site of Super League managed by a major sponsor (goodchannel.gr)</p> <p>Fast word of mouth communication. Every CSR activity is promoted immediately by sites friendly to the team before a press release is even available.</p>	<p>Press releases</p> <p>CSR page in team's Web Site</p> <p>Plan to design a more comprehensive promotional plan for CSR activities</p>

Managerial implications

The result of this study pose challenges for CSR managers of sport organisations. Specifically we observe the following:

- This study identifies the most important factors that seem to affect CSR activities. These include the power of various groups that the team belongs to (leagues etc.)

and of international organisations; the power of society and of social problems that need to be addressed; the importance of the local community, and the demands of sponsors.

- CSR is shown to have both social and corporate benefits although in the athletic market, social benefits are considered more important and that is why the effect of CSR actions is not measured with any measurement tools. The only corporate benefits acknowledged are related to the team's image and reputation that attracts more fans and sponsors. So, if teams want to increase their brand equity; enhance their reputation, and attract sponsors, CSR activities are essential.
- However, since there is no standard measurement tool for CSR success, team management should look deeper into the effects of CSR; incorporate them into the team's strategic plan and measure them. Results indicate that CSR success can be measured by attendance figures; fan loyalty, exposure to messages, and team attractiveness for sponsors.
- Finally, the promotional mix for CSR activities seems to be ad hoc and there is no specific promotional plan designed from teams. This is probably because there is widespread public interest for the team even without any organised promotion. However, a more organised approach towards the promotion of CSR activities can increase their effectiveness significantly.

Limitations and suggestions for further research

This study involves only one case study and has limited generalisability. Future research can extend the number of cases; focus on different segments of the sport industry such as sport federations, sporting goods companies, sport betting companies, professional leagues etc.; do multi-industry studies; do longitudinal research, as has been also proposed by Godfrey and Hatch (2007), in order to see how CSR practices change over time, and test CSR related concepts with quantitative methods.

INNOVATIONS IN PUBLIC SECTOR: THE BRUNEI CASE

Athmay, Alaa-Aldin Abdul Rahim A. Al¹

¹Department of Management, Marketing and Public Administration, College of Business Administration, University of Sharjah, Sharjah, United Arab Emirates.
Email:aathmay@sharjah.ac.ae

Abstract

The paper seeks to provide an overview of the service modernization introduced in Brunei's public sector and discusses its overall aims, benefits and challenges. The paper has adopted descriptive and analytical methods and is primarily based on secondary and some primary data and information. The primary data was collected through interactive discussions with some senior government officers at the Ministry of Finance. Also, the paper has provided a systematic and careful analysis of the general literature on service delivery innovations and those pertaining to Brunei.

Despite the concerted effort of the Government of Brunei to improve and expedite the internal processes at the Ministry of Finance through the use of ICT, there remain some challenges which need to be addressed by the government. Chief among them are people, cultural issues and existing administrative procedures and policies. Another concern is the lack of coordination and collaboration among various stakeholders. The findings of this paper are not based on a comprehensive and rigorous empirical work and, therefore, can only be interpreted as indicative of the current situation of Brunei public sector. Further attempt needs to be done to assess, whether TAFIS as an e-government project, has achieved or going to achieve its planned objectives. The value of the paper lies in clearly delineating the nature of change in the Brunei public sector and adds to the limited literature in the use of IT systems to support the functional areas at the Ministry of Finance. The findings can be of interest to policymakers and practitioners in the Brunei public service.

Keywords: Technology led Policy, Innovations, public sector reform, e-government, Brunei

IT and the demand for improved public sector performance

All over the world, there have been demands for improvements in the efficiency and responsiveness of public sector organizations. The effect of fiscal crises, the perceived lack of accountability of public organizations, the questioning of traditional public administration models of service delivery, and concern about mounting corruption, among other factors, have fuelled demands for change, and contributed to the emergence of what has been called 'New Public Management' (NPM) This is a framing of government in terms of outputs rather than process, and is characterized by devolution of authority, empowerment of officials, alternative ways of providing public goods and service, managerial techniques and mentality

from private business, and the search for better mechanisms of public accountability (Hughes, 2003, Hood; 1995; Pollitt, 2001; Osborne and Gaebler, 1992). Governments started the adaptation to this new reality in order to improve their effectiveness. In developed countries with well structured systems of public administration, this adaptation went smoothly, but in developing countries, the absence of acceptable norms of bureaucratic behavior, has hindered the efforts toward creating effective system of public administration (Kiggundu, 2002). Governments moved to acquire new technology to achieve NPM and build new and comprehensive approaches to administrative modernization. In particular, the adoption of ICT in public sector organizations, or e-government, is seen as enabling public sector reform by providing the requisite information for public management (Hughes 2003, (Kamar and Ongo'ndo, 2007). It can simplify the administrative processes, making them more transparent, and help to deliver services more efficiently, with better integration of services and processes (Siddiquee, 2008, Mitullah and Waema, 2008, United Nations, 2004).

These reforms have been pursued in a number of Southeast Asian countries. Singapore was cited as among the top countries in utilizing ICT in reforming every aspect of government, including the financial system (Yong, 2003). The Malaysian Ministry of Finance and South Korean Ministry of Finance have established information systems to automate their countries' national finance administration. These systems aimed to improve the efficiency and effectiveness of the government financial administration by connecting and integrating the financial systems of all government agencies to facilitate the processing of government financial transactions (Rais, 1999; Yong, 2003, Araya, 2004).

in Brunei Darussalam, ICT has been adopted in public sector reform, and the government invested large amounts to develop IT infrastructure and enhance public sector performance (Haji Musa, 2008, Kifli,2009). Public sector organizations in Brunei were seen to need management information systems which would enable them to be result-oriented, cost-effective, transparent, accountable and responsive to citizen needs. This demand for change is strengthened by globalization, the existence of technological improvements, rising public expectations, and the stagnation of public sector organizations' performance compared with their counterparts in other jurisdictions and the private sector (Commonwealth Advanced seminar, 2003; Siddiquee, 2008).

With help from Accenture, all Ministries had prepared their own potential e-government projects. TAFIS (Treasury Accounting and Financial Information Systems) has been introduced as a project intended to modernize the services provided by the Ministry of Finance. It has been chosen for the focus of this study. TAFIS was led by the Ministry of Finance (MOF) and maintained and supported by BAG Networks, a joint venture company between Brunei Government & Accenture. TAFIS application was aimed to improve the functional areas of the financial accounting and financial services of MOF and consequently affected all the departments, sections and units of all 12 Ministries (Mitullah and Waema,

2008; www.e-government.gov.bn/flagship/tafis.htm, (Haji Musa, 2008,). This study uses secondary data and some primary data extracted through a semi-structured interviews with some key administrators at the ministry of finance. The interview was aimed to acquire a realistic and fresh insight into TAFIS implementation as a case study of administration modernization in developing countries.

E-Government Readiness in Brunei Darussalam

According to Kerby, a leading Inter-Regional Adviser in e-government, e-readiness is not simply a matter of the number of computers servers, websites and mobile phones in the country, but also relates to the country e-business environment and how amenable the country's market is to Internet-based opportunities (E-Government Survey, UNDESA, 2010). Among South-East countries, Brunei in general has achieved a modest score in e-readiness. A UN study of the e-readiness of eleven South-East Asian countries (see Table 1) shows that Brunei has made considerable progress in e-readiness in 2010. In 2005 and 2008, Brunei was fifth among the eleven countries surveyed, though in global terms, it had slipped off from 73rd to 87th, but by 2010, Brunei's regional ranking had risen from fifth to third and its global ranking from 73 in 2005, 87 in 2008 to 68 in 2010, though it is still well behind Singapore, which ranks first in Asia as well as South-east Asia, and eleventh among top twenty countries in the World (UN-e-government Survey 2010). Supervisors at the MOF tend to agree that e-government in Brunei is still not performing at its expected level and they questioned the level of competence of employees who would have to operate and manage the information systems. They hoped that the e-government initiative would lead ministries being open to the public and provide relevant, reliable and accurate information via the internet.

Table 1 South-East Asian countries e-government readiness index 2005/2008/2010

Number	Country Name	Index 2005	Index 2008	Index 2010	Global ranking in		
					2005	2008	2010
1	Singapore	0.8503	0.7009	0.7476	7	23	11
2	Malaysia	0.5706	0.6063	0.6101	43	34	32
3	Negara Brunei	0.4475	0.4667	0.4796	73	87	68

9	Myanmar	0.2959	0.2922	0.2818	129	144	141
10	Timor-Leste	0.2512	0.2462	0.2273	144	155	162
11	Lao People's Democratic Republic	0.2421	0.2383	0.2637	147	156	151

The Brunei case

Brunei Darussalam is a small oil-producing state in Southeast Asia. It is ruled by Sultan Hassanal Bolkiah, and as it does not have an elected parliament, nor does it receive foreign aid, it is not subject to many of the pressures which have fuelled the demand for improved public sector performance in many other countries, but there has still been considerable interest in the potential of information and communication technology (ICT) to improve

public sector performance. Brunei is a member of a number of international groupings, including the Commonwealth, which through CAPAM (the Commonwealth Association for public administration and Management) has focused on the role of ICT in modernizing the public services and coping with the increasing needs of citizens. There is a general agreement that the ICT has led the public services to be delivered in more convenient, customer-oriented, efficient, and in a different and better way. In addition, globalization has changed the world economy and re-defined the role of public sector in relation to regulation as well as the direct provision of public services. Reforms such as privatization, outsourcing, and other market mechanisms aimed at increasing competition in the provision of public services, have prompted governments to look for innovative ways to reinvent the engine of government and to reduce costs and increase efficiency and effectiveness of service delivery, and to be in harmony with the new paradigm labeled New Public Management.

Although as an oil producer, Brunei is not subject to the same financial pressures as most other countries. However, the government is subject to the pressures of globalization, social & economic change and the increases in citizen expectations. This has not involved any moves to reduce the size of the public sector - the public bureaucracy in Brunei has remained large and the citizens continue to rely on government for the bulk of their needs – but the changing context of public administration has prompted a number of innovations in the internal operation of the public sector and the delivery of services. (ACCSM Main Conference, Brunei Darussalam, 2003). Following global trends, the government introduced major reforms to redesign and re-engineer the public sector systems and processes in order to achieve dramatic improvements in terms of quality, access and speed in service delivery. In particular, it has sought to move Brunei into paperless governance through the use of multimedia technologies for information and data exchange, within the various areas inside and outside the sphere of public sector. . These changes use ICT to transform not only the structural and procedural aspects of public sector organizations but also covered the operational expectations and values of public officials.

The government commitment to ICT policy was clearly reflected in the 8th and 9th National Development Plans (2002-2006, 2007-2012) and the National Strategic IT Plan called “IT 2000 and Beyond” (Musa, 2008; Hazair, 2010; Borneo Bulletin, 2005). The Sultan, in his address to the National Summit on Information Society on September 2005, emphasized on the need for the comprehensive, visionary e-government strategy and collaboration among government agencies to enable the provision of quality online customer services. But although the government of Brunei has recognized the importance of broadening the use of ICT in enhancing governance and improving public service delivery, there has not been much detailed and objective assessment of these measures (Siddiquee, 2008). Most of the writings on the Brunei public sector are descriptive and chronological accounts from senior bureaucratic figures. These descriptive works (e.g. Musa (2008), Ruhaidah (2004), and Hazair (2010)) offer readers a broad review of the nature of reforms introduced in some areas of

public sector, but lack analyses. There is dearth of literature that examines how electronic government is being used in the delivery and improvement of public services and their contribution in theoretical and practical terms.

Although attempts have been started as back as the 1970s in building e-Government in Brunei, but the government of Brunei has decided to speed up the IT development in various sectors of the economy ever since 1990s (Hazair, 2010). In 1995, the Information Technology Program was introduced for the civil service and aimed to raise IT usage and awareness, promoting planned IT programs for various public sector organizations and improving service levels to the citizens. Currently all the ministries and other semi- government agencies have a specialized IT department of Information Technology. A central Department within the Ministry of Finance was established in 1996 to conduct technical studies, identify IT needs, provide consultation services, develop software for governmental applications, and supervise information systems implementations. In 1997, a national IT Strategic Planning was launched but it only took off in year 2000. It is called "IT 2000 and beyond" and aimed to promote effective application of IT in the public and private sectors, raising the level of IT literacy, and ensuring of IT skilled manpower to fuel growth of Brunei economy (Musa, 2008). The Brunei Darussalam Information Technology Council (BIT Council) and its affiliated EGPEC (e – Government Program Executive Committee) was established in the year 2000 with purpose to ensure that the various ICT initiatives undertaken by the government organizations will be on line with the Public Sector vision. ICT Strategic Plan vision is:

- Brunei Darussalam to exploit IT to its full potential for national prosperity and to make Brunei as the cyber hub in the ASEAN region.

ICT Strategic sector objectives are:

- Creating a paperless society through paperless governance and services (efficient and effective online service)
- Introducing electronic government through better training programs and IT coordination
- Creating better incentives for IT adoption and e-Business deployment in the public sector

The budgetary allocations for ICT have been steadily increased and even survived the recent economic crisis. The 8th national plan allocated \$ 526 million for ICT, which was later increased to B\$ 1 Billion (about US \$690 million) for the development and implementation of infrastructure for the e – Government. This represented 12.1% of the total funds of National Development Plan (Brunei Darussalam Public Sector Journey towards e-government, 2003, Musa 2008). The bulk of the ICT sector allocation in the 8th NDP was for infrastructural e – Government projects such as the provision of Data Center, electricity, telephone lines, hardware and software. Other projects included the development of Human Resource Management System, and Collaborative e-office for all ministries, and specialized projects in the ministries: TAFIS and E-Government Center (Ministry of Finance), SISMI (Islamic

Information System) Ministry of Religious Affairs, Mukim.Net (Ministry of Home affairs), E – Health (Ministry of Health), and E – Education (Ministry of Education).

In translating these e-government initiatives into realities, the government of Brunei has tried to learn from and emulate the best of practices of other countries. Government officers were sent to countries like Malaysia, Singapore, Canada and Australia to study their e-Government initiatives (Kaliannan et al., 2009). Workshops, seminars, and training programs on e-government were also organized in Brunei Darussalam in cooperation with consultants from South Korea, Singapore, Philippines, USA and Canada (Haji Hazair, 2010). The government's reforms involve the use of ICT to transform the structures, operations and the culture of government, leading to full integration between the government and both citizens and businesses, and effective front & back-office process (Janowski, 2008).

The Ministry of Finance initiative

TAFIS was announced in a directive given by the Sultan in conjunction with his 55th birthday, which stated: "In pursuit of Information Technology Communication development, our government has approved the implementation of the 'Integrated computerized Electronic Government Accounting and Information Financial System' or TAFIS through the Ministry of Finance" (Extracted and translated from Pelita Brunei of 20th July 2001). Its introduction reflected concerns in the Ministry of Finance about public sector financial management. There had been increasing complaints about delays by government in paying bills for the private business contractors, the duplication of financial data entries, problems in the security of clients' personal files, the lack of quality criteria and performance measures, are among others which have pushed the government of Brunei to search for an improved financial management system. TAFIS was implemented on 1 March 2002 to speed up financial transactions, create reliable data, and enhance budgetary preparation and control by the Ministry of Finance. Its main objectives are:

- To improve efficiency of government financial transaction processes
- To improve tracking and management of government funds and thereby optimize utilization
- To transfer of technology-based knowledge, skills and abilities
- To move towards a 'paperless' government
- To set up TAFIS information technology networking

The main outcomes of this innovative tool, according to the Director of financial services, are increasing efficiency, effectiveness, enhancing financial transparency and accountability in the delivery of financial services (Ruhaidah, 2003). TAFIS is intended to make the administration of MOF more responsive and cost-effective. The computerized financial transactions means that transactions between the MOF and its clients can be online and thus

reducing cost and time and extending customer satisfaction. The other features of TAFIS according to the Director of Treasury Department are increasing accessibility of MOF' clients, reduction in data entry errors, integrated and real-time information, online and on-demand reporting and data retrieval, timely online approval, increased accountability and responsibility of financial services delivery, paperless workflow, and tighter security (Musa, 2008). These benefits will be reflected on enhanced financial performance, improved budget performance, and increased productivity of financial staff.

The implementation of TAFIS was preceded by the establishment of the institutional framework, the development of e-Government architecture, the deployment of both intranet and extranet facilities at all ministries and departments, and the establishment of common e-Government Application and Services which entails the setting-up of the E-government centre at the Ministry of Finance (Hazair, 2010, Ruhaidah, 2003).

The trajectory of reform

It is now widely accepted that for organizational change to be successful, it has to be driven by the organization's key players (Hammer and Champy, 1993; Senge et al., 1999, Heeks, 2003). It is the senior managers who must sponsor, stand by and exemplify the change introduced. In the context of the related changes, the drivers of change are as important as the nature of change itself (Zmud; 1984; Kaliannan, Raman, and Dorasamy, 2009). In the case of Brunei, the sole driver is the Sultan of the country. In many occasions, he has reiterated the needs for creating an efficient and effective public sector through the application of ICT. It has been observed that the adoption of IT without a vision or strategy is unlikely to produce the expected benefits for business or a government (Jayasuriya, 1993). If it is not fully integrated with the business plans and strategies, then IT is unlikely to become an important resource for the public sector (Johnson and Carrico, 1988; Curries, 1996; Kaliannan, Raman, and Dorasamy, 2009). This holistic view integrates all processes across government ministries, job specifications with system capabilities, manual processes with computerized processes, work flow with physical layout, performance management with service, etc. In totality, the government considers not just the technology element but also the human processes, organizational internal operations, security, laws and regulations and environments (Ahmad, 2006).

The government objective is for TAFIS to be a Government-wide exercise involving all departments, sections and units in all 12 ministries. The project is structured around clear milestones which provide a focus for the TAFIS team. The first milestone centered on the functional activities for Ministry of Finance. These are divided into two functional areas. One focused on the improvements of financial reporting system which would contribute to the refinement of annual budget preparation. It covers activities such cash management, debt management, commitment control and auditing. All these activities are re-designed and TAFIS was aimed to enhance the re-engineered business process. The second was aimed of

providing core functionality to the Treasury Department and other Departments within MOF to manage funds make payments and perform bookkeeping. These are mainly financial services which include housing rent maintenance, daily rated payroll, and loan management, allowance processing, gratuity and pension and human resource record (Haji Musa, 2008). This milestone was intended to rollout TAFIS to all departments of MOF. The other milestones run concurrently with first Business Process Re-Engineering and involve all the Ministries.

Based on Haji Musa Study (2007), there are more than 2500 civil servants using TAFIS. This indicates a very low percentage of users (total public sector employees are 44, 000). An average of more than 30 thousands payment transactions are processed per month. According to a manager in the Ministry of Finance “about 73% and 91% of payments to employees and vendors are now automated and processed via TAFIS system”. This has enabled significant reduction in the time taken to process them. In term of re-engineering the processes, the average time taken to approve payments and pay for invoices has been reduced from 24 to 14 days. Other accomplishments of TAFIS implementation, according to Deputy Director of the Treasury are 16 days reduction in time taken to pay leave allowance (from 37 to 21) and 5 days reduction in time taken to pay education allowance (from 30 to 25).

Other accomplishments were noted by one prominent senior official of MOF (Head of Treasury Department). According to him, now new work practices are replacing the old habits in dealing with financial transactions. All employees at this Ministry are dealing with financial transactions by electronic mean. It is noted that the process of physically delivering diskettes to banks containing electronic financial transactions payments was replaced by the electronic transfer of files. Also, the manual entry of personal information and checks payments was curtailed by the adoption of TAFIS. It is used to run through three stages and now is handled by one stage, thus eliminating the inefficiencies of financial transaction processes (Ruhaidah, 2003).

Problems and responses

The main challenge of adopting e-government in any developing country is whether the intended objectives are achieved or not achieved. This is a subjective judgment, reflecting the expectations of those involved in e-government projects. Definitely TAFIS's adoption will bring benefits to all stakeholders of the ministry of finance. Internally TAFIS will enhance the financial operations of the government and externally will have positive impact on citizens and businesses. However, implementing a project which entails such changes is not without any barriers. ICT integration means making a connection between the internal and external environment of the organization, and linking information, processes, people, and strategy (Heeks 2003, Schultheis & Summer 1998). This section discusses some critical issues surrounding the adoption of e-government in Brunei, drawing on interviews with officials at various levels in the Ministry of Finance.

- The integration of new proposed project (Like TAFIS) in the Ministry of Finance with current practice remains the main challenge facing Brunei (and most developing countries). (Heeks, 2003). According to Heeks (2003) most e-government implementation failure in developing countries lies in the conception-reality gap. In Brunei according to one financial officer at MOF, reform was stymied by the traditional, centralized IT structures within the Ministry. According to another interviewee, the distribution of computer networks on the desk of every public servant was intended to improve the management of financial resources. However, there was little improvement in the monitoring of expenditure. This is due to the structural division between central finance officers who held the monitoring information but had no power of enforcement and senior financial officers who had the power to enforce the expenditure warnings but had no information or motivation to do so. The centralized structure of the ministry of finance has hampered the efforts of the coordinated implementation of TAFIS. To rectify such problem, the MOF should undertake an integrative outlook to do necessary reforms to involve other specialists from finance, budget and human resource divisions. It needs to broaden its remit of financial information systems and devolving responsibilities and staff to other individuals departments.
- The implementation of TAFIS has raised the expected roles and responsibilities of the officials in responding to enquires of those dealings with the MOF. My interviewees suggested that many employees are still not ready to assume the new tasks and are not computer literate. The existence of technological illiteracy in most of developing countries makes it hard for people to interact with changes needed in an information society (Nagi 2009). The computer-illiterate see the technology as black art while those who are computer literate are guarded and speak another language (Obolensky 1994). This calls for involving and re-skilling staff through an active participation and training program. Communicating the new roles, responsibilities to the users of TAFIS and discussing the benefits and negative aspects of the new system will certainly increases the staff acceptance, involvement and cause them to feel that their interests are being served.
- The third challenge involves the reorientation of the public sector to make it more customer-oriented. Brunei government, according to senior government officer operates as a closed bureaucracy. Information is created by an agency, put in place by the generating ministry/department, classified as secret and held by the ministry/department which created it. The public's access to this information is determined by the creating agency. The high centralization of the government bureaucracy and the pressure to avoid making of errors by following rules and instructions are major factors which contribute to the secrecy and confidentiality of information (Hajah Sainah, 2000). TAFIS's change leaders at MOF need to

restructure the ministry's departments and processes in order to maximize the value of the information shared by the internal users of the system. Having taken a holistic approach to develop TAFIS, a key impact will be the integration of the work activities from the various teams organized along skills disciplines. It is important that MOF staff agree on the importance of incentives to ensure coordination and to promote a sense of ownership and accountability for decentralized initiatives.

- In Brunei, the national IT strategy is using English as the dominant language in navigating the internet. The first language of most Bruneians is Malay, although the schooling Curricula contain English as a major subject. But Malay-language IT formats exists in the neighboring countries of Malaysia and Indonesia. Based on interview with IT Director, Brunei national ICT strategy does not consider what users will do once they get connected, what content they may consume, and what services they will engage with.
- The fragmentation of government in Brunei also presents a challenge in the implementation of e-government. The Head of IT Department, MOF, felt that e-government activities are uncoordinated, resulting in a low level and quality of public sector of e-services, and insufficient information about e-content from low level employees. Duplication among ministries and the insufficient human resources have impeded the implementation of the e-government initiative. To rectify this problem coordination will minimize the redoing of things and eliminates duplication of interaction between the users of the new systems and other effected departments during the clearance stage of the financial transactions and the data gathering stage.
- The other challenge is the low level of computer literacy, both in the civil service and the wider society. This makes hard for a population to interact with the changes needed in an information society (Nagi & Hamdan, 2009, Heeks 2003). Employees at the MOF have shown a lack of skills and attitudes in relation to the use of TAFIS in their respective work areas (Interview with senior official at MOF). Staffs at the ministry of finance, according to IT manager, "have not shown high seriousness to the changes brought by the adoption of TAFIS". This is not only due to the lack of training but it is also attributed to the low level of commitment to engage seriously to the changes brought about in government. The adoption of IT calls for the interaction of both the cognitive and the affective state (Hazman and Alaa-Aldin 2001). Different types of training can be conducted to close the gap in skills and knowledge (i.e., project management, change management, IS and IT issues). Changing attitudes in relations to the use of TAFIS can be dealt with through a case study, role-playing exercises and group-forming activities (Heeks,

2003). A more radical participative approach would include clients groups (contractors, suppliers, citizens) as well as who are using the new system.

Conclusions

TAFIS aimed to change the internal processes and bring more improvements in the efficiency and effectiveness of the financial management system of the Ministry of Finance. It integrates information from both the financial accounting and financial services areas, making processing more efficient, streamlined and customer-oriented. This in turn will help with generating timely, and informative financial statistics useful in formulating the annual budgetary process and enhancing the financial control at the MOF. Seeking to bring major improvements in term of efficiency and quality of services, TAFIS has altered institutional procedures at MOF. TAFIS has changed the internal operations and control from a traditional vertical, functional, and hierarchal to a horizontal, cross-functional, team-based, flat structure. This type of institutional arrangements was aimed to re-engineer the management process, cost-cutting, pleasing customers and to enhance the accountability aspect of the MOF (Ruhaidah, 2004). However, despite all promises and accomplishments, there remain serious limitations and challenges. According to an interview, there are still delays in clearing the vouchers into TAFIS computerized system, due to lack of competence and professionalism among the MOF employees. In addition, there is a high evidence of bureaucratic inefficiency, procedural complications, lack of coordination between employees at the different stages of the financial transaction processes and among them and other employees of the other ministries and departments

Although the promises of TAFIS as an e-Government initiative was to streamline the financial transactions and to manage the expectations of key stakeholders, there is still lacks of any G2C (Government-to-Citizen) and G2B (Government-to-Business) components. However, on the G2E (Government to employee) front, there has been a visible sign of development. Brunei has succeeded in streamlining and improving internal government operations and administrative efficiency through the implementation of ICT solutions such as TAFIS, as well as the recent embarkation of the \$ 1 billion-budgeted Human Resource Management System for the Brunei government (Center for Strategic and Policy Studies, Brunei, 2008; Brunei Times, 2008)

As an e-Government project using a browser-based architecture, a key challenge will be the adoption and scaling of TAFIS to use the Internet as the carrier of its financial transactions, taking into account the security aspect of the Internet uses. Also, having taken a holistic approach in the development of TAFIS, key consideration should be given is the integration of the work activities from the various teams along skills disciplines. Coordination among the various internal users, between the employees of the MOF and among ministries affected will minimize the redoing of work and eliminates duplication of interaction with users during the clearance stage of financial transactions and the data gathering stage. Managing the

expectations of the stakeholders is another key factor for successful adoption of TAFIS. Gupta (2007) and Ahmad (2002) emphasized the importance of involving and managing the expectations of all the key project stakeholders during the introduction of any e-Government project. Understanding stakeholders' expectations and vision for TAFIS have assisted in obtaining their continued buying and commitment to the project success. It is necessary to ensure there is consistent and regular feedback to the stakeholders to establish the implications of key decisions on issues and direction taken by the project teams. In the case of TAFIS, stakeholders include senior government officials, grass-roots employees, other users such suppliers of government services and the public at large.

To address the employees' perceptions and attitudes towards the new technology, the MOF should find the best possible ways of motivating users' behavior and attitudes to make the change work. Getting employees feedback regarding the problems encountered in the workplace will enhance their knowledge, understanding and commitment to the need for changes. The staff satisfaction with ICT is an important factor underscores the need to shape the perceptions of the key users about the potential outcomes of ICT adoption. Besides training which is aimed at closing the skills and knowledge gaps, literature mentioned other hybrids ways to change employees' attitudes and perceptions towards the adoption of ICT. Examples of such approaches are: case study analysis, role-play exercise, group-forming activities, demonstrations of functional information systems, communication and expectation management, active participation to build consensus.

In summary, we are not claiming that the techniques mentioned above will perfectly help to address all problems, but they are likely assisting the reform process. Information reform initiative such TAFIS which require too much change along many internal and external dimensions would be more likely to succeed if the MOF reduces the scope or the complexity of the project. The TAFIS project is proceeding as planned. But as it scale up to all government bureaucracy, the management of the expectations of the expanded stakeholders' population is more significance than ever. In other words, the challenge is to undertake an assessment study in a holistic manner which could address the expectations of all internal and external stakeholders of the government.

THE BRAND-INDIVIDUAL RELATIONSHIP: INFLUENCES FROM AND TO RELEVANT REFERENCE CONTEXTS

Basile, Gianpaolo¹

¹Senior lecturer in Marketing and Place Marketing, Department of Sociology, University of Salerno, Italy. Email: gibasile@unisa.it

Abstract

The present paper, through a conceptual framework, aims at improving the studies regarding consumption and the relation between brand and individual/consumer.

The objective of the paper is to show that relations between the firm and the individual/consumer, created by the product/brand, are both cause/medium and effect of influences moving to and from the relevant reference contexts.

It focuses on the literature gaps about social consumption and the network approach, and on Giddens's and Golinelli's theories.

According to Giddens's and Golinelli's theories, relations between company/brand and individuals are influenced by and affect their reference contexts through a dual structural model cycle. This model features two isomorphic parts represented by the company/brand with its context and the individual with his/her context, bound by a mutual relationship.

Using the components of the dimensions of the duality of structure model as a checklist, the framework helps researchers and practitioners to assess the impact of social elements and structural influences on marketing decisions. Contextual influence analysis can shape segmentation and positioning strategies and policies.

The paper produces some useful considerations about the dynamic existing between the firm/brand and the individual and highlights some gaps in the studies regarding the network approach and the social consumption process.

Keywords: Brand Management, Consumer Behaviour, Viable System Approach, Structuration Theory, Theory of Communicative Action

Introduction

As individuals' needs grow, companies are called to considerable interpretative efforts to respond to them, while academics and practitioners seek to better understand how the social context and individual characteristics affect the relationship between the individual and the brand and consequently how consumers respond to marketing and communication efforts.

The following methodological path should be followed in order to build a conceptual framework:

Theoretical background: what are the intellectual sources we should access in order to increase and refine our understanding of our object of study?

Level of analysis: the relationship between brand and individual may be studied at different levels. Can models and methods developed with relation to a certain level be applied to other levels as well? (academic gaps)

Conceptualization: what are the fundamental issues to address when proposing a definition of the consumption system?

Methodology: what are the appropriate data collection techniques, analytical tools and procedures to be used with structuration analysis?

Relevance: what theoretical and practical problems can the structuration theory help us to address? What is the added value? How can the structuration frame help us to promote or manage marketing relations?

Theoretical background

Managers and researchers in marketing and consumer behaviour share a common concern: understanding the dynamic at the basis of their mutual relationship, which is crucial to their social and economic survival.

Therefore, along with the rise of relational approaches in marketing, the focus of marketing research has changed from products and firm to people, organizations and the social processes that bind the players involved (Webster, 1982; from Okonen et al., 2000).

In the last few years a lot of researchers studied the effects of consumer group membership within a social context and their responsiveness to marketing efforts (Aaker, Brumbaugh and Grier, 2000; Deshpandé and Stayman, 1994, Grier and Brumbaugh, 1999; Grier and Deshpandé, 2001).

Other researchers tried to determine why and under what conditions consumers enter into a strong, committed and meaningful relationship with a certain company, championing the company itself and its products (Battacharya and Sen, 2003). Drawing on theories of social identity and organizational identification, some researchers proposed that a strong consumer-company relationship often stems from the consumers' identification with the firm whose products help them to satisfy their self-definitional needs (Bhattacharya and Sen, 2003; McAlexander, Shouten and Koenig, 2002; Bergami and Bagozzi, 2000; Kunda, 1999; Scott and Lane, 2000).

Some researchers studied, using a conceptual model, how different aspects of the relationship existing between customers and the relevant brand community affect the intentions and behaviour of the former (Algesheimer, Dholakia and Herrmann, 2005; Cova, 1997). We can therefore say that while the earliest studies mostly focused on understanding the nature of the dyadic relationship, on the basis of the seminal observation for which both

consumer and supplier are active, hence the name 'interaction approach' (Håkanson, 1982; Turnbull and Valla, 1987), in the next phase the focus shifted towards the dynamic development of the dyadic relationships (Dwyer et al, 1987; Ford et al, 1986). Such dyadic relationship studies were also applied to intra-firm relationship, and one of the main conclusions reached by the Europe-based IMP (Industrial/International Marketing and Purchasing) Group was that a dyadic relationship has to be seen in the context of a larger set of intra-firm relations forming the business context of the focal dyad.

As Håkansson and Johanson (1992, p.49) point out, network structures are '... emergent and enacted phenomena that form webs of interdependencies extending far beyond the horizon of a single actor'.

The underlying rationale was to understand the actions of both the buyer and the seller and the longitudinal development of their relationship. Such 'network approach' has recently attracted considerable interest among business marketing researchers (Håkanson and Snehota, 1989, 1995; Webster, 1992).

The complex interaction between them needs to be addressed at organizational, departmental and personal level (Möller and Wilson, 1988). Although actors at different levels of aggregation may be identified, individuals are inevitably the basic interactors in all possible collective configurations. In other words, all aspects of interpersonal communication must be taken into account when researching exchange processes from an interaction/network perspective (Alajoutsijärvi and Eriksson, 1998).

In the last few years network researchers have focused their studies on the role of communication, saying that relations and networks are essentially formed by interpersonal communication processes which, in turn, are affected by their contextual and structural factors. On the other hand, communication processes may affect the contextual and structural features of the relationship or network (Olkkonen, Tikkanen, and Alajoutsijärvi, 2000).

Level of analysis

Literature does not pay much attention to the influences affecting social players (individual/firm) operating in their relevant contexts. This mutual exchange of influences is, according to social dynamic scholars like Giddens, Sewell and others, the cause of the birth of society.

This work wants to focus both on the influences that reference contexts have towards social players when they choose and/or create the relationship, and on the effects that the relations have towards the players and their contexts.

Giddens describes the relationship between social players/organizations like a 'dual' process, meaning that such relationship affects and is affected by the relevant reference contexts.

The present approach will be useful to display the isomorphic feature, typical of complex structures. According to it, for each component within a structure there is a similar one in another structure, and the two parts play similar roles within their respective structures.

The paper is based both on sociological theories, like those of Sewell or Giddens, and on management theories, such as Golinelli's viable system approach. According to these, interactions between firms and individuals are likely to affect both the players involved and the relevant reference systems.

The core of the relationship between company and individual that we are going to analyse in this paper is consumption. It could be either viewed from an economic perspective, where products are considered as a set of attributes providing special benefits to consumers, or from a symbolic perspective, where products are perceived as conveying different meaning (Bourdieu, 1984, Halle, 1992, Morley, 1986; Press, 1991; Radway, 1984, Holt, 1995).

Consumption will be considered in this work as a process, a social action (Simmel, 1950) conveying cultural content and allowing consumers to reach different classification and/or integration targets both in relation to other individuals and within the relevant social groups. Such process triggers in turn changes on a broader scale within communities or structures (Holt, 1997).

The evolutionary process found in social structures is called by Giddens *structuration*: 'we create society (medium) at the same time as we are created by it (outcome)' (Giddens, 1984).

Classification and social integration reached through a symbol should be considered, according to an approach very close to Bourdieu's theories, as a non-problematic process that gets validated first by possession and then by social display of the object being consumed (Bourdieu, 1984).

As it is always very difficult to assess the outcome of any consumption process, due to the many ways in which different consumers view the same product, it is paramount to study the issue in question according to social system theories, which consider systems as dynamic expressions of transformative relations among different players (Giddens, 1984, p. 17).

It appears therefore necessary, in order to contribute to the study of both consumption and consumer behaviour, to analyse the relations between the social players firm and individual, the influences that the relations produce on the relevant reference contexts, and finally the effects that the contexts have on individual players and on group players.

This approach has both theoretical and practical implications for brand management. It requires a deeper understanding of personal interaction, where a brand develops its meaning and role influencing individuals, social groups/communities, families, competitors, suppliers and other stakeholders.

The aim of this paper is also to integrate the theories dealing with the relationship between individual/consumer and brand, drawing on approaches such as Habermas's 'theory of communicative action', and other sociological and managerial works.

As already said, the product/brand will be considered not only as something going beyond its functional and commercial value, but in particular as a visual clue mediating between distinctive identity projections, which are necessary to the individual to stand out and/or to assess his status within the social group(s) he/she belongs to (Fournier, 1998).

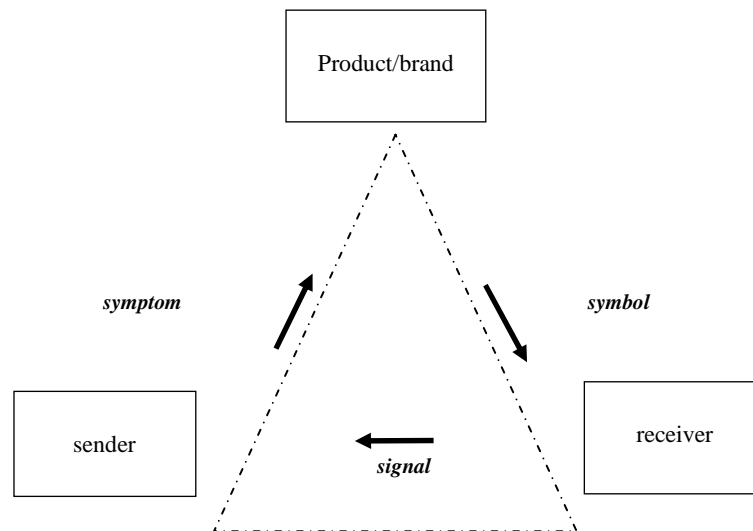

Conceptualization. The social function of brands: from individual to social individual

In order to achieve our goal, it is necessary to illustrate the role of the brand both among individuals, which we will discuss in this section, and between individuals and businesses.

It seems useful, when considering the first point, to refer to the philosopher Karl Bühler, who in his *Sprachtheorie* (1934) developed the notion of sign as a communication tool. His communication model regarding social players stems from his idea of linguistic sign (Bühler, 1990).

Bühler, focusing on the functional analysis of the sign, places it at the core of a threefold relationship involving the object (in our case the product/brand), the sender and the receiver.

According to this theory, the sign (product/brand) is to the sender/transmitter (individual/consumer) both a *symptom*, as it expresses his/her inner life and identity, and a *symbol* towards the individuals or groups the communication process is aimed at. The *symbolic* function, being linked to objects and behaviour, works as a representation of cultural and social cues displayed by the sender and aimed at the recipient. The latter (other individual or group member) then represents his perception (the *signal*) which is basically interest - or lack of - towards the sender (he is allowed into the social group, is qualified as a leader, etc) (see fig. 1).

Figure 1: Bühler's communication model

Mead integrated Bühler's model arguing that functional differentiation reached via a form of language leads in humans to a totally different organizing principle, which produces not only a different type of individual but also a different society. Linguistic symbols (products/brands), are therefore at the core of the behavioural interaction of many individuals (Mead, 1966, p.249).

Behaviour becomes therefore symbolically significant when it implicitly triggers in the acting individual the same response that receiving individuals explicitly experience, or are thought to experience (Mead, 1966, p. 273). The transmitting individual internalizes the relationship between his behaviour and the receiver's reaction (see the following case vignette). This dynamic develops both between individuals and between individuals and companies. The latter is the case examined by the present work.

The Silly Bandz phenomenon

The multicolour silicone bracelets called Silly Bandz are certainly one of the best examples of the model described.

The original Silly Bandz are 100% silicone and moulded in different, very original designs. One can stress them in any possible way and they magically return to their original shape.

They are very simple, coloured silicone bracelets available in a number of different shapes, from zoo animals to letters, from cars to musical instruments. There are hundreds of different designs, to wear on wrists or ankles, or even to spice one's haircut.

The different shapes form a coded language used by teenagers first and now also by adults. People wearing dinosaurs say: 'I am on the prowl'. Flowers: 'I am romantic'. Rhinos and crocodiles: 'Today I bite'. Phosphorescent ones (glow in the dark) suggest: 'I am looking for company'.

Millions of meters of silicon to be part of a group, to be equal and different, to socialize. Nowadays, one either wears a Mickey Mouse set on the wrist or is a nobody.

It is a product which, depending on the model chosen, is an expression of a *symptom*, that is the individual's need to communicate (what is your shape?) through a *symbol* his classificatory behaviour towards certain contexts (the second word of the product name – Bandz – clearly evokes the idea of group). Such behaviour induces the recipients to produce a response *cue* (acceptance or non-acceptance, appreciation or non-appreciation). The last phase affects not only the players involved in the communication process but also, indirectly, the reference contexts or social groups, that will adapt to changes in their members' roles and/or distribution.

The product/brand, being a *medium* conveying values and identity, plays therefore a co-ordinating role with relation to actions that have social classification content and purposes.

Sender and recipient understand the meaning of a symbolic language if they know what contribution it could provide towards the establishment of a mutually beneficial relationship.

The model presented shows that the establishment of a social relationship requires the participation of at least two players, who start communicating each time one of them cannot reach his goal by himself, that is without involving other players. At this point there are two possible scenarios: if the two parties share a common goal, a *relational* activity takes place (for example, two people co-operate).

If however the goals of the two agents are complementary, each of them will act pursuing his own, turning to the other player only if necessary to the success of his own initiative: we call this *interaction*. In both cases, the action patterns of the two individuals will display some overlaps.

The two players exchange communicative cues that allow them to co-ordinate their actions, showing each other the benefits obtained from their interaction, that is from acting according to the other party's wishes (Habermas, 1997).

Conceptualization. Structuration Theory and the relations between brand and individual

Communication between social players, as shown above, is mainly aimed at satisfying their own needs/requirements. Habermas says that such behaviour refers to the interaction between at least two social players capable of language and action who establish a relationship through either verbal or extraverbal means. The players seek an agreement to co-ordinate their action plans and their respective behaviour (Habermas, 2000).

If one of the actors is a social organization such as a company, it establishes a communicative behaviour aimed at creating a series of relations based on a common language and/or purpose, in order to reach a sustainable agreement with the other party, whether individual/consumer or stakeholder (Golinelli, 2008; Barile, 2006).

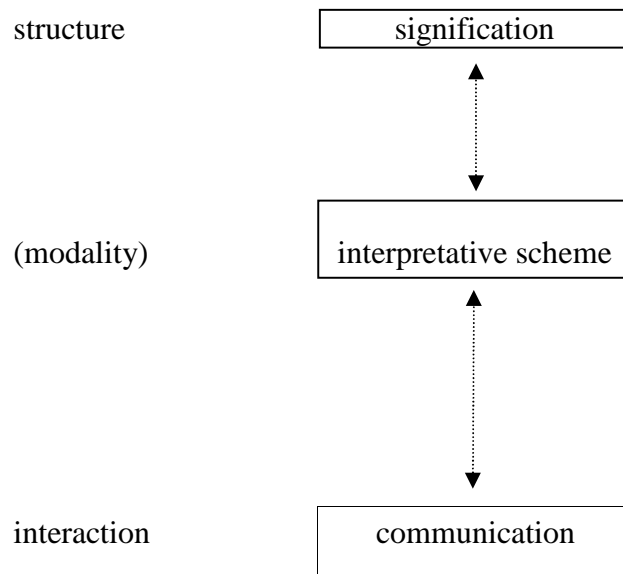

The communicative dynamic existing between company and individual evolves following a process of mutual interpretation, to be continuously reviewed, based on the definition of situations likely to be agreed upon (Habermas, 1997, p.157).

Symbolism causes therefore the establishment of both subjective and extrasubjective orientation systems, so analyzing the nature of the relevant relations becomes important in order to define their role in the dynamic operating within the players' reference contexts.

According to the structuration approach, whose main theorist is Giddens (1984), those are expression of the different social levels, both at micro and macro level, in which relations are established and reviewed.

According to Giddens the biunivocal relation processes shows the dimension of 'the duality of structure' as composed of two levels: *micro*, which is the interaction step between the social players, when the players modify their interpretative schemes giving, through the adoption of different behaviour and social practices, different 'signification' to the reference context; and the *macro* level in which, because of the different signification, the players receive in turn new/different influences to create/maintain other interactions (see fig. 2).

Fig. 2: the duality of structure

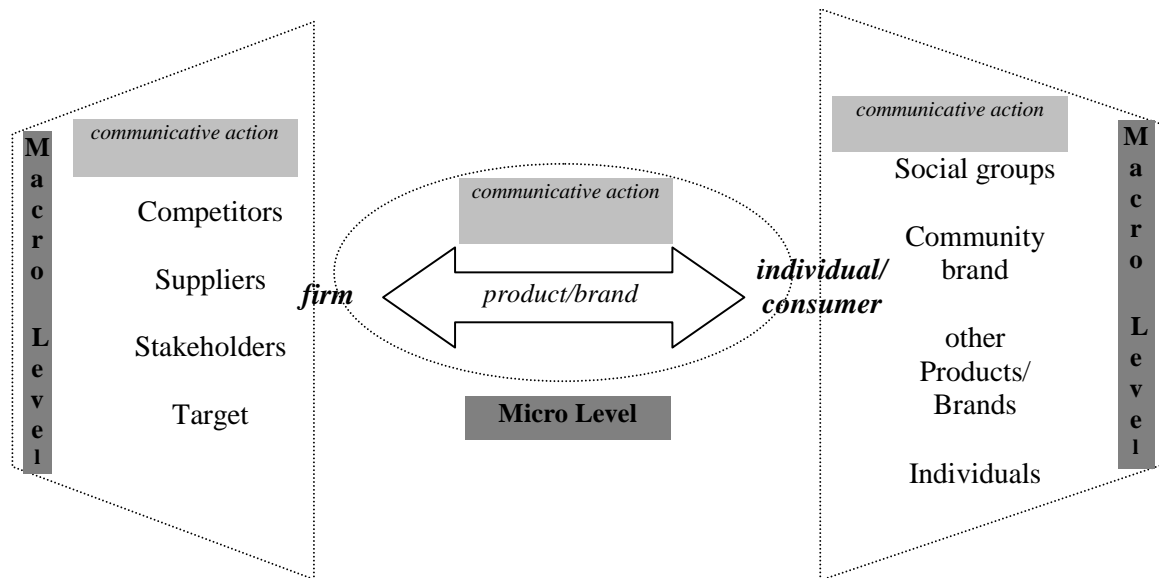

As for the firm, contextual influences occur when the management is forced to adapt the company's capability, know-how, marketing and communication behaviour to the specific stakeholder at micro level, and to the reference contexts (financial system, consumer system, labour market, et al.) at macro level.

This dynamic shows that viable system management continuously operates in a complex domain (Barile, 2009, pp. 37 e ss.).

The company has to take into account, *at micro level*, the consumers' psycho-social goals when defining its marketing mix with relation to both strategic (segmentation, positioning) and tactical issues. The company implements a communication activity, along the lines of Habermas's Theory of Communicative Action, in order to both announce its presence and to establish a relationship with the individual, based on mutual learning. This is aimed at conveying the message that its brand should be perceived as the right one by the individual/consumer pursuing his classification goals (Siano-Basile 2009; Siano-Basile et al, 2010).

If a consensus is reached between the parties as a result of such communication activity, we will call it social action. That, based on a constant dialogue between company and consumer, would allow them to share common ground *at macro level*. The individual would gain distinction and/or social participation, while the company would be able to establish intersystemic relations with all the relevant contexts (competitors, suppliers, financial system, fiscal system, et al.) it has to co-operate with (Golinelli, 2005, p.200) (see fig. 3).

Fig. 3: Relational framework according to the structuralist approach

The brand value will therefore be affected, in terms of positioning, not only by its own set of policies but also by marketing and communication policies adopted by competing brands.

This means that creation and/or maintenance of micro relations between firm and individuals involves re-positioning of the company and an 'induced' re-positioning operated by the competing brand.

This phenomenon shows a homeostatic condition where companies adapt, with or without links or networks, either in a direct or in an induced way, to their competitive condition. That highlights the importance for the firm to analyze – and respond to – the contextual influences caused by the behaviour of other actors (see the following case vignette). We might think for instance of how the Starbucks case, as studied by Thompson and Arsel, assumes different meanings in different cultural contexts, propagating a particular kind of place experience and shaping cultural expectations and ideas about what coffee shops should be (Thompson and Arsel, 2004).

H&M and Zara: fashion Midas

The two giants of fast-fashion are the darlings of the market, once again boasting mind-boggling figures and results, which are forcing designers to plan an in-depth reorganization of the entire system.

With Pittimmagine Uomo on in Florence and men's fashion shows just about to start in Milan, the fashion world once more salutes two evergreen market giants, that is Zara and H&M. The two fast-fashion brands, in fact, have just released the first quarterly results for 2010. Inditex, the Spanish group also controlling Zara, recorded a 63% net profit increase: a figure towards which all other results pale in comparison, from those of cash-stripped fashion houses (including not only recently bankrupted Christian Lacroix, but also Mariella Burani Fashion Group and It Holding/Gianfranco Ferré, which is now in administration), to those displayed by much healthier companies. For H&M, on the other hand, the period running from December 2009 to February 2010 closed with a 42% net profit increase and a plus 10% in sales over the previous year.

Not only that: the two brands have also succeeded in penetrating brand new markets. Zara, for example, has recently opened its first store in India, also making its debut in the Middle East and Asia. H&M, on the other hand, arrived in Seoul, South Korea, in February after starting a successful franchise in Tel Aviv.

The fashion system, however, is not standing still: during 2009 a process of radical structural change started underground. Leaving aside snobbery and suspicion, many designers have introduced a series of 'flash' collections, that is of fashion packages that bypass the traditional stages of fashion shows and pre-collections. The results come very close to those of the 'ready-fashion' system, as the ultra-fast production, devised in our country and brought to global success by H&M and Zara, is now called (it is worth mentioning that the Spanish brand changes clothes inside its stores every 3/4 days, at a pace that is unthinkable for any traditional designer). The real challenge of tomorrow lies not much in design creativity or in copying the two fast-fashion giants, but in the ability to adjust to a market and to consumers that have radically changed.

<http://seidimoda.repubblica.it/dettaglio/hm-e-zara:-re-mida-della-moda/70241> published June 15, 2010

As to the importance of communicative action, Habermas argued that the necessity of coordinated action implies the need for social communication, that has to be made accessible in order to guarantee a smooth operation of the entire system (Habermas, 1997).

The theory of communicative action therefore focuses on linguistic/relational comprehension as the key to the co-ordination of social action.

According to this definition the company displays, through its product/brand and after a participative analysis of the destination market, a communicative behaviour aimed at inducing a co-ordinated response/action to be performed by the individual/consumer. He will in turn do the same, once again via the product/brand, towards other individuals or social groups.

According to this definition the company displays, through its product/brand and after a participative analysis of the destination market, a communicative behaviour aimed at inducing a co-ordinated response/action to be performed by the individual/consumer. He will in turn do the same, once again via the product/brand, towards other individuals or social groups.

For these reasons companies increasingly tend to present the product/brand as conveying values and culture, in a marriage between real life and an imaginary (but possible) world needed by the individual to achieve his social goals.

Mini, for instance, does exactly that with its car. The values in question are those of Urban Culture, and people browsing the website are invited to provide fresh ideas in a sort of contest aimed at improving the ethical and aesthetic quality of urban life (see http://www.minispace.com/it_it/).

Products/brands such as Dolce&Gabbana export the Mediterranean tradition, particularly the Sicilian one, on a global scale transferring imagery, colours, scents in products such as their fragrance Sicily, aimed at a world-wide market. The intention of representing Sicilian culture has also led to the publication of a 'dictionary' of the symbols employed by D&G in their campaigns (see <http://www.dolcegabbana.it/dg/profumi/sicily/>).

Such values remotely resemble the traditional market segment, but according to our framework they also represent contexts of reference characterized by spatial, social and cultural variables such as place, life and consumption style. These contexts influence and are influenced by social players.

Spatial variables are postmodernist symbols, therefore they can either be physical places like shopping malls/centres, or virtual places such as the social networks (facebook, second life, twitter).

Methodology

Contextual analysis and/or multilevel analysis or hierarchical linear models (HLM) are becoming very important to evaluate both micro- and macro dynamic. They take into account mutual influences existing between reference social contexts (physical and/or virtual spaces) and individuals (Blalock, 1984; Snijders and Bosker, 1999).

Multilevel theories allow to assess how macro variables describing collective phenomena can affect micro ones, such as emotional and cognitive individual behaviour, and vice versa.

Such techniques could therefore describe the effect produced by macro factors on micro ones, employing a regression process in which a single variable depends on a set of other variables.

Such techniques not only significantly contribute to the evolution of consumer behaviour studies, but are also an invaluable support to practitioners, who are engaged in intercepting individual trends, and above all the variables affecting motivations and lifestyles, for segmentation and/or positioning purposes.

Relevance

What the structuration theory adds to the comprehension of the brand-individual relationship is the knowledge that such interaction cannot be managed without taking into account all other mutual social influences.

Researchers and practitioners could therefore use it to understand the system of relations from (1) the perspective of a given focal 'micro level' regarding the relationship between individual and brand and from (2) a holistic perspective typifying the reciprocal social influences existing between players and their reference contexts.

Such approach implies that the role of marketing is increasingly that of sustaining both the individual in his/her social dynamic, and the firm, in order to establish, develop and maintain its position.

The views shown in this paper bring to light the importance of relations between the social players, and of the product/brand within the relations.

The product/brand is becoming more and more an expression of the individual's/consumer's lifestyle. We may even call it a symbolic platform co-managed by producers and consumers.

That leads to the conclusion, meaningful for both researchers and practitioners, that it is important to analyse the relations/influences existing between individuals and their reference contexts, in order to understand the motivations at the basis of the relationship between brand and individual/consumer.

A VALUE-BASED MANAGEMENT PERSPECTIVE FOR THE GERMAN AUTOMOTIVE INDUSTRY

Beck, Valentin¹; Britzelmaier, Bernd²

¹Leeds Metropolitan University, Im Hansjakobsacker 23, 75180, Pforzheim, Germany. Email: V_Beck@web.de

Abstract

In recent years, the global automotive industry has generally recorded continual growth. The major market players in this industry are the original equipment manufacturers (OEMs) as well as suppliers at various stages of the value-added chain.

This study examines the value-based management (VBM) strategy and its implementation by the German automotive industry. The major findings of the study are fourfold. First, the German automotive industry operates on the basis of the VBM model. Second, the overall goal of the VBM model there is to maximize the value of an organization. Third, VBM enhances profitability in the automotive industry. Fourth, to achieve their target of creating value, organizations should design their VBM strategy to reflect their overall mission and goals.

Keywords: Value-based management, shareholder value, German automotive industry

Introduction

Increasing shareholder value as well as strategies for measuring and assessing this value improvement together represents an important issue for corporation managers. Although numerous articles have been published about value-based metrics (Pellens et al 2000; Achleitner & Bassen 2002; Fischer & Rödl 2003; Aders et al 2003; Habersetzer & Hilpisch 2004; Droste et al 2006; PWC & Kirchhoff 2006; Quick et al 2008; Schultze et al 2009; Britzelmaier et al 2010), there seems to be little published work on how specific industries, especially the German automotive industry, have successfully utilized these metrics in enhancing their overall performance. Value-based corporate management, as a corporate objective, has also been established in German automotive enterprises (Kaufmann & Götzenberger 2006). For instance, according to its own statement, the Audi AG Ingolstadt, with its "Strategie 2020" (Strategy 2020), will align its business policy to this.

There is agreement in German business literature that, by way of VBM, enterprises are enabled to work towards the implementation, preservation and development of values in a target-orientated and active manner (Britzelmaier 2009; Becker 2000). Value-orientated corporate management can be seen from two points of view. On the one hand, value-based

management is explained by saying that the actions of enterprises must exclusively orient themselves towards increasing the enterprise's value from the point of view of the shareholders. This shareholder value approach was conceived by Rappaport (1986) in the 1980s. His concept of Creating Shareholder Value supports the management's orientation towards maximising the value of shareholder investments (Rappaport 1986). Therefore, the goal of this basic orientation is to obtain the maximum value creation for the OEM's shareholders. The practical implementation of this basic idea is also carried out in German automotive enterprises using various means.

Apart from the shareholder value approach of Rappaport, the economic value added concept (EVATM), the discounted cash flow method (DCF), and the cash flow added method (CVA) among others, have been used since the 1990s. On account of neglecting other stakeholders, the orientation towards the owners' interests, as outlined above, has been subject to some degree of critical assessment (Britzelmaier 2009).

Hence, within the context of VBM, a second perspective is taken into consideration. In addition to shareholders, numerous other stakeholders of German OEMs as well as suppliers can be identified. Apart from shareholders, creditors, suppliers, employees, customers, competitors, and state organisations are also regarded as interest groups that serve original equipment manufacturers as tools for economic actions. Thus, experts call for a pluralistic and social orientation towards a value-based corporate management that also contains, in addition to the maximisation of shareholder value or economic objectives, flexibility and satisfaction goals in equal measure (Britzelmaier 2009; Beck & Britzelmaier 2010).

In this paper, we will examine the concept of value-based management (VBM) as it relates to the German automotive industry. We will consider the spread of VBM among the companies in this industry, the kind of VBM metrics they use, and the connection between VBM and executive compensation.

Before proceeding further, we will present the aims and objectives of this study.

Aims and Objectives

The aim of this paper is to discuss the use of VBM strategy by the German automotive industry. Specifically, the objectives of the paper include:

- To discover if there is a connection between VBM and profitability in the German automotive industry;
- To identify the kinds of key metrics the industry uses in this regard;
- To discuss how the industry uses the VBM system, that is whether or not it uses it in risk management, planning and budgeting, change management, and so on;
- To discover the connection between VBM and executive compensation.

Research Hypotheses

The following hypotheses will be tested in this study.

H0: Enhanced profitability does not depend on the management's willingness to adopt a VBM strategy.

H1: Enhanced profitability depends on the management's willingness to adopt a VBM strategy.

The above hypotheses will be tested by using a Chi-Square Test of Independence.

Literature Review

The review presented in this paper is made under the following sub-headings:

- VBM perspective – a conceptual overview;
- Key metrics of VBM;
- VBM versus executive compensation;
- A critical analysis of VBM.

VBM perspective – a conceptual overview

To obtain a clearer perspective on value-based management issues, we will first of all explain the meaning of VBM.

VBM can be best described as any management system that is adopted by an organization that enables the organization to be focused, measured and compensated based on its ability to create value for its stakeholders (Rappaport 1998; Biddle et al 1997; Copeland et al 2000; Eccles et al 2001; Britzelmaier 2009). The stakeholders in this regard include the shareholders, customers, vendors, employees, and the organization's host community. It is sufficient to note that under the VBM methodology, an organization's management strives to utilize practical analytical and planning steps to enhance, to a reasonable extent, all parts of the organization. To do this, they start by identifying the organization's key stakeholders (Petermüller & Britzelmaier 2008; Britzelmaier 2009). This is followed by an effort to understand the needs of these stakeholders and to develop a workable strategy for satisfying the expectations of the stakeholders as they relate to the organization's success. Hence, value in this case is considered by the organization's management to be the needs of the key stakeholders, which can then be satisfied by a prioritized strategy. In addition to this, organizations operating under a VBM philosophy always engage in activities aimed at analyzing their operational and economic performance with the objective of gaining a clearer understanding of their current position in the industry. With this form of analysis, the organization's management can easily establish a strong foundation that will be the backbone of any change initiative they may introduce. In addition, such analysis can enable the organization to create workable plans as well as reliable forecasts of their future operations.

Hence, it can be inferred that an organization operating under this perspective often describes its goals and objectives in terms of measures, and these can include a measure of their current performance, their desired performance, as well as a vector for their accomplishment. In other words, VBM works on the principle of performance measurement (Value-Based Management Institute 2001; Johnson 2009; Lazonick & O'Sullivan 2000; Martin et al 2009; Martin & Petty 2009; Beck & Britzelmaier 2010).

This simple explanation of VBM raises one important question: what are the major components of VBM? Generally speaking, value creation, value management and value measurement constitute the key components of VBM. Before proceeding further, it may be worthwhile to briefly discuss the basic key metrics of VBM.

Key metrics of VBM

Broadly speaking, when implementing the VBM strategy, the first thing the organization does is to measure economic profit (EP), which is the same thing as measuring the value the firm has already created at that time. Measures that depict the extent of value creation include the economic value added (EVATM), the shareholder value added (SVA), the cash flow return on investment (CFROI), the economic value added (EVATM), the return on net asset (RONA), and EP (Britzelmaier 2009; Johnson 2009; Lazonick & O'Sullivan 2000; Martin et al 2009; Martin & Petty 2000; Rappaport 1986; Ryan & Trahan 2003; Young & Byrne 2000). The bottom line here is that, with these measures, a firm can assess the degree to which it is creating value for its shareholders. Even though the procedures for calculating these measures as well as what they portray may vary, these differences are insignificant when it is understood that they show the same thing, albeit from varied perspectives.

The point to note here is that by using these measures or metrics, investors and analysts can assess a company's performance relative to other companies in which they have the choice of putting their money. This, to a very significant extent, influences their decision to invest, as it relates to how much they will pay for the stocks of a company. We can get a better understanding of how this works by using EP as an example. Generally speaking, EP is a very broad metric in that it measures the performance of the entire firm of interest – measuring the firm's profit before interest minus the cost of its capital. However, it is worth pointing out that one does not really add any value to a firm by simply measuring its value using the EP approach. However, the view of the proponents of this approach is that if a firm links value-creation measures such as the EP to compensation, it will increase the chances of motivating its employees to increase their efforts towards achieving stellar results – results that can enhance the economic value of the firm. Thus, to the proponents of the EP procedure, managers need to make all necessary efforts to create measures in addition to creating performance targets that will be designed to facilitate the attainment of the firm's value-creation goals. Their suggestion as to the best way to undertake this feat is to recognize and manipulate those value drivers that influence the firm's performance (Britzelmaier 2009;

Johnson 2009; Lazonick & O'Sullivan 2000; Martin et al 2009; Martin & Petty 2000; Rappaport 1986; Ryan & Trahan 2003; Young & Byrne 2000).

It is also important to note here that the performance of the EP generally increases or decreases depending, to a large extent, on the performance of the identified value drivers. Basically, the key value drivers include operating profit margin, working capital, sales growth rate, cash income tax rate, fixed capital, growth duration period and weighted average cost of capital (WACC). Depending on the firm's goals, a manager can make decisions that can go a long way towards influencing the performance of each of these value drivers. Managers can attain the objective of enhancing sales growth, for example, through the implementation of marketing initiatives as well as by the acquisition of more distribution channels, among other strategies. Managers can also facilitate the planning process of the firm, depending on the firm's goal at the time, by engaging in tasks such as the analysis of management actions so as to determine which actions can lead to a significant increase in EP. They can also conduct sensitivity analysis, where necessary, with the aim of finding out which of the identified value drivers has the most significant impact on economic profit. If sales growth rate, for example, produces a more significant impact, this analysis can help the manager to decide to expend more resources to increase sales revenue. If any other value driver has a bigger impact on EP, the manager can divert more resources in that direction to further enhance the impact of that value driver. The implication of this is that, on the basis of the prevailing business circumstances, each of the identified value drivers will have a unique leverage impact on the EP (Beck & Britzelmaier 2010; Johnson 2009; Lazonick & O'Sullivan 2000; Martin et al 2009; Martin & Petty 2000; Rappaport 1986; Ryan & Trahan 2003; Young & Byrne 2000).

In this section, we have briefly discussed the key metrics of VBM. In the following section we will present the linkage between executive compensation and VBM, and the effects of such a link.

VBM versus Executive Compensation

A useful perspective to begin this discussion is to state here that a comprehensive VBM strategy or model is one that, to a very large extent, ties executive compensation to the appropriate VBM metric. This is done by way of cash bonuses paid to the executives. Thus, for a company, establishing a reasonable relationship between executive compensation and the appropriate VBM metric involves aligning the interests of the executives or the managers of the company with those of the shareholders, as well as providing these executives with all necessary incentives to motivate them to improve the overall performance of the company. As a way of examining the potential impact of tying executive compensation to a company's VBM system, we will divide modern-day firms into two groups – those that tie executive compensation to the VBM system, and those that do not follow this approach.

Broadly speaking, most executives and managers in the 21st century often affirm that the factor that motivates them to put more effort into their work is the desire to create value. This implies that what drives most managers in their work is their goal of ensuring that their company's shareholders receive a good financial return – that is, a return that will exceed their (the shareholders') initial investment in the company as well as the amount they would have earned if they had invested in another firm, whether the firm is a competitor or not. It is necessary to note here that achieving this goal is very important, given that the present day business climate, which is characterized by hot IPOs, has created cut-throat competition for investment dollars among firms.

Modern-day managers also have other reasons for showing a keen interest in value creation. First, executive compensation packages usually include stock options. Second, if there is convincing evidence from the executive's track record that they (the executives) have consistently achieved the goal of increasing value for their companies, they will definitely increase their chances of commanding a premium with other potential employers in the industry. Moreover, an executive who can present a proven track record of value creation can significantly improve his or her professional longevity. This is because, during corporate mergers and acquisitions, they have more chance of retaining their jobs than those executives who are believed to be "under-performing" in terms of value creation (Sharman n.d.).

Note also that executives' performance was originally assessed on the basis of annual profit returns. However, the proponents of the VBM model have tended to view this approach as a short-term measure which, as a subjective assessment, does not provide any relevant information about financial return in the long run. It is thus not surprising that many firms have shifted from measuring value using the annual profit returns approach to using the VBM model. As we noted earlier, there are many metrics for assessing value performance, with the simplest being the EP. The bottom line here is that, in most modern-day firms, the compensation made to the executives is usually geared to their achieving their firms' goals as they relate to reaching the EP performance target.

Before leaving this review, we would like to make a brief critique of the VBM strategy. This will be the topic of the following section.

A critical analysis of VBM

We want to start our criticism of the VBM strategy by noting that most managers that claim to adhere to the VBM model often focus on increasing shareholder value. We see this excessive attention to creating value for the shareholders as a form of shareholder capitalism – a model where corporate managers feel responsible only to the shareholders, with less attention given to other parts of the corporation. We have our reasons for assuming this position.

During the 1950s and 1960s, corporations were run in a manner that considered all the stakeholders as kings (Pfeffer 2009). Thus the managers and CEOs of firms understood

that their main role was to take appropriate measures to balance the interests of all the firm's stakeholders, which included customers, suppliers, shareholders, employees and the firm's host community. Thus the successful executives in that era were the ones that understood the complex nature of their role, both as stewards of their firm and also as professionals who were working to further the unique interests of their firm's stakeholders. The point to note here is that what was true in the 1950s and 1960s is still valid in today's business environment, which is characterized by outsourcing, knowledge work, activist's interest groups, and globalized supply chains (Pfeffer 2009; Rappaport 1998; Beck & Britzelmaier 2010).

It is worth noting here that the idea that CEOs or their corporations should focus on creating value for the shareholders (that is, the VBM model) took hold in the 1970s due to the widespread popularity of the theory of efficiency and intelligence of markets, especially among finance and business professionals. By that time, world societies had, to a very significant extent, organized themselves through financial markets. For instance, a home was no longer considered to be merely a dwelling place for families but as an option and investment on future real estate prices. In addition, a basic need such as child care, which was previously a family issue, was now a business which, like every other stock, was being traded on the floor of the stock exchange (Pfeffer 2009).

Considerable empirical evidence and sound theoretical arguments justify the maxim that the market allocates resources efficiently. However, the market can only do this when the prevailing conditions are appropriate. This implies that the market can allocate resources efficiently if, and only if, there is an adequate level of competition and information, and people have the opportunity as well as the freedom to make rational choices on an individual basis. It is important to note here that the proponents of the idea that the market holds the solution for efficient resource allocations often tend to overlook the fact that the aforesaid conditions do not always prevail in the business environment (Pfeffer 2009).

It is thus worth pointing out that opinions on issues related to finance, deregulation, time horizons, and the leading members of the corporate world are currently shifting to something new. Hence there are a growing number of corporate leaders who currently promote the view that the logic behind the idea of making shareholders' wealth the number one priority and putting it ahead of increasing stakeholder value is no longer valid. Hence, given that many countries worldwide are undertaking significant political realignment, and the fact that the world is still in the process of emerging from what is considered to be the worst economic recession since the Great Depression, there is a very high possibility that pursuing stakeholders' interest will be among the top priorities of most firms.

From a business standpoint, we consider it important to state here that there are numerous historical economic data that offer compelling evidence that companies can make significant improvements in profitability and productivity by putting the stakeholders'

interests first instead of those of the shareholders. Besides, numerous corporations in Germany have achieved laudable success by implementing measures that require high commitment in work practices. Some of the techniques used by these organizations in this regard include making significant investments in training and development, decentralization of the decision-making process within the organization, and linking staff or executive compensation to the organization's overall performance instead of the usual practice of making staff salaries contingent on individual performance (Pfeffer 2009). A large number of researchers have provided persuasive evidence that organizations can also reap huge benefits when they make the necessary effort to build customer loyalty and enhance or increase the levels of customer satisfaction.

Given the above background, we feel very confident in refuting the idea that the CEO and managers should only use those ratios or measures that indicate the financial performance of their firms in their work. Generally speaking, we do not believe that there is a legal reason or even basis for making the shareholders' interests the number one priority of a firm. The most striking point about giving shareholders exclusive priority is that it gives managers broad latitude to justify any action they take - regardless of whether or not such actions enhance profitability - by declaring such actions to be in the interest of the firm's shareholders. The bottom line here is that they are not bound by any law to do so (Pfeffer 2009).

Even in terms of logic, shareholder preeminence fails the test. Also, the maxim that the stock information from the stock market is accurate in terms of providing reliable measures and estimates of value has been refuted on many occasions. For instance, in the past two decades, there have been many firms that have collapsed some of them almost overnight, after they were rated as viable on the basis of stock market information (Pfeffer 2009).

As a concluding remark for this section, we want to state here that the stakeholders' interests should be the number one priority of every firm. The idea of VBM, which tends to promote shareholder capitalism, need not only be the golden rule for a firm's operations.

Having presented the short review above, we will now proceed to the next section, where we will cover sample description and the methodology for the study.

Methodology

Before proceeding with the data collection exercise, we will recap our aims and objectives here to reinforce the focus of this study. Hence, our research questions are presented as follows:

- To discover if there is a connection between VBM and profitability in the German automotive industry;
- To identify the kinds of key metrics the industry uses in this regard;

- To discuss how the industry uses the VBM system; that is whether or not it is used in risk management, planning and budgeting, change management, and so on;
- To discover the connection between VBM and executive compensation.

Having restated these aims and objectives here, we will now proceed with sample description and data analysis below.

Sample Description

Data collected from samples were used in this study. The first sample was based on a survey of relevant information culled from financial reports, presentations, press releases and papers on the German automotive sector, all of which are available on the internet. The companies in this industry include amongst other Adam Opel AG, Audi AG, BMW AG, Daimler AG, Dr. Ing. h.c. F. Porsche AG, MAN SE, Volkswagen AG, Behr GmbH & Co. KG, Borg Warner Beru Systems GmbH, Continental AG, ElringKlinger AG, Knorr-Bremse AG, Kolbenschmidt Pierburg AG, Mahle GmbH, Mann+Hummel GmbH, Robert Bosch GmbH, ZF Friedrichshafen AG. The second sample consisted of 100 managerial staff working in the German automotive industry, among whom are the staff of the above mentioned companies.

Data Analysis, Results and Discussion

In this study, 100 emails were sent to a random sample of the managerial staff of the automotive companies listed above. In these emails, they were asked to respond with their opinions on how VBM strategy affects profitability in their organization. Eighty-eight of them replied and their responses were tabulated as shown in table 1 below. The null alternative hypotheses are re-stated as follows:

Table 1: Has the VBM strategy enhanced your company's profits?

<i>Company Location</i>	<i>Yes</i>	<i>No</i>	<i>Don't Know</i>
<i>Germany</i>	<i>12</i>	<i>21</i>	<i>19</i>
<i>United States</i>	<i>13</i>	<i>8</i>	<i>15</i>

H0: Enhanced profitability does not depend on the management's willingness to adopt VBM strategy.

H1: Enhanced profitability depends on the management's willingness to adopt VBM strategy.

To test this hypothesis using this sample data, we used the Chi-Square test of independence with a significance level of $\alpha = 0.10$. The results of this test are presented in table 2 below.

Table 2: Chi-Square Test of Independence Computational Results

Significance Level, α	0.10
Degrees of Freedom	2
Critical Value (C.V.)	4.605
Calculated Value (X^2)	7.825

From table 2, it can be seen that the calculated value (that is, $X^2 = 7.825$) exceeded the critical value (that is, C.V. = 4.605). Hence the decision here is to reject the null hypothesis and conclude that enhanced profitability is a product of effective implementation of VBM strategies by managers.

It is necessary to point out at this juncture that although the results of the above analysis provide direct evidence that VBM enhances productivity, organizational managers need to be cautious about basing their strategy on profit maximization. This is because when an organization's success strategy is based primarily on profit maximization; there will be a high likelihood that the organization's managers may not provide adequate incentives to take care of the long-term consequences of such a decision. To obtain a clearer perspective of this issue, we will use one hypothetical example. Suppose a firm whose VBM strategy is profit maximization raised the price of its products and also cut costs dramatically, and hence increased its quarterly earnings to the satisfaction of its investors. In this scenario, two things could happen. First, the firm's market share would be affected significantly, and this could impact on the firm's ability to compete in the near future. Second, the quality of the firm's processes and products could also be affected, and the firm's ability to attract and retain talent would be severely handicapped.

Broadly speaking, operating profitably and efficiently, with cost-effective teams and projects, is the goal of every organization. No organization wants to ignore short-term goals. However, it is not a sustainable strategy for an organization to sacrifice long-term profitability in its bid to achieve long-term profits. Ultimately, the management of every organization always strives to build and maximize their organization's capability to be profitable in the long term. The bottom line here is that the VBM approach can enable management to do this only if they adopt an appropriate approach – increasing value for all the stakeholders (customers, shareholders, employees, and the host community).

The next question that needs to be answered in this section is aimed at ascertaining the key metrics used by these organizations in the VBM program. The analysis of the information culled from the company's websites (that is, the German automotive industry), press releases, financial reports and presentations that are available from the internet revealed that the key metrics are return on capital employed (ROCE), shareholder value analysis (SVA), economic value added (EVATM), cash flow return on investment (CFROI), economic profit (EP), and net present value (NPV). However, ROCE should not just be considered as a value-based management metric because it does not integrate risk represented by the cost of capital and

different uses of options to capitalize and value assets and liabilities (Kauffmann, H. & Götzenberger, G. 2006; Britzelmaier 2010; Hannig, U. 2007). This variety of used metrics raises two interesting questions: what do these automotive organizations measure with the aforementioned metric? Is there a connection between VBM and executive compensation?

The first question can be answered by looking at table 3, which shows the response made by the respondents (88 managerial staff in the German automotive industry) on their use of VBM metrics.

Table 3: During the past three years, did you frequently use any of the VBM metrics for ...?

	Yes (%)	No (%)
<i>Measurement and control of organization's processes</i>	87	13
<i>Planning and budgeting</i>	90	10
<i>Risk management</i>	93	7
<i>Value driver management</i>	90	10
<i>Change management</i>	83	17
<i>Profitability assessment</i>	96	4
<i>Investment appraisal</i>	99	1
<i>Change management</i>	67	33

From the table, it can be seen that majority of the managerial staff interviewed confirmed that they use VBM metrics regularly in their work. For instance, 87% of them use them for measuring and controlling their organization's processes; 90% of them use them for planning and budgeting; 93% of them use them for risk management; and so on.

The second of the two questions can be answered by looking at figure 1 below, which shows the responses made on whether or not a connection exists between VBM and executive incentive compensations. The figure shows that there seems to be a connection between the two since 84%

of the respondents confirmed that a comprehensive VBM strategy or model is one that, to a very large extent, ties executive compensation to the appropriate VBM metric by way of cash bonuses paid to the executives. In their financial statements most companies give also an explanation about how they link their value-based management approaches to executive incentive compensation. This is also used to prove that there is a connection between VBM and executive incentive compensation.

Having completed the analysis and discussion of results in this section, we will now proceed to conclude the paper.

Conclusions

This study has shown that most of the German automotive industry operates on the basis of the VBM model. The study has also revealed that the overall goal of the VBM model is to maximize the value of an organization. This means that in the German automotive industry, the desire for short-term profit is not the main factor that influences the decisions made by managers. Instead, the managers of these organizations generally take into consideration the potential impact of such decisions on the sustainability and profitability of their organizations in the long run.

Before concluding this study, it is important to note that managers and executives in the automotive industry need to understand the importance of constantly searching for investment and growth opportunities that will ensure their organization's success through the creation of value as well as effective utilization of the organization's capital. Broadly speaking, the belief in and the understanding of the fact that future cash flow and growth are the main source of an organization's value is the fundamental principle of VBM. In this paper, we have demonstrated of VBM in the automotive industry believe that looking at accounting-based measures, such as earnings per share, quarterly earnings, price/earnings

ratio, and so on, may not be the best approach for making strategic decisions in an organization. However, it may be an uphill task for the management of the German automotive industry to ignore these measures completely, especially in the 21st century business environment where short-term investors are putting significant pressure on corporations.

As a concluding remark, we want to state here that the VBM approach is not only a philosophy but also a methodology. The basic tenets of the VBM approach can be summarized as follows: every decision that managers make should be based on how the decision will contribute to the value of the organization. Hence, it is important that the automotive industry in general pushes for the implementation of the VBM strategy, both in boardrooms and throughout every level of organizations. However, we will also infer here that organizational success (especially of those organizations that manufacture automobiles), which can equally increase shareholders' returns, is the result of sound organizational practices that respect the interests of all stakeholders (customers, employees, suppliers, shareholders, and the organization's host community).

The survey has been conducted based on information given in the financial reports and answered emails that were sent to a random sample of the managerial staff of the automotive companies. The next research step could use interviews with decision-makers to obtain a higher degree of detail and to justify the results acquired from the information obtained so far.

**COMPANY INTEGRITY MANAGEMENT IN THE NEW SOCIAL NETWORK
ENVIRONMENT: A STUDY OF SMALL, MEDIUM AND LARGE FIRMS ON
FACEBOOK AND TWITTER**

Abstract

Companies are increasingly recognizing that social networks are a force to contend with in reputation management. There are numerous examples of how single voices using viral systems have, in a matter of days, reached out to millions about poor service or flawed products. Managing social networks is, however, not without cost and thus one could reasonably assume that larger companies would have better defined strategies for social network reputation management than smaller ones. The paper explores this assumption and offers an integrity management model. The social network activities of ninety nine different size companies (33 small, 33 medium and 33 Large) were examined and results supported that larger companies are slightly more responsive but smaller firms seem to respond more quickly. Of interest was the number of firms (of all sizes) without social media sites. There appears to be a general lack of a strategic framework for thinking about communities as most firms in the study were not monitoring, integrating and leveraging social media adequately.

Introduction

Recognition of the importance of brand and company image, how that image is established as well as factors that might influence the bond (to include word of mouth campaigns, catastrophic events and product recalls), is of increasing importance. This is highlighted by such recent events as the: 2011 massive product recalls of Johnson and Johnson putting into question the ability of the multinational to effectively control manufacturing quality; the devastating oil spills of BP resulting in significant stock devaluation and high level; Nestlé's forced adoption of a new policy (2010) to identify and exclude companies from its supply chain that own or manage 'high risk plantations or farms linked to deforestation after an online expose by Green Peace; and the Sony identity theft problem (2011) where hackers obtained personal information about millions of game station users. Each of these occurrences resulted in significant negative image effects.

Each event serves as a reminder that what may appear to be strong connections between consumers and a company or product brands may in reality be a fragile relationship. It is highly likely that how the relationship is developed, or maintained, can directly affect whether it will withstand short term disruptions. Once consumers word of mouth (WOM)

activities were conveniently isolated involving lone voices against large firms. With the aid of viral networks these voices now have the ability to garner the attention of millions. Sheth (Sheth, J. and Patvatiyar, A, 2002) has argued that companies promote relationships with consumers to insulate the firm from market whims. They believe, however, that decisions concerning whether to maintain a brand relationship repurchase or switch brands are often more emotional/behavioral than based on facts.

One environmental threat to the equilibrium of image, which is not being adequately addressed by firms, relates to the new internet social networks (SN) which include such platforms as Facebook, twitter, blogs as well as online reviews and rating sites. These instant sources of communication have made it possible, due to widespread and low cost information, for rapid image disruptions to occur for legitimate or irrational reasons. Such disruptions are likely to put pressures on the consumer relationship by altering consumer perceptions of the brand and/or the company. Taco Bell restaurants, for example, acted quickly through an internet and YouTube campaign to maintain image by addressing concerns that were raised when a group in 2011 requested the American Food and Drug Administration to look into beef percentage in the company's products. In another example the president of Domino's Pizza responded personally when a YouTube video was posted showing an employee putting Pizza in his nose and then serving it. Acting boldly the president, within days, posted his personal YouTube response noting video was a hoax but of grave concern to the firm. He not only cited actions the firm had taken but ended by offering an apology to the loyal employees of Domino's and the firm's faithful consumers who had been deceived. It was clear that these companies recognized the possible damage to their loyal consumer base designing internet media campaigns to preserve the relationship. Broadly the fears of companies, resulting from sufficient actual incidences over the past few years and the often disorganized responses to them, have resulted in the increased awareness of corporate social network business continuity programs designed to mitigate threats to the brand and company image. Previously the major responsibility of business continuity programs was to assure that a firm could operate after facing supply chains disruptions, damaged manufacturing facilities or disturbances in personnel. Josiah (2009) found that the continual monitoring of today's highly interactive social network environment now must be added to the list of threats to a firm's image. Managing the social network environment is essential to staying relevant and building a loyal fan base. Simply having a social network is clearly not sufficient. Firms must be both engaged with those sites through monitoring and timely responses as well as actively seeking to develop consumer trust. One of the critical aspects in developing a social network relationship relates to trust. Invoke Solutions, a social media research company, "found that the most trusted information was posted by people respondents knew, "people like them"—their friends, family and other online peers. Blog posts were more likely to be trusted "completely" than posts on Facebook and trust dropped off sharply when it came to Twitter. Twitter streams were trusted less than other media, even

amongst friends” (MacAlpine, 2011). The result of a broad research project by Invoke Solutions yielded several insights into the features that are important in developing trust. It is not surprising that the most important factors in developing trust were not the size of the reader base or the how long a person had been engaged with the company’s social media. The most important factors were whether the site was open to dialog (meaning both positive and negative postings) and if there was high level quality of the content. The importance of active monitoring and professional responses is clearly highlighted

<i>Table 1. Features important to inspiring trust in social media sites</i>				
<i>% of US frequent social media users</i>				
<i>Extremely Important</i>	<i>Somewhat Important</i>	<i>Neither Important nor Unimportant</i>	<i>Somewhat Unimportant</i>	<i>Not at all Important</i>
<i>The dialog is open to both positive and negative comments</i>

Robert Kozines (March, 2010 p.71) in a historical perspective of word of mouth (WOM) research offers a series of models to explain how WOM, and the company reactions to it, have changed over time. He calls attention to Ryan and Gross’s (1946) statement six decades ago that, “conversations among buyers were more important than marketing communications in influencing adoption” as one of the first articles addressing consumer interaction. Referring to this stage as The Organic Interconsumer Influence Model Kozines notes that what is involved is action by one consumer to another without direct prompting, influence, or measurement by marketers. According to Kozines this stage was followed by the Linear Marketer Influence Model where marketers attempted to influence consumer WOM. It was during this stage that companies began to recognize the concept of the opinion leader and how they could be used to sway consumer preferences. Building on these models he developed, the Network Coproduction Model where marketers are positioned as becoming

directly involved in focused “one to one seeding and communication programs... allowing unprecedented new levels of management and measurement (p. 72)”.

According to Davis and Moy (2007) the internet has created a new wave of intensely engaged “professional consumers” that they term “prosumers”. These active prosumers create company news and can rapidly effect a firm’s image. Through them a one-time incidence of bad service can be echoed around social networks reaching thousands of consumers within minutes. Network social groups obtain their power in the same manner that Inter-networks do. As the popularity of social online communities increases companies need to take cautionary measures in protecting reputations and brands become essential. (Jones, 2009) pointed to new expanding active online consumer roles such as “consumer watchdog, investigative journalist, and opinion influencer”.

Robert Metcalf’s law designed to illustrate how computer networks on the internet derived their value is equally valuable in helping to understand how social network derive theirs. The law states that the “value” or “power” of a network increases in proportion to the square of the number of nodes on the network (Hendler, J. and Golbeck, J. ,2007). This means that as the number of people in a network grows the value of the content they share grows exponentially. For example, if there are 10 people in a social net the power of the structure is 10^2 or 100 . If the number is, however, increased by simply one member the power now becomes 11^2 or 121. This quickly explains why viral networks, which can quickly amass thousands of members/viewers, can be so dangerous.

Jolly (2001) refers to company’s choice of communication as either “dialogue” or “monologue” as companies traditionally have had a one way communication channel to their consumers. In social networks one way communications directed toward consumers are becoming increasingly ineffective. Company Web postings promoting the firm or products as well as paid on-line advertisement cannot by itself protect image since it is externally viewed as self-serving propaganda. Companies now must establish interactive communications with the many social platforms consumers use to exchange ideas, cooperate and even to seek advice from consumers in what is considered as “social casting” (Jones, 2009). Companies must have well thought online social network strategies that call for implicit collaboration between a company and the social network environment in order to shape and protect their image. In response to the recognition that social network members can significantly influence the value (positively or negatively) of a company brand or image there have been a number of new products designed to passively monitor social sites and inform users of potential dangers. These software products are similar to the “old” press clipping firms that monitored news and popular magazine articles.

The concern that social media networks are increasing in power is not exaggerated. A finding of The Rising CCO III (2010), an annual survey conducted by global executive search firm Spencer Stuart and global public relations firm Weber Shandwick stated that 34 percent

of global chief corporate communications officers (CCOs) report that their companies experienced a social-media based reputation threat during the past 12 months. That firms have yet to incorporate social networks into their monitoring or business continuity plans is clear as the same report noted that approximately 33 percent of the companies surveyed stated that were not prepared for managing social network types of online reputational threats. Without a defined strategy firms remain vulnerable to attacks and can only operate in a defensive manner. Given the seriousness of the need for social network monitoring the low figure raises questions. Is it that the CEOs of large firms grew up in the “pre-social network” generation that causes these firms to fail to recognize the threats? Is Facebook’s or Twitter’s membership and power base relegated to being not of high importance to company business because of the age of upper management? The ease with which social networks seem to be dismissed as significant business threats in spite of the clear examples is troublesome. In a recent financial times article, “The challenge of protecting reputation” Paul Argenti (2005) of the Tuck business school points to three distinct types of threats failing, as so many do, to include social media networks. His three threat areas are: 1) natural disasters, such as earthquakes, fires and hurricanes (how the company responds represents the risk); 2) man-made fiascos, such as ethical violations (for example, Martha Stewart’s questionable trades); and 3) attacks from antagonists (such as attacks by the Centre for Science and the Environment, an Indian environmental group, on Coke and Pepsi” Argenti (2005 p. 3). Argenti points out the importance of having, “an engaged CEO along with a cross-functional task force is often the best insurance a company can have as it attempts to assess its reputational risk” and recommends that firms should: Prepare for potential problems; Plan company responses; Analyze constituencies and Provide as much certainty as possible (Argenti, 2005 p3).

It is clear that small firms as well as large ones are increasingly becoming aware of the power of social media and some, to varying degrees of sophistication, are incorporating these tools in their communications portfolios. One would assume that large companies, by virtue of their resources, would be ahead of curve compared to smaller ones. A recent study (McCann, 2010) conducted by communications firm Burson-Marsteller noted “65% of the largest global companies have Twitter accounts, 54% had Facebook fan pages, and 50% had YouTube video channels” The study also noted that while financially significant for large firms a social media campaign can be “less than 1% of their overall marketing budget. The study while discovering that a number of firms had accounts did not investigate how the firms use these tools or if they were part of a organized communications strategy or answering the fundamental questions of:

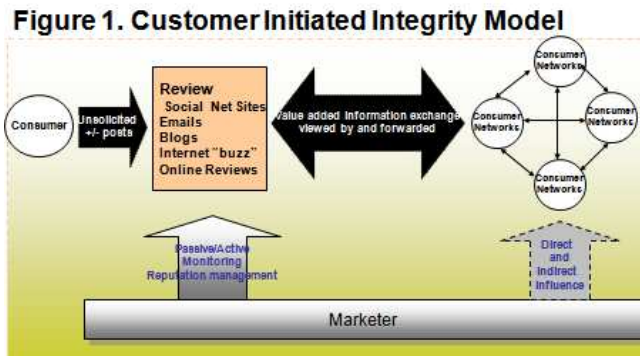

- Who will monitor and control the company social media websites?
- What kind of analytics data will be gathered?
- If visitors post to the site how is this noted and how will/does the firm react?

- Who is responsible for observing what people are saying on the web (other websites, blogs etc.) and what is in place to monitor and act to influence reputation externally?

A new social media model

The authors have developed a new model which expands the concepts of Kozines' Linear Marketer Influence Model to reflect the new reality that consumers have assumed a power base of their own which operates external to company influence. While Kozines recognizes the importance of monitoring the social environment the authors believe that a model of company/brand reputation management needs to reflect the continual interplay and accumulation of many consumer networks as a dynamic ongoing and interconnected process. In the Consumer Initiated Integrity Model the marketer recognizes the geometric growth and power of Web Word of Mouth (WWOM) and continually monitors Internet postings while cautiously attempting to influence/respond to them (Figure 1). The consumer initiated integrity model is more comprehensive in nature, and expands the reputation management list of Argenti (2005) by including social media monitoring and response. The new list includes:

- Plan reputation management strategies to be able to allow the right respond to risks in an immediate manner
- Develop a crisis management process
- Understand all threat environments
- Apply new technology to monitor social media
- Set priorities for reputation *risks*
- Plan scripts and/or policies for response including a broad representation of company departments (management, legal, marketing) as preclearance allows rapid responses
- Assure management understands the disruptive potential of Social Networks
- Analyzing constituencies to include "opinion leaders" ," influencers"" and "prosumers"
- Provide as much certainty as possible to how the firm will respond and who will be responding

The research was designed to address the Consumer Initiated Integrity Model's aspect of social media monitoring by investigating the monitoring of postings to company sponsored social networks sites (Facebook and Twitter). The purpose of the research was to explore the tenets that: (1) large firms would have more active presence in social media activities than small firms, (2) that these large firms would also recognize the importance of an ongoing vigilance of their sites and (3) large firms would be in a better position to respond in a more value added manner. Facebook and Twitter postings were made to ninety-nine firms, selected from large, medium and small capitalization United States firms. The postings asked for a response indicating the postings had been observed in order to check if:

- Firms have social network platforms in place
- These platforms are monitored and responded to
- The length of time to takes a firm to respond related to the firm's size

To this end the follow three hypothesis were formulated:

- Hypothesis 1: Large firms will respond to social network (Facebook and Twitter) posts at a greater frequency than small firms.
- Hypothesis 2: Large firms will respond more quickly to social network posts (Facebook and Twitter) than small firms.
- Hypothesis 3: Large firms will post more positive category posts than small firms.

Research Methodology

Firms studied

Ninety-nine firms were investigated from 13 industry sectors. Thirty-three firms were taken from the Fortune 500 (2010) listing, 33 were from medium sized firms (New York Stock Exchange medium size capitalization listings) and 33 firms were taken from the Small Capitalization listing of the New York Stock Exchange (all 2010). The sectors were: Airlines and Hotels, Apparel, Food and Beverage, Automobile and Services, Entertainment and Publishing, Finance (Banking, Insurance), High-tech (IT, Electronics), Health Care (Pharmacy

and Other Services), Energy (Mining, Crude-Oil Production), Transportation and Logistics, Telecommunication, Internet, Wholesalers.

Responses were classified into three categories: active, neutral and no response. Companies were considered to have responded to researchers actively if they not only replied to the post but also offered further help are considered "active response." If a firm responded with a value added contribution (e.g. "interesting research", "can I help more") the response was considered active. A firm that responded with simply doing what was requested (note the posting) was considered neutral and firms that failed to respond were classified, no response.

Methods

Companies were selected in a random manner from the Fortune 500, NSE midsize capitalization and the NSE small capitalization listings (2010 lists). If a firm did not have a Facebook page the firm was discarded and another from the sector was selected. The process was continued until 33 samples were obtained for each of the three firm sizes. A post was made to the Facebook page of each firm and to the firm's twitter site. The time of the posting was noted as was the time of a response (if there was one). The Facebook site and the Twitter site of each firm was monitored every five minutes for the first hour and then on a systematic basis for a total period of seventy-five hours. The posting on each company site was standard. The posting on Facebook was "*Boston University Research Project in Reputation Management. Could the company Facebook site manager respond to let us know this post was seen. Thank you.*" and the posting to the Twitter site was "*Boston University Research Project in Reputation Management. Could you respond to let us know this post was seen. Thank you.*" The Twitter posting was slightly different than the Facebook posting due to the limit of 140 characters. The total number of possible responses if all firms in the study had both a Facebook and Twitter site was 132. The actual number of was 119 as 13 firms were missing either a Facebook or Twitter site.

Results

While many take for granted that having a presence on a social network is something that firms now do of the 99 firms (33 of each size) six small firms, eight medium and four large size firms had no Facebook site. These firms were replaced in the selection process by firms that did, so as to maintain the total sample at ninety-nine. Two of the large firms (FedEx and Comcast) did not allow posting to their Facebook page but were kept in the study). For the medium firms there were 10 feedbacks from Facebook, 15 feedbacks from twitter (3 companies don't have twitter pages (Waste Connections Inc, Shaw Group and Martin Marietta Materials). Of the 198 possible posts figure 2 presents the responses to the postings by the three different size firms. There were twenty-six feedbacks from Facebook and thirty-nine feedbacks from twitter. Appendix 1 depicts the number of responses per sector during the seventy-two hour timeframe in which the sites were monitored for company feedback.

There were ten responses on Facebook from the large capitalization firms and fifteen from Twitter.

Figure 2

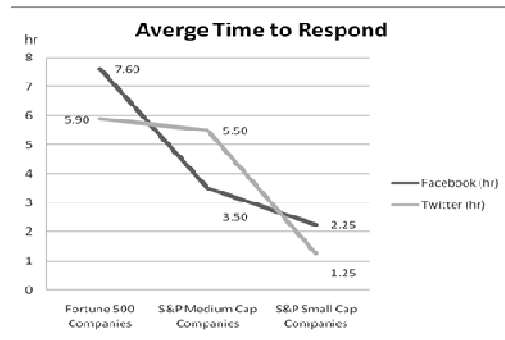

Firms differed significantly in regard to the time to respond (Table 2 and Figure 3). Of the small firms the fastest responding firm was Comsore, on Twitter (3 minutes) and the slowest was Heartland Express, Inc. taking twelve hours and fifty-nine minutes on Facebook. The fastest medium size were Westar Energy and Telephone & Data Systems Inc (Twitter, 4 minutes). The slowest was Advance Auto Parts Inc (Twitter, 27hr 15m). Of the large capitalization the fastest was Starwood Hotels & Resorts (Twitter, 3 minutes), UPS (Facebook, 3 minutes) and AT&T (Facebook, 3 minutes). The slowest large firm was Ford (Twitter, 49 hours). The average reply time (of those responding only) for large firms on Twitter was 7.6 hours and the average time to reply to a Facebook posting was 5.9 hours. The average for the medium on Facebook was 3.5 hr 32m and 5.5 on Twitter and for the S&P small-cap 600 the average was 2.25 (Facebook) and 1.25 (Twitter). Medium sized companies tend to respond to posts faster on Facebook than they do on twitter which was different from the Fortune 500 companies and S&P Small cap companies, however, medium sized firms did (as did the others) have more posts on twitter.

Table 2. Average Time to Respond

	Facebook hr (# rpl)	Twitter hr (# rpl)
Fortune 500	7.6 (10)	5.9 (15)
S&P Medium	3.5 (10)	5.5 (15)
S&P Small Cap	2.25 (6)	1.25 (9)

Figure 3

Large, medium and small firms did respond differently in regard to the quality of the response (Table 4 and figure 4). Ten large firms (16%) and 12 (19%) medium size responded in an active manner while no small firms do so. The responses of Large, Medium and small firms were relatively the same (Large 24%, Medium 21% and Small 26%) for the natural category response. More small firms did not respond (74%) than medium or large firms (both 60%).

Table 3. Attitudes of Tonality

	Active	Neutral	No response
Fortune 500	16%	24%	60%
	10 out of 62	15 out of 62	37 out of 62
S&P Medium Cap	19%	21%	60%
	12 out of 63	13 out of 63	38 out of 63
S&P Small Cap	-	26%	74%
	-	15 out of 57	37 out of 57

Figure 4.

Conclusions

The purpose of the research was to investigate some of the behaviors linked to the management of online social media site posts for three different size firms and how that management could relate to managing a company's online reputation. It is interesting that in some of the research companies behaved in a similar manner regardless of size and in some areas there was a difference. In contrast to Twitter which remained open (when available) to posts by consumers, companies imposed controls on their Facebook pages. For an individual to post a comment on any of the company sites surveyed one first had to "like" or become a "fan" of the company. A significant number of companies would not allow individuals to comment on their home Facebook pages. Normally when they did the comments went to a second level page. Most of the Small and medium cap companies acted the same as Fortune 500 companies in not allowing individuals' comments being shown on their Facebook pages.

The overall response rate was as low as 35% and several firms from all categories did not have social media sites. This is consistent with the findings of research conducted by two media firms who found that while 34 percent of global chief corporate communications officers reported their company had experienced a social-media based reputation threat in the past 12 months approximately 33 percent of the companies stated that were not prepared for managing social network types of online reputational and had yet to incorporate social networks into their monitoring or business continuity plans (Rising CCO III, 2010). Reinforcing that firms are unclear how to properly use social networks, of those firms included in this study, a significant number did not respond to postings on the firm's Facebook or Twitter sites (60% large and medium and 74% small). This is a worrisome finding, given the increasing importance of social networks to the development and maintenance of a brand or company image. The high non response rate for both small and large firms indicates that all size firms have yet to seriously focus on the use of social networks as a part of an overall integrated communications strategy. Given the increased exposure and number of examples citing the importance of recognizing the power of social networks this is surprising.

The first hypothesis that large firms would respond to social networks at a greater frequency than small firms was supported. Forty percent of the large size firms responded to postings on either their Facebook or Twitter pages while only twenty-six percent of the small firms did. The relative size of the firm was related to the frequency of response as large firms had the most responses, followed by medium with small the fewest.

While most social network sites surprisingly did not allow for interaction the majority of facebook pages were well organized with news of products and services posted regularly. Without interaction, however, one could question if these sites are not really "social media" sites but extensions of the firms static webpages. Twitter's less organized and more informal

(and less expensive) display appeared to make a more efficient two-way communications platform for firms of all sizes than Facebook.

The second hypothesis that large firms will respond more quickly to social network posts (Facebook and Twitter) than small firms was not confirmed and the opposite was observed. It is interesting that when small firms responded they did so quicker than large firms. The average time to respond to the post indicated the companies respond faster on their twitter pages than they do on their Facebook pages. Contrary to expectations the smaller the size, the faster they responded as the small companies were the shortest, the medium ones took longer, and the largest companies were the slowest. All companies responded to postings faster on twitter than Facebook. The reason could be that twitter offers a more instant-message like environment that encourages immediate communication. When small firms did respond they tended to use Twitter, not Facebook, and responded quicker than large firms. The use of Twitter might account for the lack of value added responses as fewer characters (140) are available to respond. It might also point to the use of mobile devices for small firm monitoring which makes longer messages more cumbersome and thus less likely.

The third hypothesis, that large firms will post more positive category posts than small firms was supported. Large firms posted 16% positive responses while small had no such postings. It is important to note, however, that medium sized firms (with 19%) had more posts in this category than large. It is interesting to note that the difference between small and large firms is found, not in the number of neutral response as the responses of Large, Medium and small firms were relatively the same for the neutral category (Large 24%, Medium 21% and Small 26%), but in the number of value added responses (active classification). Given that no small firm provided anything other than a neutral response might further indicate that small size firms in general are not devoting resources to maintain a professionally trained staff so as to quickly and personally reply to social posts.

There was no significant difference in the percentage of neutral category responses comparing the large, medium and small firms (Large 24%, Medium 21% and Small 26%). It is interesting to note that the positive response rate by medium firms (19%) was slightly higher than large companies (16%). One might wonder if medium firms are better positioned for change having more funds to devote to social network activities than small firms but are, at the same time, not as encumbered with massive slow moving bureaucratic processes as the larger ones.

An unexpected finding was the number of non-monitored social networks and that, regardless of category, few firms were actively involved with their own social media to the extent one would expect. The overall poor response rate is a worrisome finding. It tends to indicate that while the business world is aware of the power that social networks can yield companies of all sizes remain naïve as to how to establish truly interactive personal relationships. This is interesting given the increasing importance of social networks in

developing and maintaining a reputation and image. While surprising, the general lack of appreciation of the increasing importance of social networks has been previously noted. Murphy (2006) found an overall lack of either presence or response to sites pointing out that some traditional marketers believe that they have nothing to gain from customer empowerment, and that blogging only results in brand bashing. Sing (2008) provided some insight into why many firms have taken a rather passive approach to social networks stating that, "Marketers have been accustomed to telling the customer the message they want the customer to hear, rather than the message the customer truly cares about" (Singh, et. al, 2008 pp. 282).

A significant number of companies, large and small, did not have Facebook sites that could be directly responded to which would seem to indicate that while some firms have recognized the need to establish social network sites, most do not know what to do with them. Small companies, in particular, give less emphasis on establishing social network sites or joining the discussion of their clients. Generally there appears to be a lack of a strategic framework for thinking about communities as most firms were not monitoring, engaged, integrating and leveraging social media adequately. This points to the need for top administration to move beyond from the classic communication models as outlined by Kozines (2010) and seek to develop the highly interactive customer initiated communication model proposed by the authors.

GOING PRIVATE IN ITALY. CHARACTERISTICS AND MOTIVATIONS OF PTP TRANSACTIONS

Bettinelli, Cristina¹; Danovi, Alessandro²; Fabrizi, Enrico³

¹Università degli Studi di Bergamo Italy

²Università degli Studi di Bergamo Italy

³Università cattolica del Sacro Cuore Italy

Abstract

This paper is part of a larger work examining the characteristics of public to private transactions (PTP, delisting) in Italy.

The aim of the paper is to verify if Italian PTP transactions can be explained referring to the agency theory perspective (Jensen, 1986a; 1989). Incentive realignment in Anglo-Saxon markets is a motivation for public to private transactions, especially for those companies that feel the need to reunite ownership and control in order to realign the incentives of managers and owners.. Weir et al. (2004) found support for the idea that the decision to go private is affected by concentrated institutional shareholdings. This finding is consistent with earlier studies (Maupin, Bidwell and Ortegren, 1984) which demonstrated that US companies with high managerial shareholdings in the 70s were more inclined to engage in PTP transactions.

One of the main differences between the Italian stock market and more developed ones is that often in Italy there is not a real separation between ownership and management, so that in public companies the agency problem invests the conflict of interest within majority and minority shareholders note then management and shareholders. Keeping in mind this framework, we propose the following:

H1: A motivation for delisting is the need to realign incentives; we thus expect high concentrated ownership firms to be more inclined to delist

According to Ronnemboog et al. (2007), managers (in Italy majority shareholders) are insiders and know better than everybody what is the real worth of the firm. This implies that if the firm is undervalued, they might delist it in order to develop the firm's potential with greater freedom. These situations occur especially among small listed companies which generally are not able to attract institutional shareholders and to fund growth. Empirical findings supporting the small size motivation were reported by Kierschnick (1998). This leads to:

H2: Small companies are more inclined to delist.

Within the 381 companies that from 2002 to 2008 were listed on the Italian market, we tested the motivations to delist. Data were supplemented by collecting accounting

information and the ownership structure from the Bvdep database called Osiris on a sample of 2,667 observations (381 companies for 7 years).

We analyzed the data by applying the General Linear Model which allows to model the values of multiple dependent scale variables measured at multiple time periods, based on their relationships to categorical and scale predictors and the time periods at which they were measured. The results indicate that H1 is confirmed (the number of shareholders is negatively related to the decision to go private) while H2 is not statistically supported (we didn't find a significant relationship between the PTP decision and company size).

Keywords : delisting, public to private, Italy

Acknowledgement

The paper is part of a broader research project led by professor Danovi. As it is a work in progress comments are welcome.

Subject and motivations

There have been a number of periods in various countries which have been characterized by companies opting for a transition from public to private. The first important wave of delisting took place in the United States in the 80s for a value of approximately USD 250 billion (Opler & Titman, 1993³). While the UK kept up with the US, if on a much smaller scale, continental European private-to-public transitions only emerged strongly in 1997 (Simons, Tomas, Renneboog & Luc, 2005⁴). These markets were thus in the early stages of their public-to-private transitions from the late 80s to the early years of the new century, whereas, for the more experienced UK and US, this era represented the second wave.

In terms of the topic of delisting, scholars investigate two major themes: its *motivations* (Renneboog, Simons & Wright, 2007⁵; Simons et al., 2005) and its *consequences* with a focus on delisting returns (Beaver, McNichols & Price, 2007⁶; Goetzmann, 1986⁷; Meera, Tripathy, & Redfearn, 2000⁸; Opler & Titman, 1993; Sanger & Peterson, 1990⁹; Renneboog et. al. 2005).

Another variable that might be considered when approaching this topic is how the transformation is carried out: the most common methods are LBOs (leverage buy-outs), MBOs (management buy-outs) or MBIs (management buy-ins).

From an economic point of view, the motivations behind delisting can be divided into *micro* and *macro* ones. These reasons are not necessarily the same all over the world. For example, in the US, the macro motivations are related to a favorable tax-law, and also to the presence of a real market for corporate control. These macro motivations are not necessarily valid for the Continental European situation. Traditionally, legal and fiscal regulation in Europe is not as favorable for companies choosing to become private entities as in the US. The typical structure of European markets also differs from the Anglo-American ones (Simons et al., 2005).

Most of what is currently known about delisting comes from US studies that focused on US companies. There has hitherto been a dearth of literature on delisting in continental Europe and especially on the reasons that lead to such a decision.

Economic and managerial motivations

From a *macro* point of view, the first important PTP transactions (which took place in the US) were motivated by deficiencies in corporate governance regulations and by the general lack of managerial incentives to focus on corporate value creation (Renneboog et al., 2007). The second wave of PTP transactions which took place both in the US and in Europe from the late 90s onwards were motivated by the downturn in the stock markets and the internet 'bubble bursting' which apparently made the cost of public equity too high for companies.

Moreover, specifically in the case of Europe, some countries undertook important law reforms on M&A (i.e. the introduction of minority 'squeeze out' provisions and fiscal reforms) which facilitated the management of PTP deals. An important macro motivation was also linked to the spreading of private equity funds and other types of financial intermediaries.

We focus now on the *micro* motivations for delisting retrieved from the present available literature. Scholars define them as "sources of wealth gains" (Renneboog et al., 2007: 595), these are: savings in tax, the reduction of agency costs (due to incentive realignment, control concentration or a reduction in free cash flow), the transfer of wealth from stakeholders to shareholders, a reduction in transaction costs, defenses against takeovers, and corporate undervaluation. In order to illuminate all the possible motivations, we consider as a point of reference the theoretical framework proposed by Renneboog and his colleagues and will combine it with further literature.

Tax Benefits. Tax benefits are enjoyed by companies that have high tax bills and decide to go private: going private is generally financed with a significant amount of debt which creates a considerable additional tax shield (i.e. possibility to deduct interests). It has been showed that, in the US, companies could, to some extent, gain tax benefits from going private (Kaplan, 1989)¹⁰. Results from another American sample confirmed this hypothesis (Lehn & Poulsen, 1989)¹¹. Later, Kieschnick (1998)¹² re-examined Lehn and Poulsen's (1989) data with a more advanced analysis and found that accounting for the influence of the Lehn and Poulsen's sampling procedure and for outliers, the tax benefit hypothesis remains significantly proved. Recently this relationship in the US has been proved by Kosedag and Lane (2002)¹³. The tax benefit hypothesis, however, is not accepted everywhere. In the UK, for example, the tax advantages of using debt sources are smaller than in the US (Renneboog et al., 2007) (Weir, Laing and Wright 2003¹⁴ and 2005a,b¹⁵).

To conclude, the tax benefit motivation is empirically proven in the US, not in the UK, as Ronnenboog (2005) note, even if firms that go private have higher tax benefits this doesn't mean that tax benefit represent the most important reason for delisting.

In Italy, although empirical study on the topic have not been carried out yet, this hypothesis seem not to be proved. Listed and private companies are ruled by the same tax law¹⁶ and there is not a tax advantage in being private if we don't consider more aggressive fiscal policies that private companies could conduct because of their fewer transparencies needs.

Even the tax shield benefit hypothesis seem not to be consistent because target companies of a LBO in Italy usually don't go private. High leveraged companies prefer to stay public in order to have easier access to the stock market.

16 In 1998 by D. Lgs 466/1997, Italy introduced a tax benefit for going public companies but the law was eliminated after a few years because considered against EC competition rules.

Incentive realignment, Monitoring managerial actions, free cash flow and leverage. The Agency Theory suggests that going private could solve the incentive problem of having conflicts of interest between shareholders and managers (Jensen, 1986a,b; 1989¹⁷). *Incentive realignment* is a motivation for PTP transactions, especially for those companies that strongly feel the need to reunite ownership and control with the aim of realigning the incentives of managers and owners. US and UK Public companies have a lot of shareholders that generally own small portions of equity. This leads to low interest in *management monitoring* (Jensen & Meckling, 1976¹⁸). In such cases PTP transactions allow for a more concentrated ownership structure and hence for a higher interest in the control of management activities. The ownership structure of most Continental European companies is characterized by a large dominant shareholder who exercises significant control (Faccio & Lang, 2002¹⁹). For this reason the incentive realignment and management monitoring motivations might be weaker for the Continental European companies and especially for Italy where dominant shareholders often exceed 50%. Another implication of Agency Theory is that managers that generally act in conflict of interests with shareholders are also inclined to retain resources and grow the firm beyond its optimal size, this leads to a waste of *free cash flows* (FCF), Jensen (1986a,b). Moreover, managers actions are also disciplined by the presence of leverage. When the public company's debts are not high, it can be economically interesting to go private because the transaction is easily fundable with new debt. In such a case as debts tend to increase in PTP transactions, the risk of default tends to increase as well. This determines the free cash flow hypothesis: high leverage associated with PTPs forces managers to efficiently run the firm and avoid both *free cash flow* waste in suboptimal investments and default (Jensen 1986; Cotter & Peck, 2001²⁰). As a consequence, one of the motivations of PTP can be described as the possibility to improve management efficiency, through an increase of debt. Nevertheless it also should be considered that high levels of debt might incentive managers to substitute low-risk assets for high-risk assets (an asset substitution problem: Renneboog et al, 2007). The free cash flow hypothesis has been supported empirically in the US by Opler and Titman (1993) and by Lehn and Poulsen (1989) while a different analysis conducted by Kieschinick (1998) on the same sample doesn't find any support to Lehn and Poulsen (1989) findings. In the UK Weir, Laing and Wright (2005a and 2005b) did not find any support to the

free cash flow hypothesis. In the same way Kosedag and Lane (2002) Kieschnich (1989 and 1998) and Halpern, Kieschnich and Rotenber (199921) found no support for it. When the public company's debts are high it can be economically interesting to go private because the fact of being not exposed to the public market assessment would allow for an increase of their leverage without effects on a public share price. For the said reasons, because of the coincidence of managers and dominant shareholders there is not convenience in Italy to go private for efficiency reasons and free cash flow hypothesis does not find support.

Transaction costs. As noted by DeAngelo et al. (1984)²² the costs of maintaining a stock exchange listing are very high and going private represents a strategy to save money. This motivation has not found empirical support from the data analysis of Kieschnick (1998). In Italy transaction cost hypothesis has not been empirically tested even if costs are in percentage higher because of the small size of many companies. However it is difficult to imagine it at the main reason for delisting. Cost savings will probably be appreciated but can not lead to a going private decision.

Characteristics of the company that decides to go private (Managerial Ownership). The Jensen's (1986a) idea that PTP might be an opportunity for bringing more "discipline" to the management decisions applies only to firms with low levels of managerial equity. It has to be considered that public companies that decide to go private might have different ownership structures and motivations Halpern et al (1999). Halpern et al (1999) analysis on PTP transactions in the US over the period 1981-1986 reveals that leveraged going private transactions involve both companies with high managerial stock ownership and companies with low managerial stock ownership. High managerial stock ownership companies tend to go private voluntarily while low managerial companies typically go private because of a hostile takeover. Halpern also found that characteristics of high and low prior managerial equity LBO clusters differ significantly from one another. Low managerial stock ownership companies tend either to return to go public or to be acquired by another company, while the high managerial stock ownership companies tend to remain private. This finding is consistent with earlier research done by Maupin, Bidwell and Ortegren (1984)²³ who demonstrated that US companies with high managerial shareholdings in the 70s were more incline to engage in public to private transactions. Also this reason seems not to be consistent with the characteristics of Italian market for the same reasons shown about efficiency reasons and FCF theory.

Undervaluation and small size As Rennemboog et al (2007) explain, managers are insiders and know better than everybody what is the real firm's worth. Insiders indeed have information about the firm's strategic options and its potential value. This implies that if the firm is undervalued, managers might delist it to develop with higher freedom the firm potential (which is not understood by the financial markets) and create additional shareholder value once the firm is private. These situations occur especially among *small listed* companies which generally are not able to catch the attention of institutional shareholders and to fund growth, empirical findings supportive of the small size motivation were reported by Kieschnick (1998). Maupin et al (1984) studied a sample of US companies and found that those which went private had a lower price-to book ratio than the other companies, this implies that the undervaluation hypothesis is true for this sample. Research conducted in the US by Kieschnick (1989) reports that undervaluation is a motivation for delisting only when the PTP is done through a MBO. Uk research shows that undervaluation is one of the most important motivations for delisting Ronnemboog et.al. (2005 and 2007). In Italy, despite no completed analyses have been carried out, undervaluation and small size seem to be a possible cause of delisting even not the main one.

Financial, Strategic, Managerial, and Public Market Influence motivations. Geranio (2007)²⁴ stresses the idea that in general there are some other aims behind PTP transactions, those may be:

- Financial, if the buyer aims at owning the target company shares for a limited period of time (5 to 10 years) and then sell them to another investor or to the public market;
- Public Market influence-related, when the controlling shareholder desires to avoid the public market influence;
- Strategic, if the major objective of going private is to obtain synergies from the merging of the target public company and a private one.
- Managerial, if the public company is bought by its managers who have different views from the actual shareholders' ones.

Speculation Empirical research done in the US has showed that the likelihood of going private in the 80s was positively related to takeover speculation (Lehn and Poulsen 1989). This result is confirmed by Geranio (2004) who found that in Italy some companies decide to go public and to go private without having a clear long term perspective. This leads them to decide to go public when the public markets are in their positive trends and to delist when the market prices get lower.

²⁴ Geranio M., Franzosi, A. (2007), "Gli investimenti azionari internazionali di portafoglio: quale ruolo per l'Italia?", *Bit Notes Borsa Italiana*, n.18/2007;

Dividend policies Geranio (2007) explains that shareholders tend to expect to receive constantly dividends from the public company that is going well. Profits reinvestment policies are more easily understood by investors in private companies. This implies that public companies need more liquidity to pay dividends than the private ones. Because of this, it might be that investors in public companies are less “patient” than investors in private companies; and short-term tasks may be their unique focus. The decision to go private can solve this situation by reducing the need to pay constant dividends and allowing the company to retain liquidity and finance growth. Maupin, Bidwell and Ortegren (1984) found that companies that went private paid (before the PTP operation) a significantly higher dividend whereas the cash dividends dropped to zero in a majority of ex-listed companies after the management buyout transaction.

Restructuring needs According to Geranio (2005) Growth strategies and companies shake-ups typically imply a reduction of short-term profits. For this reason public markets may not appreciate them and the shares value could decrease. Going private gives the company the opportunity to define growth actions and shake ups without being subject to the market judgments.

The wealth transfer hypothesis It has been hypothesized that PTP transactions could be done to transfer wealth from either employees or bondholders to shareholders (Ronnemboog et al. 2005). Shareholders’ gains of wealth to employees detriment are not empirically proven in the case of PTP transactions, (Weston et al. 1998²⁵; Ronnemboog et al. 2005). It has to be considered that, even if Ippolito and James (1992²⁶) observe that there is an important increase in pension terminations after PTP transactions, their data do not prove the wealth transfer hypothesis.

Finally, the hypothesis that seems to be the less applicable to the Italian case is related to *delisting cases motivated of takeover defense*. Going private can also be a strategy to defend the company against takeovers, (Lowenstein 1985)²⁷, in such a case, managers might delist the company to avoid hostile takeovers and to protect themselves from losing their jobs . This concept was empirically proven in the past by Lehn and Poulsen (1989), Kieschnick (1998), Halpern, Kieschnick and Rotenberg (1999).

In the following sections we will provide some relevant descriptive data in order to shed some light on the PTP phenomenon in Italy.

Italian law and rules of the delisting process

The requirements that cover delisting in Italy are mainly presented in the Rules of Italian Stock Exchange (Borsa Italiana)²⁸. The Article number 2.5.1 asserts that Borsa Italiana may: **a) suspend** the listing of a financial instrument where the regularity of the market for the instrument is temporarily not guaranteed or risks not being guaranteed or where this is necessary to protect investors; **b) revoke** the listing of a financial instrument in the event of a prolonged lack of trading or where it deems that owing to special circumstances it is not possible to maintain a normal and regular market for such instrument.

The main causes of suspending (**case a**) are defined in the following elements: i) the dissemination or lack of dissemination of information that may affect the regular operation of the market; ii) the cancellation of the face value of the shares with the simultaneous resolution to reconstitute the capital; iii) the involvement of the issuer in insolvency proceedings; iv) the liquidation of the issuer; v) an adverse opinion or a disclaimer rendered by the auditor for two consecutive financial years. Suspending does not automatically mean delisting but suspended instruments are delisted if market conditions are not reestablished.

The main causes of delisting due to **case b** can be referred to: i) the average daily turnover in the market and the average number of securities traded over a period of at least eighteen months; ii) the frequency of trading in the same period; iii) the distribution among the public of the financial instruments in terms of value and number of holders; iv) the involvement of the issuer in insolvency proceedings; v) an adverse opinion or a disclaimer rendered by the auditor for two consecutive financial years. vi) the liquidation of the issuer. All these cases can be considered compulsory delisting i.e., delisting that occurs independently from the company or its shareholders willing.

Delistings occur also (and especially) voluntarily in the case of voluntary takeover bids or residual takeover bids. These are related to the abovementioned case b iii) when merger shareholders don't want (or are unable) to restore free floating.

Residual takeover bids (so called "Commitments to squeeze-out") are compulsory when, as a result of a global takeover bid, the bidder becomes holder of at least *ninety-five* per cent of the capital represented by securities in an Italian listed company and does not want to rebuild the free floating. In such a case the bidder shall be allowed to squeeze-out of the remaining securities should any other party so request (art 108 of the Consolidated Law on Finance) and the company is delisted.

28 As Macey, O'Hara and Pompilio (2004) indicate, delisting rules can be designed to insure that the exchange's relationship with the listed company remains profitable or to protect the reputation of the trading venue where the shares list. Macey, J. R., O'Hara, M., Pompilio, D., "Down and Out in the Stock Market: The Law and Finance of the Delisting Process", (April 2005), Available at SSRN: <http://ssrn.com/abstract=583401>.

Voluntary takeover bids are referred to the case described in Article 111 of the same Law and are the most interesting for the purpose of our research. A bidder coming into possession following a global takeover bid of a holding of at least ninety-five per cent of the capital represented by securities in an Italian listed company shall have the right to squeeze-out on remaining securities within three months of expiry of the time limit for bid acceptance, if the intention to exercise said right was declared in the takeover bid document²⁹.

From public to private: the delisting phenomenon in Italy

Exhibit 1 represents Listings and PTP transactions over the past 35 years in Italy. As the graph shows, total listings waves per year tend to move symmetrically with total PTP transactions. So it is reasonable to assert that the Italian stock market agents' behavior might be in part the result of macro events that- over time- boost going public decisions and hinder going private choices or increase PTP transactions and hamper new listings.

Exhibit 1: Delistings and Listings from Italian Stock Exchange Market 1975-2009

Total is calculated by net figures of transfer between markets. 1994 listing includes 9 companies transferred from the minor exchanges to the national telematic system of Borsa Valori (i.e.: from Expandi to Borsa). 2009 listing includes 35 companies transferred from Expandi to MTA. This graph is based on the figures published on the Borsa Italiana website www.borsaitaliana.it under the section "Historical Statistics".

To investigate the characteristics of delisting, we focused on the period 2006-2009. We found that 63 delisting occurred over that period. We excluded 8 cases because we were unable to gather enough information about them and we focus on the remaining sample of 55 delisting.

As our interest is to describe the most recent wave of delisting in Italy we took three steps:

²⁹ Often residual takeover bids take place after voluntary ones.

- We analyzed the causes of delisting officially declared by the companies belonging to the entire sample;
- We selected the most frequent causes of delisting (i.e. delisting made following takeover bids);
- We then obtained qualitative information from takeover bids prospectus that were published by each company that delisted (we excluded bank and insurance companies and obtained 19 relevant cases) to better illustrate some aspects of the phenomenon.

Declared causes of delisting

As shown in Exhibit 2, delisting can refer to diverse causes. The most rare over the analyzed period were bankruptcy, early dissolution of a partnership, and liquidation. The most frequent causes are related to following takeover bids. Mergers are strategic decisions that can imply also a PTP transaction. In particular, the merger cases indicated in Exhibit 2 implies that one of the companies involved in the merging operation goes private or delists in order to go public under another partners' name. On the total of PTP transactions *voluntary* takeover bids reached 25.5%, residual takeover bids reached 21.8% and mandatory takeover were 5.5%. Delisting due to merger operations are exquisitely a formal consequence of the merging of two or more companies. Takeover bids are instead the most frequent (52% of cases) and the most relevant in terms of delisting. Indeed they are referred to a PTP transaction that occurs explicitly as a consequence of a strategic decision.

Exhibit 2: Declared Causes of Delisting 2006-2009

		2006	2007	2008	2009	Total

Let's now focus on the 19 selected cases related to delisting following takeover bids in industrial companies. As Exhibit 3 and 4 show a consistent part of PTP transactions occurred among banks (7), luxury goods/Clothing (4), insurance (3), and services/tertiary (3).

Exhibit 3: Selected Case studies Industries: Takeover Bids-Delisting 2006-2009

		<i>Frequency</i>	<i>Percent</i>	<i>Valid Percent</i>	<i>Cumulative Percent</i>
<i>Valid</i>	<i>Automotive</i>	1	3.4	3.4	3.4

Exhibit 4: Selected Case studies Industries: Takeover Bids-Delisting 2006-2009

Source: Elaboration of the Authors

Interestingly we found that, considering the bidders' nature, in 15 out of 19 cases they were the same owners as before going public. In 5 out of 19 cases they were private equity funds or investment funds and only in 2 cases they were competitors of the delisted company. This seem to be consistent with some theoretical hypothesis. The speculation hypothesis stated by Geranio (2004) seems to be proved considering that in the majority of the cases:

- Companies management do not change;
- Owners directly run the company assuming managerial position;
- Owners and managers are insiders and dispose of the best set of information;
- Delisting occurs in period of low market.

Exhibit 5: Selected Case studies Bidders Type

Source: Elaboration of the Authors

We then considered the permanence on the Stock Market (i.e. the length of the period during which the company was listed on the stock market). Only 6 out of 19 companies staid on the market for more than 21 years, moreover, a relationship between bidder type and permanence on the stock market did not emerge.

Exhibit 6: Selected Case studies Industries: Bidder vs Permanence on the Stock Market

A first essay of quantitative analysis

To complete the qualitative analysis we try to test statistically some hypothesis that seemed to be applicable to the Italian case³⁰.

Hp 1 Delisting strategy is related to Speculation

Delisting strategy was measured with a dummy that equals one when the company is listed and zero when it is delisted. We measured speculation considering the standardized values of the difference between the highest share price registered each year and the lowest share price registered each year.

Hp 2 Delisting strategy is related to company characteristics

We measured the companies' book value per share, total assets value, number of employees and operating revenue (we used log values after having standardized each of these variables).

³⁰ Within the 381 companies that in the wave from 2002 to 2008 have been listed on the Italian market, we tested the motivations of the decision to delist. Data have been supplemented by collecting accounting information and the ownership structure from the Bvdep database called Osiris on a sample of 2,667 observations (381 companies for 7 years). After deleting missing values we obtained a sample of 888 observations and 267 companies.

We applied a mixed effects logistic regression model³¹ to investigate the effects of the market speculation and company characteristics on the probability of going private.

None of the hypotheses tested was proved, no statistically significant relationship was found, neither between speculation and delisting nor between companies' characteristics and delisting. This first "non result" can be due to the characteristics of data. First of all, we have a high number of missing data. Second we were not able to retrieve data about each shares' average price per month. The use of such a variable could have helped to measure speculation before delisting. Indeed it is difficult to see speculation by considering only the highest and the lowest shares price over an entire year. Third, we used a dummy variable to measure the delisting strategic decision, while this strategic decision can be implemented with different objectives and for different reasons. For example at the moment we are not able, on this entire (and big) sample, to control for the diverse types of delisting (namely: delisting as a consequence of a takeover bid, delisting as a consequence of a merger or other). It is likely that these first non-results are due to the scarce capacity of the sample used to measure properly the variables considered in our hypotheses. Future research will improve the quality of this database by introducing variables to control for the various types of delisting and to consider shares prices in a more precise way.

Conclusion

The aim of the paper was to focus on the characteristics and motivations of delisting in Italy.

We showed that in Italy the majority of PTP transactions are carried out by the same owner as the one before the company went public. So we found support to the idea that the going private decision is affected by concentrated institutional shareholdings. This finding is consistent with earlier researches (Maupin, Bidwell & Ortegren, 1984) which demonstrated that US companies with high managerial shareholdings in the 70s were more incline to engage in PTP transactions. One of the main differences between Italian market and the more developed ones is that often in Italy there is not a real separation between ownership and

³¹ The dependent variable Y_{it} is dichotomous and taking value 1 if in year t the company i goes private, 0 otherwise. Note that i ($i = 1, \dots, N$) ranges over the companies in our data set, while t ranges over the $T=7$ years from 2002 to 2008.

We model the probability $\pi_{it} = \Pr(Y_{it} = 1 | \mathbf{x}_{it}, u_{it})$ where \mathbf{x}_{it} is a vector of explanatory variables and u_{it} are random effects. More specifically, we assume

$$\text{logit}(\pi_{it}) = \mathbf{x}_{it}\beta + u_{it}$$

where $u_{it} \sim N(0, z_{it}\sigma^2)$ and z_{it} is the generic element of a $NT \times NT$ matrix $\mathbf{Z} = \mathbf{1}_T \otimes \mathbf{I}_N$.

In point of fact, we have 7 observations for each company. As decisions taken by the same agent can be correlated over time, company-specific random effects are introduced to account for this potential effect.

management, so that in public companies the agency problem invest the conflict of interest within majority and minority shareholders. To conclude, our data tell us that the hypothesis according to which *characteristics of the company that decides to go private (Managerial Ownership) affect the decision to go private might be accepted for the Italian case.*

FROM NECESSITY TO BUSINESS ENTREPRENEURSHIP: THE CASE OF THE SONGHAI CENTER, PORTO NOVO, BENIN

Bijaoui, Ilan¹; Tarba, Shlomo Yedidia²

¹Ashkelon Academic College, Israel

²College of Management – Academic Studies, Rishon LeZion, Israel

Abstract

The “push theory maintains that individuals are pushed into entrepreneurship by negative external forces. The resulting activity is referred to as necessity entrepreneurship. The “pull theory” contends that individuals are attracted to entrepreneurial activities because they seek self-fulfillment, resulting in business or opportunity entrepreneurship. In the present study we discuss the preliminary criteria required to generate business/opportunity entrepreneurship using the terms of the McClelland typology: "need for achievement," "need for affiliation," and "need for power."

We show that students at the Songhai Center, in Porto Novo, Benin have the intentions and interests needed to become entrepreneurs. We show further that Songhai's students exhibit the three levels of McClelland's business entrepreneurship: "need for achievement," "need for affiliation," and "need for power."

Keyword: necessity entrepreneurship, business entrepreneurship, Africa, motivation, cooperation, leadership

Introduction

The majority of small businesses in developing countries have been established by people who cannot find jobs otherwise (Rosa Wild, 1992). The businesses are necessity driven, and the entrepreneurs generally want to earn enough to make a living (Frese and De Kruijff, 2000; Olomi, Nilsson P., & Jaenssoon 2002; Rutashobya, 1995; Toroka and Wenga, 1997). The greater the poverty, the larger is the number of necessity business (Reynolds Camp, Bygrave, Autio & Hay ., 2001). This reality is confirmed by Mitchel's research (2001) on entrepreneurship in South Africa. 38.7% of entrepreneurs open a business for purposes of survival and 20.2% because they were unemployed and were not able to find a job. As stressed by Kautonen and Palmroos (2010), necessity entrepreneurship is generally associated with a single motivation: unemployment.

Nearly all the poorest interviewed by Olomi et al (2002) in their research appeared to be “trapped” by their incapacity to find the time to earn sufficient surplus income to invest in a new business. Evolution from economic necessity appears to be rare. It is still unknown when and how entrepreneurs decide to grow and what triggers the desire to grow (Dunkelberg and

Cooper, 1982, Kolvereid, 1992, Kolvereid and Bullvag, 1996, Kurantko Hornsby & Naffziger, 1997)

Gilad and Levine (1986) and Verheul, Thurik, Hessels, Van der Zwan (2010) proposed two closely related explanations of entrepreneurial motivation, the “push theory” and the “pull theory.”

The push theory argues that individuals are pushed into entrepreneurship by negative external forces such as job dissatisfaction, difficulty finding employment, insufficient salary, or inflexible work schedule. This is necessity entrepreneurship. The pull theory contends that individuals are attracted into entrepreneurial activities in search of independence, self-fulfillment, wealth, and other desirable outcomes. This is business or opportunity entrepreneurship (Giacomin, Janssen, Guyot & Lohest, 2011).

Motivation for growth is a characteristic of business entrepreneurship rather than of necessity entrepreneurship (Davidsson, 1989, 1991). Reynolds et al. (2002) showed that opportunity entrepreneurs are older (35-44 years) than necessity entrepreneurs (18-24 years). Conversely, based on the 2002-2004 GEM data for Canada (Robichaud, LeBrasseur, Riverin & Zinger 2006) associate youth with opportunity entrepreneurship as do also Sandner (2009), Bhola, Verheul, Thurik & Grilo (2006), Block & Wagner (2006), and Wagner (2005). For Bergmann & Sternberg (2007), age does not seem to correlate with necessity entrepreneurship.

Research objectives

The goal of the present research is to identify and analyze the main features conducive to the development of business entrepreneurship (Davidsson, 1989, 1991) in order to determine whether these are present in the students trained at the Songhai Center. Will these students emerge as necessity or business entrepreneurs?

Main generators of business entrepreneurship

The main generators of entrepreneurship are motivation, will to cooperate, and capability to lead.

Motivation

Without motivation to achieve personal and social goals, there is no interest in earning more than whatever is required for subsistence. Motivation is a fundamental requirement for entrepreneurship, and the absence of it blocks any initiative for development. Atkinson (1964) defined motivation as “the contemporary (immediate) influence on direction, vigor, and persistence of action”.

Campbell and Pritchard (1976) suggested that motivation has to do with a set of variables that explain the direction, amplitude, and persistence of an individual's behavior, holding constant the effects of aptitude, skill, and understanding of the task, and the constraints

operating in the environment. McDougall (1908) speaks about "an inherited or innate psychological predisposition that determines how its possessor perceives or pays attention to objects of a certain class, and experiences an emotional excitement of a particular quality upon perceiving such an object, and acts in regard to it in a particular manner".

Models based on drive or reinforcement suggested by drive theorists such as Thorndike (1911) and Hull, Bosley, & Udell, (1980) introduced the concept of learning through motivated behavior.

Reinforcement models continue to thrive today as explanatory vehicles for understanding work motivation and job performance, both in the workplace and in various performance management programs (Komaki, 2003).

The principal aim of content theories, such as Maslow's (1954) and McClelland's (1961, 1971) is to identify the factors associated with motivation. . Maslow (1954) proposed a steady progression upward a hypothetical hierarchy over time, as individuals grow and mature, from physical needs to safety and security needs, through social and self-esteem needs, and finally to self-actualization.

McClelland (1961, 1977) ignored the concept of the hierarchy and focused on the motivational potency of distinct levels of self- and social actualization. He called the first level of business entrepreneurship self-actualization objective "need for achievement." This level requires personal responsibility, calculated risks, performance feedback, and task accomplishment.

The entrepreneur determines his personal economic and professional objectives and the conditions required to achieve it: tasks to accomplish and monitoring of the required performance under conditions of calculated risks.

The second level is the self- and social actualization objective defined as "need for affiliation." The entrepreneur seeks the "approval" of the business and social community. He acts in conformity with the "wishes and norms," and is interested in the "feelings of others."

The third level of self- and social actualization objective is characterized by the entrepreneur's need for "power." He assumes leadership, exercises control, and maintains leader-follower relationships.

Motivation can be sustained by "intrasit" or "extrasit" orientation (Newstrom and Davis, 1993). Intrasit motivation or ambition is focused on direct relations between the individual and the task to perform. "Extrasit" motivation or ambition is related to the external environment around the task to be accomplished.

Herzberg's motivation-hygiene theory (1966) paved a way to strengthening both the intrasit and extrasit. He argued that work motivation is influenced by the extent to which a job is challenging and provides opportunities for recognition and reinforcement. Herzberg saw the

context of a job (which he referred to as *hygiene* factors) as leading to satisfaction and future motivation. He regarded also job enrichment as a key factor in work motivation.

From the point of view of the "objective to achieve," the motivation-hygiene theory is intrinsic because the objective to achieve is determined in advance and in turn it determines the task to be performed (Locke, 1968, 1996; Steers & Porter, 1974; Steer, Mowday & Shapiro, 2004, Crown & Rosse, 1995). This theory is frequently used at the individual or group level in industry (Ambrose & Kulik, 1999).

Cooperation in the entrepreneurial team

Timmons (1999, 2004) defined two criteria required to determine the main functions of the entrepreneurial team. The first one refers to creativity, the second to management skills.

Creativity vs. management skills

Creativity requires curiosity, continuously updated knowledge, and the capability to identify and develop new ideas, more specifically the right idea at the right time. The microwave oven invented by Raytheon was a creative idea but it was developed in 1950, at a wrong time, when only a small percentage of women worked outside of home. By contrast, the iPod as a mobile music entertainment device was a creative idea developed at the right time, when both young and older customers were ready to use mobile entertainment applications downloaded from the Internet

Functional cooperation within the entrepreneurial team

Timmons (1994, 2004) outlined the internal cooperation between the managerial, entrepreneurial, inventive, and promotional functions. The managerial function provides stability and continuous growth following the planned objectives, budget, timing, and performance requirements of each activity. Managers must possess a high level of management skills, but not creativity. Creative people think outside the box, and are therefore liable not to accept budget or time limitations. They can change their mind in the process of creative thinking. They would have to spend considerable time outside the firm meeting customers and specialists in search of new ideas. Their activities reflect the opposite of stability.

The entrepreneurial function must be creative in order to identify market opportunities. Entrepreneurs also need advanced management skills because they work in close cooperation with the manager.

The inventive function is in charge of improving existing products and processes and of developing new ones. Research center or representatives of international companies specializing in the relevant domains can function as inventors.

The promotional function understands the psychology of the customer and has the relevant networking relations to push the products into the market. Trading companies may be involved in the promotional process.

Leadership

Leadership style

Hersey and Blanchard (1982) distinguished between two attitudes of a leader: "directive behavior" and "supportive behavior." Directive behavior is defined as one-way communication, from the leader to the follower, with close supervision. Supportive behavior is defined as two-ways communication. The leader listens, provides support and encourages, facilitates interaction, and involves the follower in decision-making.

Hersey and Blanchard identified four distinct leadership styles:

Style 1: High Directive/Low Supportive– An autocratic "directing" leader leads the decision-making process and tells people what to do.

Style 2: High Directive/High Supportive– A democratic "coaching" leader transfers experience and knowledge to subordinates to improve their capabilities and initiate two-way communication by listening to ideas and suggestions. Eventually, the leader decides and the subordinates execute.

Style 3: Low Directive/High Supportive– A democratic "supporting" leader shares the decision-making process with others and provides knowledge to subordinates in order to delegate power.

Style 4: Low Directive/Low Supportive– A laissez-faire "delegating" leader transfers the decision-making process and control to others. He acts as a visionary and defines the rules and long-term objectives. The followers implement his philosophy and act as leaders or future leaders.

Leadership philosophy

Leadership philosophy proposes an understanding of the essence of effective leadership based on the transactional or the transformational paradigm (Barling, Weber, & Kelloway, 1996; Bycio, Hackett, & Allen, 1995; Sosik, Avolio & Kahai, 1997; Bass, 1985).

The transactional leadership paradigm is based on conservative leader-follower relationships (Hsu, Bell, & Cheng, 2002) and on a "bargaining" relation between followers and leaders (Howell & Avolio, 1993). Transactional leadership differentiates between two basic attitudes:

- *Contingent reward leadership*: an active and positive exchange between the leader and followers (Bycio et al., 1995). Followers are monitored and controlled, and receive a reward as recognition of success.

- *Management-by-exception*: the leader monitors the followers' attitude and intervenes when it is necessary.

Transformational leadership provides vision (Howell and Avolio, 1993) and stimulates followers to improve their capabilities and achieve personal and developmental objectives (Barling et al., 1996). In a two-way communication, both developmental and individual orientation generate transformational leadership (Hsu et al., 2001).

Leadership behavior may change from transformational to transactional according to business conditions and objectives. Transformational behavior is needed for determining the business's vision, objectives, and rules, and for long-term planning. Transactional behavior is required during the implementation of the mission and for achieving its objectives.

The role of a transformational leader is to develop positive self-talk with the followers and to keep confidence high. The leader uses positive visual imagery to help people successfully deal with adversity, and speaks in a way that moves others to follow him and perform well. He inspires others to higher levels of performance, establishes trust, and fosters creativity in those he leads.

The Songhai Center

Dr. Godfrey N'Zamujo, a Dominican priest from Nigeria, founded the Songhai Center in 1985 to train young agricultural entrepreneurs. In addition to its training activities, Songhai aims to develop a sustainable agricultural production system based on agrobiology.

At any given time more than 200 students attend 18-month training programs at sites in Porto-Novo, Savalou, Parakou, and Kinwédji. The first nine months are dedicated to general core courses (mathematics, economy, biology), and to training in various specializations such as poultry, pork, aquaculture, vegetables, and fruits. Each student selects a specialization in which he/she works during the last nine months and prepares a personal project.

The sample

In 2010 I had the opportunity to train Songhai trainers, and I proposed to interview a random sample of students in order to analyze their motivation to become business entrepreneurs. I selected one third of the students (N=53) participating in the 18-month program.

Before the participants were asked to complete the questionnaire, I organized an open, one-hour discussion about their expectations before, during, and after the 18-month training program. My intention was to explain the concepts used in the questionnaire and to improve the quality of the answers. During the interviews my role was mainly passive, and gave I allowed them to express themselves freely.

The questionnaire

The first part of the questionnaire contained a personal profile including age, family status, gender, parents' employment, level of education, and economic level of their family. In the second part, I asked students to indicate which subjects they found most interesting in the program and to explain the reasons why they chose those subjects. In the third part, students answered two questions about their level of motivation, leadership, and willingness to cooperate. The first question had to do with their personal interest in one or more of the following activities: production, research, management, training, and sales. Greater interest in areas other than production activity was scored as higher motivation.

The second question was related to the students' intentions after graduating from the program. Students were asked to indicate whether they wanted to work on a farm, on the family farm, continue their studies, build a farm and establish a family, build a house, and have an impact on their region. Students could provide more than one answer.

Hypotheses

The hypotheses are based on the following levels of entrepreneurial necessity:

Level of entrepreneurial necessity

Hypothesis 1: Intention to work in a farm (Intention 1) is related to interest in production activity only (Interest 1). *McClelland Level 1: "Need for achievement"*

Hypothesis 2: Intention to work in a farm (Intention 1) or in the family farm (Intention 3) and interest in production activity (Interest 1) only.

Hypothesis 3: Intention to continue to study (Intention 2) is related to interest in production (Interest 1) only.

McClelland Level 2: "Need for affiliation"

Hypothesis 4: Intention to build a farm and establish a family (Interest 4) or to build a house (Interest 5) and interest in a wider range of activities than strictly production (Interest 1) research (Interest 2), management (Interest 3), training (Interest 4) and sales (Interest 5).

McClelland Level 3: "Need for power"

Hypothesis 5: Intention to have an impact on the development of the region (Intention 6) and interest in a wider range of activities than production (Interest 1) research (Interest 2), management (Interest 3), training (Interest 4) and sales (Interest 5).

Based on the answers to these questions it is possible to determine whether the students were interested in necessity entrepreneurship or in business entrepreneurship. If they were business entrepreneurship-minded, it was possible to determine which of the McClelland levels was expected to be achieved by each student after completing the training program: the

first level (need for achievement), the second level (need for affiliation), or the third level (need for power).

Results and Discussion

Descriptive statistics

Below are the main results of the sample analysis of 53 questionnaires, representing around one third of the students participating in a yearly training program:

11% were under 20 years old, 58% between 21 and 25 years old, and 31% over 25 years old.

Parents' Employment was: 49% in agriculture, 22% bookkeeping, and 29% trade. Education level was: secondary school, 13% baccalaureate, and 14% primary school. 79% wants to specialize in production; 55% had a wider perspective in research; 51% in training, and 37% in management. Some of them express their interest for more than one specialization.

Expectations after the training: 23% intended to work as employees, 47% to continue studying, 24% to work on the family farm, 65% to create their own farm, and 50% to have an impact on economic development. Some of them had more than one expectation.

H1 and H2

The dependent variable "work on a farm" (Intention 1) correlates strongly with training (Interest 4) and sales (Interest 5), but not with production. H1, concerning necessity entrepreneurship, was rejected. H2, referring to the first level of McClelland business entrepreneurship, "need for achievement," was supported.

The dependent variable "to work on the family farm (Intention 3) does not correlate with any of the parameters.

Students who want to work on a farm are not potential necessity entrepreneurs, but they are potential business entrepreneurs at McClelland's "need for achievement" level.

Table 1: Regression with "towork in a farm" (Intention1) as dependent variable (independent variables: training (Interest 4) and sales (Interest 5).

Coefficients^a

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.776	.731		-1.062	.294
	Interest 5	.383	.126	.443	3.029	.004
	Interest 4	.256	.111	.296	2.301	.026

ANOVA^b

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	73.214	5	14.643	4.162	.003 ^a
	Residual	154.786	44	3.518		
	Total	228.000	49			

R	R Square	Adjusted R Square	Std. Error of the Estimate
.567 ^a	.321	.244	1.876

H3

The regression based on the dependent variable "to continue to study" (Intention 2) correlates positively with management (Interest 3) and sales (Interest 5) activities (Table 2). H3 was therefore supported. Students who want to continue to study are potential business entrepreneurs at McClelland's "need for achievement" level.

Table 2: Regression with "to continue to study" (Intention 2) as dependent variable (independent variables: management (Interest 3), sales (Interest 5)

Coefficients^a

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	3.835	1.495		2.566	.014
	Interest 3	-.377	.176	-.361	-2.141	.038
	Interest 5	.339	.160	.334	2.120	.040

ANOVA^b

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	72.809	4	18.202	3.453	.016 ^a
	Residual	226.671	43	5.271		
	Total	299.479	47			

R	R Square	Adjusted R Square	Std. Error of the Estimate
.493 ^a	.243	.173	2.296

H4

The parameter expressing the intention to build a farm and establish a family (Intention 4) and to build a house (Intention 5) correlate strongly with an interest in production (Interest 1), research (Interest 2), management (Interest 3), and training (Interest 4) (Table 4). This correlation expresses McClelland's second level of "self- and social actualization." H4 was therefore supported.

The regression between the dependent variable "to build his own farm and establish a family" (Intention 4) and the independent parameters confirms a positive correlation not only with production (Interest 1) but also with management (Interest 3) (Table 3).

The regression between the dependent variable "to build a house" (Intention 5) and the independent parameters confirms the positive correlation with management (Interest 3) and training activities (Interest 4). Both results position the students at McClelland's level 2, business entrepreneurship, the "need for affiliation."

Table 3: Regression with "to build a farm and establish a family" (Intention 4) as dependent variable (independent variable: production (Interest 1), management (Interest 3))

Coefficients^a

Students who want to "to have an impact on the development of agriculture are potential business entrepreneurs at McClelland's "need for power" level.

Conclusion

Songhai center succeeded in attracting students who are beyond necessity entrepreneurship. They are mainly potential business entrepreneurs, interested in developing not only their own business but also in having an impact on business development in their region. Even students who want to work on a farm are not potential necessity entrepreneurs but potential business entrepreneurs at McClelland's "need for achievement" level.

To become business entrepreneurs, Songhai students must acquire entrepreneurial experience during the 18 months of their training in more activities than production. Necessity and business entrepreneurship are driven by different mechanisms (Hechavarria & Reynolds, 2009). According to Gabrielsson and Politis (2009), the motivations of individuals affect their decision-making processes and reactions. In the present paper we identified the entrepreneurial intentions and interests required to differentiate between entrepreneurs at the necessity level and those at McClelland's "need for achievement," "need for affiliation," or "need for power" levels of business entrepreneurship. Using these distinctions, we proved that Songhai students are potential business entrepreneurs.

SUB SAHARAN AFRICAN (ASS) COUNTRIES TOWARDS ECONOMIC DEVELOPMENT: THE PROCESS MODEL

Bijaoui, Ilan¹; Tarba, Shlomo Yedidia²

¹Ashkelon Academic College, Israel

²College of Management – Academic Studies, Rishon LeZion, Israel

Abstract

In sub-Saharan African (SSA) countries, economic growth has very little impact on economic development. Based on international models, the study suggest a process model starting with open incubators, generating the formalization of the informal economy, followed by industrial districts, organizing the knowledge, know how and finance infrastructure relevant to the development of the formal economy into clusters. The feasibility of the process model was checked in Cote d'Ivoire, in three sectors that is, processed fruits and vegetables, processed wood and textiles.

Keywords: SSA countries, regional development, incubators, industrial districts, clusters, agribusiness.

Introduction

Growth versus economic development in SSA countries

GNP annual growth rate of sub-Saharan African (SSA) countries enjoyed higher prices of crude petroleum, minerals and agricultural products and grew from 2.4% in 1999 - 2001 to 3.9% in 2001 - 2004 (World Bank, 2001, 2006).

But this economic growth has not had any impact on economic development and poverty. The income poverty indicator of Millennium Development Goal No. 1 (MDG1), the number of people living on less than US\$1 per day (purchasing power parity, or PPP), did not change from 1990 to 2004 (UNECA, 2006). While the total number of people worldwide living on less than US\$1 per day from 1981 to 2001 declined from 1.45 to 1.1 billion , the number in SSA countries increased from 164 to 314 million (World Bank, 2004). Poverty is expected to decrease in Asia and Latin America, but to increase in Africa and the Middle East.

According to analyses initiated by the International Labour Organization (ILO, 1999, 2007), growth in the extractive mineral and fuel sectors has generated very few jobs across economies.

From 2008 onwards, the world economic crisis generates a slowdown of demand for oil and minerals and cut the revenues of several SSA countries, worsening their economic situation. From an overall current account surplus position of 2.9% of GDP in 2008, the continent will face a deficit of -4%. of GDP in 2009. The large surplus of 8.8% of GDP for the group of oil

exporters will turn into a deficit of -4% of GDP (ADB, 2009). This is a direct result of the expected decline in oil revenue.

SSA countries will not be spared from the pessimistic world trade outlook for 2009. Exports and imports growth rates are forecast at 3.6% and 10.5% in 2009, respectively compared to 10.6% and 15.2% in 2008. As a result, the impact of the crisis on foreign exchange is expected to be negative. Having benefited from the recent primary commodity boom, Africa will experience a loss of 45.4% of its exports value in 2009 (ADB, 2009). Losses in export growth rates are not compensated for by decreasing import growth rates in value terms, implying that the trade balance may deteriorate.

Exports growth or external support cannot be the only solution.

The main objective of this paper is to discuss and suggest a model able to generate sustainable growth of local demand and supply in the local informal and formal economy.

Models of regional development

The main models of development discussed in the literature are the Incubator, the Industrial District and the Cluster.

The incubator model

The United States National Business Incubation Association (NBIA) (see website) defines the business incubator as “a dynamic process of business enterprise development, providing, under one roof shared office services, access to equipment, flexible leases, and expandable space”. Its main task is to create a dynamic of development in the supported small and medium-sized enterprises (SMEs) by providing management and consulting services as well as relevant material and financial resources. Its wider task is to support macro-economic-related (employment) or micro-economic-related (implementation of technologies) objectives.

In 1956, Massey-Ferguson, the largest industry in Batavia, New York, United States of America, closed down, leaving vacant an 850,000 ft² complex of multi-story buildings. The Mancuso family purchased the complex and gave Joe Mancuso the responsibility of creating jobs and making money. Mancuso decided to divide the building in smaller units and rent them to individual businesses that he would nurture by providing shared office services, assistance with raising funds and business consulting.

One of his first tenants was a chicken processing company, thus, the origin of the name “incubator” and of a new model of promoting SME development. The first business incubator, Batavia Industrial Park (BIP), was thus, created. BIP reached capacity after five years and created thousands of jobs for the area and appreciable earnings for its owners, its tenants and the city of Batavia.

The incubator model supports the development of SMEs as a source of local economic development. In 1979, June Lavelle, in her capacity as Executive Director of the Industrial

Council of Northwest Chicago, developed the incubator concept as a model for neighborhood revitalization programs.

In a vacant 350,000 ft² facility in northwest Chicago, the Fulton-Carroll Center for Industry (FCCI) became the headquarters for the revitalization of an abandoned industrial neighborhood.

As a result of the work of FCCI's support team of successful business people, the vacancy rate of the surrounding neighborhood's commercial property dropped sharply and real estate values have risen. The FCCI incubator fosters local development by creating job opportunities initiated by new entrepreneurs.

The United Nations Industrial Development Organization (UNIDO) adopted the incubator model in order to "create a favorable environment for entrepreneurship and the expansion of SMEs in developing countries" (UNIDO, 2002). It has been implemented with many difficulties in SSA countries such as Angola with the INEFOP-PEA Business Incubator in Luanda, in Kenya with the Jomo Kenyatta University of Agriculture and Technology Center for Business Innovation (JKUAT-CBI), and the private incubators Kountry Business Incubator (KeKoBI) and SACOMA. (See website busynet)

Nigeria is quite representative of the difficulties encountered by SSA countries in order to implement the incubator model. The Nigerian Incubator System Foundation (TBI) founded in 1993 as a cooperation with UNFSTD, the private sector, the states and the federal government, decided to create three incubators, in Lagos, Nara and Kano. But due to corruption, the Federal government nationalized it in 1995.

The Lagos incubator started only with 11 tenants.

South Africa only differs from the other SSA countries and succeeded in implementing the incubator model (Giddings, 2009).

South Africa has 21 incubators supporting entrepreneurs in various sectors.: Nine technology incubators (one biotech; one bio-medical; two chemical and five Information and Communication Technologies-ICT, six manufacturing incubators (automotive, wood, stainless steel, base metals, aluminum, platinum), one mining incubator, three agricultural incubators (flowers, biodiesel, essential oils), one construction incubator and one fully private sector. Most are supported by the national government and to a lesser extent by provincial and local governments. The South African Business and Technology Incubator Association (SABTIA) was created by incubator professionals and has since become an organization representing incubators in South Africa. The few hundred entrepreneurs supported by those incubators have a small impact on economic development in South Africa.

The industrial district model

Becattini (1990) conceptualizes the industrial district, defining it as: “a socio-territorial entity which is characterized by the active presence of both a community of people and a population of firms in one naturally and historically bounded area”. In the district, community and firms tend to merge. In Italy, the industrial district model first appeared in the 1970s. Industrial districts in the textile industry in Carpi and Prato, the furniture industry in Brianza and Cascina, and the footwear industry in Vigevano opened new markets in Europe and Japan for the Italian industry (Brusco, 1982).

National and local authorities built a network of support centers specialized in research, technological transfer, management or international marketing.

Today, industrial districts in textiles, ceramic tiles, food processing, furniture and agricultural machinery tools are concentrated in northern and central Italy (Paniccia, 1998).

The industrial district model requires flexible specialization, deepening division of labor between firms, differentiation of enterprises by process or products (Rabellotti, 1995; Schmitz, 1995; Rabellotti and Schmitz, 1999), inter-firm cooperation and mutual trust, as well as a positive industrial atmosphere (European Commission, 2002).

The main driver of an industrial district is the local and national support policy which can be defined as “a set of humanly devised behavioral rules that govern and shape the interaction of human beings, in part by helping them form expectations of what other people will do” (Nugent and Lin, 1996).

The cluster model

The cluster model (Porter, 1998) is a “geographic concentration of an array of linked, competitive firms that have close buy-sell relationships, utilize common technologies, share customers, or share a labor pool that provides them with a competitive advantage”.

The cluster model gains competitive strength due to its better access to trained and experienced employees, suppliers, specialized information and public goods, as well as from motivating forces of local competition and customer demand (Rosenfeld, 1996; Enright, 2000; Saxenian, 1994).

In their research on successful cluster development practices in the United States and Italy, Christensen, McIntyre and Pikhoid (2002) emphasize the business generator aspect of the cluster.

Lissoni (2001) argues that authorities and institutions should facilitate collaboration and networking, but Porter does not endorse this view on the grounds that such networking would lead to a reduction in competition.

An example of bottom-up development is the Silicon Valley, the first United States cluster model, which was initiated by private parties. Frederick Terman, Professor and Provost of

Stanford University, proposed the leasing of Stanford's lands for use as an office park, the Stanford Industrial Park (SIP).

Leases were limited to high-tech companies. Its first tenant was Varian Associates, founded by Stanford alumni in the 1930s to build military radar components. Terman also found venture capital for civilian technology start-ups. One of the major success stories was Hewlett Packard, which was founded by Stanford graduates William Hewlett and David Packard. Networks were generated autonomously in both regions, Silicon Valley and SIP (Saxenian, 1994; Segel, 1985).

In most European Union (EU) countries, the clustering process was the initiative of governments. The EU Expert Group's final report *Enterprise Clusters and Networks* surveyed 59 traditional clusters and 25 science-based clusters (European Commission, 2007). According to the report, in the member states, policies towards cluster development are generally issued by national governments with the co-operation of regional or local governments. National authorities focus on designing and coordinating cluster policies to create the general framework conditions and developing R and D programs. In certain countries such as Belgium and Spain, cluster policy is strictly a regional government initiative.

Regions in these two countries enjoy autonomous authority in this field and develop their own approaches and instruments.

In Germany, projects such as EXIST and BioRegio are the result of the Federal Government's cluster policy, a top-down approach (Colovic-Lamotte and Tayanagi, 2004). Regional governments have been required to share with the Federal Government the provision of financial support to spin-off companies from universities. The Finnish Government also encourages the development of industrial clusters. Finland's best-known cluster, "Networking", located at Turku and Oulu, specialized in telecommunications and involves companies such as Nokia and ABB (TEKES, 2005).

The best examples of functioning clusters in SSA countries are in South Africa. The South African Petro Chemical cluster around Sasol near Witbank,

is one of the most successful clusters. In this cluster various supporting industries and downstream linkages were created, manufacturing products like: solvents such as alcohol, ketones, tar products, sulphur, ammonia, krypton/xenon, nitrogen and oxygen, feedstock, fuels like petrol, diesel, gas and paraffin (Nortjé, 1998). These and other by-products are used in the production of paint, fertilizers, plastics and plastic products, washing detergents and feedstock.

The cluster's motor vehicle industry around East London and Uitenhage in the Eastern Cape already produces 40 percent of the country's output of vehicles, components, like motor

spares and platinum exhausts, services and ten per cent of the chemical, pharmaceutical and petroleum industries (Nortjé, 1998).

McCormick (1999,) differentiates between “groundwork clusters”, “industrializing clusters” and “complex industrial clusters”. Based on this classification, Kleynhans (2003) thinks that even those successful clusters cannot be classified as complex industrial clusters. They tend to be smaller and less developed than their counterparts in Western countries.

In the 80s and early 90s, the government of Uganda ran a number of state enterprises and projects including those engaged in the production of fish nets (Uganda Fishnet Manufacturers), fish trawling (the Sino-Ugandan Fisheries Joint Venture with the Chinese), fish processing, three fish distribution centers, and a fleet of fish trucks (Uganda Fisheries Industries Limited) and the supply of fishing inputs (EEC funded Artisanal Fisheries Rehabilitation Project). Many of these state outfits ran into management and financial trouble prior to their closure or privatization (Kiggundu , 2007). According to Kiggundu, the key point is that despite this long history of public investments in the fisheries, no attention was paid to the need to build and support local systems for learning and innovation.

This role is not limited to enforcing regulation and standards of performance. It includes funding research, facilitating innovation, and arranging the provision of technical assistance.

The Ugandan case underlines the vital role of public efforts in providing overall leadership and co-ordination of systemic learning, institutional change and continued interaction with the various players in order to ensure that combined efforts bring about the required knowledge flows.

The production of leather shoes in Ethiopia dates from the late 1930s when Armenian merchants founded two shoe factories in Addis Ababa. These factories nurtured a number of shoemakers, who opened their own factories in Addis Ababa and trained their workers. Today, the neighbourhood of Merkato, a huge marketplace in the city, swarms with shoemakers, wholesale shops dealing in leather, soles, and shoe accessories, and shoe retail stores (Adeya 2006). Sonobe, Akoten and Otsuka (2007) selected randomly a sample of 100 large, medium and small firms in this cluster in order to analyze its development.

Eighteen enterprises only in the sample were managed by second-generation entrepreneurs. The fact that the majority of the enterprises were new also indicates that only a small number of enterprises could survive in the face of intense market competition.

Van der Loop,(2003) selected also in Merkato 42 enterprises composed of different footwear manufacturers and shops, such as large, medium and small-scale footwear producers, as well as shoe shops. He found that horizontal linkages, or cooperation among similar types of enterprises, are rather weakly developed among footwear enterprises.

Seventy percent of the sampled firms do not undertake any joint purchase of raw materials with similar firms. In general terms, footwear enterprises have rather weak vertical linkages.

A minority of enterprises (29%) sometimes works jointly with other footwear enterprises in the form of receiving contracts or giving contracts, in particular capacity.

The remaining enterprises do not work jointly at all, due to various reasons: they want to operate independently (47%), they do not have the trust (23%), there is no need for it (18%), or they are not aware of the possibility of joint work (12%). The first two reasons given (totalling 70%) are both pointing to a lack of trust in each other. The lack of trust among entrepreneurs seems to be an overriding argument.

In Kenya, McCormick (2001) found that firms belonging to the textiles cluster undertake “production process”, while other activities such as design, procurement, and marketing are undertaken by firms located in developed countries. Those firms operate at the lower level of the garment chain.

Adaptation of the Models to the Economic Environment of SSA Countries

Within any SSA country, three parallel economies live side by side, the informal, the formal and the international oriented economy. (Exhibit1).

The informal economy, employs more than 80% of the manpower in thousands of SMEs supplying basic products and services to the local market, from farming products, food, furniture, shoes, clothes, to transportation or trade.

The majority of those small businesses have been launched by people that cannot find jobs otherwise (Rosa, 2006).

They are poverty and subsistence driven and mainly want to earn just enough to live (Frese and De Kruijff, 2000) (Olomi, 2001; Rutashobya, 1995; Toroka and Wenga, 1997). The greater the poverty, the more necessity business there is (Reynolds et al., 2001) (Rosa, 2009).

This is confirmed by Mitchell's research (2001) on entrepreneurship in South Africa: 38.7% open a business for survival purposes and 20.2% because they were unemployed and did not find any other job.

Nearly all of the poorest interviewed by Olomi (2001) in his research appeared “trapped” by their incapacity to find the time to earn a sufficient surplus to invest in a new business. Evolution from economic necessity appears to be rare (Olomi 2001). It is still unknown when and how entrepreneurs decide to grow and what triggers the desire to grow (Dunkelberg and Cooper (1982), Kolvereid (1992), Kolvereid and Bullvag (1996) and Kurantko et al. (1997).

The issue is how to support those thousands of SMEs in order to achieve motivation which characterizes business entrepreneurship (Schumpeter, 1934; Davidsson, 1989, 1991).

The formal local economy consists of firms of different size working in agriculture, industry, trade and many other services, such as banking, construction and telecommunications.

Formal local firms mainly supply the needs of the local wealthier population and partially supply the needs of the international customer (mainly exporters of agribusiness products). They are beyond the level of subsistence, but they require infrastructural support such as relevant research, technological transfer, education and training services in order to grow.

The multinationals and the international firms, supply the needs of the local and the international market. Some firms produce and sell mass products to local customers (soft drinks, ice cream) or high-end products to the wealthier population (cell phones, computers). Others buy coffee, cocoa, crude oil, minerals or rubber in SSA countries.

Exhibit 1: The Current and Potential Links between the Three Economies in SSA Countries.

The incubator versus the open incubator and SMEs in the informal and formal economy

The management and the experts in an incubator support 20 to 30 SMEs. A SSA country has a limited number of experts and so, can open very few incubators.

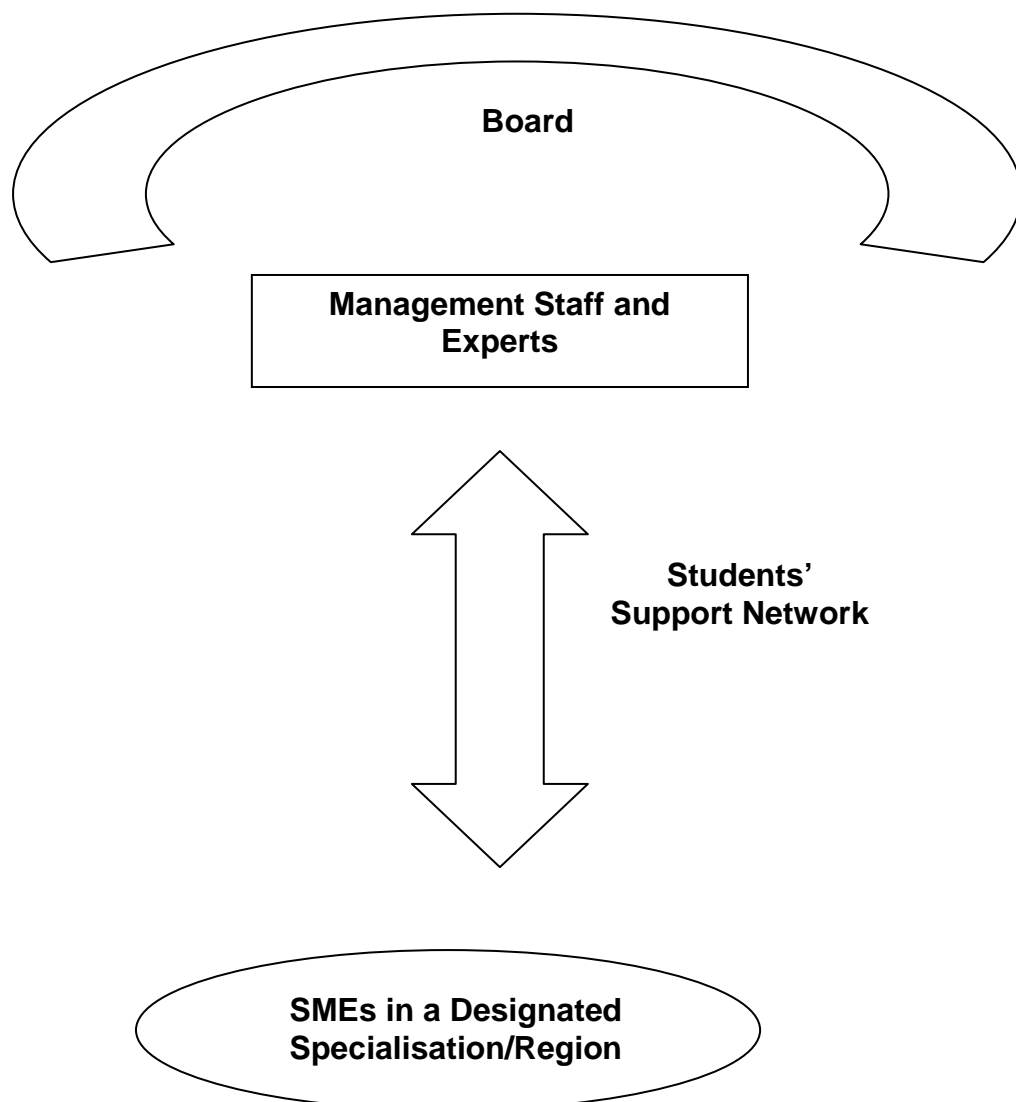

Support to thousands of SMEs from the informal and the formal economy is required in order to generate economic development of sectors or regions. The "closed" incubator cannot support thousands of SME's but the "Open" incubator can.

The study propose make available the services of incubators to thousands of scattered SMEs in the informal and formal economy in a specific region and creating regional open

incubators (Exhibit 2). In this way, the limited number of experts will serve a larger number of SMEs.

In order to overcome both problems, that is, the lack of business knowledge of informal SMEs on the one hand and the limited available number of experts, on the other, the study propose to establish a network of students who would be responsible for presenting the SMEs' requests and reporting on their business progress to the managers and experts of the open incubator as the final project of their studies. One student can support 5 SMEs, and 100 students, 500 SMEs.

Exhibit 2: The Open Incubator Model

The students would thus acquire experience; some might even become employees or partners in the SME they support. Students specializing in business management, agriculture or any technical field could be a part of this supporting student network. Their task would be to support the SMEs in improving their business efficiency and pass subsistence level.

Each incubator will have its own specialization and will support SMEs related to it. The objective will be to create the critical mass of SMEs required in order to generate economic growth in the different economic sectors.

The proposed Open Incubator model can support the formalization process of thousands of firms. The board of the open incubators, in order to be integrated in the sector and the region, will represent the different economic forces, local authorities' suppliers of research, education, technological transfer, finance, management and marketing services.

Hereafter is presented (Exhibit 3,4) the case of poultry and vegetable sectors in which SMEs could be supported by the open incubator upstream and downstream of the production of chicken , eggs and vegetables. .

Exhibit 3:Open Incubator in vegetables

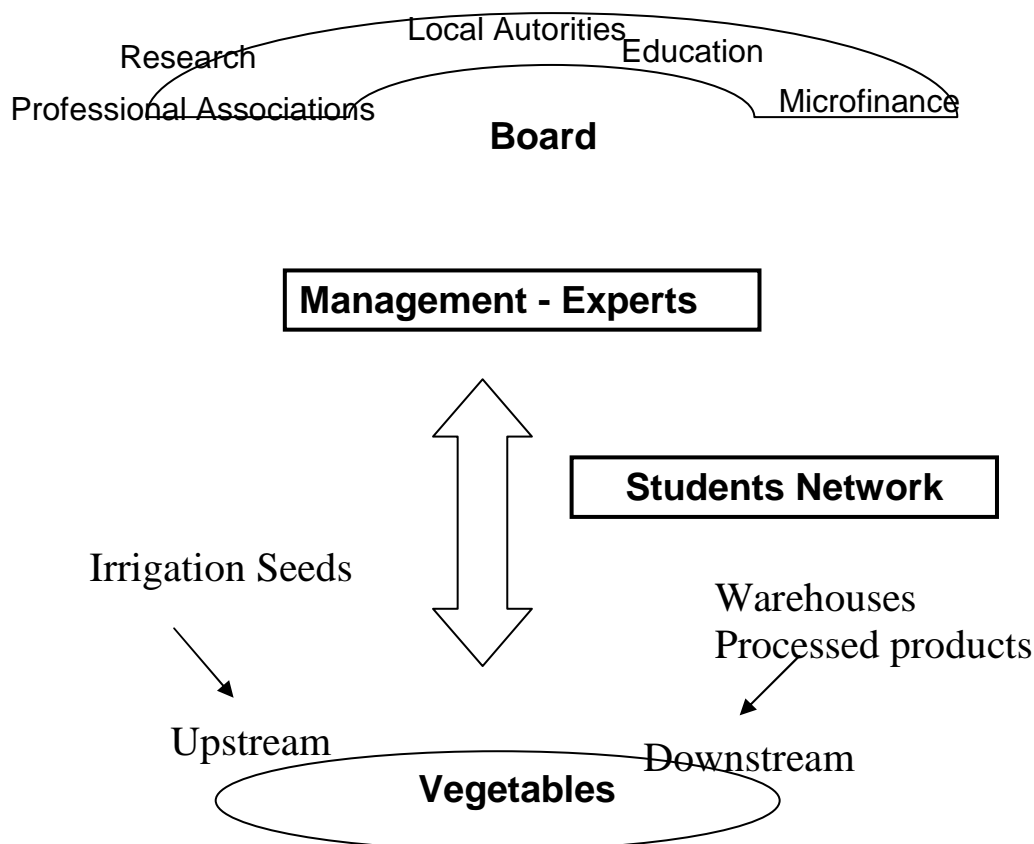

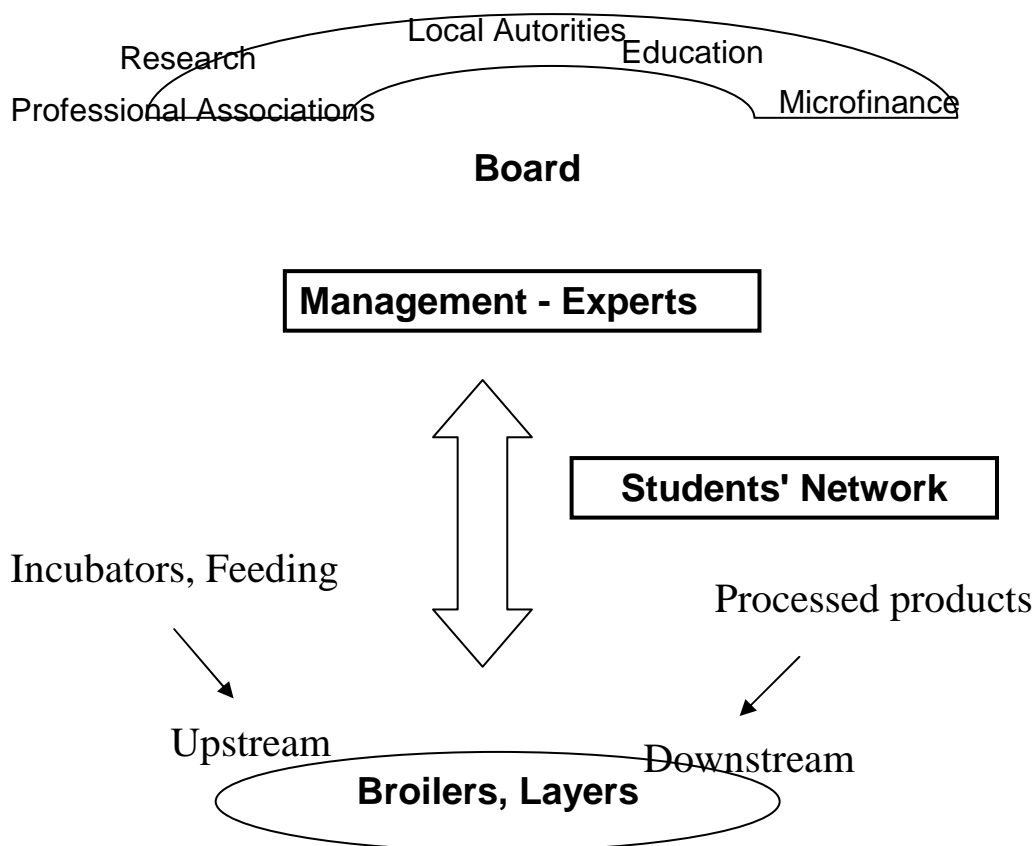

Exhibit 4: Open Incubator in Poultry

The Progressive model, from Open Incubators to Industrial Districts and Clusters

Specialized open incubators will open the ground for the development of existing and new institutions and organizations, supplying technological and managerial knowledge. In such a way, the open incubators could be transformed into industrial districts

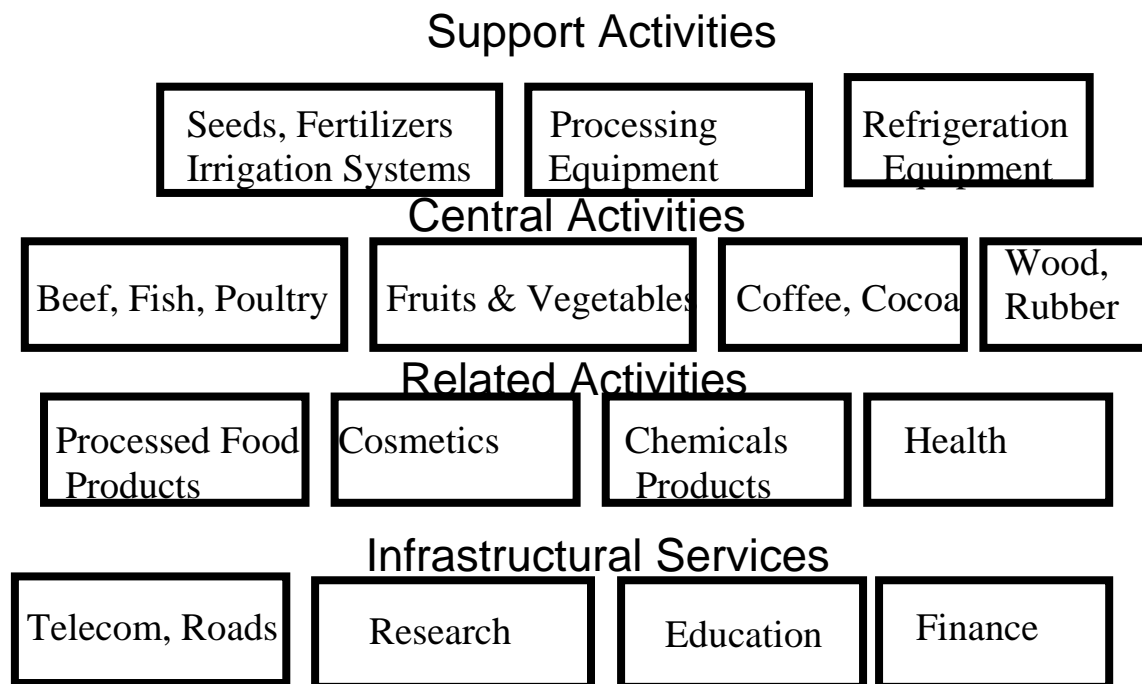

In order to become a cluster, an industrial district needs, an economic driver able to generate synergic development. National or local authorities can be the economic driver and decide to generate for example an agricultural cluster around main activities such as meat, fish, crops, wood, rubber, and minerals (Exhibit 5). Upstream, they will promote support activities such as seeds, feeding, processing equipment, post harvest and refrigerating equipment. Specializations downstream such as processed food, cosmetics and chemicals will be generated.

The infrastructural activities such as research, education and finance will grow according to the evolution of the cluster.

Large local and international firms, working in the SSA countries could be the co-partner of national authorities and also play the role of economic driver.

Nestlé, as a basic philosophy decentralizes its production in order to adapt the products to customer taste in each country (see website). Nestlé has 95 plants in Europe, 74 in North America, and five only in Africa. Its production is limited to basic Nescafé, Maggi soups using starch from cassava. The other products are imported. Nestlé don't invest more in Africa because of better business opportunities in other regions. Nestlé has the relevant technologies in order to process cassava, coconuts or maize and to sell to the local market in SSA countries. But the market is limited due to low level of income of consumers.

Exhibit 5: SSA Cluster in Agribusiness

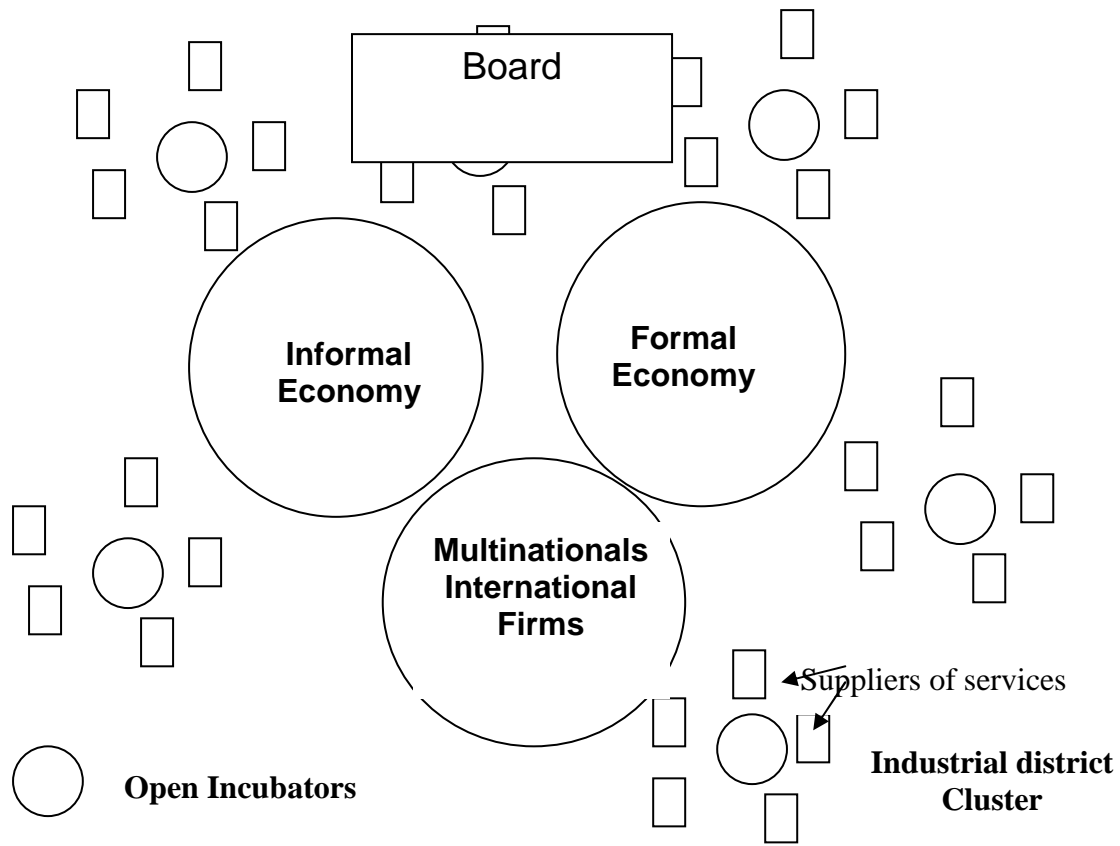

Coca Cola has also plants in SSA countries and sells soft drinks, but produces no local drinks based on coconuts, coffee or cocoa for similar reasons as Nestlé.

Michelin imports from SSA countries rubber but does not produce tires in any SSA country. The reasons are that most customers are in developed countries and that the industry is capital intensive. But if it is feasible to produce tires in China and even in a small country like Israel, it should be possible to do so in SSA countries. Better business opportunities exist in other countries than SSA countries.

In order to convince companies as Nestlé, Coca Cola or Michelin to be an economic driver in the development of clusters, the economy of SSA countries has to be more attractive than others.

The economic development of SSA countries requires a progressive approach (Exhibit 6).

Open incubators help to formalize a part of the informal economy and to strengthen the SMEs in the formal economy. Support services initiated by local authorities around each open incubator transfer the relevant knowledge to SMEs in order to achieve sustainable economic growth. This positive development in the economy will attract large local and international companies to invest in a growing economy and to be economic drivers in the development of clusters.

Exhibit 6: The Process Model towards SSA Industrialization

Hereafter, the study presents the results of a research it launched in three sectors in Cote d'Ivoire, in order to check the feasibility of the Progressive model starting from open incubators to clusters initiated and generated by national authorities and large local firms.

Implementation of the Process model in Cote d'Ivoire

The IMF last report (IMF, 2009) suggests a Poverty Reduction Strategy for Cote d'Ivoire. But 0.07% of the financial support only is allocated to SMEs, 0.7% to the private sector and 0.8% to human capital.

This report is based on secondary official Ivorian information sources such as, the national planning committee, CNPRA (Comité National de Pilotage du Redéploiement de l'Administration), the Ministry of Agriculture and Animal Resources, or Ministry of Economy and Finance, or international sources such as UNDP or UEMOA.

The report uses a macro economic top down approach and does not deal with the basic problem of the integration of the informal economy, mainly composed by SMEs. The progressive model discussed and proposed here is bottom up oriented and based on a cooperation between the national and international authorities and the economic forces:

farmers, growers, cooperatives, traders, large and small local or international firms, service suppliers, professional associations and research centers.

The interviewed representatives of national authorities, the Ministry of Industry and SMEs and of the Ministry of Planning requested us to concentrate our research on the sectors contributing to both agriculture and the industry.

The study selected the following sectors in order to check the feasibility of the Progressive Model:

- Fruit and vegetable processing (pineapple, mango, and other exotic fruits): southeast region. Main city – Abidjan
- Textiles (cotton, jute, silk): northeast region. Main city - Bouaké
- Wood processing and products (plywood, peeled veneers, windows, doors, furniture): southwest region. Main city - San Pedro

In each sector, the study interviewed large local and international firms, local authorities, and professional organizations in order to ascertain their capabilities for contributing to the development of the open incubators, the industrial districts and the clusters.

The study used a questionnaire divided into three sections:

- Section I: Firm's / organization's activities
- Section II: Present and planned activities with SMEs
- Section III: Barriers to the development of SMEs

Support infrastructure

The study interviewed organizations offering three kinds of support—technical, financial, and marketing.

They included FDFP (Fonds de Développement et de Formation Professionnelle), the Chamber of Commerce and Industry and FIDI (a fund for SMEs). The study collected information also about the research centers (CNRA).

Fonds de Développement et de Formation Professionnelle (FDFP)

The FDFP is a public training organization funded by the employees in the public and private sector. Membership is compulsory for the public sector and state owned industries: the membership fee amounts to 0.5 percent of the total wage bill plus an additional tax for on-going vocational training (1.5 percent) (AfDB/OECD, 2008).

The FDFP also administers other funding earmarked for vocational training entrusted to it. Its tasks relate to financing, monitoring and evaluation of in-service training plans and projects. The FDFP provides in-service training with the support of partners.

The FDFP hardly works with the informal economy and SMEs because they are not able to pay for their membership fee. But it is able and ready to launch training programs for SMEs if initiated by national or local authorities.

FIDI (Fonds ivoirien de développement et d'investissement)

The FIDI is a fund for the development of and investment in SMEs. This fund works mainly with very small enterprises.

The main bottleneck of its activities is the lack of business knowledge of its potential beneficiaries and the difficulty they encounter to invest the loan into the planned direction. Oftentimes, the survival needs are stronger and loans fund current basic needs and even the marriage of relatives.

Chamber of Commerce and Industry

All the firms in the formal sector are members of the Chamber of Commerce and Industry. Today the chamber supports its members through international exhibitions, training programs and specialized services such as warehousing and the weighing of coffee at the port of Abidjan. But this organization is capable and ready to launch, in cooperation with the local and national authorities any development program supporting the different economic sectors. They can contact at any time all the few thousand formal companies in Côte d'Ivoire.

CNRA

CNRA, Centre National de Recherche Agronomique de Côte d'Ivoire (see website) support the agriculture related research activities in Côte d'Ivoire, Created in 1998, CNRA has representations all around the country. The cotton research center is in Bouaké, close to the selected textile firms and employs 9 research workers. The fruit research center in Bimberesso employs 10 research workers. Its main activity is on banana and pineapple. The forest and environment research center in Abidjan employs 8 people and is mainly working of the management of forest and forest seedlings production.

The firms we interviewed in the three selected sectors did not benefit of any of the research work implemented by their respective research center. The researchers work in a closed environment and have very few contacts with growers or firms.

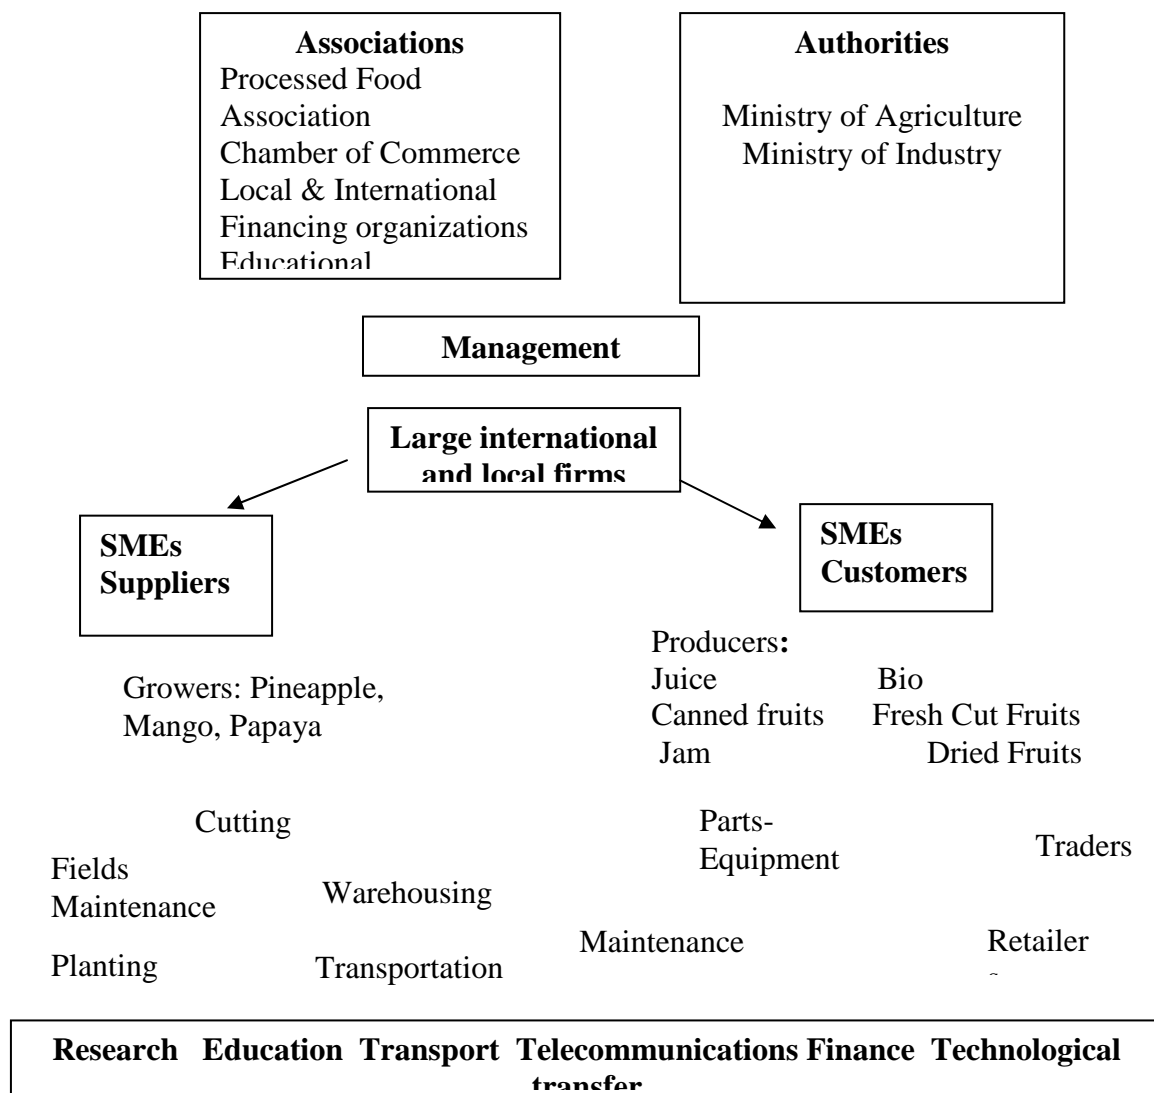

Process model in Abidjan-Thiassalé (Southeast) – Fruit and vegetable processing (see Exhibit 7)

In this area, we interviewed, one dominant international company, SAFCO (juices) at Thiassalé and one medium-sized company, Confipral (juices and jam) at Abidjan. SAFCO, a leader in pineapple juice, is owned by foreign investors, who have production units in other developing countries and lead the marketing process using their own marketing infrastructure, mainly in Europe. SAFCO exports pineapple juice in bulk (thousands of liters), because there are no packaging services in the region.

This company utilizes only 50 percent of its production capacity. The reason is the lack of efficient and reliable supply networks of raw materials. In parallel, at the growers' level, more than 50 percent of the fruit is wasted and the rest sold or processed. This situation opens opportunities for SMEs, able to supply upstream fruits and vegetables to processing companies, and downstream if able to transport and sell the processed fruit.

SAFCO expressed its interest in cooperating and even in creating joint ventures with SMEs specialized in the supply of fruits and vegetables, transportation, packaging, and processing based on fruit juice/fruit extracts (jam, ice cream).

Exhibit 6: Process model in Abidjan District - Fruit and Vegetable Processing

SAFCO cannot improve the range of its products in order to enter the second generation with bio products and fresh cut packaged products. The main reasons are a lack of growers able to produce bio fruits and the large investment required for a "clean" room

The second generation of products requires SMEs or joint ventures between existing companies specialized in the construction of "clean" rooms and aseptic packaging (for fresh cut products) and SME growers specialized in bio fruits (bio products).

CONFIPRAL, a family-owned company emphasized the importance of the local and regional markets that can be developed, if a network of SMEs supports it upstream by providing transportation of raw materials; and downstream by providing marketing services in order to supply the local and sub regional demand.

Research centers (ITT), educational and training programs (FDFP), transfer of technologies and extension services (ANADER, Agence Nationale d'Appui au Développement Rural) exist in this agribusiness sector, but they have to improve their knowledge in bio culture for example in order to transform the open incubator in fruit and vegetable processing into an Industrial District and a cluster.

Process model in Bouaké District - Textiles (Exhibit 7)

The study interviewed the dominant state-owned producer of cotton fabric, Ivoire Coton; the largest international private producer of cotton spinning and fabric, Cotivo and CIDT (Compagnie Ivoirienne pour le Développement des Textiles); two medium-sized private producers of cotton and silk spinning, and two cooperatives specializing in textile products, Women's Clothing Cooperative and Printed Arts Cooperative.

Knowledge regarding local and international markets is very limited in both private and state-owned firms. In privately owned firms, market knowledge is in the hands of the owners and not the managers. In state-owned companies, the business focus is on production, and the managers depend on the marketing experience of large traders. Diversification has occurred in four main spheres: cotton spinning, printed textiles, jute bags, and silk spinning.

Export is mainly oriented to Asian markets (Taiwan, Thailand, and Indonesia). The competitive advantage based on local raw materials and low-cost labor is eroded by international competition from other developing countries from Asia and North Africa. Unbleached textiles are no longer profitable.

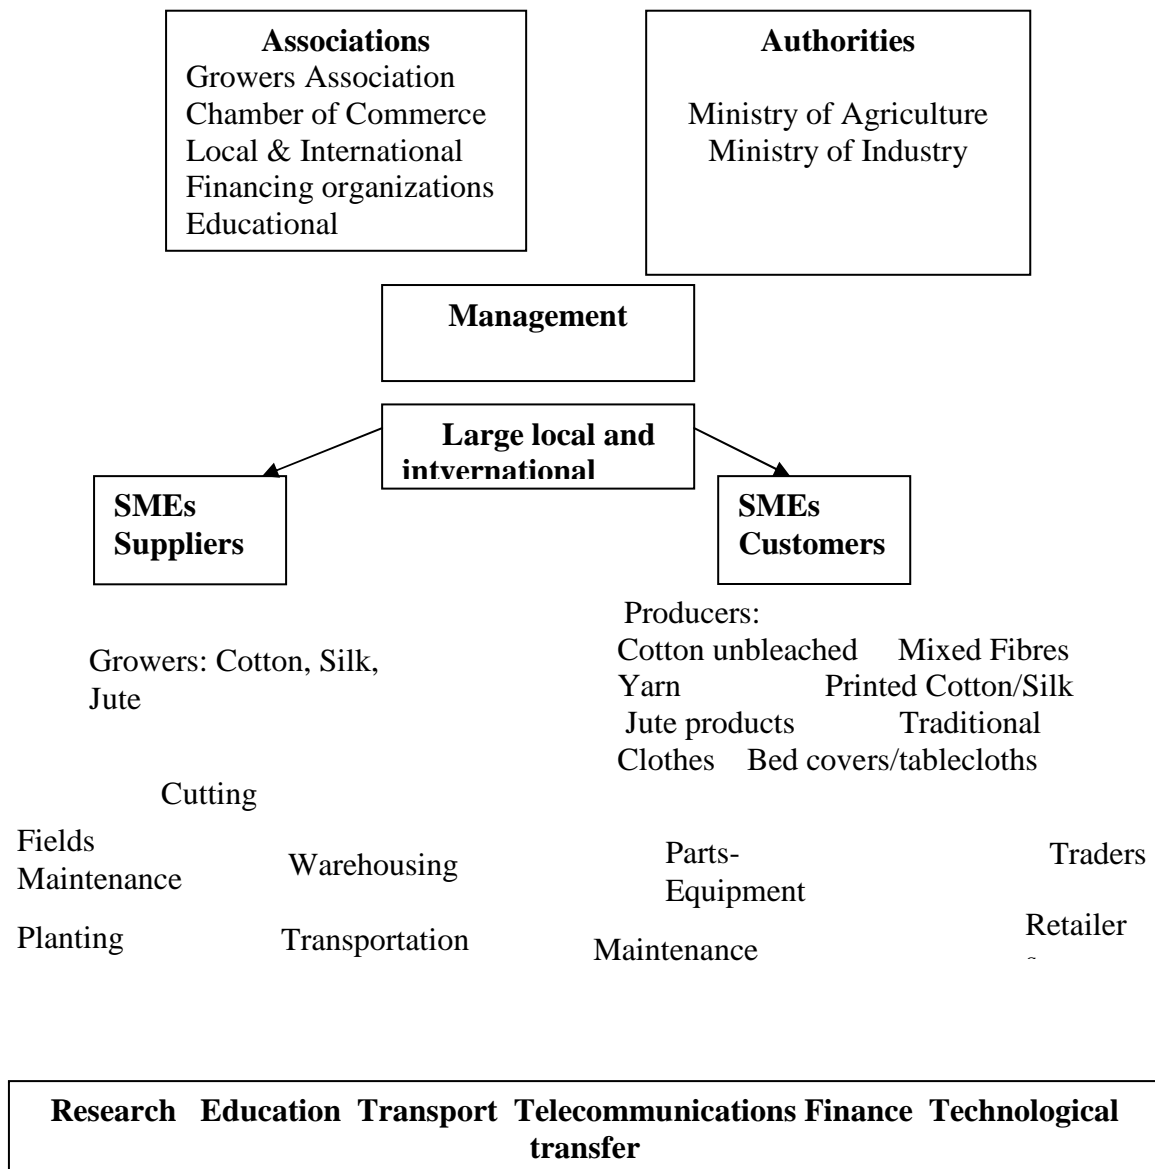

North African countries compete not only on the European market but also in the Ivorian market. At the beginning of the season, North African companies concentrate their activity in the European markets. At the end of the season, they cut their prices and sell their product in the Ivorian market below even the cost of production of local companies. Challenger, a local producer of clothing (jeans), puts pressure on Cotivo to reduce the price of its cotton fabric, which in turn pushes down Cotivo's profits (that today have become losses).

SMEs can develop new design for the local and sub regional markets of clothes (traditional clothing) and textile products (bed covers, tablecloths, curtains). In addition, jute products have a large domestic market in the packaging sector (coffee, cocoa), as well as potential markets in neighboring countries. Numerous SMEs could derive economic advantages in these two fields.

SMEs could produce or repair spare parts for textiles equipment

The interviewed firms expressed their interest to train and support SMEs willing to enter the textiles products market.

Exhibit 7: Process Model in Bouaké in the Textile Sector

In the textile sector, there is no similar support infrastructure as in agro business. They have to be created by local and national authorities in order to develop the open incubators into Industrial Districts and Clusters.

Process model in San Pedro district: Wood processing (Exhibit 8)

The study interviewed Thanry, the dominant private producer of plywood and sliced veneers, and IGD, a medium-sized firm.

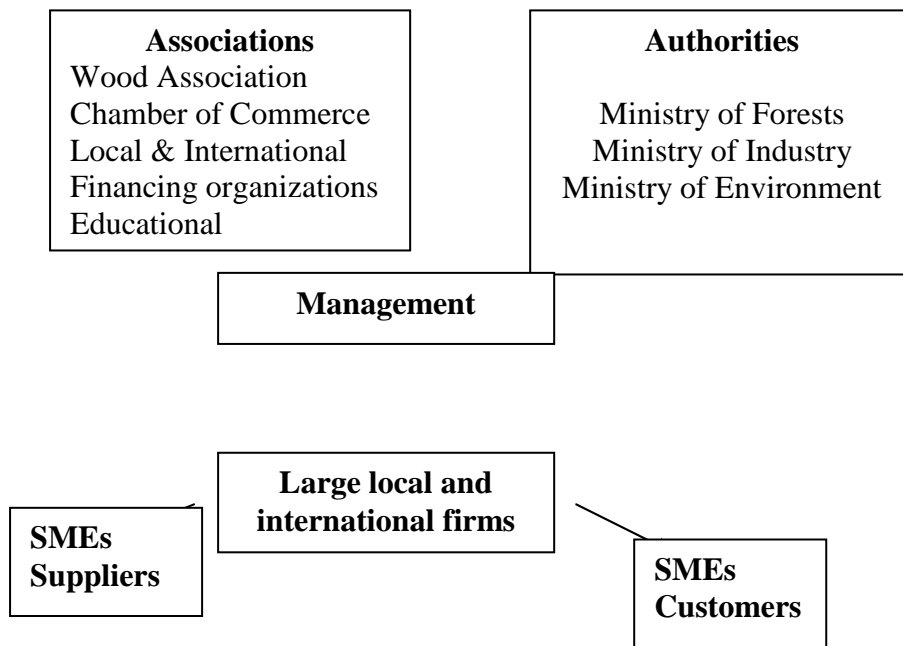

Villagers cut trees in order to clear arable land and plant corn for their own consumption. Large timber companies cut trees in order to supply raw material for the international market. The deforestation process creates environmental and economic problems. Wood is more expensive due to higher local taxes. There is room for the creation of SMEs that would maintain forests through planning and cutting trees at the right time.

Both companies interviewed produce peeled veneer, sliced veneer, plywood and basic wood products, all at a low level of added value. The end customers are unknown to the companies. They use traders to sell the products.

The few tentative attempts at diversification—such as the production of curtains and wooden swimming pool and sauna appliances—have failed. Few SMEs cooperate with these companies downstream, because the local customer cannot afford dried wood products.

The wood sector is threatened by the prospect of de-industrialization due to the limited wood supply and the high taxes levied in Cote d'Ivoire as compared to countries such as Guinea. However, large firms such as Thanry or IGD are willing to support the development of SMEs by providing them with their experience and even the opportunity to use their equipment to produce new products based on dried wood such as doors, windows or furniture. These products are mainly made today of wood, which is not dried enough and therefore, have a shorter shelf life.

Exhibit 8: Process Model in San Pedro District in the Wood Sector

Forester:
Species

Producers:
Plywood Doors, Windows
Sliced veneers Furniture

	Cutting		Parts- Equipment	Traders
Forest Maintenance		Warehousing		
Planting		Transportation	Maintenance	Retailer

Research Education Transport Telecommunications Finance Technological transfer

While the wood sector needs to diversify, the fact that the market knowledge available to the large companies is limited hampers the identification of business potential.

As in agro business, the wood sector has no similar support infrastructure. It has to be created by local and national authorities in order to develop open incubators into Industrial Districts and Clusters.

A process model starting with an open incubator in San Pedro will act as a bridge between large companies and SMEs by improving the transfer of technical and marketing knowledge between the large firms and themselves and between local, sub-regional and international markets.

Conclusion

In the three selected sectors of Côte d'Ivoire, the large local and international companies interviewed expressed their willingness to cooperate with national and local authorities, in order to create open incubators supporting SMEs upstream and downstream of their business activities. This attitude is positive for their long term business interest and for the economic development of the sector. Those open incubators could improve the contribution of the informal economy to the development of the selected sectors.

*The proposed process model starting with numerous specialized and regional open incubators can be the starting point for the development of a critical mass of SMEs in each sector, thereby ensuring sustainable growth. Local and national authorities could use part of the IMF support and taxes collected from this new economy, in order to invest in infrastructural services and develop industrial districts which will attract large local and international enterprises to joint efforts in order to generate clusters.

THE EFFICIENCY OF ITALIAN BANKRUPTCY PROCEDURES: AN EMPIRICAL ANALYSIS

Bisogno, Marco¹

¹Associate Professor of Accounting, Department of "Studi e Ricerche Aziendali", University of Salerno, Italy. Email: mbisogno@unisa.it

Abstract

The importance of efficient bankruptcy procedures is widely recognized and the consciousness of the possible costs due to inefficient procedures has induced several European countries to introduce reforms of their systems in order to improve the efficiency.

The early Italian bankruptcy act was promulgated in 1942; its main goal was the punishment of the inefficient debtor and the protection of interests of creditors. In this context, the interests of the debtor were not taken into account and the creditors were merely participants in a compulsory proceeding in which they played a marginal role. Recently, the Italian bankruptcy act was modified in order to avoid inopportune liquidation of firms, trying to safeguard the value of firms, and to reduce time of liquidation as well as costs of bankruptcy procedures.

The focus of the paper is the analysis of ex post and ex ante efficiency of the Italian bankruptcy procedures.

The analysis of ex post efficiency is based on official statistical data annually published by the ISTAT (the Italian Office of Statistics), investigating: direct and indirect costs of bankruptcy procedures; average ratio of claims reimbursed to the creditors; length of bankruptcy procedures. The period investigated is 2000-2007.

The analysis of ex ante efficiency is based on two non-paired samples of failed and non-failed firms, investigating their financial statements of 2003-2008.

The main expected result is that the Italian bankruptcy procedures are not efficient both in an ex post and in ex ante perspectives.

Keywords: Bankruptcy procedures; ex ante efficiency; ex post efficiency; costs of bankruptcy; length of bankruptcy; failed and non-failed firms.

Introduction

The importance of efficient bankruptcy procedures is widely recognized. The consciousness of the possible costs due to inefficient procedures has induced several European countries to consider reforms of their systems in order to improve their efficiency and effectiveness.

The early Italian bankruptcy act was promulgated in 1942 and only recently (2005) the Italian parliament introduced some innovations. The demand for reform arises from the

perceived inefficiency of previous bankruptcy procedures, the main limits being the following (Marcucci, 2000):

- a) Limited protection of the value of the firm;
- b) Excessive punishment for debtors, reducing the incentives to initiate the procedure in good time;
- c) Complexity, excessive length and high costs of the procedures.

Most of these limitations were a consequence of the limited scope of previous bankruptcy legislation, essentially intended as a mean to expel firms from the market.

Coherently, the main objective of the bankruptcy procedure was the punishment of the inefficient debtor and the protection of interests of creditors (respecting the absolute priority rule). In this context, the interests of the debtor were not taken into account; moreover, the creditors were merely participants in a compulsory proceeding in which they played a marginal role. Nevertheless, procedures were generally characterized to a small average rate, because only a small percentage of claims of creditors were reimbursed.

In 2005 (and in other decrees of 2006 and 2008), different innovations were introduced; their main aims are commented below.

1. Bankruptcy procedures should avoid inopportune liquidation of firms, trying to safeguard the value of firms. As a consequence, bankruptcy law lose its initial punitive aspect, considering insolvency as a physiological stage in the life cycle of entrepreneurship; then, if there is a concrete possibility of re-starting the activity, legislation should help firms to manage this phase, considering liquidation as an extreme solution.

2. Bankruptcy procedures should reduce time of liquidation: if a firm is insolvent, it is important to sell rapidly its assets in order to pay debts, because if the procedure takes on more time, the value of assets could reduce.

3. Bankruptcy procedures should reduce costs of bankruptcy procedures, in order to avoid that a great percentage of money derived from the liquidation of assets could be absorbed by the procedure itself, reducing the average ratio of claims reimbursed to the creditors. Moreover, Italian legislation should exempt or prescribe simplified procedures for small debtors.

Moving from these aspects, the focus of the paper is the analysis of the efficiency of the Italian bankruptcy procedures by comparing empirical data before and after the introduction of the above-mentioned reforms; more specifically, the paper analyses ex post and ex ante efficiency (Cornelli and Felli, 1996):

– The analysis of ex post efficiency will be based on official statistical data annually published by the ISTAT (the Italian Office of Statistics); the variables investigated will be: direct and indirect costs of bankruptcy procedures; average ratio of claims reimbursed to the

creditors; length of bankruptcy procedures. The period investigated is 2000-2005 and 2006-2007 (i.e. before and after amendments of Italian bankruptcy act);

– The analysis of *ex ante* efficiency will be based on two non-paired samples of failed and non-failed firms, considering their financial statements of 2003-2008.

The paper is articulated as follows. After a brief review of the literature (see Section 2) and the specification of the research questions, Section 3 introduces empirical analysis, while Section 4 analyzes results and draws some conclusions, also clarifying the limitations of the study and suggesting improvements for future researches.

Literature Review and Research Questions

Literature concerning efficiency of bankruptcy procedure distinguishes two profiles.

The first one concerns *ex post efficiency*: in this case, the legislation should provide tools which affect variables such as costs of bankruptcy procedures, average rate of claims reimbursed to the creditors and length of bankruptcy procedures.

Costs can be articulated in direct and indirect.

While direct cost are relatively easy to calculate, concerning all the expenses originated during the procedure, indirect costs are very hard to estimate: a possible methodological approach could take into account the ratio between the average rate of claims reimbursed to the creditors and the total amount of debts of failed firms. There are numerous papers which investigated the costs of bankruptcy and reorganization procedures; these studies prevalently were based on samples of US firms, analysing direct and indirect costs of Chapter 7 and Chapter 11 (see: Warner, 1977; Ang *et al*, 1982; Altman, 1984; Lawless *et al*, 1994; Anderson and Betker, 1995; Betker, 1995; Lawless and Ferris, 1998; Bris *et al*, 2006; Hotchkiss, 1995; Lubben, 2000). Unfortunately, the evidences are contradictory: some authors consider the costs of procedures to be high; others consider costs to be low.

Anyhow, the main aim of bankruptcy (and reorganization) legislations should be the reduction of both direct and indirect costs, in order to avoid that procedures absorb a lot of resources that are subtracted to their natural destination: the payment of all debts. As a consequence, the average rate of claims reimbursed to the creditors represents another important variables in analyzing *ex post* efficiency.

Another classical parameter used in estimating *ex post* efficiency is the length of bankruptcy and reorganization procedures, which represent the main “Achille’s heel” of the Italian legislation.

Obviously, the variables mentioned above (direct and indirect costs; rate of claims reimbursed to the creditors; length of procedures) are mutually connected (for example, if the time of a procedure increases, the relative costs should also increase and *vice versa*); as a

consequence, they will be jointly analyzed in order to gain a better understanding of ex post efficiency of the Italian procedures.

The research questions concerning the analysis of ex post efficiency are:

Do the Italian legislation (before and after its modification) minimize direct and indirect costs of bankruptcy procedures, ensuring a great rate of claims reimbursed to the creditors?

Do the Italian legislation (before and after its modification) guarantee rapidity of bankruptcy and reorganization procedures?

The second profile of the investigation concerns *ex ante efficiency*. While there are different studies which analyses ex post efficiency of Italian bankruptcy procedures (see, for example, Barontini, 1997), there are few researches that investigate ex ante efficiency.

This paper tries to study ex ante efficiency by adopting a peculiar approach which benefits from methodological approaches adopted in forecasting models for default risks (even if the goal of the paper is not to discriminate between healthy and unhealthy firms but also to demonstrate the substantial delay in commencement of a bankruptcy procedures).

The methodological approach used in this paper is based on an empirical analysis of two non-paired sample of failed and non-failed firms; more specifically, firms for which a bankruptcy petition has been submitted compose the latter sub sample but the court did not order relief, rejecting the petition. The aim is to understand if these non-failed firms were or not in a state of insolvency. In more detail, we think that the economic and financial conditions of these firms are substantially equivalent to those of failed firms; as a consequence, court should order relief (i.e. the failure of firms should be declared).

The research questions concerning ex ante efficiency is: *if non-failed firms have the same negative performance and the same liquidity and financial problems of failed firms, why court does not order relief? (In other words, if these firms were insolvent, why a court does not declare their failure?)*

If the Italian legislation provides incentives for managers and/or creditors, one of the main implications could be a timely commencement of a reorganization or liquidation procedure, with the aim of protecting the value of the firm (or maximizing the proceeds for creditors).

On the contrary, if the Italian legislation does not provide for any incentives, the debtor does not have any stimulus for a timely commencement. As a consequence, court could not promptly order relief, with the effect of postponing a bankruptcy procedures and reducing the value of the firm.

We expect that there are not significant differences between failed and non-failed firms. If this is the case, we can infer that the bankruptcy procedures prescribed by the Italian legislation are not efficient in an ex ante perspectives. In addition, if the Italian legislation does not provided for any form of incentives for management (who should try to delay the

bankruptcy), the main consequence is also a reduction of ex post efficiency: bankruptcy procedures take on long time, are expensive and the rate of claims reimbursed are very low.

Empirical Analysis

The empirical analysis is divided in two parts.

The first part (see par. 3.1) concerns the investigation of ex post efficiency and it is mainly based on official statistical data annually published by the ISTAT (the Italian Institute of Statistics). The aim of this step of the empirical analysis is to show some basic aspects of Italian bankruptcy procedures in order to understand the degree of ex post efficiency.

The second step (see par. 3.2) concerns ex ante efficiency and it is based on empirical analysis of two non paired sample of failed and non failed firms; as mentioned above, the latter sub sample is composed by firms for which a bankruptcy petition has been submitted but the court did not order relief. The aim is to understand if these non-failed firms were or were not in a state of insolvency.

Ex post efficiency

Ex post efficiency consists in maximizing the value of an insolvent firm; this objective can be reached by reducing time and costs of a bankruptcy procedure and by maximizing the percentage of claims reimbursed to the creditors.

As a consequence, the empirical analysis concerning ex post efficiency is based on the following variables:

- a)* Direct costs of bankruptcy procedures;
- b)* Indirect costs of bankruptcy procedures;
- c)* Average rate of claims reimbursed to the creditors;
- d)* Length of bankruptcy procedures.

The analysis concerns two periods; from 2000 to 2005 and from 2006 to 2007 that is before and after the introduction of new bankruptcy act, in order to compare the results.

Table 1 illustrates descriptive statistics of direct costs of bankruptcy procedures expressed in percentage of total assets.

Table 1: Direct costs of bankruptcy procedures

	Period (years)	
	2000-2005	2006-2007
<i>Mean</i>	0,2103	0,2295
<i>Std Error</i>	0,0042	0,0035
<i>Median</i>	0,2085	0,2295
<i>Std. Dev.</i>	0,0104	0,0049
<i>Variance</i>	0,0001	0,00002
<i>Min</i>	0,198	0,226
<i>Max</i>	0,226	0,233

The incidence of these costs does not change in the two periods examined (the average ratio is about 21% and 22% respectively).

Indirect costs are very difficult to calculate and in literature, authors adopted different approaches; in this paper, we express indirect costs by considering the percentage of claims reimbursed to the creditors and by calculating the ratio between this percentage and the total amount of debts of failed firms. Table 2 shows that the values of this ratio are substantially similar in the two periods we analyzed.

Table 2: Indirect costs of bankruptcy procedures

	Period (years)	
	2000-2005	2006-2007
<i>Mean</i>	0,8556	0,8545
<i>Std Error</i>	0,0052	0,0025
<i>Median</i>	0,858	0,8545
<i>Std. Dev.</i>	0,0128	0,0035
<i>Variance</i>	0,00016	0,00001
<i>Min</i>	0,838	0,852
<i>Max</i>	0,87	0,857

In addition, we can express the average rate of claims reimbursed to the creditors by comparing bankruptcy procedures characterized from a full payment of all debts and those showing only a partial reimbursement of debts (see Table 3). Italian legislation prescribes also other hypothesis (for example, a bankruptcy procedure could be substituted by a reorganization procedure), but they are not illustrated in the table because of their limited impact and their irrelevance with the aim of this study.

Table 3: Full vs. partial pay off of debts

	Period (years)			
	2000-2005		2006-2007	
	Full reimbursement	Partial reimbursement	Full reimbursement	Partial reimbursement
Mean	0,0315	0,4321	0,029	0,413
Std Error	0,0006	0,0062	0,002	0,01
Median	0,0315	0,434	0,029	0,413
Std. Dev.	0,0015	0,0152	0,0028	0,0141
Variance	0,000002	0,0002321	0,000008	0,0002
Min	0,03	0,414	0,027	0,403
Max	0,034	0,454	0,031	0,423

It is clear that creditors gain a full reimbursement of their claims in a small percentage of cases, showing a very low ex post efficiency of bankruptcy procedures before and after the modification of Italian bankruptcy act.

Finally, Table 4 shows the length of bankruptcy procedures; it is clear that the Italian procedures take on very long time (on average about 2.800 days). In addition, there are no substantial differences between the first and the second period we analyzed, even if the second period evidences a small increase.

Table 4: The length of bankruptcy procedures

	Period (year)	
	2000-2005	2006-2007
Mean	2722,8333	2999,5
Std Error	77,6103	35,5
Median	2754,5	2999,5
Std. Dev.	190,1056	50,2045
Min	2431	2964
Max	2923	3035

The results shows a limited ex post efficiency; however, if the results concerning costs of procedures and the average ratio of claims reimbursed to the creditors are substantially comparable with those of other countries, the result concerning the length of procedures are worse than those of other countries (see Caprio, 1997, p. 30; other comparative studies are: Franks *et al*, 1996; Blazy *et al*, 2010). Moreover, the new bankruptcy act of 2007 has not produced any improvements (even if a conclusive judgment requires the availability of data for a longer period of time).

Ex ante efficiency

Ex ante efficiency consists in maximizing the proceeds to creditors from the reorganization of firms and providing incentives for the creditors to monitor the firm (Cornelli and Felli,

1996) as well as providing incentives to management to not delay a request for a reorganization or a liquidation procedure.

The analysis of ex ante efficiency is a very difficult task and it is not easy to understand the methodological approach suitable in a specific context.

In this paper, we propose a specific approach founding the analysis of ex ante efficiency on two non-paired sample of Italian failed and non-failed firms.

Firms whose bankruptcy procedures started in October 2009 compose the first sample. We choose this month because, in an explorative step of the research, we notice that the highest number of bankruptcy procedures characterizes October.

Firms for which a bankruptcy petition has been submitted compose the second sample but the court did not order relief (rejecting the petition) in October 2009.

The samples of failed and non-failed firms were formed using a database of the Italian "Osservatorio sulle crisi d'impresa" (see: www.osservatorio-oci.org), a research team composed by university researchers and professionals as well as judges involved in bankruptcy procedures. This team organized a vast research involving 65 Italian courts (a representative sample of the population of all Italian courts; see Ferro and Di Carlo, 2010); we used this database by analyzing financial statements of all failed and non-failed firms (in the sense clarified above). More specifically, the analysis was based on the financial statements of failed and non-failed firms concerning five years before October 2009 (i.e. from 2003 to 2008).

Although many authors have highlighted (Lincoln 1984; McDonald and Morris 1984; Mensah 1984; McGurr and DeVaney 1998) that the analysis of a specific sector of activity leads to better results, in this case this distinction is not necessary, the aim being the understanding of the efficiency of bankruptcy procedures.

For each year investigated, we selected a limited number of ratios without taking into account their reciprocal links (in other words, we adopted an approach similar to univariate analysis; see Beaver, 1966). The ratios adopted are: Current assets to Current Liabilities (CA/CL); Quick ratio; Return on Equity (ROE); Return on Investment (ROI), because they are frequently used in forecasting model for default risks, to which we implicitly refer. We do not calculate leverage ratio because a great proportion of Italian firms have a high degree of leverage (as pointed out by different empirical researches; see, for example: Paoloni and Demartini, 1997; Aureli *et al*, 2004; Mussolino, 2006; Viganò, 2010); as a consequence, this ratio is not explicative in differentiating failed and non failed firms.

The tables presented below show the descriptive statistics concerning failed (F) and non-failed (NF) firms (the number in brackets indicates the number of observations for each year investigated).

Table 5: Ratios of failed and non-failed firms: year 2004

Tables show different results concerning the first and the second ratio of failed and non-failed firms in each year investigated, while ROE and ROI do not present relevant differentiation.

In order of understanding if the differences between failed and non-failed firms are significant, we implement a t test, comparing means of two samples.

We expect that there are no significant differences between the two samples, because the Italian legislation does not provide incentives for managers and/or creditors; as a consequence, the debtor does not have any stimulus for a timely commencement and, in addition, court could not order relief, with the effect of postponing a bankruptcy procedures and reducing the value of the firms. If this is the case, we can infer that the bankruptcy procedures prescribed by the Italian legislation are not efficient in an ex ante perspectives.

The null hypothesis (H_0) is that there is no difference between means (μ_1 = means of failed firms; μ_2 = means of non failed firms) of two samples; the alternative hypothesis (H_1) is that means are significantly different:

$$H_0 = \mu_1 = \mu_2$$

$$H_1 = \mu_1 \neq \mu_2$$

For each year and for each ratio, we compare means of failed and non-failed firms; the Stat *t* has been compared with the critical value and the *p-value* has been calculated.

We accept the null hypothesis (H_0) if *p-value* > 0,05; this result implies that means of two samples are not different: as a consequence, non-failed firms are not different from failed firms and we can infer that the Italian procedure are not efficient (in an ex ante perspective).

We reject the null hypothesis (H_0) if *p-value* ≤ 0,05; this result implies that means of two samples are different: as a consequence, non-failed firms are different from failed firms and we cannot infer that the Italian procedures are not efficient (in an ex ante perspective).

Tables 10 to 14 show the results of the test.

Table 10: Test *t* (year 2004)

Year 2004	CA/CL		Quick ratio		ROE		ROI	
	F	NF	F	NF	F	NF	F	NF
Mean	24,78247	1,523783	0,725611	0,919254	-0,077516	-0,232147	0,029453	0,02166
Variance	19027,6	6,579758	0,23369	1,140790	1,244256	1,457692	0,019929	0,043061
N. Observations	167	131	167	131	167	131	167	131
Stat <i>t</i>	2,178487698		-1,926079932		1,134475351		0,368035446	
<i>p-value</i>	0,030779919		0,055743405		0,257608896		0,713202274	
Critical value	1,974357726		1,97385213		1,968855114		1,970855317	

The results concerning 2004 show that *p-value* > 0,05 in three cases, being ≤ 0,05 only in one case. As a consequence, in the first three situations, we accept the null hypothesis.

Table 11: Test *t* (year 2005)

Year 2005	CA/CL		Quick ratio		ROE		ROI	
	F	NF	F	NF	F	NF	F	NF
Mean	508,0913	2,099513	81,95200	1,016693	0,656938	0,832771	0,000496	0,028474

Critical value	1,977053689		1,976810963		1,971059073		1,968756254	

Also the results concerning 2007 lead to the same conclusion (we accept the null hypothesis).

Table 14: Test t (year 2008)

Year 2008	CA/CL		Quick ratio		ROE		ROI	
	F	NF	F	NF	F	NF	F	NF
Mean	0,911643 0	1,186456 1	0,561009 1	0,8218725	1,099406 2	0,770413 2	1,501214 3	0,231057 8
Variance	1,385641 7	3,219373 0	0,365870	0,6490848	1,733112	2,458400 0	43,84108 5	0,542673 1
N. Observations	67	73	67	73	67	73	67	73
Stat t	-1,079715722		-2,17746843		-1,348240665		-1,561352416	
p-value	0,28234771		0,031209867		0,179805843		0,123082914	
Critical value	1,979124084		1,977961236		1,977431183		1,995468907	

The results concerning 2008 imply that we accept the null hypothesis in three cases.

Finally, we conclude that non failed firms (i.e. firms for which a bankruptcy petition has been submitted but the court did not order relief, rejecting the petition) are not different from failed firms; in more details, considering the results of *t test*, we conclude that non failed firms were substantially insolvent, being the economic and financial conditions of these firms to a large extent equivalent to those of failed firms; as a consequence, court should declare the failure of these firms and a bankruptcy procedure should start as soon as possible. If the court did not order relief, it means that the Italian legislation does not provide any incentives for either the debtor or the creditors. The result is a delay in bankruptcy, minimizing the value of the firm and the rate of claims reimbursed to the creditors.

Conclusions

The paper analyses ex post and ex ante efficiency of Italian bankruptcy procedures.

The investigation concerning ex post efficiency is based on a database annually published by the Italian Institute of Statistics (ISTAT). The variables analyzed are: costs and length of bankruptcy procedures and average rate of claims reimbursed to the creditors. If costs of Italian procedures are substantially comparable with those of other countries, the length is too high. In addition, there are no significant differences between years before and after the amendments of Italian Bankruptcy act (even if a conclusive judgment requires the availability of data for a longer period of time).

The investigation of ex ante efficiency is based on the analysis of two non paired samples of Italian failed and non failed firms; the methodological approach adopted is based on ratios frequently used in the analysis of financial statements as well as in forecasting models for default risks. After a descriptive statistics, we implement a *t test* comparing means of two samples, in order to understand if non failed firms are (or are not) in the same conditions of failed (insolvent) firms. The empirical analysis shows that there are not significant differences between failed and non-failed firms so we conclude that the Italian legislation does not provide enough incentives for debtor and creditors and bankruptcy procedures are not efficient (in an ex ante perspective).

The methodological approach used in the empirical analysis concerning ex ante efficiency represents a first attempt to join approaches used in forecasting models for default risks and methods of investigation of efficiency of bankruptcy procedures. Therefore, we are aware of the incompleteness of the research that requires further investigation and additional efforts, especially in the selection of ratios that calls for more robust statistical procedures.

Abstract

Family businesses are an alternative organizational typology that crosses all segments, in terms of size and sectors. They are a primary organizational type all over the world and innovation has long been considered vital for their growth and survival. However, research on the linkages between family firms and innovation is scant and lacking empirical investigation.

This research begins to fill this scientific gap in knowledge by studying the influence of family characteristics, in the context of family owned firms, on business innovation capacity. The research identifies the differences in innovative behaviour between family and non-family firms; and empirically proves that family firms, contrary to conventional thinking, are more innovative than non-family. The research investigates the matter particularly with reference to the resource perspective, that is measured in terms of the human, social and marketing capitals.

Methodologically, the paper combines the knowledge drawn from an extensive literature review with the primary research results of a structured questionnaire survey on Italian firms. The Llach Pagès and Nordqvist (2009) analysis model was employed in the process, and to identify family firms, the AIDA database was utilised, in conjunction with the Chua et al. (1999) principle: that a family firm must also perceive itself to be one.

Keywords: family business, family firm, innovation, resource perspective, Italy

Introduction

The competitive scene of recent years has been characterized by structural change, consequent to many factors, but mostly two forces: globalization and technology. It is now increasingly recognized in scientific literature that the new economy is the result of these changes (Tardivo et al., 2011), which ultimately determine the reformation of the drivers of competitiveness. A significant transformation is in fact noticeable in the drive to maintain, even improve, on the economic development of territories/localities and enterprises, in parallel to developing strategies that improve performance. These factors are critical to Italian

businesses, which are characterized by the presence of numerous small and medium-sized enterprises, often family-controlled (AIDAF, 2011; Prencipe et al., 2008; Cappuyens et al., 2003; IFERA, 2003, La Porta et al., 1999).

Family firms compete in a dynamic market with unique resources, which differentiate them from non-family firms. A family business, is an organization in which one or several families exert their influence on the properties and/or the management of the business itself (Demattè et al., 1993). More specifically, family firms differ in terms of goals (Tagiuri et al., 1992), size and financial structure (Romano et al., 2000), international structure and strategies (Zahra et al., 2004), corporate governance (Golinelli, 2000; Montemerlo, 2000) and entrepreneurial behaviour (Zahra et al., 2004).

Three main elements further characterizing family businesses are: (a) the influence of the family on the firm, justified by the legal ownership of all (or part) of the risk capital; (b) the entrepreneurial activity intimately identified with one (or several) families for one or more generations; and (c) the relatives who work in the family firm and run and own (jointly or separately) the family assets in a complex environment, that is often marked by family conflicts (Devecchi, 2007).

In this context, innovation arises as an important strategic resource that family-run firms use to achieve competitive advantage. Innovation is inevitably also an element that researchers can use to determine whether family and non-family businesses differ in their strategic marketing processes. Innovation is ultimately a crucial point in the effort to understand the capabilities of family firms, their procedural capacities and their potential in terms of surviving and competing in the global economy (Tanewski et al., 2003).

Innovation and (consequently) entrepreneurship are of fundamental importance to our economy as they spur economic growth and wealth creation (Barringer et al., 2008). Innovation, in fact, stimulates firm growth and this growth occurs almost regardless of the condition of the larger economy. The role of innovation has been widely studied in large and publicly traded firms and high-tech ventures. However, those firms that have remained family owned have been largely ignored by innovation researchers.

The paper studies the relationship of family owned firms with innovation capacity, largely through an investigation into the differences in innovative behaviour between family and non-family firms. The structure of the paper follows this methodological approach. The next section undertakes an extensive literature review towards defining the terminological context of 'family business' and its contextual framework. The following section, studies innovation and family business and concepts to ultimately develop the hypotheses of the section after that. Subsequently, the research methodology is presented, followed, finally, by the research results and conclusions, along with some discussion and directions towards further research.

Family Business - Terminological Definition and Contextual Framework

Family businesses represent the oldest form of economic organizations. Until the '70s, studies on family business, conducted mainly in the Anglo-Saxon world, were characterized by their focus on the transition from small business to large Fordist organization. These studies mostly relate to the separation between ownership and management (Marris, 1964; Galbraith, 1971; Chandler, 1977), the generational change at the top of the organization (Donelley, 1964; Megivern, 1978) and the links between the various elements of the business system (Zappa, 1946). The '80s and '90s, however, gradually shifted focus to emphasize more on the relationship between life-cycle of the family and the firm (Danco, 1982; Churshill et al., 1983 and 1986, Peiser et al., 1983; Lansberg, 1988). Specifically in Italy, some authors dealt in detail with small and medium-sized family firms (Lorenzoni, 1987; Beccatini, 1989; Nanut et al., 1989; Marchini, 1989), while others studied family firms regardless of size, but focusing on the operating conditions (Corbetta, 1995), the generational shift (Boldizzoni, 1988; Piantoni, 1990; Demattè et al., 1993; Bertella, 1995), and corporate governance (Demattè, 1988; Caffrey, 1988; Schillaci, 1990; Demattè et al., 1993).

In the 2000s, scholars have expanded their analysis to study the relationship between family firms and performance, governance and internationalization (Chrisman et al., 2003; Thrassou and Vrontis, 2008a). In particular, Tardivo et al. (2011) highlight the studies on organizational structures and decision making (Gubitta et al., 2002; Compagno et al., 2003; Songini et al., 2006; Songini, 2007), on corporate governance (Compagno, 2000; Montemerlo, 2000; Corbetta et al., 2002a, 2003 and 2007; Gnan et al., 2007; Pittino et al., 2007; N. Miglietta, 2009; Carminati, 2010), on strategies and growth processes (Ansell, 1999; Compagno, 2003, Compagno et al., 2005, 2006 and 2007; Lassini et al., 2006; Thrassou and Vrontis, 2008b), on leadership and the continuity of generations (Corbetta et al., 2002b, Compagno et al., 2004; Zocchi, 2004; Mezzadri, 2005, Montemerlo, 2010), on value creation (Tischer, 2001; Mussolino, 2005; Mussolino et al., 2005; Viganò, 2006; Thrassou and Vrontis, 2006), on international development (Cerrato et al., 2007; Belussi et al., 2008; Stampacchia et al., 2008) and on the prospects for development in specific sectors (Franch et al., 2008; Thrassou and Vrontis, 2008a) or in particular geographical areas (Zocchi, 2003, 2007 and 2008).

Though the variety of foci and the subject spectra covered by the different researchers allow for some useful secondary data, they do not presently offer a consistent generally acceptable definition of family business. Existing literature does indeed present a 'sharing' of general parameters utilized towards the formation of a single definition (Astrachan et al., 2002; Klein et al., 2005). This is inadequate though, at least for the purposes of this research, while also leading to the false identification of family businesses with small and medium-sized enterprises. While it is true that small and medium-sized enterprises are often managed at the household level, what constitutes a family business is much more than size. Family firms are in fact sometimes big and multinational ones e.g. Armani, Cargill Estee Lauder, Fidelity,

Home Depot, Ikea, JP Morgan, Michelin, Motorola, Nordstrom, Tetra Pack SC Johnson, Wal-Mart, Ford Motor Company, Carrefour, Samsung, PSA Peugeot, Fiat, Ferrero, Benetton, Luxottica..

Predictably, researchers have come up, diachronically with many definitions of ‘family business’, some more generic and others more fit for specific contexts (see Table 1).

Table 1: the evolution of the family business definition.

Authors	Years	Definition
Donnelley	1964	<i>A business in which can be identified at least two generations of the same family whose ties should influence both the strategy of the enterprise and the interests/objectives of the family.</i>
Bernard	1975	<i>A company controlled by members of one family through shares.</i>
Codice Civile art. 230 bis (L 151/75)	1975	<i>The company in which the collaborating spouse, relatives within the third degree and kin to the second, unless it constitutes a different relationship, the family that pays its activities on an ongoing work has a right to the aristocracy to hold according to condition sheet the family and the right to profit sharing and / or increases the company, in proportion to the quantity and quality of the work.</i>
Barnes, Hershon	1976	<i>A company in which an individual or members of one family have a controlling interest.</i>
Alcorn	1982	<i>A company in which the family, even if the property is held by external actors, must manage the business and participate in equity.</i>
Davis	1983	<i>They are family businesses in which the strategic and managerial aspects are subject to significant influence of one or more families. The influence is exerted through the property and, upstream, the contribution of family management.</i>
Rosenblatt	1985	<i>A company in which the majority of the capital (or control) is in the hands of a single family and at least two family members are or have been directly involved in management.</i>
Pratt, Davis	1986	<i>A business in which two or more family influence management through the exercise of family ties, of managerial roles or rights of ownership.</i>
Stern	1986	<i>A business owned and operated by members of one or more families.</i>
Ferrero	1989	<i>A family enterprise is an enterprise where, in fact, they establish relations of mutual conditioning between the company and the company's production, consumption of one or a few families linked by kinship or affinity, to retain ownership of the capital provided by the lien of the full risk.</i>
Churchill, Hatten	1987	<i>An enterprise is considered the family business in which it is proposed or in case of sale of control by a family elder to a younger family.</i>
Babicky	1987	<i>Is a type of small business, started by one or a few people who have a business, working hard to ensure their development and that, often with the help of limited resources, fail to ensure their growth, keeping the majority of the capital .</i>
Lansberg	1988	<i>A business in which members of a family have the legal control of the firm.</i>
Handler	1989	<i>An organization in which the major operational decisions and succession planning are influenced by family members in the management or the board of directors.</i>
Dreux	1990	<i>There are companies that appear to be controlled by one or more families, who have a level of incidence in organizational governance sufficient to substantially affect business decisions.</i>
Leach et al.	1990	<i>A company in which more than 50% of the votes are controlled by a family or a family actually controls the company and / or a significant proportion of managers are members of one family.</i>
Donkels, Frohlick	1991	<i>A company in which family members have at least 60% of the capital.</i>
Gallo, Sveen	1991	<i>A company in which a single family owns a majority stake and has total control.</i>
Lyman	1991	<i>A company in which a single family owns a majority stake and has total control.</i>

Holland, Olivier	1992	<i>Any business in which decisions concerning the ownership or management are influenced by relations between members of one or more families.</i>
Demattè, Corbetta	1993	<i>We are in the presence of a family business where one or several families linked by close ties of kinship or affinity, will put at the disposal of financial capital in full risk or low risk, real or personal guarantees and managerial skills.</i>
Welsch	1993	<i>A company concentrated ownership, with the owners or relatives of owners involved in management.</i>
Carsrud	1994	<i>A company owned by a limited number of subjects, in which the property and the decision process are dominated by a group of persons linked by affective relations of kinship.</i>
Litz	1995	<i>Is family that business in which ownership and management are concentrated in the hands of a single family unit whose members are committed to maintaining an organization that focuses on the ties of kinship.</i>
Tagiuri, Davis	1996	<i>A business in which two or more family influence management.</i>
Astrachan, Schanker	1996, 2003	<i>Broad definition: is family that business in which the family has control over strategic activities and participate in various ways and levels to the business. Definition media: is that family businesses in which the owner intends to pass the company to the heirs and the founder or his heirs should be involved in management. Narrow definition: That is family business for generations Which are undertaking and controlling at least one family member must be involved in management.</i>
Sharma, Chrisman, Chua	1997	<i>The business enterprise which is managed with the intention to train, develop and sustain over time, a vision shared by a dominant coalition controlled by a member of the same family or a small group of families.</i>
Smyrniotis, Romano, Tanewski	1997	<i>The business to be considered family has to be characterized by at least one of the criteria identified: more than 50% of the property is held by a single family; more than 50% of the property is held by more than one family; a single family group holds the effective control of the business.</i>
Chua, Chrisman, Sharma	1999	<i>Is family a run business with the aim to model and pursue the vision of the business that distinguishes the ruling family, not necessarily the largest shareholder, to make it sustainable in the intergenerational level.</i>
Angiola	2000	<i>The family business is that enterprise consists of a household or by two or more nuclei linked by close ties of kinship or affinity, which provide the financial capital of the full-risk or low risk, real or personal guarantees or managerial skills.</i>
Habbershon, Williams, MacMillan	2003	<i>The concept of family business is tied to the desire to convey the property to the next generation and the trans-generational commitment to create value.</i>
Villalonga, Amit	2006	<i>Is family that businesses in which one or more family members holding 5% of capital or are directors or managers, there is at least a family member as an administrator and as a manager, the family is the main shareholder voting, one or more family members of generations after first having at least 5% of capital or are managers or directors, the family is the major shareholder and has at least one family as a manager and at least one as an administrator, the family owns at least 20% of the capital and is the main shareholder. One or more family members possess at least 5% of capital or are administrators but there is no family among the managers, the family is the largest shareholder, owning at least 20% of the voting capital, at least one family member is an administrator and manager, the family is a second generation or later.</i>
Di Mascio	2007	<i>The family business firm which is characterized by: the interplay of familiar figures in the various private and managerial roles and the close relationship of interdependence between the family business and the family business itself, by a strong grounding in economic and political territory; by a strong institutional overlap between family, business, property that generates critical especially during the generational</i>

		<i>transition of the company and the family property.</i>
Zocchi	2007	<i>The family business is that enterprise is characterized by two main factors: the feelings of family members and the patrimonial assets of the family. This affects the appearance and transmission of capital, income, investment, corporate boards and management.</i>
Aidaf	2008	<i>Family firms are the business enterprises in which one or more families, linked by family ties and strong alliances, have the power to appoint the governing bodies.</i>

Determinants of Innovation in Family Businesses - the Resources Perspective

It is a challenge to find a single generic definition of either the 'family business' or 'innovation'. It is exponentially more difficult though, to find a definition of the link between these two, especially in view of the varying use of the terms depending on the context. As it is not this research's aim to invent a universal definition of the above, and much in line therefore with past researchers' approach, Chua's et al (1999) perspective is accepted as the one that best fits this research's scientific context. Specifically, family business is being defined for this research's purposes as "a business governed and/or managed with the intention to shape and pursue the vision of the business held by a dominant coalition controlled by members of the same family or a small number of families in a manner that is potentially sustainable across generations of the family or families" (Chua et al., 1999, p.25). In the same spirit, Lumpkin and Dess's (1996) definition is accepted regarding 'innovation' i.e. that it is "a firm's tendency to engage in and support new ideas, novelty, experimentation, and creative processes that may result in new products, services, or technological processes. Although innovations can vary in their degree of radicalness, innovativeness represents a basic willingness to depart from existing technologies or practices and venture beyond the current state of the art" (Lumpkin et al., 1996, p.142).

Initial studies regarding innovation in family firms found that they were less innovative than non-family ones (Donckels et al., 1991, Morck et al., 2003). In fact, family businesses were found to present aversion to risk, resisting change to invest in new ventures, and lacking innovative capacity, since they are more likely to maximize their profits by investing in political rent-seeking behaviour rather than in innovation. That is the reason why the literature often criticizes family firms for their lack of innovation (Carney, 2005).

From a strategic point of view, family business is considered a business that develops across generations. It follows that innovation is family-based if and only spontaneous interaction between family members across generations takes place and it is relevant to the process's outcome. It's difficult for innovation in family business to take place without both

generations being involved. The secret of innovation in family business lies with the capacity of dynamically balancing power and trust, and control and freedom in the developmental process of a senior-junior relationship. Both roles contribute to the quality of this relationship. On the one hand, the older generation should be able to set the newer free to follow its path, but at the same time it is also the former's responsibility to ensure that the latter will have developed the necessary competencies to continue the family business. Moreover, the younger generation should willingly and with vision be ready to take full responsibility for their choices regarding the family business. Intergeneration innovation does not take place in a context where each party is simply set free to follow their own interest and career (Litz et al., 2001).

Family firms, especially larger and older ones, are in fact characterized by generational evolutionary stages, three of which are visibly identifiable in the businesses' evolution path: the controlling-owner stage, in which the founder exercises the control rights; the sibling partnership stage, in which several members of a single generation (sibling team) control the firm, and the cousin consortium stage, in which several family branches represent ownership (Lubatkin et al., 2005). This evolution nonetheless, may be detrimental to the long term investment perspective and the pursuit of more innovative strategies. In addition, Westhead and Howorth (2006) argue that multi-generation family firms also have a lower entrepreneurial drive than first-generation family firms.

Moreover, referring to managerial determinants of innovation, several authors on entrepreneurship, strategy and management literature, have emphasized the importance of managerial characteristics in explaining performance differences in terms of innovation (Hoffman et al., 1993; Wu et al., 2005; Elenkov, Judge et al., 2005). The hypotheses formulated in these studies are based on top managers' capacity to influence or challenge strategic decisions with certain personality attributes, or the influence of executives' experience on strategic firm choices, known as CEO locus of control, CEO-tenure, and top management heterogeneity (Van Gils et al., 2008). They all have a positive influence on the innovation process.

Additional to the managerial determinants, several studies also suggest that specific family-related variables may explain variation in innovative output (e.g. Sirmon et al., 2003; Le Breton-Miller et al., 2006; Kellermanns et al., 2008). The theoretical arguments behind this rationale are mainly resource and agency based. In fact empirical evidence of the relationship between innovation and family characteristics is scant.

In literature, family determinants of innovation are often built on the resource-based view. The patient financial capital is one of the main resources that provide family firms with potential advantages over non-family firms. Family firms have a longer investment time horizon and can focus more on long term results. The effective management of this financial capital is especially important given the primary objective of continuing the firm as a family

firm. Hence, patient capital creates the necessary conditions for pursuing more creative and innovative strategies (Sirmon et al., 2003).

Regarding family management, and more specifically family CEOs, it is often argued that the presence of family members in the board team may reduce agency costs and increase stewardship attitudes. In addition, family CEOs are expected to perform better than non-family CEOs (Bennedsen et al., 2007). The distinction between a family and a non-family CEO and its relationship with innovation has been recently investigated, with results that portray family CEOs as negatively influencing organizational innovation (Van Gils et al., 2008).

The aim of this research is to extend the knowledge on how family businesses compete through innovation, taking into account their specific characteristics and their differences with non-family firms; particularly, the “familiness” of firms: their human, social and marketing capital (Sirmon et al., 2003; Miller et al., 2005; Llach Pagès et al., 2009). The focus is on these resources, with the underlying reasoning that family firms have a potential advantage which should positively affect their innovative behaviour; with a difference from non-family firms; and against the conventional wisdom that holds family firms as less innovative than non-family ones.

“Familiness” is described as the unique bundle of resources created by the interaction of family and business (Habberson et al., 1999). Familiness can be a point of difference that contributes to competitive advantage. One of the main advantages for example, is the use of a unique language, which allows members to communicate more efficiently and to exchange more information. It is a resource with a firm and deep linkage with the human, social and marketing capitals.

Developing the Hypotheses

The research subsequently expands the knowledge on family businesses’ innovation-based competition, through the above-defined concept of firm “familiness” i.e. their human, social and marketing capitals.

Human capital can be defined as “the knowledge and skills embodied in people” (Hatch et al., 2004). Human capital is an important family firm resource, because it can bestow the firm with a competitive advantage through skills, abilities or attitudes (Sirmon et al., 2003). However, most related literature suggests that family firms are constrained by their limited pool of human capital, which often lacks qualified employees. The explanation for the latter phenomenon lies in the difficulty of attracting and retaining non-family qualified employees into the firm, due to certain long-term barriers (Donnelley, 1964). For these reasons, it is possible to formulate the following hypotheses:

- Hp1: To support innovation, family firms devote a lower proportion of human capital than non-family firms.

Following Adam (2006) and Pagès and Nordqvist (2009) models, we can consequently and naturally hypothesize that:

- Hp1a: The percentage of qualified employees is lower in family firms than in non-family ones.
- Hp1b: The percentage of employees devoted to R&D activities is lower in family firms than in non-family ones.

In line with Putnam's (1993) work, this research defines 'social capital' as the resources that exist in relationships among people. Keeping a high social capital is important to gain access to other forms of capital (e.g., intellectual, human, financial capital) that are critical to a firm's survival (Sirmon et al., 2003). Social capital provides information, technological knowledge, access to markets, and complementary resources; it can reduce transaction costs, facilitate information flows, knowledge creation, creativity and alliance success (Nahapiet et al., 1998).

Family firms may gain specific advantages by developing social capital, especially with customers who can sustain the business in times of trouble. They can further enjoy long-term relationships with external stakeholders; and through them develop and accumulate even greater social capital. As a result, social capital is potentially a primary contributor to high family firm performance. Cooperation in fact, is often a means of compensating for the lack of internal resources: firms find solutions in their immediate environment, as provided by competitors, suppliers, customers, and other elements of the external and macro-environments, including research centres and/or universities. Consequently, the following hypotheses are investigated:

- Hp2: The use of cooperation agreements to support innovation is higher in family firms than in non-family ones.

In order to more deeply analyze the degree of cooperation, the sample is split into three sub-samples, which permit the research to formulate the following sub-hypotheses:

- Hp2a: Family firms have a higher number of cooperations than non-family ones in production.
- Hp2b: Family firms have a higher number of cooperations than non-family ones in purchasing.
- Hp2c: Family firms have a higher number of cooperations than non-family ones in services/sales/distribution.

While the human capital is important for the initial and developing stages of the innovation process, at the stage of launching and implementation, other capabilities gain importance such as market investigation, market testing and promotion. Family firms, due to their high social capital, have access to different resources such as information, technology, knowledge, financial capital and distribution networks (Arregle et al., 2007). These resources also permit

them to communicate closer with the customers, and build marketing capital. This has potential direct effects on the firm's innovativeness or more indirect effects, such as facilitating the development of innovation. Lastly, the flexibility/adaptability of family firms, especially of small and medium sized ones, is enhanced through product and service customisation advantages. This, in its turn, restructures demand and of course firm product marketing; from mass production to high quality 'individualized' products. Family firms, from this point of view, are likely to be closer to customers and their needs/wants/demands, rather than non family firms. This phenomenon adds to the competitiveness potential of family firms since, as Adams et al. (2006) support (and business researchers generally accept), one of the most important factors for the success of a company is its capacity to successfully introduce new products and services into the market. From the above flows the final hypothesis to be tested, as follows:

- Hp3: The proportion of new products launched into the market is higher in family firms than in non-family ones.

Research Methodology

The research was conducted in two interlinked but separate phases: in the first, a sample of 400 Italian firms was selected from AIDA; a database of company accounts, ratios, activities of more than 700,000 Italian companies; in the second phase, a structured questionnaire was mailed to the 400 firms of the sample. 127 firms answered the questionnaire successfully and satisfactorily (in the methodological sense of the terms), which corresponded to a successful response rate of 32 per cent.

The model of analysis applied by this research is the one used by Llach Pagès and Nordqvist (2009). Importantly though, an additional constricting factor was adopted by this research, in line with Chua's et al. (1999) philosophy i.e. that a family firm must also perceive itself to be one. Though this factor may instinctively be viewed as scientifically superfluous, the research partly rests on and investigates social elements of the family firm. This parameter alone therefore, demands that family firms are not termed as such simply because they conform to certain numerical/legal/factual criteria; but also because they socially and consciously view themselves as family firms.

Table 2 shows some basic descriptive statistics of the responding companies (sample). Family firms are more than non-family ones (59.8% vs 40.2%), with the majority belonging to the manufacturing sector (41 firms, i.e. 53.9%).

<i>Main activity</i>	<i>Family</i>	<i>Non-family</i>	<i>% Family firms</i>	<i>Total</i>
<i>Manufacturing</i>	41	26	61.2%	67
<i>Services</i>	12	9	57.1%	21
<i>Finance</i>	4	9	30.8%	13
<i>Food&Beverage</i>	17	5	77.3%	22
<i>Pharma</i>	2	2	50.0%	4
<i>TOTAL</i>	76	51	59.8%	127

Table 2: number of firms by economic activity and family vs. non-family.

In order to verify that the items of each stream only load on a single factor and the discriminant validity; and also to validate the convergent validity of the measures detected in the literature, a principal component analysis was performed.

Factor analysis is a statistical method used to describe variability among observed variables, in terms of fewer unobserved variables, called factors. The observed variables are modelled as linear combination of the factors, plus "error" terms. The information gained on the interdependencies is subsequently used to reduce the set of variables in the dataset. Company size is related to size and "family", so it was necessary to verify its potential effect.

We have verified the possibility of using the factor analysis model through two different tests: Barlett's sphericity test and the Kaiser-Meyer-Olkin (KMO) index. The Barlett statistic puts in evidence a value $\chi^2=1433.96$ (p value 0.0001); the KMO (0.550) also confirms the analysis.

Table 3 presents in evidence the results of the factor analysis. A varimax rotation was applied in order to better analyze the components. The analysis extracted four factors, choosing those which presented eigen values greater than one. These four factors explained 89.24% of the total variance.

It is evident from Table 3, that there is a strong relation between:

- the two measures defining human capital; showing that firms with qualified employees devote a high number of them to R&D;
- the measures defining social capital; showing that the co-operations in production, purchasing, and services/sales/distribution are strongly linked;
- the measures defining marketing capital; showing that many new firm products are new for the market too; and
- the two control variables; showing that there is no effect on the other variables.

	<i>Component</i>			
	<i>1</i>	<i>2</i>	<i>3</i>	<i>4</i>
<i>Human capital</i>				
<i>Qualified employees</i>	0.933	-0.042	0.022	0.111

Research Results

This section presents the results of the comparison between family and non-family firms, using the constructed analysis based on human capital, social capital and marketing capital. Using the Mann-Whitney U-test it is possible to compare family and non-family firms.

Table 4 shows that family firms outperform non-family firms in all the variables considered. Moreover, five out of eight measures are statistically significant.

These results are in line with those of Llach Pagès and Nordqvist (2009), but in contrast with other literature. As described in previous sections in fact, most literature states that family firms are less innovative than non-family firms. The evidence of this research nonetheless is very clear and can be summarized as follows.

For human capital, family firms have a higher average value both in qualified employee and in employees devoted to R&D. So, the first hypothesis (1) has to be rejected.

	<i>Non-family firm</i>		<i>Family firm</i>		<i>Signif.</i>
	<i>Mean</i>	<i>St.Dev.</i>	<i>Mean</i>	<i>St.Dev.</i>	
<i>Human capital</i>					
<i>Qualified employees</i>	127.02	368.38	247.23	553.11	0.0200*
<i>Employee in R&D</i>	20.32	58.94	61.81	138.28	0.0001**
<i>Social capital</i>					
<i>Co-operation in production</i>	0.65	0.84	1.25	0.87	0.0001**
<i>Co-operation in purchasing</i>	0.29	0.50	1.30	0.73	0.0001**
<i>Co-operation in services/sales/distribution</i>	0.69	0.88	1.38	0.80	0.0001**
<i>Marketing capital</i>					
<i>Proportion of new products into the market</i>	0.17	0.04	0.19	0.06	0.3250
<i>Proportion of new market products into the market</i>	0.12	0.04	0.13	0.06	0.6680

Table 4: Summary of basic descriptive statistics and Mann-Whitney U test

* indicate that the Mann-Whitney U-test is significant ($p < 0.05$)

** indicate that the Mann-Whitney U- test is significant ($p < 0.0005$)

For social capital, family firms outperform non-family in every area considered, with the highest difference found in purchasing. So, cooperation and relationship are key competitive advantage factors of family firms in comparison to non-family ones. Hypothesis 2 is therefore accepted.

Finally, for marketing capital there is no statistically significant difference. The average data is very similar between family and non-family firms, with a very slight prevalence of family firms.

Conclusions and Further Research

The primary aim of the research was to study the influence of family characteristics, in the context of family businesses, on innovation capacity. The focus hence was on the differences in innovative behaviour between family and non family firms.

Although innovation is widely accepted as a key competitive advantage, studies on innovation in family firms, is scarce. This research's work with secondary data and literature review nonetheless, has uncovered past research (see literature review) on the link between innovation and aversion to risk in family firms. This past research portrayed family firms as unused to taking risks, with an apparent hasty conclusion that their level of innovation is consequently lower. However, this research's more specific work on the subject analyzes the innovative behaviour of family firms in terms of the three resources of human, social and marketing capitals and concludes differently.

Llach Pagès and Nordqvist (2009) on the other hand, working on a Spanish sample of companies, contradicted past research to support that family firms are in fact more innovative than non-family firms. Their significantly different results and conclusions challenged this

research to apply their model to an Italian sample. The results were essentially the same: family firms outperform non-family firms in human and social capital.

Additionally, it was found that family firms have the need to attract and utilise qualified employees (see hypotheses 1) and that the high number of collaborations of family firms (see hypotheses 2) indicates their heavy connection with their locality. These findings are also naturally anticipated in marketing capital (see hypotheses 3) owing to the fact that family firms largely rest their competitive advantages on this strong connection they have with their geographical domain.

These findings are even more relevant in the Italian case, where clusters are based on the flexible specialization between a large number of SMEs sharing a complementary technological specialization in a territorial network of common norms and values. This competitive framework has been, until recently, a source of advantages both for the firms belonging to this network and for the regions where these networks have emerged. However, the main source of this competitive advantage, the possibility to share the costs of learning and innovation in a territorial network, is close to being exhausted. The main reason is that the extension of the network is insufficient to metabolize the degree of complexity generated by the global process of interaction between people, institutions and firms. The local network of shared norms and values has become a barrier to local knowledge creation because it constrains interaction rather than leveraging it across geographical boundaries.

This research has taken a significant step both towards closing the gap in knowledge on family firm innovation and towards changing some commonly held beliefs on the subject. Beliefs formed largely through projections of past research and which may need reinvestigation or reinterpretation. Unavoidably, this calls for further research on both sides. From the past research's point of view, to test the projections; and from the present research's point of view, to further verify the findings. Regarding the latter, which this research supports to be the wisest methodological path, it is recommended that further research:

- Performs similar research in other geographical contexts (i.e. not Italy or Spain)
- Performs similar research using different but scientifically relevant models
- Performs similar research which is sector specific.
- Performs similar research which is also size-focused

On a catalectic note, this research calls for a re-evaluation or at least reinterpretation of some commonly held beliefs on family firms, not just in relation to innovation, but other aspects as well. The fundamental principle that should be established is that family firms are not ordinary firms, which just happen to have a different ownership structure. They are firms whose family aspect affects many of its other aspects, but most of all those of a social nature. This entails that their differences are not only deep, but also of a less tangible and less visible nature. Projections therefore that lead to conclusions are unscientific at the very least. Family

businesses have a unique culture and a complex nature that demands respect; respect that should be portrayed through research that is specific, focused and bears into consideration exactly those factors that make family firms unique.

Abstract

Based on the development of China's Microfinance Industry the paper first gives an overview on China's Microfinance Institutions. It shows the main regulations and challenges in the legal environment and investigates and analyzes challenges in corporate governance, competition and management capacity

Keywords: Microfinance, China, sustainability

Introduction

There are two related terms in international microfinance field: microfinance and microcredit. **Microfinance** is the provision of financial services to low-income clients who traditionally lack access to banking and related services. The financial services here include not just credit but also savings, insurance, and fund transfers. **Microcredit** is provision of credit services to poor clients. In this sense, microfinance is a broad category of services, which includes microcredit.

To understand microfinance in China better, we think there are two special points to be addressed. First, microcredit has been the main scope of business in the development of microfinance institutions (MFIs) in China. Only recently village banks are allowed to extend their business to the other financial services. Meanwhile, microcredits provided by the existing financial institutions are widely considered a part of the microfinance. Second, due to the imparity of distribution of financial resources, there is larger demand for credit besides from the poor or near-poor population. Small and medium private enterprises are notable entities among such demand. In many cases, the credits going to SMEs are also treated as microfinance. However, the credit line can be as much as several hundred thousand RMB.

Tracing down the history, Du Xiaoshan (2008), He Guanwen (2009) defined the phases of development of China's microfinance industry. For our purpose of analysis, we outlined the key factors in the following table 1.

Now the role of the microfinance has been recognized by the Chinese government. And with its supporting policies, new forms of microfinance institutions such as MCC, VTB, RMCC came into being, meantime traditional commercial banks downscaled their operations to microfinance. However, during the development of microfinance, sustainability has been

the biggest concern of all stakeholders. **Sustainability** refers to the ability of a MFI to cover its operating costs from its operating revenues, so that the MFI is able to survive and prosper in the long run.

Table 1: *Development Phases of China's Microfinance Industry*

<i>Driving Force</i>	<i>Fund Resources</i>	<i>Operating Organizations</i>	<i>Subsidized Interest Y/N</i>
<i>Phase 1: (1994 – 1999) Experimental Phase</i>			
<i>multilateral and bilateral development projects⁽¹⁾</i>	<i>international grants soft loans</i>	<i>project office quasi-official Organization NGOs</i>	<i>some Yes / some No</i>
<i>Phase 2: (1999 – 2005) Expansionary Phase</i>			
<i>government through: PBOC (People's Bank of China), and Other governmental agencies</i>	<i>government funds</i>	<i>Cooperation between gov- ernment and: ABC (Agriculture Bank of China) RCC (Rural Credit Coop- eratives) commercial banks (for urban laid-off)</i>	<i>normally Yes</i>
<i>Phase 3: (2005 – present) Breakthrough Phase</i>			
<i>government through: PBOC (People's Bank of China), and CBRC (China Banking Regulatory Commission)</i>	<i>non-government funds overseas funds traditional commercial banks' funds government funds grants and soft loans</i>	<i>MCCs (microcredit companies) VTBs (village/township banks) NGO MFIs (from previous development projects) RMCCs (rural mutual credit cooperatives) lending companies of commercial banks traditional commercial banks</i>	<i>normally No / a few Yes</i>

Source: extracted by the authors from relevant references

In this article, we don't intend to assess the operation performance of certain MIFs, but focus more on the overall situations which would negatively affect the sustainability of MIFs. Since by nature subsidized microcredits can not be sustainable, we exclude such business in our discussion. We also exclude the downscaling of traditional commercial banks because we think traditional commercial banks (including their lending companies) are doing microcredits within their general scope of operation thus it is more difficult to assess separately. Therefore, we'll mainly discuss the challenge to the sustainability of NGO MFIs, MCCs, VTBs, and RMCCs in China thereafter.

Overview of China's MFIs

NGO MFIs originate from the project offices of the development projects in 1990s. For more independency and better governance, many microfinance project offices took the reform in

early 2000s to register as Social Organizations or Non-business Entities both of which are generally categorized as NGOs. Du Xiaoshan (2008) showed only around 100 NGO MFIs remain in operation out of approximately 300 such microcredit projects or organizations.

MCCs (since 2005), VTBs (since 2006) and RMCCs (since 2006) are all pilot projects initiated by PBOC and CBRC. The purpose is to encourage private capital to invest in the finance business in rural or less-developed areas where the traditional banks would not like to go, thus there is a broader aim of promoting the economic growth in those areas. Among these three forms, only MCCs are not subject to the strict requirement for prudential regulations. MCCs developed very fast especially since May 2008 when PBOC and CBRC issued the *Guideline for Pilot Microloan Companies*. Latest statistics from the PBOC show that there were 2614 MCCs with total loan balance of 197.5 billion RMB by the end of 2010^[2]. Table 2 below gives an overview of China's MFIs on their business.

Table 2 Overview of China's MFIs (Traditional Commercial Banks Excluded)

MFIs	Incentives aligned with development	Fund Resources		Credit Business			Non-credit Business	
		Capital Sources	Liability Sources	Traditional Collateral	Average Loan Size	Annual Interest Rate	Savings	Remittances
NGO MFIs	Yes	Grants from multilateral and bilateral aid institutions international NGOs Chinese government	Soft loans from international organizations such as Grameen Trust, KfW, etc. Wholesale loans from banks such as the CDB	No	Several thousand	no clear regulation, actual 3-18%	No	No
MCCs	Yes + No	Private capital from: individual investors institutional investors	Loans from no more than 2 banks and amount no more than 50% of its net capital	Yes	Several thousand – hundred thousand	0.9-4.0 times basic rate in law, actual around 20%	No	No
VTBs	Yes + No	Domestic or foreign commercial banks as: sole proprietorship, or joint stock partnership with individual and/or institutional investors	savings from depositors	Yes	Several thousand – hundred thousand	0.9-2.3 times basic rate	Yes	Allowed in law, but currently No
RMCCs	Yes + No	Capital from: Member farmer, citizens and enterprises donations from other organizations	voluntary savings from members bank loans allowed by law but difficult to get	No	Several thousand	0.9-2.3 times basic rate	Yes but only from members	Allowed for members in law, but currently No

Challenges in Legal Environment

Main Regulations Issued by the PBOC and the CBRC on MFIs

So far the main regulations/guidelines issued on MFIs include:

- CBRC, *the Opinions Regarding Easing Market Access for Banking Financial Institutions in Rural Areas in order to Better Support the Construction of a Socialist New Countryside*, Dec., 2006. → **Overall guideline**
- CBRC, *the Provisional Regulations on the Management of VTBs*, Jan., 2007. → **VTBs**
- CBRC, *the Provisional Regulations on the Management of RMCCs*, Jan., 2007. → **RMCCs**
- CBRC, *the Provisional Regulations on the Management of Lending Companies*, Jan., 2007. → **Lending companies**
- CBRC, *the Guideline on How to Greatly Develop Rural Microloan Business by Banking Financial Institutions*, Aug., 2007. → **Microloans Business**
- PBOC and CBRC, *the Notice of Relevant Policies about VTBs, Lending Companies, RMCCs and Microloan Companies*, Apr., 2008. → **All the new MFIs**
- PBOC and CBRC, *the Guideline for Pilot Microloan Companies*, May, 2008. → **MCCs**

These regulations set up a framework for the establishment and operation of MFIs. It promotes microfinance development especially by encouraging private capital entering into the business. But in this framework, there are also challenges to the sustainable development of MFIs in the long run, and we will discuss them in detail later.

Instable Legal Status of MFIs

By scope of business, NGO MFIs, MCCs, VTBs, and RMCCs should all be treated as financial institutions and subject to the supervision of the PBOC and the CBRC. However, currently NGO MFIs are supervised by the Bureau of Civil Affairs in the sense of NGO. In addition, among them only a few obtained the permission from the PBOC, while the others are operated mainly based on informal business agreement between fund donors and the local governments.(He Guanwen, 2009) There is no official regulation related to the establishment of such NGO MFIs, nor for the supervision of their business. This leads NGO MFIs to an instable legal status and an uncertain future.

Although MCCs are promoted by the PBOC and the CBRC, the supervision is entrusted to the local governments. So far it involved in such governmental department as Financial Management Office or SME Management Bureau. The MCC regulation only stipulates that MCC should be registered as a limited company, but not clearly says that it is a financial institution.

VTBs and RMCCs are recognized as financial institution and supervised by the CBRC. But the CBRC adopts nearly the same prudential supervision as in traditional commercial banks such as the requirements for at least 8% of Capital Adequacy Ratio (CAR), 100% of Loan Loss Provisions, etc. it also specified the qualification of the top managements. All these are thought too strict for the small institutions, especially for RMCCs where the capital is rather small^[3] and the clients are limited to the shareholders.

The uncertain future of MFI's legal status affects the confidence of both the present and the potential investors. It may make MFIs difficult to attract investments and may also lead MFIs focusing too much on the short-term benefit.

Limited Sources of Funds

For all MFIs, fund constraint is a common problem that restrains their expansion. So far, credit is the only business for most of the MFIs. So their operating revenues totally depend on the interest income from loans, i.e. on the total volume of loan and the interest rate. The implication is with the same interest rate loan volume is the key factor for higher profit; and for covering certain operating cost, there is a need of certain capital.

Not like banks which can mobilize more funds by deposit creation, MCCs and RMCCs are strictly forbidden from attracting public deposit in any forms. Although RMCCs are allowed to attract voluntary savings from their members, it is more difficult to realize it since the interest rate for savings shall not be higher than the national basic interest rate according to the regulation and thus it can not be attractive even for RMCC members. The same situation happened in VTBs where the saving is allowed but VTBs found it very difficult to collect deposit due to the same reason. We can understand the prudent attitude of the PBOC and the CBRC towards saving permission, worrying about the default risk and the associated social unrest. But this regulation would result in the constant fund restriction for these new types of MFIs.

Donation is mentioned as one of the fund sources for MFIs in the regulation. Both international and national grants and soft loans for microfinance are with the purpose of poverty alleviation. It is still not clear whether MCCs, VTBs and RMCCs can align this goal with their development as expected by the government. In this sense, no matter from their origin or their current operations, NGO MFIs have better access. Actually grants and soft loans have always been the main source of fund for NGO MFIs.

For taking commercial loans, current policy allows MCCs to take from no more than 2 commercial banks and with the amount not exceeding 50% of the net capital. While due to the nature, RMCCs find it difficult to get loans although it is allowed by the policy. Meantime CDB, the policy bank, is trying to promote microfinance by wholesale loans. That would be a new source of fund for MFIs.

Restrictions on Business and Expansion

In order to control risk, it is regulated not only for the fund resource, but also for the other business aspects such as the range of the interest rate, the cap on the single loan amount, and the cap on the leaving loan balance of single client, etc. And normally the business areas are limited to the county where MFIs are registered. RMCCs' business is limited to their members (i.e. shareholders).

Challenges in Corporate Governance

Like other business organizations, ownership and governance structure are the essential factors that determine whether MFIs succeed or fail. Based on the current legal environment and the operating practice, we find there are challenges and problems in corporate governance in China's MFIs as reflected in the following table 3.

Table 3: Challenges and Problems in Corporate Governance in China's MFIs

MFIs	Ownership	Governance Structure	Main Problems
NGO MFIs	Grants providers are not the true owners in the sense of ownership Local governments have factual control over the funds of grants especially after the ending of projects Local government normally has contributed to office place, office equipments, etc.	Board → Top Management By law a NGO needs to be registered under a certain government department Normally chairman of the Board is the chief officer of the affiliated government department ^[4] Normally the top management is designated by the government directly or through the Board Top management members normally have status of government employees and enjoy the affiliated welfares	No real ownership No real functional Board Not independent from local government No real incentives for top management to increase efficiency
MCCs	Registered Capital of: RMB 5 million for limited liability company; RMB 10 million for shareholding company; however the standard is raised by at least 4 times in provincial regulations ^[5] Private investors (individual or institutional) No single founder > 10% principal ownership (raised in provincial regulations for the principal founder ^[6])	Comply to the Corporate Act of China: Shareholders → Board → Top Management Vote by capital shares Requirement on banking experience for top management (normally in provincial regulations)	Conflicts among shareholders More interested in short-term profits Reluctant to adopt social missions Doubtful management capacity
VTBs	Registered Capital of: RMB 3 million in county; RMB 1 million in township Sole ownership or controlling ownership by a traditional	Shareholders (?) → Board → Top Management President of Board and the top management require 5 years' experience in banking or 8 years'	Control by traditional commercial banks or large shareholders More interested in short-term profits Reluctant to adopt social missions Difficult to attract qualified directors

	<i>commercial bank</i> <i>Controlling shareholder bank > 20% principal ownership</i> <i>Any other non-bank shareholders < 10%</i> <i>Any shareholder > 5% needs advance approval of CBRC local office</i>	<i>related experience (including 2 years' banking)</i> <i>Candidate for directors and top management needs qualification check of CBRC local office</i> <i>Branch director to get certificate from local CBRC exam</i>	<i>and top management</i>
RMCCs	<i>Registered Capital of: RMB 300 thousand in township; RMB 100 thousand in village</i> <i>At least 10 qualified initiators</i> <i>No single founder > 10% principal ownership</i> <i>Any shareholder > 5% needs advance approval of CBRC local office</i>	<i>Shareholders / members → Top Management, or</i> <i>Shareholders / members → Board → Top Management</i> <i>If members > 100, then to elect representatives consist of > 31 members</i> <i>Each member has one basic vote</i> <i>Large shareholders can have additional votes, but total additional vote should < 20%</i> <i>Directors and general manager need qualification check of CBRC local office</i> <i>Supervision committee by the stakeholders</i>	<i>High possibility of being controlled by a few influential leaders</i> <i>Low internal cohesion</i> <i>Weak internal control mechanisms</i> <i>Generally poor management capacity and staff quality</i> <i>Ineffective external supervision</i>

Source: prepared by the authors

Our research shows it is not easy to combine commercial operation with social expectation of serving the poor. The NGO MFIs supported by grants can fulfill social missions better, but have less incentive for high efficiency due to lack of real ownership. So they can not be sustainable in the long run. While the other type of MFIs, which involve in private investment, tend to ignore social missions and go for profit only, especially for the short-term benefit. They intend to charge higher interest rate and disburse large loan sizes. The risk may accumulate and finally affect the sustainability of the MFIs, Not to mention the other aspect that such behaviors already move away from the initial aim of microfinance.

Challenges in Competition Context

The Competition from the Traditional Commercial Banks

As we showed in the table 1, the traditional commercial banks are also encouraged to downscale their products. Now the Agricultural Bank of China, the Rural Credit Cooperatives, and the Postal Savings Banks are very active in the rural areas, while urban commercial banks and the other traditional commercial banks are rather active in the urban areas. Compared to the internal competition among MFIs, we think the threat from the traditional banks is more serious.

Banks have many competitive advantages. They have easier access to the good clients and can provide better services beside credit; they can monitor the fund use better; they have better financial condition both on capital and on attracting savings; they have better staff and management capacity; they have better experience on developing new products and conducting marketing; and so on. So if they go into the same business sector, the present MFIs can hardly compete.

Besides the good clients may be taken away by banks, in reality the interest rate offered by banks is actually the interest rate cap for MFIs for transactions at the same condition. Lacking of their own remittances channel, MCCs need to cooperate with banks for the relevant services. Traditional state-owned banks had retreated from poor and rural areas during their reform of efficiency improvement; therefore there is the room for MFIs especially VTBs to grow. But so far remittances channel still needs to be settled for VTBs to broaden their business.

Higher Operating Cost and Risk

Theoretically MFIs will go to the poor or low-income clients who are normally considered unqualified clients by traditional banks. Generally the traditional collateral is not feasible for such clients, and this leads MFIs to higher default risk. This is especially true for NGO MFIs.

To solve this problem, NGO MFIs tried Grameen Model of group guarantee and repayment in installment. Normally a loan group consists of 3–5 clients, and 2–5 groups constitute a loan center. The disbursement of loans and the collection of repayments are organized in the regular center meeting (weekly, biweekly, or monthly) by the credit officers of MFIs. The individual loan size normally is several thousand. It is very costly to manage a large number of clients with small loan size^[7]. It also costs to maintain the regular center meeting system, especially when the clients are remote^[8]. That is why some NGO MFIs reduced the frequency of center meeting from weekly gradually to biweekly and then to monthly. However, regular center meeting enable MFIs to keep close monitoring on the clients and to guarantee repayment rate. Reduction in meeting frequency may have a negative impact on the repayment risk.

Du Xiaoshan (2008), Cheng Enjiang (2006) both mentioned there were once approximately 300 microcredit organizations or projects in China, and only around 100 MFIs still remain operation. Among them, only about 10 MFIs have managed to become operationally self-sufficient, means the operating revenues (mainly from interest) can cover the operating costs and the subsidized capital cost (the grants and the soft loans). They are still far from financially self-sufficient, means the operating revenues can over not only the operating costs, but also the market capital cost (capital cost calculated in the market interest rate).

Actually it is widely believed that there is a trade-off between outreach^[9] and sustainability due to the high transaction costs, high risk and lower expected returns for providing microfinance services to the poor. This explains exactly why the newly established MCCs and

VTBs, operating on a business approach, are reluctant to adopt social missions and incline to issue large loan size and server the non-poor.

As another means of guarantee, some NGO MFIs required up-front group funds or compulsory savings. But this policy now encounters the legal risk when MCCs are strictly forbidden by the regulation from attracting savings in any form. We noticed that some NGO MFIs have given up this practice due to this reason.

Challenges in Management Capacity

Management capacity is another key bottleneck for the sustainable development of MFIs. This reflects in the quality of MFIs' staff, innovation in microfinance products, and implementation of management information system.

Staff quality is the basis for implement sound management. This is also noticed by the supervision authorities and reflects in qualification requirements on top management of MFIs (see table 3). However, in reality MFIs can hardly compete with commercial banks for qualified personnel in view of financial benefits and professional prospect. In our field survey to CZSWDA, we noticed more than half of its loan officers came from its earliest farmer clients, and the rest was recruited from graduates of high school or vocational school. Nearly none of them has financial education background, and their financial skills mainly came from work experience and internal trainings. Other surveys prove this phenomenon is rather common in MFIs.

For credit products, there is little innovation so far in China's MFIs. They tied either the Grameen Model of group lending or the traditional collateral loan as banks do. Despite of the success of the Grameen Bank (by group lending), it is generally considered difficult to replicate this success, especially in areas with lower population densities. There the cost-saving effect of group lending will be offset by the increase of operating cost of extending outreach. This is just the challenge faced by NGO MFIs working in the western poor areas in China. For MCCs and VTBs, the main methodology now is still the collateral or the third-party guarantee. As soon as commercial banks discover the same client group, they can hardly compete. For the long-term success of MFIs, it is believed necessary to develop new products and/or new operating models according to the local situation and the target groups. For credit loans, effective collection policy and techniques also need to be developed in case of delinquent borrowers and group coalition defaults. However such professionals are scarce in MFIs.

Management information system (MIS) is another weak point in management. In most MFIs, only a very basic manual MIS is in operation. There is no verification of the accuracy and timeliness of this process and whether the information has been used for management decisions. Thus there is a common need to upgrade current manual MIS to a comprehensive computerized system which will improve transparency of operation and support

management decision making. To achieve this goal, more computer skills need to be obtained by MFIs' staff. So are the management techniques.

Limited management capacity in MFIs was also realized by international development agencies such as World Bank, KfW, Grameen Foundation, etc. Recently they initiated several technical aid projects on capacity building and organized training workshops on microfinance. Without fundamental improvement in management, we think MFIs may run into trouble when their operations are extended and become too complex.

Conclusion

Microfinance is promoted across the world because it is generally believed that microfinance will contribute positively to poverty reduction. But to target at poor areas and poor people, it means high transaction costs, high risk and lower expected returns. This makes financial sustainability an ever challenge for all MFIs.

In recent years, Chinese government took several initiatives to develop microfinance sector, especially encouraging private capital take part in MFIs. Apart from remaining NGO MFIs founded in previous development projects, new types of MFI came forth as MCC, VTB, and RMCC. Although the initial regulatory framework has been established for these new MFIs, there are many legal restrictions related to attracting funds (especially savings) and extending their business. And their legal status remains unclear. The outer supervision from authorities is either too much or not enough. All these factors bring challenge to the success of MFIs. Meantime they are counter more and more competition from traditional commercial banks which have obvious competition advantages. Ownership and governance structure also play a negative role. In general, NGO MFIs which lack of real ownership develop little interest in efficiency, while commercial MFIs (MCCs and VTBs) which involve in private capital care too much on short-term profit. RMCCs as member-owned organizations have high risk of being captured by a few influential leaders, and the members may lose their money. Another constraint to sustainability is management capacity and staff quality. And there is still a long-way to go.

In view of all these challenges, we think it is still too early to say whether MFIs will succeed or fail in China. And the government needs to take more measures to improve microfinance environment and promote the industry; meantime MFIs need to improve their governance structure and management capacities.

Abstract

Based on the description of the theoretical background of value-based management and the characteristics of SMEs, the paper analyses the state of knowledge and the diffusion of value-based management among SMEs, shows the result of a recently undertaken empirical study and identifies possible implementation barriers of this concept.

Keywords: SME, Value Based Management, Performance Measurement

Introduction

SMEs are seen as the “backbone” of the German economy (Schauf, 2009a, p. 15). According to the statistic of the SME-research institute „Institut für Mittelstandsforschung Bonn“ 99.7 % of the German companies subject to value-added tax in 2009 belong to the group of SMEs (IfM Bonn).

The management style of SME entrepreneurs is often characterised by short-term considerations (Wegmann, 2006, p. 148). In addition, a lot of decisions are taken intuitively (Wegmann, 2006, p. 185). Because of the increasing need of capital and the growing intensity of competition SMEs face high challenges (Schlüchtermann and Pointner, 2004, pp. 24-25). Thus, there the professionalization of the management in SMEs is getting more and more important (Schauf, 2009a, p. 15).

The importance of value-based management increased in recent years and it is now considered as one of the key management philosophies (e. g. Britzelmaier, 2009, p. 11). According to the shareholder value concept, the fundament of value-based management, the main objective of the management is to increase the value of the company for the shareholders (Rappaport, 1986, p. 1). However, value-based management is not only focused on the increase of the company value but also constitutes a managerial approach that enables a sustainable economic development (Piontkowski, 2009, p. 357). Fundamentally, value-based management can be applied by any company independent from its size and its capital market orientation (Krol, 2007, p. 3). Large listed companies are using value-based management instruments since years (Arbeitskreis “Wertorientierte Führung in mittelständischen Unternehmen“, 2003, p. 525). The objective of sustainable economic development is also pursued by SMEs (Piontkowski, 2009, p. 357). Additionally, there are several factors that promote the application of value-based management for SMEs (e.g. Krol, 2009a, pp. 89-128). Nevertheless, value-based management is only spread to a limited extend among SMEs (Piontkowski, 2009, p. 357).

Based on the description of the theoretical background of value-based management and the characteristics of SMEs, the paper analyses the state of knowledge and the diffusion of value-based management among SMEs and identifies possible implementation barriers of this concept.

Fundamentals of value-based management

The first approach of value-based management was the shareholder value concept developed by Rappaport in 1986 (Rappaport, 1986). The company's activities should focus on the increase of the company value (Tappe, 2009, p. 64). Based on this concept, other approaches of value-based management like the Economic Value Added or the Cashflow Return on Investment have been developed (Britzelmaier, 2009, p. 12).

It has to be pointed out, that value orientation is not necessarily focused on monetary values. Business activities should always be based on ethically correct behavior. In western countries this is characterized by Christian and occidental values, in China e.g. by Confucianism and Taoism. Ethically correct behavior - the orientation of own actions along spiritual values - and shareholder value orientation do not exclude each other. A flourishing company preserves and generates jobs; content employees support a good company's performance. Economic, ecologic, ethic and social goals are not stringently working in opposite direction, but often have a complementary character.

Investments are only seen as beneficial if a positive net present value is reached under consideration of risk-adjusted capital costs (Arbeitskreis "Wertorientierte Führung in mittelständischen Unternehmen", 2003, p. 525). The consideration of this principle leads to an ameliorated capital allocation; management and decision-making are focused more in the long run and with a higher strategic focus (Krol, 2007, p. 3). This approach can be applied independently from the size and the capital-market orientation of a company (Krol, 2007, p. 3). The focus of value-based management on a sustainable and profitable growth goes perfectly with SMEs (Arbeitskreis "Wertorientierte Führung in mittelständischen Unternehmen", 2003, p. 526). To implement value-based management value-oriented figures and management instruments have to be integrated in the the control system of the company (Krol, 2009a, p. 85).

Characteristics of small- and medium-sized enterprises

SMEs can be characterized by using qualitative as well as quantitative criteria. There are different quantitative definitions (Tappe, 2009, pp. 12-13). The definition of the SME-research institute „Institut für Mittelstandsforschung Bonn“ is commonly used in Germany (Stiegemann, 2007, p.19; Waltermann, 2009, p. 3). It defines SMEs as companies with less than 500 employees and sales below 50 million € (Institut für Mittelstandsforschung Bonn). Quantative definitions are also made by the German Commercial Code (HGB) and the EU Commission. The plurality of SMEs is not reflected by quantitative criteria (Tappe, 2009, pp. 14-15). They should be completed by qualitative factors to show the characteristics of SMEs (Tappe, 2009, p. 12).

Besides their legal and economic independence (Krol, 2007, p. 4), SMEs are characterised by the unity of ownership and management (Tappe, 2009, p. 15). The owner-manager exercises the functions of the owner and the manager (Krol, 2007, p. 4). Thus, the principal-agent problem, occurring often in

big companies, is less important for SMEs (Tappe, 2009, p. 16). Usually the owner-manager is the only decision maker; therefore he matters substantially for the company (Krol, 2007, p. 4) and has a major influence on the management of the company (Piontkowski, 2009, p. 357). Besides the positive features resulting from this person-oriented company structure, there are also negative ones (Piontkowski, 2009, p. 357). A lot of tasks are exercised in personal union. There is the danger of a too patriarchal management by an entrepreneur who's not qualified sufficiently (Piontkowski, 2009, p. 357). Often the management is also involved heavily in the operating activities (Krol, 2009b, p. 10). The management style of SME entrepreneurs is often characterised by short-term considerations and a lot of decisions are taken intuitively (Wegmann, 2006, p. 148). This management style is seen as a reason for the negligence of strategic and formal planning (Piontkowski, 2009, p. 358). The phenomenon of a lacking determination of specific goals and the lack of an institutionalised planning process is described as lack of planning (Tappe, 2009, p. 32).

Usually a clear distinction of the personal, meta-economical goals and entrepreneurial, mainly financial goals is not possible in SMEs (Tappe, 2009, p. 15). The high importance of meta-economical goals especially in independent companies and/or companies that are family-owned also reflects in an empirical study of Krol (Krol, 2009b, pp. 5-6).

A lot of SMEs are family businesses; this means that the majority of interest is held by up to two people resp. the members of the entrepreneur family, who are also part of the management board. In general family entrepreneurs face the same requirements as sole proprietors. But there is the risk of a conflict of interests between members of the family (Khadjavi, 2005, p. 60).

The embedding in tight and regional networks of relations is also typical for SMEs (Arbeitskreis „Wertorientierte Führung in mittelständischen Unternehmen“, 2003, p. 525). Tight relationships to customers, suppliers and employees usually exist for several years (Arbeitskreis „Wertorientierte Führung in mittelständischen Unternehmen“, 2003, p. 525). The importance of these relationships for the company success is much higher than in major enterprises (Arbeitskreis „Wertorientierte Führung in mittelständischen Unternehmen“, 2003, p. 525). The high relevance of stakeholders other than the owners for the definition of the company goals is also shown by an empirical study of Krol (Krol, 2009b9

SMEs often exhibit flat hierarchies because of the small company size in contradiction to major companies (Krämer, 2009, p. 210). This supports a high transparency and leads to short and direct information exchange and a low level of formalization (Krämer, 2006, pp. 214-215). Quick decision-making, realisation and processing indicate a high flexibility in SMEs (Hilzenbecher, 2006, pp. 88-89). In addition, SMEs are able to react quickly and efficiently on changes in the market environment (Hilzenbecher, 2006, p. 89). Low transaction costs, high efficiency and a high level innovation are additional strengths of SMEs.

Another characteristic of SMEs is the limited availability of resources. Usually, the management is not supported by staff departments (Krol, 2007, p. 12). Often, there are no independent controlling departments (Krol, 2009b, p. 2). This can increase the risk of negligence of strategic planning. SMEs are also often dependent on only a few know-how bearers (Krol, 2007, p. 5). Moreover, the information

and communication technologies and thus also the documentation in SMEs are more modest than in major enterprises (Arbeitskreis „Wertorientierte Führung in mittelständischen Unternehmen“, 2003, p. 525).

Oftentimes, the financial means of the proprietor are the main source of financing (Behringer, 2009, p. 46). The financial situation is very dependent on the personality and possibilities of the owner (Helbling, 2002, pp. 189-190). SMEs usually have low equity ratios (Hilzenbecher, 2006, p. 90). SMEs have to rely more on debt capital because their access to equity capital is limited in comparison to bigger companies. The capital market offers possibilities for alternative sources of financing. However, most SMEs have difficulties to get financial means on the capital market because they are not able to fulfill the requirements of the capital market and have a lower size of company (Bussiek, 1996, p. 139). Modern forms of equity financing are mostly rejected (Krol, 2009b, p. 13). This leads to a high dependency on the financing of the house bank, which can be seen as a main stakeholder of the company (Krol, 2007, p. 4). This is also a finding of an empirical study of Krol, in which nearly 78 % of the SMEs state that they use credits of the house bank frequently or very frequently (Krol, 2009b, p. 13). Though, it can be detected that more and more SMEs get access to the stock market (Behringer, 2009, pp. 34-35).

Concept of the empirical study

Determining an operational definition

Because there is no generally accepted definition of SMEs, it seems to be reasonable to introduce an operational definition for the empirical study. Following the commonly used definition of the “Institut für Mittelstandsforschung Bonn” a SME is a legally and economically independent company,

- that is not publicly listed,
- that employs up to 500 employees and
- generates external sales of not more than 50 million € per year.

If the quantitative criteria are exceeded, more than 50 % of the shares should be held by the management.

Data collection approaches

The aim of the empirical study was to achieve adequate knowledge about the form of management in SMEs to be able to make statements to what extent SMEs act value-oriented.

To get relevant data, a questionnaire was developed on the basis of the empirical studies of Gonschorek, Krol and Tappe (Gonschorek, 2009; Krol, 2009a; Tappe, 2009, Britzelmaer et al 2009). The enquiry was carried out between the 12th april and the 15th may 2010. The participation in the survey was voluntary and anonymous. The collected data were treated strictly confidential and were not transferred to third parties. To obtain a high response rate a specific online portal for enquiries was

created. The advantages of this distribution channel towards other methods of survey (e.g. via mail or via fax) are the quick and cost-effective possibility to take part in the enquiry.

Two ways were used to collect data. On the one hand, a cover note asking for support and the reference to the URL address to fill out the questionnaire was posted to the International Controller Association ICV (www.controllerverein.com). On the other hand, the "Hoppenstedt Firmendatenbank", the federal company register and the database of the Chamber of Industry and Commerce in Baden-Württemberg, which provide criteria for the sampling process, were used. 201 German companies which fulfill the criteria presented in chapter 4.1.1 were addressed. The analysis of the data collected was made automatically with Q-set-Portal.

Corporate objectives of small- and medium-sized enterprises

Analysis of the importance of different corporate objectives

The respondents have been asked to specify the importance of different corporate objectives for their company. It can be stated that all corporate objectives listed have a high importance to the responding SMEs. Each corporate objective was classified as "very important" or "important" by more than 50 % of the companies. Thus, it can be reasoned that the systems of objectives of the companies polled are multidimensional (Krol, 2009a, p. 176). The following figure shows the results.

Comparing the arithmetic means, it's apparent, that especially liquidity protection, continued existence of the company, and customer satisfaction are important for SMEs. Since the continued existence (100 %) and the entrepreneurial independence are of very high resp. high importance, the long-term focus of the business operations of SMEs can be assumed (Tappe, 2009, p. 205). Analysing the corporate objectives gives some indication about the value orientation of SMEs. It's apparent, that the increase of the corporate value under consideration of the stakeholder's interests is of high importance. The satisfaction of the customers (92 %) and the employees (77 %) as well as the increase of the company value (80 %) are "very important" resp. "important" for a major part of the responding companies. Analyzing the means of the several corporate objectives, it can be recognized that the financial objectives have a leading role. It's remarkable that the achievement of financial objectives like profit maximization and the increase of the return on equity have been named "not very important" resp. "unimportant" by 6 % resp. 5 %.

In total, it can be stated that the SMEs polled are characterised by the long-term focus of their corporate objectives and the desire to increase the corporate value. But it remains open, if they actually act value-oriented.

Figure 1: Importance of different goals for the respondents

Importance of different stakeholders for the determination of the corporate objectives

The following figure shows, how much value is attached to the different stakeholders in the process of determining the corporate objectives.

Figure 2: Relevance of different stakeholder groups for the determination of the corporate objectives

The majority of the SMEs (94 % “very important” resp. “important”) stated that mainly the interests of the investors are taken into account when determining the corporate objectives. This is of top priority because by providing capital the investors bear the entrepreneurial risk and enable the business activity (Behringer, 2009, p. 37). Furthermore, the interests of customers and employees have a great impact on the system of objectives (92 % resp. 83 % „very important“ or „important“). This can be ascribed to their major contribution to the value-added process (Krol, 2009a, p. 180). Because of the high importance of debt financing a high significance of outside creditors was assumed (Krol, 2009a, p. 180). Though, the empirical study showed that this stakeholder group which is important from a theoretical point of view, was “not very important” or “unimportant” for 34 % of the respondents. In comparison to the other stakeholders, the interest of the publicity is considered the least.

The analyses made so far give indications that SMEs are focused on shareholders as well as on stakeholders. The fulfillment of the expectations of all stakeholders has great attention in SMEs, what corresponds to the main principles of value-based management.

Characteristics of the strategy orientation

The enquiry shows that more than half of the respondents (55 %) have a strategy that is written down. Besides that, 48 % stated that the objectives set out are phrased clearly and definitely (“applies completely” resp. “applies predominantly”). This is an essential prerequisite for the successful implementation of the company’s strategy (see Krol, 2009a, p. 186 for the rationale). Furthermore, 37 % objected the statement that the management has not enough time for the strategic planning. Nearly every second respondent prepares plans and budgets for all relevant business areas systematically. Despite the percentage of the companies where the management is “completely” or “predominantly” occupied with operative tasks is 42 %, only 18 respondents (29 %) stated that is a reason for the lack of application of new business administration methods.

Although the majority of the respondents take the interests of the employees into account (see chapter 4.2.2) only 46 % declared that they communicate the long-term corporate objectives and

strategies “completely” or “predominantly” to their employees. Furthermore, it’s negative that external stakeholders like customers or suppliers are “predominantly not” or “not at all” informed about the current business development (42 %).

In compliance with the lack of long-term strategy, often criticised in the literature (e.g. Wegmann, 2006, p. 148), the empirical study indicated that SMEs are characterized by deficits in strategic planning and a lack of communication of the objectives set out. But they are aware of the necessity of a strategic orientation. However, worse results were expected. But it has to be taken into account that the information given in an enquiry is not necessarily consistent with reality. Aspects considered positively can be overemphasized or imagined intentionally or unknowingly (Bortz and Döring, 2002, p. 231).

Analysis of the financing of SMEs

The questioned SMEs were asked to evaluate different instruments of financing according to their importance for their company. It could be proven that bank loans are the most favored source of financing (68 % “(very) important”). This can be confirmed by the fact that the majority (89 %) of the companies is interested in a long-term cooperation with their bank. 77 % report the current business development systematically to their house bank. Every second agreed to the statement that the granting of a bank loan became a highly complex process in the last three years. This may be a reason for the fact that leasing as alternative form of financing is gaining importance in SMEs (Wegmann, 2006, p. 231). Only 18 % are of the opinion that leasing is „not very important“ or „unimportant“. Nearly every SME (91 %) renounces the possibility to raise capital by admittance of new partners. The fear of small- and medium-sized entrepreneurs to lose the sole responsibility for the business activities can be stated as one reason for this (Bussiek, 1996, pp. 42-44). The importance of forms of financing like bonds, increase of capital via the capital market, private equity, mezzanine and factoring is seen mainly as „not very important“ or „unimportant“.

Thus, the results of this empirical study are in compliance with other studies which came to the conclusion that the bank loan is the most often used form of financing in SMEs (Krol, 2009a, pp. 195-196; Gonschorek, 2009, pp. 200-201).

Diffusion of value-based management in small- and medium sized enterprises

Findings of previous empirical studies

Up to now, value-based management for SMEs doesn’t attract a lot of attention in economic literature as well as in the practical application (Tappe, 2009, p. 2). Krol investigated the application of value-based instruments in SMEs in an empirical study (Krol, 2009b). For independent SMEs the increase of the corporate value was the most important financial goal (Krol, 2009b, p. 5). Nevertheless, 81 % of the companies polled stated that they make investment decisions “very often” respectively “often” based on experience rather than on calculations (Krol, 2009b, p. 12). The net present value and the internal rate of return which are value-oriented assessment criteria are used only seldom (Krol, 2009b, p. 12). The enquiry of Piontkowski comes to the conclusion that SMEs show an underdeveloped application of value-based management also related to such instruments and

controlling processes which would be suitable for SMEs (Piontkowski, 2009, p. 363). Larger SMEs tend to use value-based instruments for management more often than smaller SMEs (Piontkowski, 2009, p. 362). The analysis of the use of different target figures also shows the rather low use of value-oriented figures (Krol, 2009b, p. 8). Traditional, not value-oriented figures like profit or sales are used much more often (Krol, 2009b, p. 8). Also regarding the management instruments used, mostly operative management instruments are widespread (Krol, 2009b, p. 16, Beck and Britzelmaier 2010). This and the examination of the methods of investment calculation show the low consideration of value-oriented principles in the management of SMEs (Krol, 2009b, p. 17).

Findings of the empirical study

Application of different target figures for management

The respondents were asked to state how often they use different target figures. Two new answering possibilities were added to the five answering possibilities. The respondents could state that this figure is unknown or that they plan to use this figure in the future.

Figure 3: Application of different target figures for management

By examining the number of companies who apply several figures „very often“ or „often“, it can be determined that the traditional figures are seen as more relevant for practical application than value-oriented target figures. Figures like return on sales (83%), net income (82%) and earnings before interests and tax (71%) are used „(very) often“. Typical value-oriented figures like CFROI (40%), DCF (52%) und EVA (72%) are applied „seldom“ or „never“. Besides this, 8% of the companies stated that

they even don't know these metrics. The low intensity of use is seen critical in light of the high importance of the corporate objective to increase the corporate value. Overall, it can be assumed that SMEs are not familiar with the basics and specifics of value-based management and that value creation is a vague goal (see Krol, 2009a, pp. 182-183 and 219 for the rationale).

Application of management instruments

To make a final assessment of the degree of establishment of value orientation in SMEs, it's not sufficient to focus on the analysis of the use of value-oriented figures. It's necessary to analyse the answers related to the application of management instruments (see chapter 5.2.1.3; Krol, 2009a, p. 68 and 78). According to their frequency of use (used "very often" or "often"), the results were grouped into four categories:

- High level of application (51-100 %),
- Medium level of application (26-50 %),
- Low level of application (11-25 %) and
- scarcely used

The results are shown in the following graph.

<i>Diffusion</i>	<i>Management instrument</i>	<i>Application „very often“ resp. „often“</i>
<i>High level of application (51 - 100 %)</i>	<i>Liquidity planning</i>	91 %
	<i>Cost type and cost centre accounting</i>	82 %
	<i>Business analysis</i>	72 %
	<i>Budgeting</i>	65 %
	<i>Standard costing</i>	63 %
	<i>Marginal costing</i>	60 %
	<i>Ex post calculation</i>	57 %
<i>Medium level of application (26 - 50 %)</i>	<i>Variance analysis</i>	54 %
	<i>Budgeted balance sheet and budgeted income statement</i>	51 %
	<i>Multi-period investment calculation</i>	48 %
	<i>Business plan</i>	43 %
	<i>Variable compensation systems</i>	42 %
	<i>Risk management</i>	38 %
<i>Low level of application (11 - 25 %)</i>	<i>Cash-flow statement</i>	35 %
	<i>One-period investment calculation</i>	22 %
	<i>Balanced scorecard</i>	18 %
	<i>Value driver analysis</i>	18 %
<i>Scarcely used (0 - 10 %)</i>	<i>Analysis of strengths and weaknesses</i>	15 %
	<i>Portfolio analysis</i>	9 %
	<i>Process analysis / activity based costing</i>	9 %

Figure 4: Application of management instruments

It can be observed that value-oriented management instruments are not used as frequently as standard management instruments. Multi-period investment calculation, variable compensation

systems, risk management and cash-flow statements are only applied on a medium level by SMEs. Only 42 % use e.g. a variable compensation system. However, it's necessary that executive managers as well as employees do not only understand the basic principles of value-based management but are also encouraged to act value-oriented (Weber et. al., 2004, p. 189).

While the balanced scorecard and the value driver analysis show a low level of application (18 % each), process analysis / activity based costing are scarcely used. This is seen critically regarding the contribution of these instruments to a successful realization of a value-increasing strategy (Krol, 2009a, pp. 205-211).

In total, a low relevance of value-based management instruments in SMEs can be observed. Nevertheless, it's positive that some companies plan to apply the balanced scorecard (17 %), the variable compensation system (9 %), the value driver analysis (6 %) and the process analysis / activity based costing (6 %) in the future.

Obstacles of the application of value-based management in small- and medium-sized enterprises

Findings of the literature and previous empirical studies

The principal-agent problem is considered as one of the main reasons for the application of value-based management in major enterprises (Vogelsang, 2009, p. 19). Usually, there is an information asymmetry between the owners, who are in the role of the principal and the management, which has the role of the agent (e. g. Britzelmaier, 2009, pp. 19-20). Value-based management helps to enforce a management behavior in the interest of the owner (Piontkowski, 2009, p. 359). Because of the unity of ownership and management in SMEs, there's no principal-agent problem and such a control function is not necessary (Vogelsang, 2009, p. 19). Thus, this incentive for value-based management is not important for many SMEs.

A significant obstacle for value-based management is the lack of resources in SMEs (Schomaker and Günther, 2006, p. 218). Often a documentation and information management structure, needed for the implementation of complex value-based management systems can't be found (Krol, 2007, p. 13). This may cause the problem that the information necessary for a precise and detailed calculation of the value-based figures are not available (Tappe, 2009, p. 3). To determine the essential parameters out of the accounting requires economical and financial understanding and causes considerable effort (Schomaker and Günther, 2006, p. 218). The companies questioned by Krol state that the lack of resources is the main obstacle for value-based management in SMEs: 38 % think, that additional information management systems are necessary, 35 % are of the opinion that there's a need for an increase of employees and 30 % expect high expenditures (Krol, 2009b, pp. 18-19). The enquiry of Krol shows that mainly effort and cost aspects are seen as obstacles for an implementation of value-based management instruments (Krol, 2009b, p. 19).

Due to mainly technical-oriented careers of SME entrepreneurs, there is a lack of information about value-based management (Krol, 2009a, p. 3). 31 % of the respondents state this as an implementation

obstacle (Krol, 2009b, pp. 18-19). This lack of information cannot be overcome because there are no staff departments and an uneasiness to hire outside consultants (Krol, 2007, p. 12).

The low diffusion of value-based management in SMEs can also be explained by the fact that value-based management was developed especially with regard to large, listed companies and does not take the characteristics of SMEs into account (Schomaker and Günther, 2006, p. 217). So far, there is no generally accepted concept which considers the characteristics of SMEs. This is caused among other things by the heterogeneity of SMEs. The fact that the specific situation of the company has to be considered to develop and apply a value-based management system makes the development of a universal concept more difficult (Krol, 2009a, p. 3).

Findings of the empirical study

Attitude towards value orientation

The study is focused on the analysis of the respondents' attitude towards a value-oriented management. At first, the information about occasions for the determination of the corporate value is analysed. 28 % of the companies calculate the corporate value in case of the sale of the company or parts of it or in case of reorganizations. Every second names the credit check and value-based management as important occasions. This indicates the value-oriented perception of the half of the respondents. The following graph shows the results of the survey on the attitude towards value orientation.

Figure 5: Perception to value-based management

The statements, that value-based management takes only the interests of the shareholders into account and that it's mainly focused on the short-term increase of the return on equity are seen as „predominantly incorrect“ resp. “not correct” by more than a half of the respondents each (58 % resp. 57 %). Since 28 % agree „completely“ respectively „predominantly“ to this statements, it can be

concluded that there are some misunderstandings about the focus of value orientation among some SMEs.

The next question was related to the evaluation of the contribution of value-based management to the success of the SMEs. The majority of the respondents agrees „completely“ or „predominantly“ to the statement that not only the owners but also other stakeholders benefit from the increase of the corporate value. The number of respondents who agrees „completely“ or „predominantly“ to opposite statements³² was 18.

Furthermore, the majority of the respondents (74 %) knows, that value-based management is an extensive concept, in that all activities and subsystems have to contribute to the increase of the corporate value (Tappe, 2009, pp. 69-70). 66 % also answered that the statement that an increase of the corporate value indicates that the return generated in the long run is higher than the expected return on equity is “completely” resp. “predominantly” correct.

The statement that value-based management will get more and more important in the near future was also highly accepted by 65 %. More than the half of the respondents (52 %) stated that the successor problem is a reason for this development. The growing interest in value orientation can be confirmed by the fact that one third of the questionnaires was filled out by a member of the management.

Another interesting fact is, that 46 % are of the opinion that the not-value oriented management instruments currently used are absolutely sufficient for a successful management.

Regarding the results it can be concluded that the majority of the SMEs knows the basic principles of value-based management. Nevertheless there are some misunderstandings regarding the focus of value orientation among some SME entrepreneurs.

Implementation problems

Previous studies found a low level of diffusion of value-based management in SMEs (Gonschorek, 2009, pp. 98-203; Krol, 2009a, pp. 157-219; Tappe, 2009, pp. 191-294). Therefore one objective of this empirical study was to examine implementation problems. The following illustration shows the related results.

32 „Value-based management takes only the interest of the shareholders into account.“ and „An increase of the corporate value is not only beneficial for the owners but also for other stakeholders.“

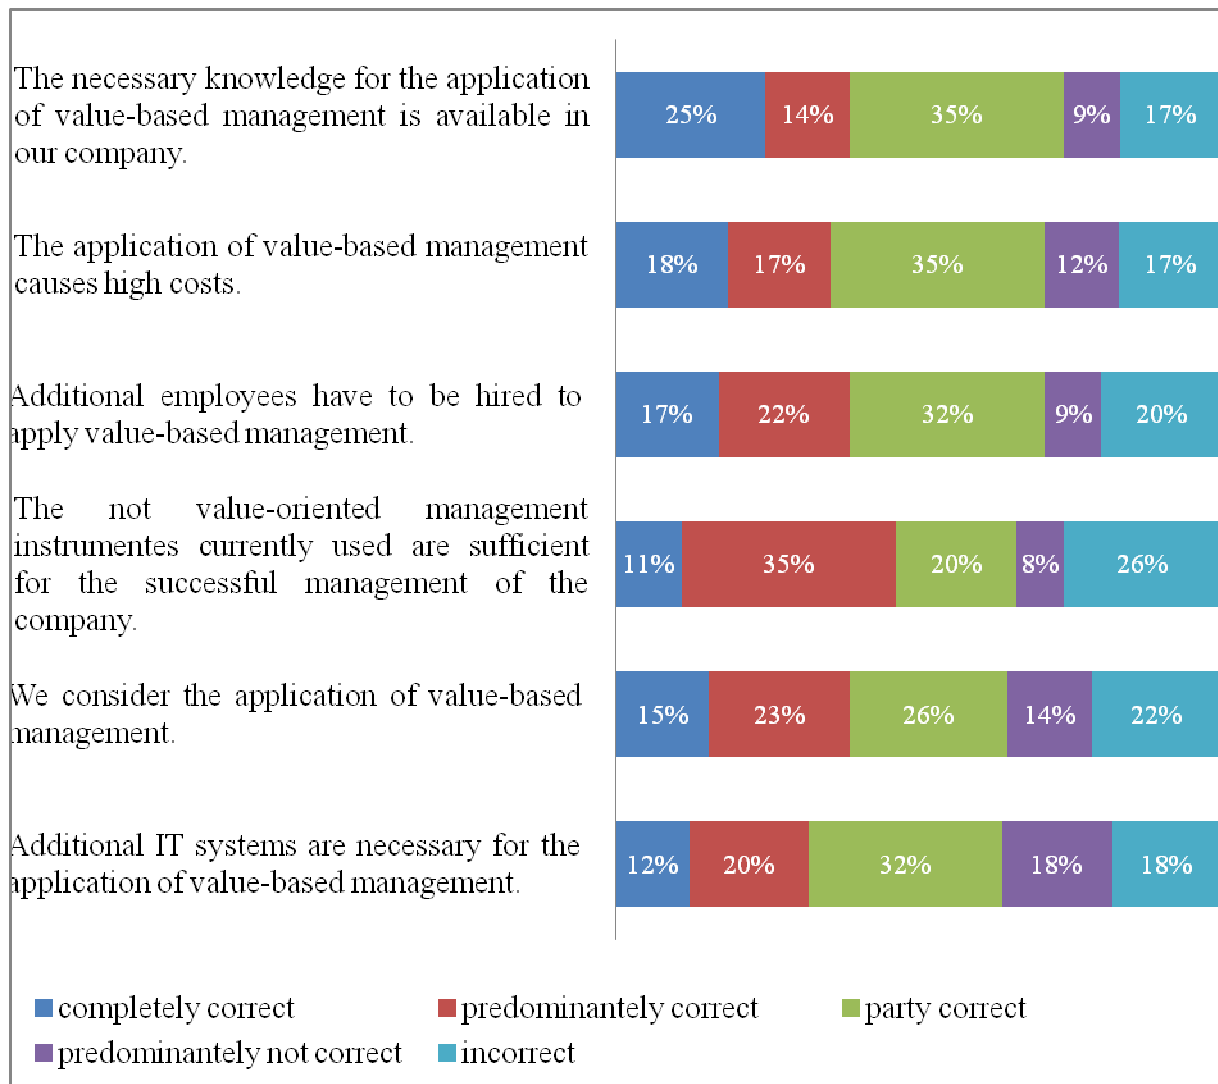

Figure 6: Implementation problems of value orientation

26 % believe that the company doesn't have the necessary knowledge to apply value-based management (statement "completely correct" resp. "predominantly correct"). Despite this, 38 % of the respondents state that the application of value-based management requires the hiring of additional employees. Nearly every third respondent names the costs related to the application of value-based management as implementation barrier. According to the economic literature there is a lack of well structured IT-systems in SMEs. It is not possible to make a clear-cut statement to this opinion because one third (32 %) agrees to this position and one third (37 %) doesn't agree.

The study showed some evidence that the lack of resources is an implementation barrier of value-based management in SMEs, but this cannot be assessed finally.

Perception of the potential benefits of value-based management

As there is the assumption that there are other implementation barriers than these dealt with in this empirical study, the respondents were asked to evaluate potential benefits of value-based management. By analyzing the answers it should be examined if the low level of diffusion of value-based management is related to the ignorance of the benefits of value-based management (Krol, 2009a, pp. 215-219). The results are shown in the following graph.

fact that the sale of the company is not very popular among the majority of SME entrepreneurs and that there are nearly no variable compensation systems for employees (Krol, 2009, pp. 218-219).

On the basis of the high approval to the different potential benefits it can be concluded, that the responding companies are aware of the benefits that can be achieved by value-based management.

Requirements for value-based management concept appropriate for small- and medium-sized enterprises

Despite the positive results described above, it's negative that only 37 % take the impact on the company value "completely" resp. "predominantly" into account in the decision-making process. The fact that the concept of value-based management was developed for the needs of big listed companies and that the specifics of SMEs are not considered can be seen as reason for this (Krol, 2009a, p. 1). The majority of the respondents (75 %) agrees „completely“ resp. “predominantly” to the statement that value-based management has to be adjusted to the specifics of SMEs. This confirms the assumption stated above.

The respondents were asked to evaluate the requirements for a value-based management concept appropriate for SMEs. Simplicity and practicability can be seen as the most important requirements because all participants agreed "completely" or "predominantly". The understandability of the concept, the ease of use of value-oriented instruments and the consideration of the typical lack of resources in terms of personnel and financial means are also important for the SMEs questioned. 92 % also state that the acceptance of the value-based management is an important requirement. Thus, value-based management can only be applied successfully if the corporate objectives are communicated transparently to the management as well as to all stakeholders. 52 % deem the flexibility of the concept necessary. This is an indispensable requirement for the implementation and application of value-based management because especially operational objectives change very quickly which makes the immediate adjustment of the objective targets necessary.

In total, it can be concluded that value-based management cannot be transferred to SMEs without necessary simplifications and adjustments. In addition the cost effectiveness has to be made sure. The cost-effectiveness can be evaluated by a cost-benefit-equation. No respondent is of the opinion that the cost effectiveness of value-based management is not important.

Conclusion

It was focused on the form and diffusion of value-based management in small- and medium-sized enterprises by a synthesis of the description of theoretical and empirical findings.

By analysing the answers of respondents to several aspects of the object of research a high relevance of the objective to increase the corporate value was determined. Although there are several figures and management instruments that contribute to the achievement of this corporate objective, a low level of diffusion of value-oriented methods was perceived. Possible reasons for this are the lack of institutionalization of the controlling department, scarce management support by strategic planning and a lack of resources. Despite these disadvantages it can be observed that the respondents consider value based-management positively. Based on the findings it can be concluded that the basic

principles of value-based management and its potential benefits are known to a large extent by SMEs. However, the hiring of additional personnel and the application of additional IT systems are considered necessary. In addition the costs related to the implementation of value-based management are stated as implementation barrier. The perception of nearly the half of the respondents that the existing management instruments are absolutely adequate for the management of the company can be seen as another main obstacle for the diffusion of value-based management among SMEs. The majority of the respondents is of the opinion that the concepts of value-based management have to be adjusted to the specifics of SMEs. The findings of this empirical study can be determined by the random sample and cannot be generalized for the main unit of German SMEs (Gonschorek, 2009, p. 206; Krol, 2009a, p. 196 and pp. 219-221).

It has to be pointed out that there is only a small theoretical basis and little empirical research on value-based management for SMEs (Krol, 2009a, pp. 3-4; Tappe, 2009, pp. 289 and 291-292; Britzelmaier et al 2009). Due to this it is desirable, to do more scientific research on this subject to close this research gap and to promote the establishment of value-based management in SMEs.

AMERICAN, EUROPEAN AND AFRICAN SYSTEMS OF GOVERNANCE: HOW DO THEY DIFFER?

Caiazza, Rosa¹; Ferrara, Graziella²

¹Assistant Professor, Parthenope University of Naples

²Assistant Professor, Università degli Studi Suor Orsola Benincasa di Napoli

Abstract

Most researches in corporate governance field are focused on developed nations. Institutional differences between developed and developing nations call for a better comprehension of corporate governance systems in developing nations.

In this article we examined Egyptian system of governance through a longitudinal and cross national analysis. The state of corporate governance in Egypt is assessed using official World Bank–IMF reports on corporate governance in Egypt, proceeding of regional roundtable discussions and personal interviews with managers of Egyptian firms.

We first evidenced the evolution of corporate governance in Egypt. Then we compared Egyptian system of corporate governance with two model developed in advanced economies: Anglo-American and Italian model.

Our study helps to explain the differences of Egyptian corporate governance from developed countries and why certain practices are more widely spread in developed countries than in Egypt. Our research also has implications for studies of internationalization of firms from developed countries in Egypt.

Keywords: America, Europe, Africa, Corporate governance, cross national analysis.

Introduction

Corporate Governance is the system by which companies are directed and controlled. Involving laws, regulations, institutions and enforcement mechanisms, it is part of the institutional infrastructure underlying sound economic performance. It is the set of processes, customs, policies, laws and institutions affecting the way a corporation is directed, administered or controlled. It also includes the relationships among the many stakeholders involved and the goals for which the corporation is governed. The main stakeholders are the shareholders, management and the board of directors. Other stakeholders include employees, suppliers, customers, banks and other lenders, regulators, the environment and the community at large. Good corporate governance stimulates performance, generating higher returns and profitability of companies, leads to higher total factor productivity growth, a major source of economic growth. Thus, corporate governance is an area of great interest for groups across the Middle East and North Africa (MENA). However, most researches in corporate governance field are focused on developed nations. Institutional differences

between developed and developing nations call for a better comprehension of corporate governance systems in developing nations. In this article we examined Egyptian system of governance through a longitudinal and cross national analysis.

Since 1980s laws that govern the incorporation of companies in Egypt and laws that govern companies listed in the Cairo and Alexandria Stock Exchange (CASE) represent the legal framework that impacts the concepts of corporate governance. However, corporate governance in Egypt is a novel term that has started to appear in the late 1990s as part of a modernization program for the whole economy. In the late 1990s, in fact, Egypt noted the need of gaining trust of the international community and foreign direct investment. At the aim to raise new foreign capital and to encourage more Egyptians to invest in the domestic the Egyptian government revitalized its capital market, by improving its reputation and building confidence among investors. This development program aimed at sound financial principles, availability of reliable corporate information, and adoption of international accounting and auditing standards. As a result the Egyptian government recognized the need for a high level of corporate governance practices to reach its aspired goals. The first assessment of World Bank and IMF to test the alignment of Egypt's corporate governance system with internationally accepted norms evidenced that in 2001 Egyptian companies applied 62% of the OECD principles. As a result of the ROSC, Egypt started issuing new rules to guarantee companies' implementation of corporate governance practices. The most important among these rules were the new CASE listing rules issued in 2002. Currently, CASE is working on producing new listing rules that incorporate a number of changes to further strengthen the corporate governance practices of the companies that are listed on the CASE. In 2004 the World Bank conducted a re-assessment of corporate governance implementation in Egypt, concluding that Egypt applied 82% of the OECD principles (OECD, 2004). This indicated that Egypt is continuously improving in the area of corporate governance. The report observed that the major areas of improvement included creation of a center for directors that could develop a Code of CG, new listing rules and implementation of legislative reform to bring the policy framework into greater compliance with the OECD Principles. As result the Egyptian Institute of Directors (EIOD) was created for working on designing CG code. In October 2005, Egypt adopted a draft Corporate Governance Code based on the OECD principles, to improve the legal, institutional and regulatory framework and to provide guidance and suggestions for stock exchanges, investors, corporations and other parties that have a role in the process of developing good corporate governance (OECD, 2005). There is a growing tendency among Egyptian companies to apply principles of corporate governance. This trend is more common and visible among large companies listed on the Cairo & Alexandria Stock Exchanges and monitored by the Capital Market Authority (CMA). Despite of two decades of changes Egyptian corporate governance system, like the other MENA regions, differs from Anglo-American model, stylized in terms of financing through equity, dispersed ownership, active markets for corporate control, and flexible labor

markets, and from Continental European model, stylized in terms of long term debt finance, ownership by large block-holders, weak markets for corporate control, and rigid labor markets (Becht and Roel, 1999; Berglof, 1991; Hall and Soskice, 2001; La Porta et al., 1998).

In this article we first evidenced the evolution of corporate governance in Egypt. Then we compared Egyptian system of corporate governance with two model developed in advanced economies: Anglo-American and Italian model.

The state of corporate governance in Egypt is assessed using official World Bank–IMF reports on corporate governance in Egypt, proceeding of regional roundtable discussions and personal interviews with managers of Egyptian firms.

First, our study helps to explain the differences of Egyptian corporate governance from developed countries and why certain practices are more widely spread in developed countries than in Egypt. Second, our research also has implications for studies of internationalization of firms from developed countries in Egypt.

Longitudinal Analysis of Egyptian Corporate Governance System

The foundation of Egyptian corporate governance system is provided by its legal framework. Company, civil, and securities laws, regulations of the stock exchange, and the accounting standards in fact, affect the way in which corporations are directed, management behavior and values of the business culture.

The concept of corporate governance was introduced in 1990 as part of a modernization program for the whole Egyptian economy. Since then Egypt reform program has included a legal reforms, new institutions and codes of conduct which specifically seek to create good corporate governance practices. Periodical World Bank's ROSC studies of Egypt, have evidenced country's progresses in promoting corporate governance. In 2001, an assessment of Egyptian corporate governance of World Bank and IMF evaluated that Egypt applied 62% of Organization for Economic Cooperation and Development (OECD) Principles of Corporate Governance. After the assessment Egypt started issuing new CASE listing rules. The new listing rules included corporate governance disclosure requirements and detailed requirements for financial statements preparation and presentation. In addition, the new rules required the presentation of complete information about a company's board members, signed contracts with other companies, auditors, and the audit committee. Improvement in the area of corporate governance led the World Bank to evidence that Egypt applied 82% of the OECD corporate governance principles in 2004 (OECD, 2004). Some areas of improvement included shareholders rights and disclosure standards. The Egyptian Institute of Directors (EIOD) was created jointly with a range of international organizations, including the World Bank, International Finance Corporation, UNCTAD and the Centre for International Private Enterprise for working on designing corporate governance code and new listing rules (OECD, 2005).

The Egyptian Institute of Directors (EIoD), working under the umbrella of the Ministry of Investment, aims to spread awareness, knowledge, and best practices of corporate governance in Egypt, the Middle East, and North Africa (MENA) region in a way that meets the legitimate expectations and best interests of various stakeholders, and in different types of organizations such as listed, non-listed, family-owned and state-owned enterprises (SOEs). The activities of the Institute are targeted at directors, key executives, shareholders, and other stakeholders of such organizations.

Contemporary Egyptian government implemented legislative reforms to bring the policy framework into greater compliance with the OECD Principles. In October 2005 the Capital Market Authority (CMA) restructured its organization and the Ministry of Investment and GAFI introduced the first Egyptian Code of Corporate Governance (ECCG) written in Arabic. The code indicates that its rules should be considered in addition to the corporate related provisions stated under various laws and the executive regulations and decrees regarding their implementation. In 2006, the Ministry of Investment issued the Code of Corporate Governance for State Owned Companies based on the ECCG and the report of the OECD working group on privatization and corporate governance of State-owned assets. The code focuses on the actions of the State as a regulator versus its role as an owner and introduces the principles of governing State-owned companies by presenting an organizational and legal framework within which such companies should operate. In addition, The Egyptian Junior Businessmen association issued the Corporate Governance Manual for Family Businesses in October 2006.

In 2006, CMA created an auditors registry. The auditors that join this registry are the only ones that are allowed to audit companies that are listed on the stock exchange. In 2007, CMA issued a new code of ethics for auditors in Egypt and The Egyptian Institute of Directors Institute issued a manual for audit committees to ensure that corporate governance principles will be applied properly. In 2009, 11 corporate governance codes were introduced by national regulations, in addition to specialised guidance for state-owned enterprises, banks and family-owned companies (OECD, 2009). The Egyptian Institute of Directors was the first in the region to introduce a governance code targeted specifically at state-owned entities, based on the OECD Guidelines on Corporate Governance of State-Owned Enterprises (World Bank, 2010). Despite of much has been done, in Egypt there is still a need for corporate governance reform. Thus, a comparison of the Egyptian corporate governance system with advanced economies' models would indicate the required reforms.

Cross-national Analysis of Egyptian System of Corporate Governance

Following La Porta et al. (1998) we used several variables to compare Egyptian system of corporate governance with Anglo-American and Italian models.

The first variable of comparisons between the different systems of governance is the degree of ownership concentration (La Porta et al., 1998). Anglo-American model is stylized in terms

of financing through equity, dispersed ownership and active markets for corporate control. Some Continental-European countries, such as Italy, instead, have concentrated ownership with stronger external influence on management. In Egypt the free float of listed companies on the stock exchanges is small because strategic investors, the State, or other stakeholders control most shares. It is possible to distinguish three main categories of joint stock companies: privatized state-owned companies, small and medium sized companies and family firms. Many large companies are closely held and often controlled by family groups or by individuals. Few companies are widely held and many listed companies have at least one shareholder with more than 20% of the shares. The dominance of family-owned firms and the absence of a system that prevents family members from dominating the decision making process has resulted in the poor protection of minority shareholders' rights and restriction of managers autonomy.

Countries are also distinguished as having strong or weak shareholder rights (La Porta et al., 1998). United States exemplifies a liberal market approach facilitating market-oriented mechanisms of control. Liberal property rights provide strong minority shareholder protection owing to relatively high disclosure requirements and norms of one-share-one-vote. Property rights thus create incentives to pursue greater capital liquidity and gravitate against strategic interests by discouraging disproportionate control through blocks. While a strong shareholder right characterizes American system of governance, weak shareholder right characterizes some continental european countries, such as Italy. Earlier versions of Egyptian commercial laws lack sufficient and detailed provisions of shareholder protection, which explains the tendency towards concentrated ownership structures. Minority shareholders are usually protected by the laws that allow those representing more than a certain percentage of the capital to force a specific topic onto the agenda at the General Assembly and call it to a vote, even if it is not already on the agenda. The laws are relatively clear on the notion that, within a given share class, all shareholders have the same rights. Any interference with voting rights within the class is illegal. However, company laws appear to comply with the basic standard of one-share one vote.

Another variable we used to compare Egyptian system of corporate governance with the developed ones is the role of managers. Managers are the stakeholders occupying positions of strategic leadership in the firm and exercising control over business activities (Chandler and Daems, 1980). Autonomous managers with a large degree of independence from specific relationships within the firm characterize American system. These managers may find it easier to make tough decisions or to impose hierarchical control in the firm. In contrast, European systems of governance characterized by concentrated ownership have committed managers. In Egypt, managers' lack of autonomy, flexibility, and objectivity to monitor company activities and to achieve its objectives is the main barrier to the implementation of corporate governance principles.

While in the American system of public companies the board role is to mitigate conflicts between shareholders and managers, in Italy and the other systems with concentrated ownership board of directors is much more dependent from block-holders and less active in the process of firm strategic orientation. In Egypt, companies tend to follow a parliamentary model of board representation, where directors represent the constituency that elected them. Boards' members oversee the management of the company and are elected by shareholders who meet in General Assemblies (GA). Board managing director is responsible for the Board's detailed oversight of the company. The Board can also hire a general manager who is an employee of the company to run the operations. In addition to defining strategy, selecting, monitoring and overseeing management is the most fundamental function of the board. A board that cannot dismiss management is not an effective board. This function requires an independence from management and controlling shareholders that is generally lacking in Egypt. In Egypt where ownership is highly concentrated, chief executive officer (CEO) is also the chairperson of the board and represents the majority shareholders. This set-up makes it virtually impossible for outsiders to replace management because it would mean firing themselves. Therefore, the board fails in this fundamental respect. In addition to this fundamental problem, another recurring theme on the subject of board duties in Egypt is the lack of training and the limited understanding that directors have of corporate governance issues.

Another important variable in describing corporate governance systems is financial issues. Financial systems influence the relation of capital to the firm by shaping the supply-side capacity to provide diverse sources of finance and thereby generate different patterns of control. The two major alternatives for financial mediation between households and enterprises are bank based or market based. In the American market-based financial systems, households invest in companies' publicly issued equity, such as stocks and bonds, thereby expanding the size and liquidity of capital markets and leaving the primary monitoring role to institutional investors and other shareholders (Steinherr and Huveneers, 1994). Market-based systems encourage equity finance through active capital markets in which shareholders invest chiefly to pursue financial interests. Some continental European countries, such as Italy, instead are dominated by model of governance in which the bank has a central role. Egypt also is a bank-based financial system in which takeover market is in early stages of development. In Egypt banks are the key financial institutions, mediating deposits from households and channeling them into loans made directly to firms.

Another variable we used to describe the different systems of governance is the labor market and skill formation. Differently from advanced America and European economies, in Egypt the labor market hasn't a strict regulation and cost of labor is country specific factor that attract some investment. Skill formation directly affects corporate governance, because the portability or firm-specific nature of skill investments influences the relation of employees to the firm. Skill formation institutions are subject to considerable national variation

(Finegold and Soskice, 1988; Locke et al., 1995; Sorge, 1990). In the United States and some European countries with concerted ownership, a mix of on-the-job training and markets is used to generate employee skills (Brown et al., 1997). The undersupply in skills, particularly among production workers, is closely related to high employee turnover and strategies of control in representing employee interests (Freeman, 1994). The lack of local capabilities imposes to firms that operate in Egypt to spend money and time in creating skills. As emerging economy, Egypt has weak legal and judiciary system, some political and economic problems. Moreover differently from advanced America and European economies, in Egypt disclosure is not a common practice (Table 1).

Table 1 Cross National Analysis

	USA	Italy	Egypt
<i>Degree of ownership concentration</i>	<i>Dispersed ownership</i>	<i>Concentrated ownership</i>	<i>Concentrated ownership</i>
<i>Shareholder rights</i>	<i>High</i>	<i>Low</i>	<i>Low</i>
<i>Managerial autonomy</i>	<i>High</i>	<i>Low</i>	<i>Low</i>
<i>Board activity</i>	<i>High</i>	<i>Low</i>	<i>Low</i>
<i>Financial issues</i>	<i>Equity</i>	<i>Long term debt</i>	<i>Long term debt</i>
<i>Capital market liquidity</i>	<i>Active takeover market</i>	<i>Limited takeover market</i>	<i>Limited takeover market</i>
<i>Labor market</i>	<i>Rigid labor markets</i>	<i>Rigid labor markets</i>	<i>Flexible labor markets</i>
<i>Legal and juridical system</i>	<i>Strong legal and judiciary system</i>	<i>Strong legal and judiciary system</i>	<i>Weak legal and judiciary system</i>
<i>Disclosure</i>	<i>Not limited disclosure</i>	<i>Limited disclosure</i>	<i>Limited disclosure</i>

Conclusion

In Egypt key support for the corporate governance agenda has come directly from the public sector. Thus, the corporate governance centers operate under the umbrella of governmental institutions. There are many integral factors that hinder the development of corporate governance in Egypt. Egyptian system of corporate governance, in fact, is characterized by weak legal and judiciary system, weak institutions and limited human resources capabilities. Moreover, it faces financial problems of weak and illiquid stock markets, government interventions, economic uncertainties, weak legal controls and investor protection and frequent government intervention (Fawzy, 2004; Bremer and Elias, 2007). These characteristics would definitely have a strong impact on Egypt corporate governance system.

It differs from the Anglo-American model is stylized in terms of financing through equity, dispersed ownership, active markets for corporate control, and flexible labor markets. However, Egyptian corporate governance system has some similarity with some continental European systems of governance, such as Italian, stylized in terms of long term debt finance, ownership by large block-holders, weak markets for corporate control, and rigid labor markets (Becht and Roel, 1999; Berglof, 1991; Hall and Soskice, 2001; La Porta et al., 1998).

Italian System, thus, could be used as benchmark for the future development of Egyptian system of corporate governance.

The rescue of financial and industrial entities in Europe and North America might be seen as remote. Egyptian regulators will need to learn from these cases, taking into account international developments, which will only gain importance as the region becomes increasingly integrated in the global financial architecture. Whereas efforts to establish common regional or sub-regional corporate governance policies may not be the immediate objective, ongoing dialogue between regulators will be crucial. The ability of regulators to address bread and butter corporate governance issues in the coming years will be paramount to upholding investor confidence in the Egyptian markets. Particularly at a time regulators' ability to combat related-party transactions, improve transparency and disclosure, and foster effective board outcomes will determine the future of corporate governance in Egypt. Moreover, after President Hosni Mubarak leaves office, America and Europe could support Egyptian democratization. This process of democratization of institutions could affect the whole Egyptian system of corporate governance facilitating all the requested changes able to reduce the existing differences between Egypt, Europe and America.

Abstract

This article responds to the lack of research on the way a new idea is transformed into a market-accepted new product. Through non-participant observation and multiple interviews, an empirical investigation within a large French telecommunications operator (OPERACOM), shows the strategic role of exploration as a new activity integrated into the innovation process. In order to facilitate its implementation by managers, the research proposes a synthesis of features, comprising the exploration axes/criteria (technology, client use and business value), the participants (clients/creative users, designers, partners...), the organizational system (exploration center, core team), the governance as well as the added value of the activity. The paper further combines theoretical findings with empirical data to identify the managerial implications of the findings, as well as additional theoretical considerations.

Keywords: New Product Development, Innovation, Idea, Creativity, Exploration, Telecommunications

Introduction

Reviewing existing research on creativity and innovation, depicts that these two fields are often studied separately and that their understanding and definition among researchers, are frequently ambiguous (Chebbi, 2008). Indeed, the innovation process has, for a long time, been described as sequential and linear since it creates value through the implementation and use of one or several ideas (Van de Ven & al., 1989). Criticized by evolutionists (Nelson & Winter, 1982; Dosi, 1982) and neo-Schumpeterians (Kline & Rosenberg, 1986), innovation became a part of an interactive process based on learning (Roozenburg & Eekels, 1995; Hatchuel & Weil, 2003). Thus, we can consider innovation as a process of value creation, through the implementation and setting of one or several ideas. Certainly, this evolution bestows a central role to the conception and birth of ideas, but it does not integrate creativity into the innovation process. Several researchers who studied the characteristics of individual and collective creativity (Pelz & Andrew, 1966; Amabile, 1997; Woodman & al., 1993; Majaro, 1992; Styhre and Sundgren, 2005) consider creativity to be a process in itself, independent of

the innovation process. In this research's opinion though, this does not necessarily relate to the existing, practically implemented, innovation process in organizations. This research further found, that very little research has focused on or at least partially studied the path from creativity to innovation (Staw, 1990, Flynn & al, 2003, Hatchuel & al. 2003), and this paper's partial aim is to fill this gap. Specifically, the research develops a reflection that operationalizes this strategic stage of the innovation process and provides a more precise understanding of the transformation from stage of ideas into innovations.

The aim of this study is to undertake theoretical and empirical research that will descriptively improve our understanding of the process through which new market-accepted products are developed; and prescriptively indicate its theoretical underpinnings and managerial implications.

Towards this aim, five objectives have been set:

- To perform an extensive literature review, that will set the research's theoretical foundations and will define and interrelate the various product development process concepts and sub-processes.
- To identify any potential gaps and/or inconsistencies of the existing literature.
- To undertake empirical research, towards filling the identified theoretical gaps.
- To indicate the managerial implications of the existing theoretical gaps and propose managerial actions.
- To record the various theoretical considerations, consequent of the existing gaps, and propose further research action.

Literature Review (Objectives 1 and 2)

Creativity

The researchers in the fields of individual and organizational creativity endeavor to answer the question, "How are ideas born?" This question is linked with the genesis of novelty, as introduced by Lecoivre and Verstraete (1998). The generation of ideas is a matter of creativity, and several authors have accented the confusing border between it and innovation (Woodman & al., 1993; West & Farr, 1989; Ford, 1996; Hauch, 2002). Creativity has been studied at the individual level (Pelz & Andrew, 1966; Amabile, 1997) or the collective and organizational level (Woodman & al., 1993) in connection with the management of innovation. It is this last dimension that interests this research most. These authors define organizational creativity as the creation of new products, services, ideas or useful processes on behalf of individuals working together in a complex social system (Woodman & Sawyer, 1993).

Creativity can be different according to the situation (Majaro, 1992). As Flynn et al. (2003) underlined, creativity can be reactive and answer to a specific need. Also, it can be exploratory and proactive, generating a large spectrum of ideas, not necessarily bound to

demands or previous situations. In this case, creativity reveals opportunities, without any link to planned objectives. In addition, creativity is related to "Serendipity", so it is more linked to discovery and science. In general, researchers converge to underline that creativity leads to the collection of information (preparation) and analysis (Incubation/Illumination) before being tested in the real world (Verification). Researchers have also studied the factors that encourage creativity (McFadzean, 1988) such as wishful thinking, unrelated stimuli and mind mapping.

this research has noted that some researchers tried to link creativity with innovation. Amabile (1997), for example, suggested that creativity permits the production of new products, ideas, and services that could be implemented through an innovation. She suggests that, creativity is connected to socio-cultural validation or even to acceptance by the social environment (Cropley, 1999). However, it is important to think about the modes that can be used to structure ideas and identify the axes of values, before moving on to the development. To make this possible, an intermediate phase seems necessary to study the path from creativity to innovation.

From creativity to the innovation

To think about the uphill phases of the innovation process, we have to study the generation, selection and assessment of ideas. Thus, creativity and the transition to innovation can take on a truly strategic character for all innovating firms. Some authors have attempted to integrate creativity into the process of innovation. Staw (1990), for example, proposed a model that considers innovation as the result of developing ideas in a specific context (figure 1).

figure 1 : the two parts of the innovation process, staw (1990)

Getz (2002) suggests that research and development (R&D) activity is removed from the reality of the market. That is why it should be included in what he called "the execution of the idea". Creativity can even be considered as the first step toward "intrapreneurship" (Carrier, 1997) by making innovation more dynamic. Another important work has been presented by Flynn et al. (2003), who propose an integrator model called "the Innovation Funnel". This model integrates a sub-creativity and a sub-innovation process. The authors distinguish two main funnels: the first one concerns the creative process (environment

analysis, identification of opportunities and ideas generation); the second transforms creative ideas into real innovations (objectives, teams and resources). In their model, the authors focused mainly on creativity, while proposing a tool, based on creativity techniques (like brainstorming for example).

Although all these quoted authors have the privilege of introducing the first integrative reflections on creativity in the innovation process, this research underlines the lack of operationalisation of the ideas' transformation steps. According to Stoycheva and Lubart (2001), this transient phase is strategic because it can be included within a "pre-conception" logic: selecting projects, reducing risks and time to market (TTM). This research's extensive review has encountered only one work (Hatchuel and Weil, 2003) that really covers this phenomenon. They, while studying the innovation strategies within "Sekurit Saint Gobain", showed that each enterprise must think about new creative tracks, without cutting down on planned objectives. Thus, they developed the R-I-D (Research-Innovation-Development) model. Embedded in collective action theory, this model marks the passage of the reflections dealing with innovation to those studying the innovating organizations. Their so-named "I" function consists of managing the "*fields of innovation, which are conducive to new programs of product developments and new questions for research*". It creates value and manages the process of the emergence and structuring of new knowledge.

According to Hatchuel and Weil (2003), this strategic dimension appears on three levels:

- *Piloting by concepts* - Innovation activity is characterized by a "prudential" logic. It aims to explore the strategic space in order to generate new ideas with potential value;
- *Joint learning* - The learning takes place at the internal level and with customers;
- *The conception of strategy* - The strategy is based on the previous two kinds of piloting.

Based on this reflection, this research notes that Hatchuel and Weil (2003) highlight the importance of studying the transition from idea to development. However, two remarks deserve to be looked at in more detail. Firstly, the authors evoke the "I" function (innovation) between the research and development stages. Secondly, they present this phase as a supplementary organizational system to establish innovation in less structured situations. Certainly the "I" function is important, but it focuses only on one dimension of this strategic activity. Thus, it is necessary to develop a deeper study of the modes of the transition from idea to product. It is in this setting that we studied this phenomenon within the OPERACOM group.

Conclusions – Theoretical Gaps

The theoretical part of this research has shown that the concepts of 'idea', 'creativity', 'innovation' and others, are relatively extensively researched. At the same time there appear to be a number of matters that demand further research into these subjects.

Firstly, the various concepts are not defined, nor utilized in the same manner by the researchers. Secondly, a gap appears to exist in terms of the way that these concepts are transformed from the one into the other, especially the leap from 'new idea' to 'market-accepted product', or essentially, 'creativity' to 'innovation'. Thirdly, these concepts are not adequately intra-related i.e. their linkage within a defined process is still not distinct. Finally, these concepts are not adequately inter-related i.e. their relationship with other critical organizational functions, such as market/consumer research and R&D, within the wider strategic/marketing contexts, is also still not distinct.

Empirical Research Findings (Objective 3)

Methodology

The path from idea to innovation has a strategic character for an organization. Indeed, the ideas chosen are usually integrated into a strategic "roadmap". Thus, before all conception activity, innovating ideas are pedantically studied and selected.

In order to identify the features of this innovation phase, which is generally inexistent or rarely structured within firms, this exploratory research has effectively pursued an empirical investigation within OPERACOM (Yin, 1994). This large operator of telecommunications is currently a leader in France and has recently followed an intensive innovation strategy at a group level. In order to structure it and accelerate the marketing of new telecommunication services, OPERACOM reconsidered its innovation process. In this setting, new exploration activity has been undertaken. This section of the paper presents the methodology and subsequently the main findings of the research.

This research's verified position, that exploration characterizes the transition from creativity to innovation, led to the study of its features. Towards this end, a qualitative research is better advised (Hlady-Rispal, 2002). Therefore, the research methodology consisted of a non-participant observation over a period of six months, at the R&D site of the OPERACOM group. The non-participant presence of the researchers within this company enabled the observation and recording of the creation of the new exploration activity and the study of research-significant internal documents. Additionally, twenty-seven semi-directive interviews were conducted, with the managers of the group. The profiles of the managers interviewed are detailed in table 1.

<i>Job/ role</i>	<i>R&D</i>	<i>IS integrator</i>	<i>Developers, ergonomists, designers, quality</i>	<i>Marketing manager</i>	<i>Strategic marketing & middle managers</i>
<i>Division</i>	<i>Creative studio</i>	<i>Information system</i>	<i>R&D</i>	<i>Explocenter</i>	<i>Technocenter</i>
<i>Number of interviews</i>	6	1	7	7	6

Table 1: Profile of interviewed managers

In order to analyze the information collected from the interviews, observation and internal documents, the research employed the “Nvivo” software. This tool enabled the organization of information and better defined the new activity created by the innovation department of OPERACOM.

From the answers, exploration appears as an intermediary stage, between creativity and conception, within the innovation channel, in order to study the ideas found. Towards defining and comprehending the attributes of this new activity, five categories were created and studied using the “Nvivo” software: *the exploration axes/ Criteria, the participants, the organizational system/pattern, the governance* and the added value of the activity. The research subsequently presents the findings of the study.

Findings – Exploring the activity features

Aiming to become a leader of European telecommunication, the OPERACOM group attaches significant importance to searching for innovative and original ideas. To achieve this goal, several methods are used, such as creativity sessions, innovation open door days and meetings on an international scale. A “creative studio” was even created to this end. Once the ideas are identified, a team project starts the conception refinement and development, before merchandising the innovation.

In this setting, customers were solicited to test the services before their introduction to the market. In spite of the importance of this step, “*some service offers experienced real failure*”, declared an interviewed manager. In order to understand the reasons underlying this phenomenon, a survey was initiated by the innovation committee of OPERACOM. Several factors were identified, including the weak funding of the concepts, the lack of reflection on the ideas identified and the path followed to develop ideas. These results drove the managers to create a new structure: “the Explocenter”.

This exploration activity has a very short-term orientation (three months). It aims to ensure a better transition between research on ideas and their development into a marketable product. In this context, new concepts of service are brought to maturity to add value for the group. “Given the strategic character of this phase, it remains confidential, with an added value to and compatibility with the global strategy of the group” (R&D and quality manager).

As mentioned above, the research findings identified many features of the exploration activity:

The Three Exploration Criteria: 'Technology', 'Client Use' and 'Business Value'.

For every non-mature concept, the exploration studies also technological aspects and risk. An analysis of the "business case" is also conducted (target, business model, positioning). Considering this element, exploration activity calls for various kinds of knowledge: design of services, marketing, information systems and networks, technology, etc.

"The exploration concerns ideas or concepts that present a strong potential, but are risky because they are not of a mature technology"

(Manager, Explocenter).

"Within the Explocenter, we find good ideas, but also ideas not to be pursued. There is also a paradox between the long-term vision and business goals, which may not be in the same time frame"

(Excerpt meeting, ExploDay).

The Actors

The exploration activity is characterized by the "trial and error" process with training/experimentation by customers. Consequently, this "user-creative" step is linked to service co-creation. During the explorations, the client "ambassadors" give sense to the ideas. Some external partners also participate, depending on the nature of the service being studied.

"The customer is indeed in the heart of the Explocenter's activity. Indicatively, during six months of exploration, more than two hundred working hours were spent with customers"

(Manager, Explocentre).

"A co-localized team composed of five or six people is often used to study the concepts and to choose those that have potential value, while being among the strategic priorities of the group"

(Marketing manager).

The Organizational Pattern

The creation of the Explocenter is the first organizational step toward consolidating the exploration of new "business territories". This center is based on the innovation-related concept of incubation. Its creation is made in a very confidential setting, and announced to the staff of the group at an information day: the ExploDay. During this day, the responsible individuals present the new structure as an innovating project "nursery". Functional for one year, it is characterized by a "core team" that collaborates closely with customers (co-creation).

According to the interviewed managers, the ideas of new concepts of business to explore, are formulated by their owners in the setting of an exploration file (DEX). This is a common procedure for the whole group, that guarantees better homogeneity and internal coordination. Every file contains “reviews”, “jalons” and standardized categories. For every concept to study, in fact, the actors are brought in, to exchange their thoughts about the aspects summarized in table 2.

<i>Kind of Knowledge exchanged</i>	<i>Features</i>
<i>Knowledge linked to services and customer uses</i>	<i>Evolution of customer uses, uncertainty, divergences / convergences</i>
<i>The group's strategy</i>	<i>The adequacy of the potential offering within the group's services portfolio, the ecosystem</i>
<i>Technological knowledge</i>	<i>Risks, problems, infrastructure and technical network</i>
<i>The cost structure</i>	<i>Profits, uses, costs</i>
<i>The customers' knowledge</i>	<i>Tests and technical experiments, customer perceptions</i>
<i>Knowledge linked to materials</i>	<i>Technical specifications to consider, design, universality, potential industrial partners, integration of the service</i>
<i>Business needs</i>	<i>Pricing, media and sales plan</i>

Table 2 : The content of explorations

As shown in the table above, the exploration of innovative concepts requires a continuous exchange among the actors, which facilitates the transition of a creative idea to a real, market-accepted innovation.

The Explocenter is also characterized by the division of work between the "core team" and "the second circle". The former regroups people from the design, marketing, business, ergonomic and technical fields. The latter (“second circle”) consists of people who participate in the Explocenter’s activities from home or abroad. It is in this setting that subsidiaries or international R&D laboratories participate.

"The Core team is a multidisciplinary team that regroups managers from the design, marketing, ergonomic, and technical domains with customers. This team is made up of about five or six people. The second circle is made up of the people who are involved in the Explocenter while abroad"

(Excerpt from the Exploday meeting).

Governance

The governance style within the Explocenter is inspired by a financial approach. It diverges from the internal fundamental venture with a "deal flow" process. Every project is considered as a small firm or "start-up". Some small budgets are provided by investors and sponsors, who support the exploration projects. According to the interviewed managers, this method of

governance is compatible with the length of the exploration and the risk denoted through this new activity.

"Indeed, in the second or the third exploration phase, depending on the degree of maturity of the projects, there is a business sponsor who comes from the Technocenter"

(Explocenter manager, Exploday).

The Added-Value of the Exploration Activity

After some experience within the Explocenter, the innovation committee analyzes the projects associated with the services developed. The interviewed managers underlined that the creation of the exploration activity brought real added value on several levels, and offered benefits such as accelerating the ideas' transformation, an improved perspective on the fitness of the projects with OPERACOM's strategy and better concept maturity. As shown in the figure below (figure 2), some managers interviewed stressed that the analysis of the concepts on three levels (technology, market/use and business) consolidated the files of new ideas. They also mentioned "pre-conception" while describing the exploration process and stated that this activity is a strategic link in OPERACOM's innovation chain.

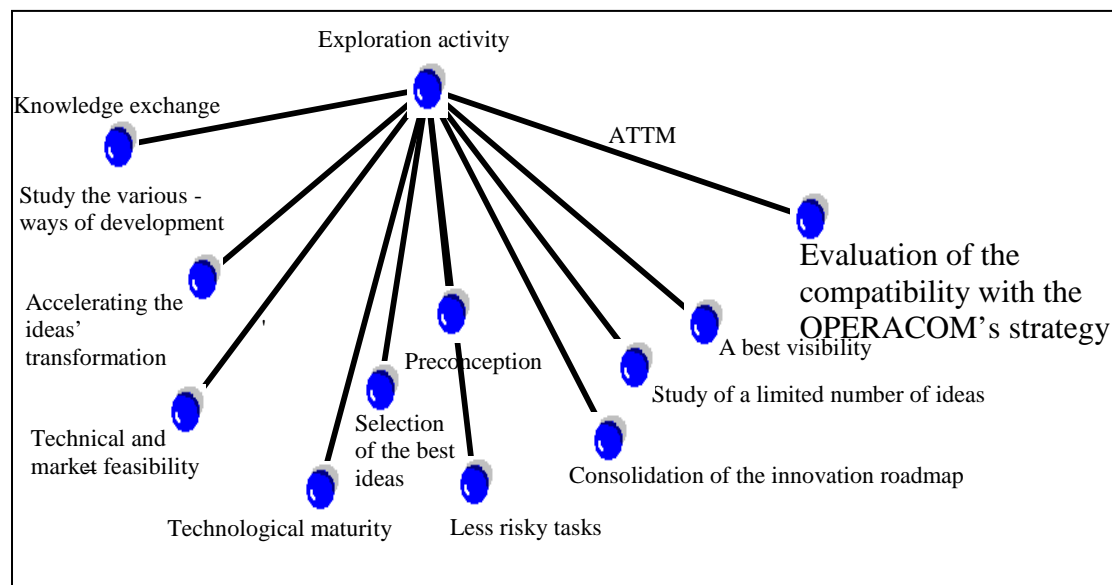

Figure 2 : The added-value of the exploration activity

In terms of the progress of the exploration activity, some managers said that there were various achievements, and distinguished three categories of concepts: swarmed, capitalized and transformed.

- The "swarmed" concepts, which can be used as "inputs" for other new projects;
- The "capitalized" concepts, which can be mobilized for other projects (customer uses, technical features); and

- *The “transformed” concepts”, which emerge when the ideas initially coming from creativity sessions mature through the contributions of customers and partners. The output is concept transformed in the preliminary offer (innovation), which is refined and elaborated in more detail throughout the innovation process.*
- These issues show that at the end of the exploration activity, the concept is sent back to the researchers if it proves to be technologically “non-mature”. When the concept appears too risky, the project is abandoned after the capitalization or swarming process. If the concept is not mature enough, an anticipatory action and a feasibility survey are undertaken. If the idea proves to have high potential, a project team is put in charge of the conception and development within the Technocenter. For all consolidation needs, the concept is sent back to the Explocenter. The choice of the trajectory of every innovative idea is made according to three main criteria: the degree of maturity, the market concerned and feasibility.

“According to the degree of maturity of the concept, the project is oriented to anticipation or capitalization. Then, according to the market, we choose the Technocenter to develop the services. In some cases, we find that the project is too complex, so we don’t proceed. It is too risky. Otherwise, if the project is not complex, we launch what we call a fast cycle of TTM (time to market)”

(Project manager, R&D)

Based on the investigation led within the OPERACOM group, the research found that the development of a creative idea into a real innovation is not a hazardous step. It is about a reflexive and structured process that should be integrated into the innovation chain. The strategic nature of the exploration activity also shows that the flexibility and degree of interaction can be facilitated by the mode of governance.

Discussion

The Features of Exploration

As described in the previous section, exploration is an activity recently created within the OPERACOM group. Its features (governance style, new structure, confidentiality, criteria of analysis) allow managers to strengthen the innovation roadmap of the group. Based on these features, the research has shown that the development of an idea into a real innovation (accepted by the market) must take place in the setting of a structured and organized process (also, Le Masson et al., 2006). Depending always on the characteristics of the individual organization, it is proposed that all organizations should explore new fields of innovation through the development of an exploratory activity and its integration with their corresponding innovation processes.

The potential paths of innovation though, do not emerge in a spontaneous way. The ideas are studied in a pre-conceived way within the business test (market opportunity) phase.

Customers play a very important role in testing the commercial feasibility of new ideas. This role recalls the notion of "lead user" introduced by Von Hippel (1978, 1986). In this setting, a distinction is made between the customers who think and conceive new products, from the "early adopters" or precocious purchasers.

The exploration of new tracks of innovation requires the mobilization of customers, as well as partners from different fields: research, development, marketing and design. Based on this finding, it is indicated that for the best results from this intermediate step, works must better be project-based (also, Midler, 1993; Azan and Mayrhofer, 2003; Garel et al., 2004). Consequently, the co-localization of managers facilitates inter-functional integration and the exploitation of hybrid knowledge (Chebbi & Yahiaoui, 2008). It also reduces risk, analyses new ideas and reduces the time to market (TTM). Finally, the ideas become "pre-concepts" that are better refined and enriched with potential business value. This approach can be called piloting by learning (also, Hatchuel & Weil, 2003).

Adjacent to the project mode, a second organizational feature characterizes exploration. It entails the creation of a structure exclusively dedicated to this activity, corresponding to the 'Explocenter' for OPERACOM. The importance of the organizational structure deserves to be emphasized, noting also the thin and obscure line that divides technological and organizational innovation (Damanpour, 1991). Recapitulating on the above, the main features of the exploration process are summarized in the table 3.

<i>From Creativity to Innovation : the features of the exploration</i>	
<i>The exploration criteria</i>	<i>New concepts with business potential: risks of use, business case (target, business model, positioning), design, technology</i>
<i>The actors (participants)</i>	<i>Customers (creative users and ambassadors), designers, ergonomists, marketing managers, partners, R&D engineers...</i>
<i>Structure and organization of the activity</i>	<i>New structure : The Explocenter Projects and co-localized teams (Core team & Circle 2) Trial-and-error process Coordination through the exploration file (DEX)</i>
<i>Governance</i>	<i>Method of governance «venture capital» Sponsor from the Technocenter (development)</i>
<i>Added value to the innovation process</i>	<i>Accelerating the transformation of ideas (more mature concepts) Improved view of the relationship between projects and the strategy of the company Better selection of concepts with great business potential</i>
<i>Results and concepts</i>	<i>Swarmed concepts Capitalized concepts Transformed concepts</i>

Table 3 : Synthesis of the characteristics of the exploration activity

As shown by the table above, the nature of the concepts resulting from the exploration activity is variable. Indeed, a capitalization process must be conducted when the ideas are not completely mature and cannot be transformed into innovation. However, new concepts can constitute real "input" for new projects. This allows the enrichment of the innovation pipelines (Amabile, 1997). All of these features improve our descriptive, but also prescriptive understanding of the method of operationalising the transition from idea to innovation; a method that also recalls the concept of exploratory creativity of Flynn et al. (2003).

Empirical Research Conclusions

Noting that very few researchers have studied the passage from creativity to innovation, this work brings true added value to the field. This research underlines the importance of interconnecting creativity and conception within the innovation process. It further proposes an operationalization of this strategic step for firms. On the theoretical level, it links two fields of research that have been disconnected until now.

For managers, this research highlights the necessity of creating exploration activity in order to bring to maturity the ideas and concepts for organizations. This "pre-conception" step can be organized at several levels: the axes of exploration (technology, business), the participants (customers, managers), the organizational pattern (new structure, standardization of the procedures, project) and the mode of governance.

While articulating the exploration into the different activities of the innovation process, this research also portrays the diversity of the outputs generated by the exploration. Concepts can be swarmed, capitalized or transformed, which increases the degree of interaction in the process. New projects can also be initiated to enrich the pipeline of firm-level innovation in order to create further added value. Researchers are invited to study this phenomenon within other organizations; a step that strengthens our understanding of and propose a mode of operationalizing the transition from creativity to innovation.

Projected Managerial Implications (Objective 4)

The above theoretical and empirical research findings have expanded our knowledge on the subject, and made the various aspects of the process more distinct. As it often occurs in such cases though, the findings also gave rise to the need for substantial considerations in the overall manner that organizations practically deal with the wider process of new product development.

More specifically, the research showed that organizations need to:

- Focus even more greatly on the process and its constituent components, such as innovation, creativity, exploration, R&D etc.

- Understand these components, place them within a single, unified and comprehensive context, and define the role and function for each, specifically for each organization at hand.
- Organize the practical implementation of the whole transition process, in a manner that makes both practical and economic sense.
- Breakdown the concept of 'value' in relation to each of the value stakeholders, both within and outside the organization e.g. value to existing customers, potential customers, employees, associates, departments, the public, society, the industry etc.
- Breakdown the concept of 'value' in terms of value type e.g. financial, time, effort, psychological, image, social/ethical, functional, technological, infrastructural, knowledge etc.
- 'Evaluate value' i.e. be able to decide on the absolute and relative importance of each value type and for each value stakeholder.
- 'Transcribe value' into a single currency i.e. be able to objectively and if possible quantitatively measure each value type in a manner that allows direct comparison between benefits/options.
- Interrelate the whole 'idea to innovation' process with (and if needed incorporate into) the wider strategic marketing, marketing research, R&D and consumer analysis processes.

Irrespective of the theoretical taxonomy, classification and categorization of the components and steps comprising the 'idea to innovation' and wider new product development processes; individual organizations need to redefine and reorganize their processes based on their individual characteristics, resources and strategic aims. The refinement of the processes at a scholarly level is a useful knowledge foundation; on which nonetheless, organizations need to build their own practical implementation.

Catalexis - Theoretical Considerations (Objective 5)

The research findings, along with the managerial implications listed above, also give rise to considerations of a scholarly/scientific nature. Considerations, which need to be born in mind by researchers continuing the work on the subject.

More specifically, researchers, further to the points above, need to:

- Theoretically position and test the 'idea to innovation' process, within the wider strategic marketing context.
- Theoretically position and test the 'idea to innovation' process, within the more specific new product development process.

- Interrelate and 'synergise' the 'idea to innovation' process with the marketing and consumer research functions
- Interrelate and 'synergise' the 'idea to innovation' process with the management and human resource contexts, as the value stakeholders of innovations / new products are often internal ones
- Investigate the features of the 'exploration activity' presented earlier (Criteria, Actors, Governance etc), separately and adjacent to economic factors
- Research the ultimate strategic-level question, adjacent to organizational culture: whether innovation / new product development are more consequent of abstract human qualities (creativity, vision, imagination, inspiration, ingenuity, inventiveness, resourcefulness), or methodical and mechanistic processes (market research, consumer profiling and analysis, idea filtering systems, etc).

Perhaps, more importantly than any other theoretical consideration, researchers need to understand that the epicenter of innovation ('value') also has a context. A context shaped by consumer behavior and all the macro- and micro-environmental factors affecting it (Thrassou, 2007; Vrontis and Thrassou, 2007; Thrassou and Vrontis, 2009). While, therefore, further research should continue to focus on the various new product development processes and sub-processes, a 'zoom-out' path must also be followed. This will allow the understanding and definition of the factors that create the value offered to value stakeholders (Vrontis and Thrassou, 2010) and thus, ultimately, add value to value itself.

THE JOINT ORDER AND PROMOTIONAL EFFORT DECISIONS FOR A FASION APPAREL COMMODITY UNDER PRE-ACQUIRED MARKDOWN INFORMATION

Chen, Li-Ming¹

¹Assistant Professor, Department of Business Administration, National Chengchi University.

Email: lmchen@nccu.edu.tw

Abstract

This work considers a two stage newsvendor problem that a retailer places an order of a fashion product with the short life cycle from her supplier and sells goods directly to customers. Due to the vulnerability of a product over time which results in customers losing interest, she then markdowns items. The buyback contract is adopted that the supplier pays a fixed cost per unit to redeem unsold items when the life is over. Based on this, a retailer makes the ordering and promotional effort decisions which depends on a pre-acquired markdown information before the sale starts. The development of model begins from the decentralized supply chain and later extends to the vertically-integrated supply chain. This work highlights to analyze the effect of markdown to the joint promotional effort and quantity decisions. In addition, numerical experiments illustrate the sensitivity analysis to various parameters. To achieve the channel coordination, the share of promotional effort and the penalty charged to a retailer's shortage are proposed. The performance of profit under these two methods are examined in the computational section as well.

Keywords: joint promotion effort and ordering decisions; markdown timing and magnitude; buyback; channel coordination

Introduction

Unlike products with stable demand over time, the sales of fashion clothes are affected by factors, such as the attractiveness to customers and substitute of similar products from competitors. Hence, these commodities have a shorter sales period and the sales condition is getting worse when it approach the end of sales. For example, Zara, a world famous clothing retailer, sells a type of cloth no longer than 30 days from its debut to the off from the shelf. This fact results in Zara's retail stores not to adopt the replenishment during the sales period. Most likely, a type of item plans one order only which arrives before the sale starts. The seasonality-influenced apparel, such as ski clothes, is another example to illustrate how demand shrinks when the winter comes to the end. Sport Obermeyer Limited, a company which offers a broad line of fashion ski apparel, received 80% of retailers orders in the annual Las Vegas Show hold in March which is six months before the release of goods in the stores. If specific items are sold well during the selling period, then the replenishment is planned.

Generally speaking, retailers would choose to make one or few times order for fashion clothes.

The promotional marketing is a popular and effective method to generate revenue directly from customers who shop in these store. For them, being recognized with a good taste in wearing apparel is one of the essential reasons how they choose clothing commodities. Through the appropriate advertising on the various media and celebrity endorsement, demand can be expected to increase drastically. Although the promotion allures customers' buying, the cost paid for the promotional efforts becomes a trade-off when a retailer regards the profit as a significantly operational performance. In addition to quantity, the promotional effort is also a critical decision a fashion retailer should pay attention.

Another mechanism a retailer would love to manipulate is through the pricing strategy. Due to the fashion characteristic, the skimming pricing becomes favorable in the fashion clothing industry. In the early stage of the sale, the high price tag aims at the high end customers who are willing to pay premium to get goods sooner. As time goes, the closer the sale approaches the end, the less unattractive items become. Therefore markdown at some point of time is exerted to stimulate demand. The consequence of the discount follows the saturation effect. This effect is caused from various factors, including the loss of customers' interest and items' acquisition from other sources. When the initial price is set too high, customers tend to be conservative of owning goods at first and wait for the price drop. When items are discounted, the potential surge on demand becomes larger due to the less saturation effect (Raman and Chatterjee, 1995).

As for the unsold items, the retailer would generally not let them obsolete and absorb all the overstock loss. The book industry, for instance, adopts the buyback mode from which publishers bundle old books with new released books for sale. The buyback contract between the retailer and supplier plays an important role to accomplish a win-win situation, from which a retailer orders more and has the opportunities to generate more revenue. When the time is over, the supplier buybacks unsold items, from which a retailer receives the salvage value, and could resell them to other channels, such as discounted stores and countries with developing economies.

To summarize all the observations and motivations mentioned above, this work considers a two stage newsvendor problem that a retailer places an order of a fashion apparel with the short life cycle from her supplier and sells goods directly to customers. Due to the vulnerability of product over time which results in customers losing interest, a markdown is adopted in the late stage of sales. When the life is over, a supplier pays a fixed cost per unit to redeem unsold items. Based on this, the retailer makes the ordering and promotional effort decisions before the sale starts in attempt to gain a better profit. As argued above, a fashion product's value drops over time quickly. A common method a brand vendor would take is to request its retailers to markdown the same style of items concurrently. Most likely, when to

let markdown take effects in each store can be evaluated from the past sales analysis and the synchronized markdown is usually derived by a brand vendor's hope to have consistent sales price. Here this work intends to make the joint decisions which depend on the pre-acquired markdown information. In addition, the share of promotional effort and the penalty of a retailer's shortage are proposed to achieve the channel coordination.

To the best of our understanding, this is the first work to probe how the joint quantity and promotional decisions is affected by markdown. The following gives a broad literature review and then develops the mathematical model in Section 3. In Section 4, numerical experiments are computed for the sensitivity analysis and profit performance. Conclusions are made in Section 5.

Literature Review

The literature is classified into three categories. The first category belongs to the pricing strategy. This mechanism plays an essential mechanism to support the retailer's operation of fashion goods whose sales conditions would be heavily affected by customers' degree of freshness. There are abundant pricing literatures addressed in the economic and marketing area. (Noble and Gruca, 1999) compared three pricing strategies: skimming, penetration, and experience curve pricing exerted in the new product. (Nagle, 1984) focused on the pricing strategy in identifiable segments and (Stole, 2007) concentrated on price discrimination. (Spann et al., 2009) empirically studied the profit rewards to various dynamic pricing strategies in the digital camera market.

From the operations management perspective, (Khouja and Robbins, 2005) analyzed the pricing decisions of a firm offering a products with two versions. Several recent studies examine the coordination of price (or demand) and production/ordering decisions for non-perishable products. Using a periodic review model with random demand, (Chen and Simchi-Levi, 2004) and (Federgruen and Heching, 1999) developed optimal policies with and without fixed cost of order placement and backlogging. (Chen et al., 2006) considered the problem with fixed cost but assume that excess demand is lost. (Huh and Janakiraman, 2008) generalized these results using alternative proof techniques. For short-life cycle products with a single replenishment opportunity, (Petruzzi and Dada, 1999) analyzed a newsvendor model with price-dependent demand. Excellent reviews of literature on the coordination of price and inventory decisions appear in (Parlar and Weng, 2006) and (Elmaghraby and Keskinocak, 2003). (Chande et al., 2005) and (Chande et al., 2004) also considered replenishment and demand management decisions for perishable products, but these papers model only a single promotion (the only demand-related decision) during the horizon.

Another type of pricing is to markdown items when they become more unattractable over time. (Feng and Xiao, 2000) and (Feng and Gallego, 2000) analyzed the optimal timing of price change. (Smith and Achabal, 1998) developed the optimal clearance prices and inventory management policies where sales rate is dependent on inventory and time. (Nair and Closs,

2006) examined the effects of price markdowns, replenishment, and transportation decisions on the retailer's performance of a short life cycle product. (Pashigian, 1998) adopted the clearance markdown for a single product with heterogeneous demand. (Bitran et al., 1998) developed a methodology with coordinated clearance markdown sale of a seasonal product.

Literatures on the decisions of joint quantity and sales effort compose the second category. (Tsao and Sheen, 2008) analyzed the dynamic pricing and promotional effort of a deteriorating product inventory system with multi-cycle, where the demand is deterministic. Demand which is affected by sales efforts, is broadly studied by (Taylor, 2002). For various sales effort on inventory decisions, list a few as follows. (Balcer, 1980, Balcer, 1983) investigated the joint inventory and advertising policies. (Cheng and Sethi, 1999) modeled demand as a Markov decision process and explore the joint promotion and inventory decisions. (Chen, 2000) studied the inventory problem by offering incentive to salespersons for more sales effort. (Ernst and Kouvelis, 1999) adopted the newsvendor problem where items are sold in a bundling form. (Wei and Chen) considered the joint sales effort and replenishment decisions with uncertain market responses, attempting to maximize the long-run average profit over an infinite horizon. (Zhang et al., 2008) examined the joint promotion and price decisions based on the finite, periodic-review setting.

The last category aims at the channel coordination. (Weng, 1995) justified that the mechanism of quantity discounts with a franchise fee paid from a retailer to its supplier can coordinate the channel. (Pasternack, 2008) showed that a partial credit for all unsold perishable items can achieve channel coordination in a multi-retailer environment. (Padmanabhan and Png, 1997) explored the return policies in the retail competition environment. (Cachon and Lariviere, 2005) coordinated the channel through the revenue-sharing contract. (Krishnan et al., 2004) proposed contracts to coordinate supply chain with retailer promotional effort. To the best of our understanding, this is the first work analyzing the effects of markdown magnitude and timing on joint promotional effort and ordering decisions.

Mathematical Models

The following work starts to establish the inventory model of a fashion commodity, particularly in the apparel industry. A supplier charges a wholesales price w to his retailer and the sales price p has been decided before the sale starts. The randomness of demand here is considered based upon the entire sales period. To an easy exposition, the randomness in each period(interval) is not taken into account in this work. To illustrate that the items' sale decreases in time, an exponential trend, $\xi(p) \cdot e^{-\lambda t}$, is adopted to represent the amount of demand in time t accumulated from the beginning of sale, where λ is the declining rate of demand as time eclipses and $\xi(p)$ represents the price-dependent demand with distribution $F(\cdot)$ and density function $f(\cdot)$. To simplify the notation, we represent a realized ξ only

unless necessary since price is known in advance. In addition, a retailer takes the markdown action at time s which counts from the start of the sale. When the discount timing arrives, a retailer provides $(1-\mu)\%$ off of the original sales price. This action provides an incentive for a stronger purchasing willingness and results in a multiplier $v(p, \mu)$, which is relevant to the discount percentage and initial pricing, of demand surge. This work assumes the transparency of markdown information to the public and, hence, demand from period t to the end of sales equals $\xi \int_s^T v(p, \mu) e^{-\lambda t} dt$. Note that $v \geq 1$ and $v(\cdot, \mu)$ drops in μ , otherwise the markdown brings a negative effect of attracting demand. This multiplier is set to be price-dependent since the characteristic of fashion commodity. A higher pricing strategy at the beginning intimidates customer. Following the markdown, more people, who originally intended to purchase goods but eventually gave up due to price consideration, are now back. Hence, this saturation effect demonstrates that $v(p, \cdot)$ decreases in p .

With the information mentioned above, a retailer then makes the joint decisions on promotional effort ρ and quantity q , which depends on the pre-acquired markdown information, before the sales. The effort stimulates demand from $\xi e^{-\lambda t}$ to $\rho \xi e^{-\lambda t}$ and a cost $\Psi(\rho)$, assumed as nondecreasing convex in ρ , is incurred. When items are released to the shelf, a retailer sells $\min\{q, \rho \xi \int_0^s e^{-\lambda t} dt\}$ units with the original sales price. When the markdown timing arrives, she then markets $\min\{(q - \rho \xi \int_0^s e^{-\lambda t} dt)^+, \rho \xi \int_s^T v(p, \mu) e^{-\lambda t} dt\}$ units with discounted price μp to customers. If ordered quantity can not satisfy demand, a shortage cost π per unit is incurred. When the sale ends, unsold items are pulled out of the shelf and the supplier buybacks them with price b per unit. Given a set of (ρ, q) , a retailer's revenue is established mathematically as

$$R_r(s, \mu, \rho, q) = pE[\min\{q, \rho \xi h(s)\}] + \mu pE[\min\{(q - \rho \xi h(s))^+, \rho \xi \int_s^T v(p, \mu) e^{-\lambda t} dt\}] \\ + bE[q - \rho \xi c(s, \mu)]^+ - \pi E[\rho \xi c(s, \mu) - q]^+ - \Psi(\rho),$$

$$\text{where } h(s) = \int_0^s e^{-\lambda t} dt, \quad c(s, \mu) = \int_0^s e^{-\lambda t} dt + \int_s^T v(p, \mu) e^{-\lambda t} dt, \quad \text{and } x^+ = \max[0, x].$$

Including the purchasing cost, a retailer's profit is written as

$$G(s, \mu, \rho, q) = -wq + R_r(s, \mu, \rho, q).$$

Thus, the optimal profit function of a retailer is written as

$$v_r(s, \mu) = \max_{\rho \geq 1, q \geq 0} G(s, \mu, \rho, q). \quad (1)$$

Proposition 1 (a) Given (s, μ) , $G(s, \mu, \rho, q)$ is a joint concave function in (ρ, q) .

(b) There exists a unique set of (ρ, q) to maximize $v_r(s, \mu)$.

Proof. See appendix.

Eq. (1) can also be represented as

$$v_r(s, \mu) = \max_{q \geq 0} \{-wq + \{\max_{\rho \geq 1} R_r(s, \mu, \rho, q)\}\},$$

where $R_r(s, \mu, \rho, q) = pq + (b - p)E[q - \rho\xi c(s, \mu)]^+ - \pi E[\rho\xi c(s, \mu) - q]^+ - \Psi(\rho)$.

Given a q , $\rho^*(q)$ optimizes $R_r(s, \mu, \rho, q)$ and the following lemma is justified.

Proposition 2 $G(s, \mu, \rho^*(q), q)$ is concave in q .

Proof. Proposition 1 demonstrates that

$$G(s, \mu, \frac{1}{2}\rho^*(q^1) + \frac{1}{2}\rho^*(q^2), \frac{1}{2}q^1 + \frac{1}{2}q^2) \geq \frac{1}{2}G(s, \mu, \rho^*(q^1), q^1) + \frac{1}{2}G(s, \mu, \rho^*(q^2), q^2)$$

Since $\rho^*(q) = \operatorname{argmax}_{\rho} G(s, \mu, \rho, q)$,

$$G(s, \mu, \rho^*(\frac{1}{2}q^1 + \frac{1}{2}q^2), \frac{1}{2}q^1 + \frac{1}{2}q^2) \geq G(s, \mu, \frac{1}{2}\rho^*(q^1) + \frac{1}{2}\rho^*(q^2), \frac{1}{2}q^1 + \frac{1}{2}q^2),$$

from which $G(s, \mu, \rho^*(q), q)$ is justified as concave in q .

Consider the replenishment decision of the non-cooperated retailer, an order, denoted as q_r^* , must be placed. Furthermore, observe that the increase on wholesales cost will decrease retailer's order quantity. The following proposition formally represents it.

Proposition 3 (a) $q_r^* > 0$.

(b) $q_r^*(w)$ is nonincreasing in w .

Proof. (a) When $q_r = 0$, $\frac{\partial}{\partial q}[R_r(s, \mu, \rho^*(q_r), q_r)|_{q=0}] = p + \pi$. The maximization of v_r

results in

$$\frac{\partial}{\partial q}[R_r(s, \mu, \rho^*(q_r), q_r)]|_{q_r=q_r^*} = w < p + \pi.$$

From the concavity of $R_r(\cdot, \cdot, \cdot, q_r)$, $q_r^* > 0$.

(b) $\frac{\partial}{\partial q}[R_r(s, \mu, \rho^*(q_r), q_r)]|_{q_r=q_r^*}$ increases in w . Hence, the concavity also

demonstrates that q_r^* decreases in w .

For fashion clothes in particular, a retailer's loss from the inventory understock is restricted. The reason is since customers can find the substitute in the same store or are willing to wait for the retailer's replenishment. Based on the setting of $\pi = 0$, the following identifies a nice structure for the promotional effort and quantity decisions with respect to the markdown action.

Proposition 4 When $\pi = 0$, then

(a) $\rho^*(s, \mu)$ and $q^*(s, \mu)$ are nondecreasing in s if $\mu p \geq b$.

(b) $\rho^*(s, \mu)$ and $q^*(s, \mu)$ are nondecreasing in μ if $\mu p < b$.

Proof. See appendix.

Vertically-integrated Supply Chain

From the above discussion, a retailer regards the buyback as a incentive and further makes the joint promotional effort and ordering decisions. Apparently, a retailer's gain from the action of buyback becomes her supplier's cost but these two shifts are offset when channel's profit is taken into account. It is well known that the the collaborated channel profit performs better than non-collaborated one (details omitted). In the following, this work continues to explore the joint decisions based on the case of channel cooperation. First, the profit is represented as

$$v_{\Pi}(s, \mu) = \max_{q \geq 0, \rho \geq 1} \{-cq + R_{\Pi}(s, \mu, \rho, q)\}, \quad (2)$$

where $R_{\Pi}(s, \mu, \rho, q) = pE[\min\{q, \rho \xi h(s)\}] + \mu p E[\min\{(q - \rho \xi h(s))^+\}] - \pi E[\rho \xi c(s, \mu) - q]^+ - \Psi(\rho)$. Note that $\rho \xi \int_s^T v(p, \mu) e^{-\lambda t} dt$.

$R_{\Pi}(s, \mu, \rho, q)$ also equals $R_r(s, \mu, \rho, q) - bE[q - \rho \xi c(s, \mu)]^+$. To know if a retailer can make the decisions from which the performance of the channel cooperation is maximized, this work thus defines $H(s, \mu, \rho, q)$, the terms of $-cq + R_{\Pi}(s, \mu, \rho, q)$, as the channel profit based on a given (s, μ, ρ, q) . The mathematical justification illustrates that it is jointly concave in (ρ, q) which implies the optimal decisions exists. Denote $(q_{\Pi}^*, \rho_{\Pi}^*)$ be the optimal decisions to form $v_{\Pi}(\cdot)$ and then more findings are concluded in the following proposition.

Proposition 5 (a) $H(s, \mu, \rho, q)$ is joint concave in (ρ, q) .

(b) $R_{\Pi}(s, \mu, \rho^*(q), q)$ is concave in q .

(c) When $b = 0$, $q_{\Pi}^* > q_r^* > 0$.

Proof. (a) and (b) These two can be justified through the same steps shown in the proof of Proposition 1. (c) When $b = 0$, $R_{\Pi}(s, \mu, \rho, q) = R_r(s, \mu, \rho, q)$. Hence,

$$\frac{\partial R_{\Pi}(s, \mu, \rho^*(q), q)}{\partial q} \Big|_{q=q_{\Pi}^*} = c < w = \frac{\partial R_r(s, \mu, \rho^*(q), q)}{\partial q} \Big|_{q=q_r^*}$$

demonstrates that $q_r^* \geq q_{\Pi}^*$ which is justified from part (b). To know an order must be placed under the integrated supply chain, examine

$$\frac{\partial}{\partial q} [R_{\Pi}(s, \mu, \rho^*(q), q) \Big|_{q=0}] = p + \pi,$$

which is larger than w . Thus, $q_{\Pi}^* > 0$.

With the inclusion of buyback, more properties related to decisions where this work focuses are illustrated in the following.

Proposition 6 Given (s, μ) ,

(a) $\rho_{\Pi}^* > \rho_r^*$.

(b) $q_{\Pi}^* > 0$.

(c) $q_{\Pi}^* > q_r^*$ if $c < w - b$.

Proof. (a) Through the algebraic identity,

$$\frac{\partial H(s, \mu, \rho, q)}{\partial \rho} = \frac{\partial G(s, \mu, \rho, q)}{\partial \rho} + b \int_{\xi=0}^q \rho c(s, \mu) \xi c(s, \mu) f(\xi) d\xi.$$

Hence, $\frac{\partial H(s, \mu, \rho, q)}{\partial \rho} \Big|_{\rho=\rho_r^*, q=q_r^*} > \frac{\partial G(s, \mu, \rho, q)}{\partial \rho} \Big|_{\rho=\rho_r^*, q=q_r^*} = 0$. We have known that, for any q , $\frac{\partial H(s, \mu, \rho, q)}{\partial \rho} \Big|_{\rho=\rho_r^*} > 0$ implies that $\rho_{\Pi}^* > \rho_r^*$ due to the characteristic of joint concavity of $H(\cdot)$ in (ρ, q) .

(b) To know an order must be placed under the integrated supply chain, examine

$\frac{\partial}{\partial q} [H(s, \mu, \rho^*(q), q) \Big|_{q=0}] = -c + p + \pi$, which is a positive value. Hence, $q_{\Pi}^* > 0$ is justified.

$$(c) \frac{\partial H(s, \mu, \rho, q)}{\partial q} \text{ can be represented as } \frac{\partial G(s, \mu, \rho, q)}{\partial q} - c + w - bF\left[\frac{q}{\rho c(s, \mu)}\right]. \text{ When}$$

$$\rho = \rho_r^*, q = q_r^*, \left. \frac{\partial H(s, \mu, \rho, q)}{\partial q} \right|_{\rho=\rho_r^*, q=q_r^*} = -c + w - bF\left[\frac{q_r^*}{\rho_r^* c(s, \mu)}\right] > 0 \text{ since } c < w - b.$$

Hence, $\rho_{\Pi}^* > \rho_r^*$ holds.

Observe that the results acquired from Proposition 5 are once again illustrated in this proposition when buyback is set as zero. The changes on joint decisions with respect to markdown needs to do some revision in terms of what is mentioned in Proposition 4. When π is set as zero, the different parameter settings would result in the difficulty to identify if decisions display a positive or negative trend as the markdown magnitude increases. However, the joint decisions have a nondecreasing trend when a retailer delays the discount timing. The following formally represents this.

Proposition 7 When $\pi = 0$,

(a) $\rho_{\Pi}^*(s)$ is nondecreasing in s .

(b) $q_{\Pi}^*(s)$ is nondecreasing in s .

Proof. Similar to the steps in the proof of Proposition 4,

$$\Psi''(\rho_{\Pi}^*) \frac{\partial \rho_{\Pi}^*}{\partial s} = (-\mu p) \int_0^{\frac{q^*}{\rho^* c(s, \mu)}} -\xi \frac{\partial c(s, \mu)}{\partial s} f(\xi) d\xi$$

$$+ p \int_0^{\frac{q^*}{\rho^* h(s)}} \xi \frac{\partial h(s)}{\partial s} f(\xi) d\xi + \mu p \int_{\frac{q^*}{\rho^* h(s)}}^{\infty} \xi \frac{\partial h(s)}{\partial s} f(\xi) d\xi - \mu p E[\Xi] \frac{\partial h(s)}{\partial s},$$

>0

which implies $\frac{\partial \rho_{\Pi}^*}{\partial s} \geq 0$. Besides, $\frac{\partial q_{\Pi}^*}{\partial s} \geq 0$ can be further justified as well.

Next, this work continues to discuss the channel coordination. Based upon the model we develop, the coordination can not be achieved when buyback plays the only mechanism (detail omitted). Thus, the following proposes two types of contract designed to accomplish the channel coordination. Observe that a retailer would still intimidate to order more even the buyback is designed to offset her potential loss. One scenario is when the buyback is set to low and becomes unattractable. In addition, recall that the shortage cost is limited or neglected in the fashion cloth industry. Thus, a retailer can play conservative to make order decision due to the mitigated damage from shortage. From the supplier's perspective, the first contract considers that he, on one hand, buybacks unsold items. On the other hand, he charges a fraction ϕ of total lost-sales cost to penalize a retailer's insufficient order. This

could prevent a supplier's potential loss of a retailer's unwillingness to order more. Hence, represent the retailer's profit as

$$v_r^{(\phi)} = \max_{q \geq 0, \rho \geq 1} -wq + R_r(s, \mu, \rho, q) + \phi \pi E[\rho \xi c(s, \mu) - q]^+.$$

Proposition 8 Set $\phi = \frac{-b}{\pi}$ and $b = w - c$ coordinate the lost-sales cost sharing contract.

Proof.

To obtain

$$\frac{\partial v_r^{(\phi)}(s, \mu, \rho, q)}{\partial q} = (p + (1 - \phi)\pi - w) + (b - \mu p - (1 - \phi)\pi) F\left[\frac{q}{\rho c(s, \mu)}\right] + (\mu p - p) F\left[\frac{q}{\rho h(s)}\right] \Big|_{\rho = \rho_{\Pi}^*, q = q_{\Pi}^*} = 0$$

, substitute $\frac{\partial v_{\Pi}}{\partial q} = (p + \pi - c) + (-\mu p - \pi) F\left[\frac{q}{\rho c(s, \mu)}\right] + (\mu p - p) F\left[\frac{q}{\rho h(s)}\right] \Big|_{\rho = \rho_{\Pi}^*, q = q_{\Pi}^*} = 0$

into the function. Thus, $\phi = \frac{-b}{\pi}$ and $b = w - c$ coordinate the supply chain.

Another type of contract is the sharing of the promotional effort. When the buyback is used as the only mechanism to encourage a retailer ordering more and then matching items by generating more demand, the cost of effort paid to stimulate demand becomes a concern. The high price of effort would force a retailer's stoppage to pursue more demand, which makes the buyback be ineffective. To wipe out this concern, this work proposes a contract to pass on partial effort cost to the supplier. Hence, the retailer's profit becomes

$$v_r^{(\Omega)} = \max_{q \geq 0, \rho \geq 1} -wq + R_r(s, \mu, \rho, q) + \Omega \Psi(\rho),$$

where Ω denote the fraction of the promotional cost shared by the supplier.

Proposition 9 When $\Omega = \frac{bc(s, \mu) \int_0^q \rho c(s, \mu) \xi f(\xi) d\xi}{\frac{\partial}{\partial q} \Psi(\rho_{\Pi}^*) \Big|_{q = q_{\Pi}^*}}$ and $b = \frac{-c + w}{F\left[\frac{q_{\Pi}^*}{\rho_{\Pi}^* c(s, \mu)}\right]}$, the contract

with promotional effort sharing is coordinated.

Proof. Since $\frac{\partial v_{\Pi}}{\partial \rho} \Big|_{q = q_{\Pi}^*, \rho = \rho_{\Pi}^*} = 0$, set $\frac{\partial v_r^{\Omega}}{\partial \rho} \Big|_{q = q_{\Pi}^*, \rho = \rho_{\Pi}^*} = 0$ derives

$bc(s, \mu) \int_0^q \rho c(s, \mu) \xi f(\xi) d\xi = \Omega \Psi'(\rho) \Big|_{\rho = \rho_{\Pi}^*}$. As for the derivative of v_{Π} with respect to q ,

$$\frac{\partial v_{\Pi}}{\partial q} \Big|_{q = q_{\Pi}^*, \rho = \rho_{\Pi}^*} = (p + \pi - c) - [\mu p + \pi] F\left[\frac{q}{\rho c(s, \mu)}\right] + (\mu p - p) F\left[\frac{q}{\rho h(s)}\right] \Big|_{q = q_{\Pi}^*, \rho = \rho_{\Pi}^*} = 0.$$

By setting $\frac{\partial v_r^\Omega}{\partial q} \Big|_{q=q_\Pi^*, \rho=\rho_\Pi^*} = 0$ and substituting terms from the above equation, we have

$$-w + bF\left[\frac{q}{\rho c(s, \mu)}\right] \Big|_{q=q_\Pi^*, \rho=\rho_\Pi^*} = -c.$$

Note that (ρ_Π^*, q_Π^*) is irrelevant to Ω but depends on parameters c , s , and μ .

Numerical Experiments and Sensitivity Analysis

This section presents an elaborate computational experiment and probes the numerical findings from the analytical perspective. First explore the channel and retailer's profits with respect to various combination of markdown magnitude and timing. Then examine if a retailer takes advantage of markdown and if so, to what extent. As for the performance of retailer's profit based on the contracts we proposed to coordinate channel, the last part of the experiments is to see which contract could benefit a retailer more according to the change on wholesales cost. The parameter setting is illustrated as follows. Define $v(p, \mu) = \beta \frac{p}{p_0} [\gamma_1 e^{-\gamma_2 \mu} + (1 - \gamma_1) e^{-\gamma_2}]$. The cost of promotional effort, representing a convex form by assumption, is measured by $\Psi(\rho) = \kappa(\rho - 1)^2$. The randomness of demand is captured in the interval $[E[\Xi] - \varepsilon, E[\Xi] + \varepsilon]$ with truncated normally distributed parameter $(E[\Xi], \sigma)$. The detail of parametric values is summarized below.

T	c	w	p	π	b	γ_1	γ_2	β	λ	$E[\Xi]$	σ	κ	ε
50	10	15	20	0	8	20	1	1	0.05	40	10	3000	30

Table 1: Parameter Setting

Profit Performance for Various Markdown Settings

Considering the optimization on a retailer's profit (see Fig. 1), experiments reveal that a better profit performance can be achieved when a larger(smaller) discount choice accompanies the synchronized decision of delaying(expediting) the markdown timing.

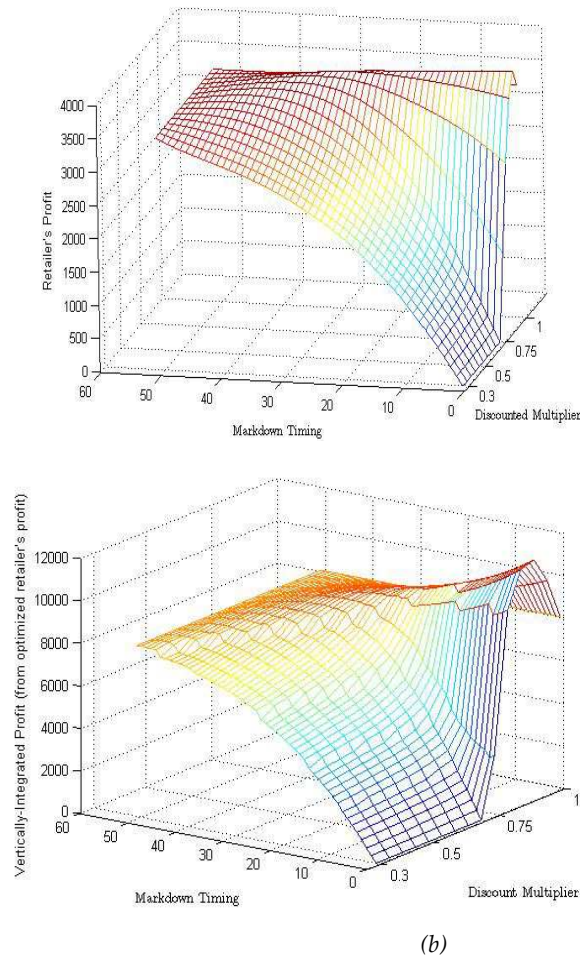

Figure 1: Profits based on the optimization of retailer's profit. a) Retailer's profit. b) Vertically-integrated profit.

For the optimized vertically-integrated (channel) profit (see Fig. 2), a smaller discount results in a even quicker arrival of markdown comparing to the decisions made from only the retailer-dependent profit. As displayed in both graphs, providing a 10% off of the original price tag at the beginning of sales period maximizes the channel profit. However, this does not address what the best pricing straty is. Note that this result depends on the design of $v(s, \mu)$ used in the experiment. Instead of identifying the optimal pricing strategy, this work concentrates on the exploration of how decisions are affected by markdown.

Based upon the promotional effort and ordering decisions from the optimized channel profit, observe that a retailer displays a serious profit loss when the range between 50 to 60% off discount is scheduled on the early stage of sales cycle. Breaking down each term of a retailer's profit reveals that sales revenue is insufficient to compensate the expense on items procurement. Besides, the buyback brings a limited gaining on profit. Hence, the decisions depending on the channel profit could potentially become the retailer's barrier to cooperate with her supplier. To prevent this, the following sensitivity analysis adopts scenarios that 20, 30, 40 % off of the original price are offered to customers in the 30th, 35th and 40th period in order. Before this exposition, first sums up observations based on the above figures.

1. Even though the cooperation brings the maximum vertically-integrated profit, the retailer's profit is hurt in comparison with the non-cooperated case.
2. The retailer would endeavor to make more promotion effort when she collaborates with the supplier.
3. The extra demand stimulated from the increase on promotion effort consequently results in the retailer ordering more.

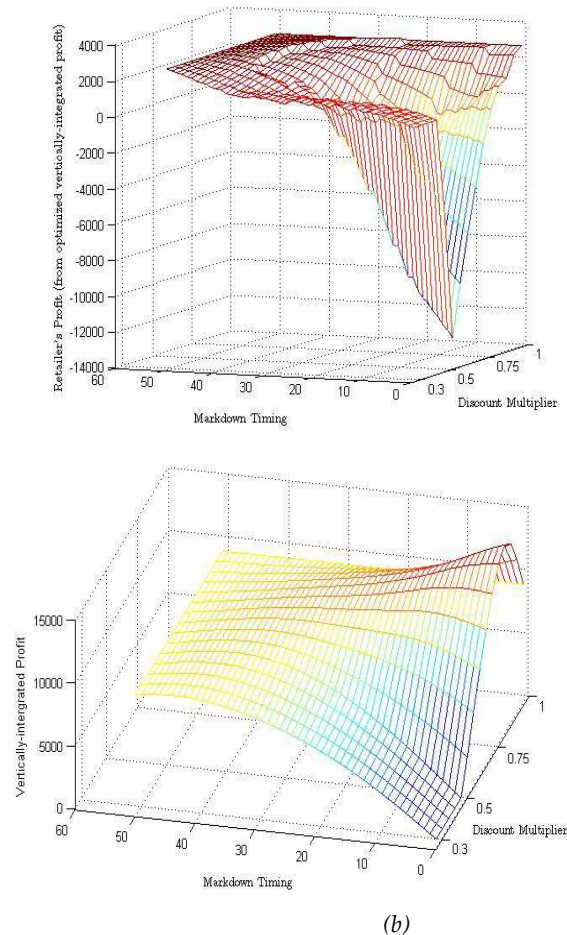

Figure 2: Profits based on the optimization of vertically-integrated profit. a) Retailer's profit. b) Vertically-integrated profit.

Sensitivity Analysis

To evaluate if markdown benefits profits, define the metric, Fraction of the Single Price Strategy, as

$$\text{Fraction of the Single Price Strategy} = \frac{\text{Profit}_{\text{with markdown}}}{\text{Profit}_{\text{without markdown}}}$$

The following denotes R to represent this fraction on retailer's profit and VI to be the fraction of the vertically-integrated profit. When the retailer cooperates with her supplier to

pursue the maximum profit, how much the supplier is willing to buyback unsold items does not affect her profit too much (see Figure 2). In the non-cooperated case showed in Figure 2, each scenario reveals that a retailer indeed adds her order amount when the buyback cost per unit increases. However, the metric used to measure the markdown performance constantly goes down when the offered buyback cost enlarges, from which keeping the single price strategy probably becomes a much wiser choice for a high b value.

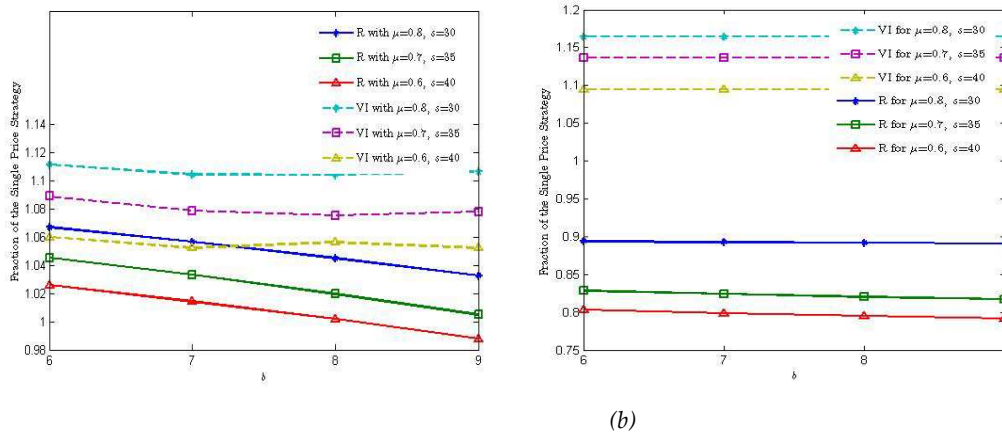

Figure 3: Fraction of the single price strategy based on different buyback cost. a) Optimization of the retailer's profit. b) Optimization of the vertically-integrated profit.

This work assumes that demand has an exponential decrease over time. Figure 4 demonstrates that the larger descending rate of demand diminishes the benefit of the vertically-integrated profit in either cooperated or non-cooperated case since markdown results in less demand raise and further compressed the growth on profit. However, the retailer takes advantage of the larger descending rate of demand and gains more from the supplier's buyback action.

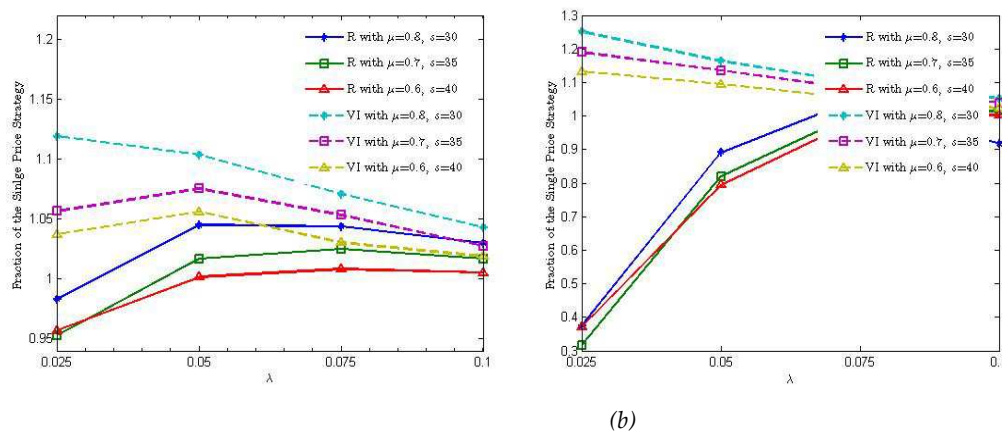

Figure 4: Fraction of the single price strategy based on different λ . a) Optimization of the retailer's profit. b) Optimization of the vertically-integrated profit.

This work next probes the sensitivity of profits on unit promotional cost (Figure 5). Under the vertically-integrated profit scenario, the effort a retailer is willing to devote drops once the corresponding unit cost raises. Consequently, the profit gap between the non-discounted and discounted strategies of the retailer diminishes. As observed, the profits do not reveal too much change in the retailer-optimized case.

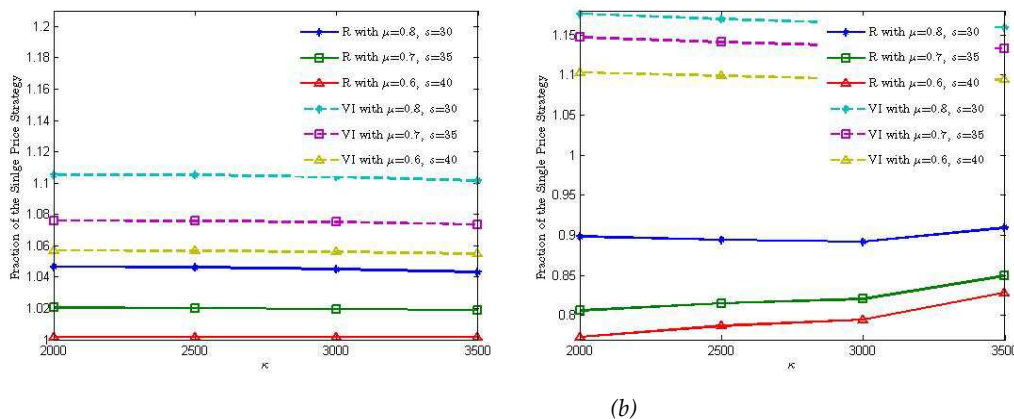

Figure 5: Fraction of the single price strategy based on different K . a) Optimization of the retailer's profit. b) Optimization of the vertically-integrated profit.

In Figure 6, the existence of shortage cost brings a trade-off about whether the retailer should discount a product. When this cost is small, the non-cooperated retailer's profit get a slight benefit from discount. With the higher cost, it exacerbates her loss of profit and results in that the decision maker prefers the single pricing strategy. Furthermore, the retailer would love the saturation effect brought from the high pricing strategy when a new type of product is launched (Figure 7).

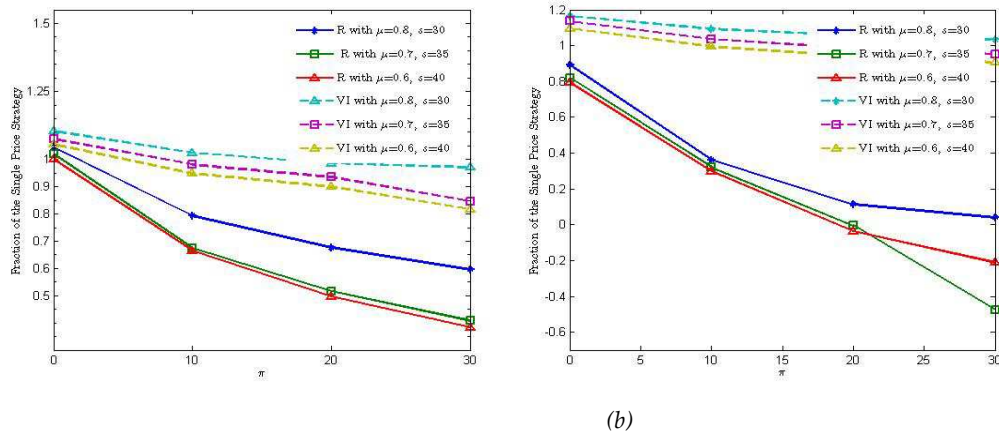

Figure 6: Fraction of the single price strategy based on different π . a) Optimization of the retailer's profit. b) Optimization of the vertically-integrated profit.

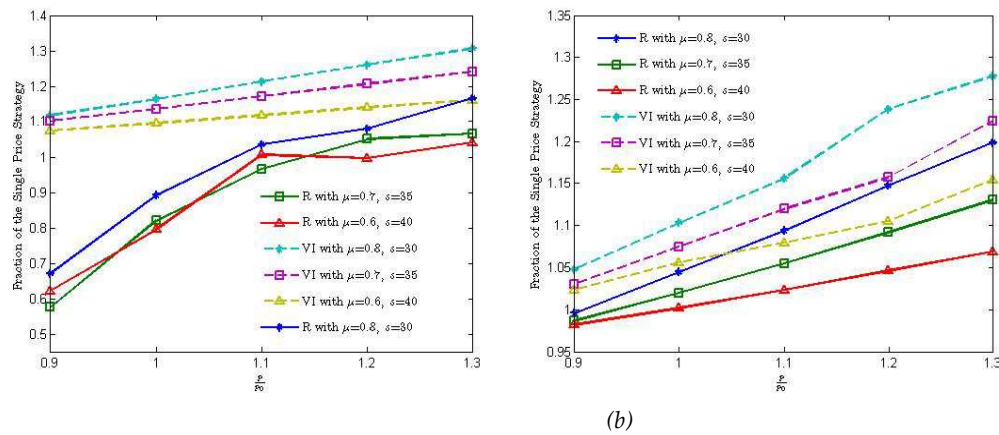

Figure 7: Fraction of the single price strategy based on different π . a) Optimization of the retailer's profit. b) Optimization of the vertically-integrated profit.

Performance of Supply Chain Coordination

In this subsection, we slightly adjust the parameter setting for a better interpretation of results. Here the lostsales cost is taken into account with $\pi = 20$ and wholesales price is set equal to $w = 14$. To measure the retailer' performance from the channel coordination, define a metric as

$$\text{Percent of Profit Advantage} = \frac{v_r^{(\phi)} - v_r^{(\Omega)}}{v_r^{(\Omega)}} \times 100\%.$$

Figure 8: Percent of Profit Advantage

From Figure 8, the lost-sales compensation contract takes advantage of the promotional effort sharing contract when the wholesales price is low. With the increase of a supplier's charge per unit to a retailer, this advantage diminishes. By observing the negative value of this metric, this shows that the effort sharing becomes an ideal contract for channel coordination. Furthermore, the effort-sharing contract comes more preferable when the retailer makes an early promotion. As for the markdown magnitude, the high discount strategy (small μ) favors the effort-sharing contract.

Conclusions

When a retailer finds that she orders too much and has the potential overstock crisis, she afterward provides discount to draw customers and solves the inventory excess. Most likely, markdown is regarded as a decision while managing inventory. The current trend in the fashion clothing industry discloses that a product has a shorter life cycle due to the intense competition which implies that the value of a product fades away quickly. This work provides a proactive vision to make the early stage decisions. A retailer makes the quantity and promotional effort based on considering the following markdown action. One way to evaluate the information of markdown timing and discount magnitude is through the past sales data for similar products. Assume the markdown information is given in advance, the purpose of this work is to identify the ordering and promotion effort. These decisions made are more accurate to match demand with supply when the fashion clothing industry manage inventory.

Based on the developed model, we verify the existence of optimally joint decisions. Besides, the properties and comparisons of decisions in both non-cooperated and cooperated channel profit cases are analyzed mathematically. To achieve the channel coordination, two contracts, effort-sharing and penalty of shortage, are proposed. The experiment reveals that an early promotion or larger discount rate favors the promotional effort sharing contract and vice versa.

Appendix

Lemma 1 (a) $\frac{\partial c(s, \mu)}{\partial s} \geq 0$.

(b) $\frac{\partial c(s, \mu)}{\partial \mu} \leq 0$.

Proof. $\frac{\partial c(s, \mu)}{\partial s} = (1 - v(p, \mu))e^{-\lambda s}$ which is nondecreasing in s .

As for $\frac{\partial c(s, \mu)}{\partial \mu} = \frac{-1}{\lambda} \frac{\partial v(s, \mu)}{\partial \mu} [e^{-\lambda s} - e^{-\lambda s}]$, this is a non-positive value. Through the

same logic, $\frac{\partial h(s)}{\partial s} \geq 0$.

Proof of Proposition 1. From Eq. (1),

$$G(s, \mu, \rho, q) = -wq + pq - pE[q - \rho\xi h(s)]^+ + \mu pE[q - \rho\xi h(s)] + (b - \mu p)E[q - \rho\xi c(s, \mu)]^+ \\ + \mu pE[\rho\xi h(s) - q]^+ - \pi E[\rho\xi c(s, \mu) - q]^+ - \Psi(\rho),$$

which is another form to represent a retailer's profit. From the fact that the distribution of ξ is assumed to be continuous and differentiable, rewrite

$$G(s, \mu, \rho, q) = -wq + pq + (b - \mu p) \int_{\xi=0}^q \frac{q}{\rho c(s, \mu)} [q - \rho \xi c(s, \mu)] f(\xi) d\xi - p \int_{\xi=0}^{\frac{q}{\rho h(s)}} [q - \rho \xi h(s)] f(\xi) d\xi$$

$$+ \mu p E[q - \rho \xi h(s)] + \mu p \int_{\xi=\frac{q}{\rho h(s)}}^{\infty} [\rho \xi h(s) - q] f(\xi) d\xi - \pi \int_{\xi=\frac{q}{\rho c(s, \mu)}}^{\infty} [\rho \xi c(s, \mu) - q] f(\xi) d\xi - \Psi(\rho).$$

To justify that $G(s, \mu, \rho, q)$ is jointly concave in (ρ, q) for a given (s, μ) , first differentiate it respect to ρ and q where

$$\frac{\partial G(s, \mu, \rho, q)}{\partial \rho} = (b - \mu p) \int_{\xi=0}^q \frac{q}{\rho c(s, \mu)} [-\xi c(s, \mu)] f(\xi) d\xi + p \int_{\xi=0}^{\frac{q}{\rho h(s)}} \xi h(s) f(\xi) d\xi - \mu p h(s) E[\Xi]$$

$$+ \mu p \int_{\xi=\frac{q}{\rho h(s)}}^{\infty} \xi h(s) f(\xi) d\xi - \pi \int_{\xi=\frac{q}{\rho c(s, \mu)}}^{\infty} \xi c(s, \mu) f(\xi) d\xi - \Psi'(\rho) \quad (3)$$

$$\frac{\partial G(s, \mu, \rho, q)}{\partial q} = (p + \pi - w) + (b - \mu p - \pi) F\left[\frac{q}{\rho c(s, \mu)}\right] + (\mu p - p) F\left[\frac{q}{\rho h(s)}\right] \quad (4)$$

$G(\cdot)$ is then twice differentiated with respect to $\partial \rho^2$, ∂q^2 , and $\partial \rho \partial q$ to get

$$\frac{\partial G^2(s, \mu, \rho, q)}{\partial \rho^2} = (b - \mu p - \pi) \left[\frac{q^2}{\rho^3 c(s, \mu)} \right] f\left(\frac{q}{\rho c(s, \mu)}\right) + (\mu p - p) \left[\frac{q^2}{\rho^3 h(s)} \right] f\left(\frac{q}{\rho h(s)}\right) - \Psi''(\rho) \leq 0 \quad (5)$$

$$\frac{\partial G^2(s, \mu, \rho, q)}{\partial q^2} = (b - \mu p - \pi) f\left(\frac{q}{\rho c(s, \mu)}\right) \left[\frac{1}{\rho c(s, \mu)} \right] + (\mu p - p) \left[\frac{1}{\rho h(s)} \right] f\left(\frac{q}{\rho h(s)}\right) \leq 0 \quad (6)$$

$$\frac{\partial G^2(s, \mu, \rho, q)}{\partial q \partial \rho} = (-b + \mu p + \pi) f\left(\frac{q}{\rho c(s, \mu)}\right) \left[\frac{q}{\rho^2 c(s, \mu)} \right] + (p - \mu p) \left[\frac{q}{\rho^2 h(s)} \right] f\left(\frac{q}{\rho h(s)}\right). \quad (7)$$

From above, the Hessian Matrix

$$\frac{\partial G^2(s, \mu, \rho, q)}{\partial \rho^2} \cdot \frac{\partial G^2(s, \mu, \rho, q)}{\partial q^2} - \left[\frac{\partial G^2(s, \mu, \rho, q)}{\partial q \partial \rho} \right]^2$$

$$= -\Psi''(\rho) \left\{ (b - \mu p - \pi) f\left(\frac{q}{\rho c(s, \mu)}\right) \left[\frac{1}{\rho c(s, \mu)} \right] + (\mu p - p) \left[\frac{1}{\rho h(s)} \right] f\left(\frac{q}{\rho h(s)}\right) \right\},$$

which displays a non-negative value. Thus, the joint concavity holds.

$$\frac{\partial G(s, \mu, \rho, q)}{\partial q} \Big|_{\rho=\rho^*, q=q^*} = \frac{\partial G(s, \mu, \rho, q)}{\partial \rho} \Big|_{\rho=\rho^*, q=q^*} = 0$$

Proof of Proposition 4. (a) Since the Implicit Function Theorem (Krantz and Parks, 2003) results in

$$\begin{aligned} \frac{\partial}{\partial s} \left[\frac{\partial G(s, \mu, \rho, q)}{\partial q} \Big|_{\rho=\rho^*, q=q^*} \right] &= (b - \mu p) f\left(\frac{q^*}{\rho^* c(s, \mu)}\right) \left[\frac{\frac{\partial q^*}{\partial s} \rho^* c(s, \mu) - q^* \left(\frac{\partial \rho^*}{\partial s} c(s, \mu) + \frac{\partial c(s, \mu)}{\partial s} \rho^* \right)}{(\rho^* c(s, \mu))^2} \right] \\ &+ (\mu p - p) f\left(\frac{q^*}{\rho^* h(s)}\right) \left[\frac{\frac{\partial q^*}{\partial s} \rho^* h(s) - q^* \left(\frac{\partial \rho^*}{\partial s} h(s) + \frac{\partial h(s)}{\partial s} \rho^* \right)}{(\rho^* h(s))^2} \right] = 0 \quad (8) \\ \frac{\partial}{\partial s} \left[\frac{\partial G(s, \mu, \rho, q)}{\partial \rho} \Big|_{\rho=\rho^*, q=q^*} \right] &= (\mu p - b) f\left(\frac{q^*}{\rho^* c(s, \mu)}\right) \left[\frac{\frac{\partial q^*}{\partial s} \rho^* c(s, \mu) - q^* \left(\frac{\partial \rho^*}{\partial s} c(s, \mu) + \frac{\partial c(s, \mu)}{\partial s} \rho^* \right)}{(\rho^* c(s, \mu))^2} \right] \left(\frac{q^*}{\rho^*}\right) \\ &+ (p - \mu p) f\left(\frac{q^*}{\rho^* h(s)}\right) \left[\frac{\frac{\partial q^*}{\partial s} \rho^* h(s) - q^* \left(\frac{\partial \rho^*}{\partial s} h(s) + \frac{\partial h(s)}{\partial s} \rho^* \right)}{(\rho^* h(s))^2} \right] \left(\frac{q^*}{\rho^*}\right) \\ &- \Psi''(\rho) \frac{\partial \rho^*}{\partial s} + (b - \mu p) \int_0^{\frac{q^*}{\rho^* c(s, \mu)}} -\xi \frac{\partial c(s, \mu)}{\partial s} f(\xi) d\xi \\ &+ p \int_0^{\frac{q^*}{\rho^* h(s)}} \xi \frac{\partial h(s)}{\partial s} f(\xi) d\xi + \mu p \int_{\frac{q^*}{\rho^* h(s)}}^{\infty} \xi \frac{\partial h(s)}{\partial s} f(\xi) d\xi - \mu p E[\Xi] \frac{\partial h(s)}{\partial s} = 0, \quad (9) \end{aligned}$$

which are derived from Eqs. (3) and (4). The first two terms in Eq. (9) can be substituted by Eq. (8) and thus

$$\begin{aligned} \Psi''(\rho) \frac{\partial \rho^*}{\partial s} &= (b - \mu p) \int_0^{\frac{q^*}{\rho^* c(s, \mu)}} -\xi \frac{\partial c(s, \mu)}{\partial s} f(\xi) d\xi \\ &+ p \int_0^{\frac{q^*}{\rho^* h(s)}} \xi \frac{\partial h(s)}{\partial s} f(\xi) d\xi + \mu p \int_{\frac{q^*}{\rho^* h(s)}}^{\infty} \xi \frac{\partial h(s)}{\partial s} f(\xi) d\xi - \mu p E[\Xi] \frac{\partial h(s)}{\partial s}. \end{aligned}$$

To make the equality hold, it must be $\frac{\partial \rho^*}{\partial s} \geq 0$ since $b \leq \mu p$ and $\frac{\partial c(s, \mu)}{\partial s} \geq 0$. To verify how the quantity decision changes according to the discount timing, we prove this by

contradiction. Suppose $\frac{\partial q^*}{\partial s} < 0$, the inequality in Eq. (8) would not hold. Hence, $\frac{\partial q^*}{\partial s} \geq 0$ is verified.

(b) Following the same logic as we prove in part (a), the Implicit Function Theorem once again shows the following equations that

$$\begin{aligned} \frac{\partial}{\partial \mu} \left[\frac{\partial G(s, \mu, \rho, q)}{\partial q} \Big|_{\rho=\rho^*, q=q^*} \right] &= (b - \mu p) f\left(\frac{q^*}{\rho^* c(s, \mu)}\right) \left[\frac{\frac{\partial q^*}{\partial \mu} \rho^* c(s, \mu) - q^* \left(\frac{\partial \rho^*}{\partial \mu} c(s, \mu) + \frac{\partial c(s, \mu)}{\partial \mu} \rho^*\right)}{(\rho^* c(s, \mu))^2} \right] \\ &+ (\mu p - p) f\left(\frac{q^*}{\rho^* h(s)}\right) \left[\frac{\frac{\partial q^*}{\partial \mu} \rho^* h(s) - q^* \left(\frac{\partial \rho^*}{\partial \mu} h(s) + \frac{\partial h(s)}{\partial \mu} \rho^*\right)}{(\rho^* h(s))^2} \right] \\ &+ p - pF\left(\frac{q^*}{\rho^* c(s, \mu)}\right) + pF\left(\frac{q^*}{\rho^* h(s)}\right) = 0 \end{aligned} \quad (10)$$

$$\begin{aligned} \frac{\partial}{\partial \mu} \left[\frac{\partial G(s, \mu, \rho, q)}{\partial \rho} \Big|_{\rho=\rho^*, q=q^*} \right] &= (\mu p - b) f\left(\frac{q^*}{\rho^* c(s, \mu)}\right) \left[\frac{\frac{\partial q^*}{\partial \mu} \rho^* c(s, \mu) - q^* \left(\frac{\partial \rho^*}{\partial \mu} c(s, \mu) + \frac{\partial c(s, \mu)}{\partial \mu} \rho^*\right)}{(\rho^* c(s, \mu))^2} \right] \left(\frac{q^*}{\rho^*}\right) \\ &+ (p - \mu p) f\left(\frac{q^*}{\rho^* h(s)}\right) \left[\frac{\frac{\partial q^*}{\partial \mu} \rho^* h(s) - q^* \left(\frac{\partial \rho^*}{\partial \mu} h(s) + \frac{\partial h(s)}{\partial \mu} \rho^*\right)}{(\rho^* h(s))^2} \right] \left(\frac{q^*}{\rho^*}\right) \\ &- \Psi''(\rho) \frac{\partial \rho^*}{\partial \mu} + (b - \mu p) \int_0^{\frac{q^*}{\rho^* c(s, \mu)}} -\xi \frac{\partial c(s, \mu)}{\partial \mu} f(\xi) d\xi \\ &- p \int_0^{\frac{q^*}{\rho^* c(s, \mu)}} -\xi c(s, \mu) f(\xi) d\xi + p \int_{\frac{q^*}{\rho^* h(s)}}^{\infty} \xi h(s) f(\xi) d\xi - ph(s)E[\Xi] = 0. \end{aligned} \quad (11)$$

Deriving from Eq. (10) and (11),

$$\begin{aligned} \Psi''(\rho) \frac{\partial \rho^*}{\partial \mu} &= p \frac{q^*}{\rho^*} \underbrace{\left[1 - F\left(\frac{q^*}{\rho^* c(s, \mu)}\right) + F\left(\frac{q^*}{\rho^* h(s)}\right) \right]}_{>0} + (b - \mu p) \int_0^{\frac{q^*}{\rho^* c(s, \mu)}} -\xi \frac{\partial c(s, \mu)}{\partial \mu} f(\xi) d\xi \\ &- p \underbrace{\int_0^{\frac{q^*}{\rho^* c(s, \mu)}} -\xi c(s, \mu) f(\xi) d\xi + p \int_{\frac{q^*}{\rho^* h(s)}}^{\infty} \xi h(s) f(\xi) d\xi - ph(s)E[\Xi]}_{>0}. \end{aligned}$$

Observe that $c(s, \mu)$ decreases in μ , and thus $\frac{\partial \rho^*}{\partial \mu} \geq 0$. By taking this result back to Eq. (10), $\frac{\partial q^*}{\partial \mu} \geq 0$.

TOWARDS THE DEVELOPMENT OF A CRM SUCCESS INDEX

²University of Nicosia, Cyprus. Email: kaufmann.r@unic.ac.cy

Abstract

The field of Cause-Related Marketing has expanded rapidly in recent years and organizations invest a large amount of money in CRM campaigns in order to improve sales performance, and positively enhance their corporate and brand image. However, the results expected from CRM practices are often not achieved. Based on an extensive and systematic review of the literature, this article identifies all 21 CRM success factors for profit organizations, examined implicitly in 18 articles published in top tier scientific journals. As such, the paper consequently synthesizes the results into a CRM success index and divides the CRM success factors into four main categories: CRM design and structure, Experience, Authenticity, and Socio-demographic variables. In parallel, it is contended that the conceptualization of the results and the generation of a CRM success index, provides theoretical and practical implications that advance the current level of success in CRM campaigns. This CRM success index can help marketing practitioners manage CRM campaigns more efficiently and fulfil their company's goals more effectively. Lastly, the research conducted in this paper, represents the only systematic identification, examination and incorporation of all CRM success factors identified through the existing literature and discusses promising aspects of Cause-Related Marketing for future research.

Keywords: Cause-Related Marketing, Social Marketing, influence*, affect*, success factors.

Introduction

Over the past two decades, corporate social responsibility (CSR), within the context of business activities, has been increasingly recognized, researched by scholars and utilized by organizations as an effectible business tool that promotes sustainable competitive advantage (Larson et al., 2008; Vlachos et al., 2009; Demetriou et al., 2010). In a recent examination of corporate associations and their degree of influence on consumer behaviour, Brown and Dacin (1997), as cited in Webb and Mohr, (1998) found that consumers' perceptions of corporate social responsibility predisposes their beliefs about and attitudes toward new products. (ibid.).

In principle, CSR can infuse brand loyalty and trust, strengthen corporate reputation and increase profitability (Larson et al., 2008; Demetriou et al., 2010). However, towards the quest of a holistic understanding of the concept of CSR, is not easy for the public to comprehend. When a company is involved with CSR practises, it might need to give explanations on what they stand for, the way corporate responsibility is carried out, and how the community benefits from such actions. Therefore, in order to justify support of nonprofits from a corporate perspective or a specific cause for promotional purposes, many organizations have refocused their social responsibility programs to

include cause related marketing. (Varadarajan and Menon, 1988; Webb and Mohr, 1998; Mohr et al., 2001; Polonsky and Speed, 2001; Brink et al., 2006; Nan and Heo, 2007; Singh et al., 2009; Sheikh and Beise-Zee, 2011). As a CSR technique, cause-related marketing (CRM) has received particular interest from corporations. This is due to the fact that especially CRM campaigns have positive effects on consumer behavior and they provide an ideal context for delving into consumers' interpretation of promotions with a social dimension and exploring their behaviours to such corporate "do-gooding" (Webb and Mohr, 1998; Tangari et al., 2010).

Furthermore, continued growth in this area is expected as a result of the fruitful outcomes experienced by vast corporations in their cause-related marketing (CRM) efforts (Varadarajan and Menon 1988; Barone et al., 2000). However, in parallel with the rise of CRM, scepticism by the consumers is starting to surface in the marketplace regarding the for profit companies' CRM practices. It has been argued that CRM breeds public cynicism, suspicion of green washing and cause exploitation (Bronn and Vrioni, 2001; Vlachos et al., 2009; Folse et al., 2010). Scandals within the business society, ethical mistakes, and anxiety for contemporary life, all steer consumers to be sceptical and doubtful regarding firms' reasons for practising CRM (Vlachos et al., 2009). Consequently, this scepticism can lead consumers to reject claims raised in CRM campaigns, it can influence their purchasing behaviour and can even lead to stronger actions (Bronn and Vrioni, 2001). Hereupon, it is necessary for organizations pursuing CRM to understand the underline success factors and have a key success index of CRM practises because even if the benefits associated with well-implemented and well-promoted cause-related marketing (CRM) campaigns are well documented, ineffective cause-related marketing campaigns can cause negative results to the reputation of the partner organization and damage the work of the charity (Demetriou et al., 2010; Tangari et al., 2010).

In sum, the structure of this systematic literature review paper is as follows: Section 2 presents the research aim and objectives of this study and reveal the literature gap that exists both in theory and practice. Furthermore, in the same section the key concepts are defined and an analysis of the Systematic Literature Review concept is fulfilled. In the following section the methodology adopted is described along with the Quality assessment and the Data extraction process. Section 4 refers to the synthesis that is adopted, analyzes the key findings and illustrates the initial conceptualization of a CRM success index to be tested in a later stage. Section 5 is comprised by the limitations occurred for the present systematic literature review paper and section 6 concludes the paper by summarizing the key findings and a discussion of implications and opportunities of future research.

Background

Research Aim and Objectives

The aim of this research is to develop an interactive conceptual framework for successful Cause-Related Marketing practices through a CRM success index. Therefore, as with any other research project, Systematic review of the relevant existing literature comprises the basis for the framework's development. A certain number of the discovered success factors constitute the CRM success index,

by which it will be tested and then adjusted accordingly in order to create new knowledge and thus, to contribute both to theory and practise.

Towards this aim, four specific research objectives have been set:

1. To undertake an extensive systematic literature review that will set the theoretical foundation of the research and span the field of Cause Related Marketing.
2. To investigate and identify the key success factors of Cause Related Marketing practice.
3. To bring together the refined research outcomes towards the development of a conceptual framework.
4. To test the CRM success index as a result of the developed conceptual framework in the Cyprus market and thus, to create new knowledge contributing in that way not only to theory, but also in practise, and to overlaying the way for further research.

The value and originality of this work relates to its focus on a new theoretical framework comprised by a CRM success index which is tested to Cyprus market, by which the research study is conducted.

In addition, this paper develops for the first time a success index for CRM strategies by incorporating all the key success factors from the existing literature. Moreover, by implementing objective 4 the paper also contributes a new CRM framework to existing literature, which constitutes a trail-blazer platform for future research, as well as a tool for practical implication.

Towards the necessity of a CRM success index

Due to the growth of corporate social responsibility and corporate alliances with non-profit organizations, the potential for future research on cause-related marketing is clear. However, factors leading to the success or failure of cause related marketing programs implemented by for profit organizations, haven't been documented or explored in a methodologically broader way (Grau and Folse, 2007; File & Prince, 1998; . Larson, et al., 2008; Moosmayer, and Fuljahn, 2010). Consequently, in order to fill this gap there is a need for research in order to identify those factors that have a direct impact on successful implementation of cause-related marketing practice and how they could be applied in order to create a success index for CRM practice.

Defining Cause Related Marketing

The origins of CRM can be traced back in 1983, when American Express supported the Statue of Liberty's restoration through donations based on card usage and uptake (File and Prince, 1998; Polonsky and MacDonald 2001; Porter & Kramer, 2002; Broderick et al., 2003; Grau and Folse, 2007; Hoek and Gendall, 2008; Demetriou et al, 2010;). From the marketing perspective, CRM is a marketing strategy that combines company charity, fundraising for a non-profit organization and social responsibility. CRM, first proposed by Varadarajan in 1986, as cited in Wu and Hung (2008), as a joint-transaction model, resulting from the coalition of product and donation through the partnership between a firm and a non-profit organization. In addition, the author adds that this coalition promotes gain and interests for both parties. Furthermore, in their research work on CRM,

Varadarajan and Menon (1988, p. 60), provided a comprehensive conceptual examination of CRM and defined it *'as the process of formulating and implementing marketing activities that are characterized by an offer from the firm to contribute a specified amount to a designated cause when customers engage in revenue-providing exchanges that satisfy organizational and individual objectives'*. This definition of CRM has been widely accepted from the scientific community and used in a major degree for a long time (Mullen, 1997; Bronn and Vrioni, 2001; Pracejus et al., 2003).

Gradually, Andreasen (1996), extended the concept of CRM, using the condition that increasing product sales for the organization concomitances with fundraising for the non-profit organization. Any marketing activity promoted by the firm and the non-profit organization can be reckoned as a CRM activity as long as it has a direct or indirect impact on sales boost. In parallel, Kolter & Andreasen (2002), as cited in Wu and Hung (2008), believed that when a company promotes a certain issue or idea by itself, it should also be considered as CRM activity. Hereupon, according to them, the scope of CRM covers all kinds of social issues.

In conclusion, Varadarajan and Menon (1988), argued that CRM helps to achieve many substantial benefits, such as improving performance, strengthening corporate reputation and brand image, and expanding the target market of a company. Hereupon, continued growth in this area is expected as a result of these benefits experienced by major corporations in their cause-related marketing (CRM) efforts (Varadarajan and Menon 1988; Tate 1995; Brown and Dacin 1997; Barone et al., 2000). Dupree (2000), as cited in Broderick et al., (2003), suggests that this rapid growth and interest within Cause Related Marketing is happening due to the consumers' increased social consciousness.

Defining the term success within the concept of Cause Related Marketing

According to Eid (2007), there is no clear definition of a successful CRM project. A successful CRM implementation is one that meets the business objectives. Mustonen (1996), as cited in Rainisto (2003), defines success as the accomplishment of some explicit or implicit goals, evaluated with criteria set at a specific time. Assessment criteria of the same situation can also vary with the anchoring point changes. In corporate marketing the term "success" is interrelated with the fulfillment of the set goals, which can be concrete (turnover) or abstract (corporate image) (ibid.). In parallel, Varadarajan and Menon (1988), argued that a successful CRM program is translated by achieving many substantial benefits towards the organization, such as strengthening corporate and brand image, improving performance, and extending the target market. Furthermore, Andreasen (1996), as cited in Wu and Hung (2008), connected the concept of CRM, with sales growth, thus CRM success also depends on whether or not it has a direct or indirect impact on sales growth .

With the arguments of Varadarajan and Menon (1988), and Andreasen, (1996), regarding the meaning of a successful CRM campaign and what benefits arise from it, seems to agree the majority of scholars. For instance, Ross, Patterson, and Stutts (1992), Brown and Dacin 1997, Berger, Cunningham and Kozinets (1996), and Creyer and Ross (1996), as cited in Strahilevitz (2003), argue that some of the benefits to using charitable donations as purchase incentives include improving the corporate image of and attitude towards the sponsoring organization, differentiating a brand from its competitors

(Berger, Cunningham and Kozinets, 1996; Murphy, 1997; Brown and Dacin, 1997;) and increasing sales in the short run (Sen and Morwitz, 1996; Strahilevitz and Myers 1998; Murphy, 1997; Strahilevitz, 1999; Strahilevitz, 2003). In the context of this research, the term "success" complies with the analysis given by both Varadarajan and Menon (1988), and Andreasen, (1996).

Defining the term Index

According to Diamantopoulos & Winklhofer, (2001), as cited in Arnett et al., (2003), an index is a value assigned to people that reflects the degree to which they possess some latent trait and the calculation of it requires the use of more formative than reflective indicators. In addition, when a latent construct is measured using formative indicators it is hypothesized that the observed indicators cause or 'develop' the latent construct. On the contrary, when reflective indicators are used, it is hypothesized that the latent construct causes the observed indicators, and as a result the observed variables "reflect" the changes in the latent construct (Bollen, 1989, as cited in Arnett et al., 2003).

Another definition given by Babbie (2011), refers that the term index within the social sciences perspective is defined as a method of classifying subjects for analysis, in terms of some variables or attributes by the combination of their responses to items included in the index. In addition, indexes measure variables and their measurements are based on more than one data item (Babbie, 2011; Kim et al., 2011). In addition, Babbie (2007), as cited in Kim et al., (2011), argues that the development of an index involves several methodological steps, comprising by: the selection of the index items; scoring of the items that are going to be included in the index; and validating the index.

Furthermore, indexes can be used for a variety of reasons such as to provide both researchers and practitioners with broad measures of marketing phenomena. In the present study the development of the CRM success index will be derived in two steps:

- Identification and documentation of key success factors for Cause-related marketing programs;
- Integration of these factors by means of an index formula;

Systematic Literature review versus narrative literature review

The kind of the review that is adopted for the present study is the systematic review due to the multiple advantages against the narrative review. The aim of the present literature review is the systematic review of the existing literature on the cause-related marketing concept. Towards this aim, the following three objectives have been set:

1. A thorough examination of the existing literature review towards the holistic understanding of Cause Related Marketing concept.
2. The identification and documentation of the key success factors of CRM practices.
3. Conceptualization of a CRM success index.

Methods

Search Strategy

The search strategy of the present systematic review was implemented by using an automated search.

Specification of the search terms

In the context of the present systematic literature review the following English search terms were used in the corresponding electronic databases:

EBSCO Host: Cause related marketing OR social marketing AND success factors

Emerald Insight: factor* AND influence* AND Cause-related marketing

Science Direct: cause-related marketing AND success factor*

Springer Link: 1.) Factor* AND affect* AND cause related marketing
2.) cause related marketing

Google Scholar: Cause related marketing

Wildcard character: The asterisk symbol (*) within the search terms was used in order to include both singular and plural forms of the search terms such as factor, but also factors.

Different search term sequences and strategies were used for each electronic database due to the lack of standardization between them. In addition, the variety of search terms used, enhanced the possibility to include as much as possible relevant literature. Moreover, the choice of the above mentioned search terms emanates from the fact that they are sensitive for the present research topic. Hereupon, this reduced the possibility of missing research papers that could be relevant with the present study.

Moreover, the selection process for the identification and inclusion of the relevant research papers included the following three steps:

- A broad screen of the titles of the citations retrieved from the literature search and extraction of the studies irrelevant with the present study.
- A broad screen of the abstracts of the citations passed from stage one and selection of the most relevant with the present research topic.
- A strict screen of the remaining studies that past the previous two stages and selection of the most appropriate and relevant ones with the present research topic.

Specification and justification of the time frame to be examined by the systematic literature review

Due to the fact that one of the objectives of this study is to identify and document all the researched CRM success factors, the time period investigated starts from the inception of Cause-related marketing in 1983 until present (2011).

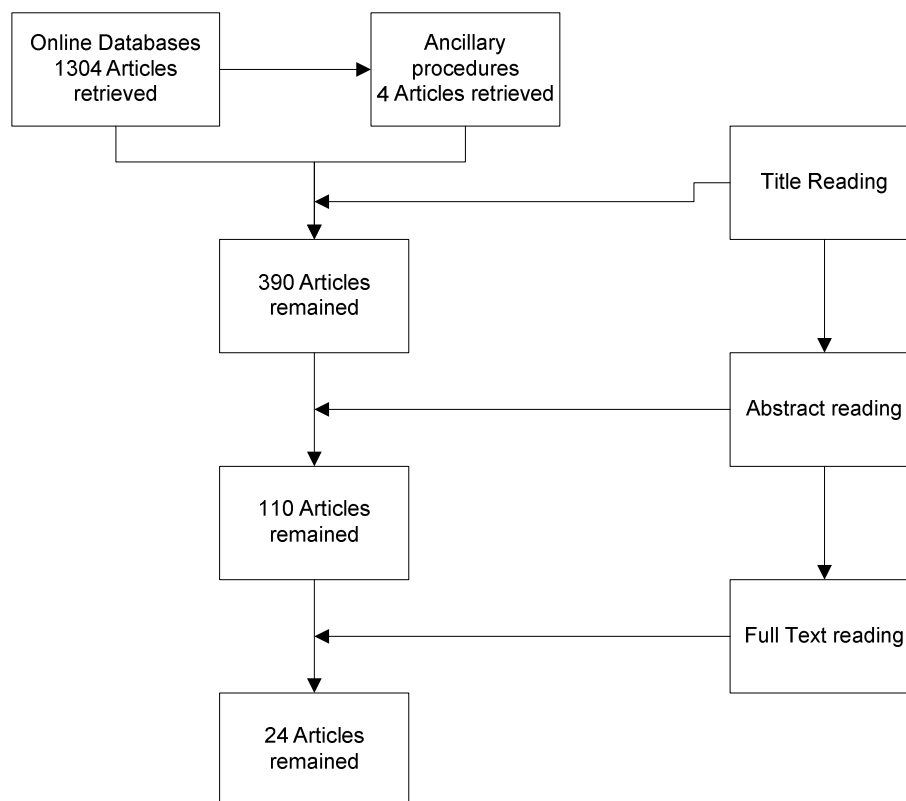

Ancillary procedures during search

The references of all articles that fulfilled the selection criteria were screened to identify other articles within the review period that are relevant with the research question.

The aggregate outcome of the search strategy

The sum of the results retrieved from the literature search are illustrated in Figure 1 as a flow diagram.

Figure 1 : Selection Process

Selection Criteria

The selection criteria of the remaining 24 articles from the screening process are analyzed below:

Time frame

As already mentioned, the time period for investigation of the existing literature was set from the inception of Cause-related marketing concept in 1983 until 2011 in order to identify and document all factors that drive a CRM program into success.

Language

The paper language must be English or Greek, due to the language limitations of the researcher.

Study topic

Included research papers is necessary to meet the aim of this study. Thus, studies that were irrelevant with the research question, excluded from the final selection.

Study type

Towards the desire to include research papers on the best-quality evidence, this study excluded any relevant literature that was not classified as primary.

Methodology adopted

As it is mentioned in the previous section, research papers that adopted both qualitative and quantitative methodology approach were included for 2 reasons: to limit the possibility of excluding significant and highly relevant studies, and to maximize the possibility of finding and documenting all the researched CRM success factors.

All studies retrieved by the search engines from the first until the third stage were read by two researchers in order to limit the possibility of selection bias. In addition, 22 out of 24 studies that passed the third stage of the selection process, were verified by two researchers that met the inclusion/exclusion criteria. The other two studies were rejected because they weren't research papers.

Quality Assessment

A Quality checklist was developed in order to evaluate the quality of the selected studies, and includes four basic components: Validity, Reliability, Credibility and Integrity, each one graded with three marks. An explanation of these elements of quality measurement is given below:

Validity

Validity refers on how successful and accurate is the study measurement towards its research question. In other words, it concentrates on the study's successfulness at measuring what the researcher intents to investigate and measure (Caldwell et al., 2010; Collis & Hussey, 2003).

Reliability

Reliability refers to the consistency and the degree of replication of the results and how generalizable they are (Caldwell et al., 2010; Collis & Hussey, 2003). However, the difficulty with reliability, is that it cannot be measured, it can only be assumed.

Credibility

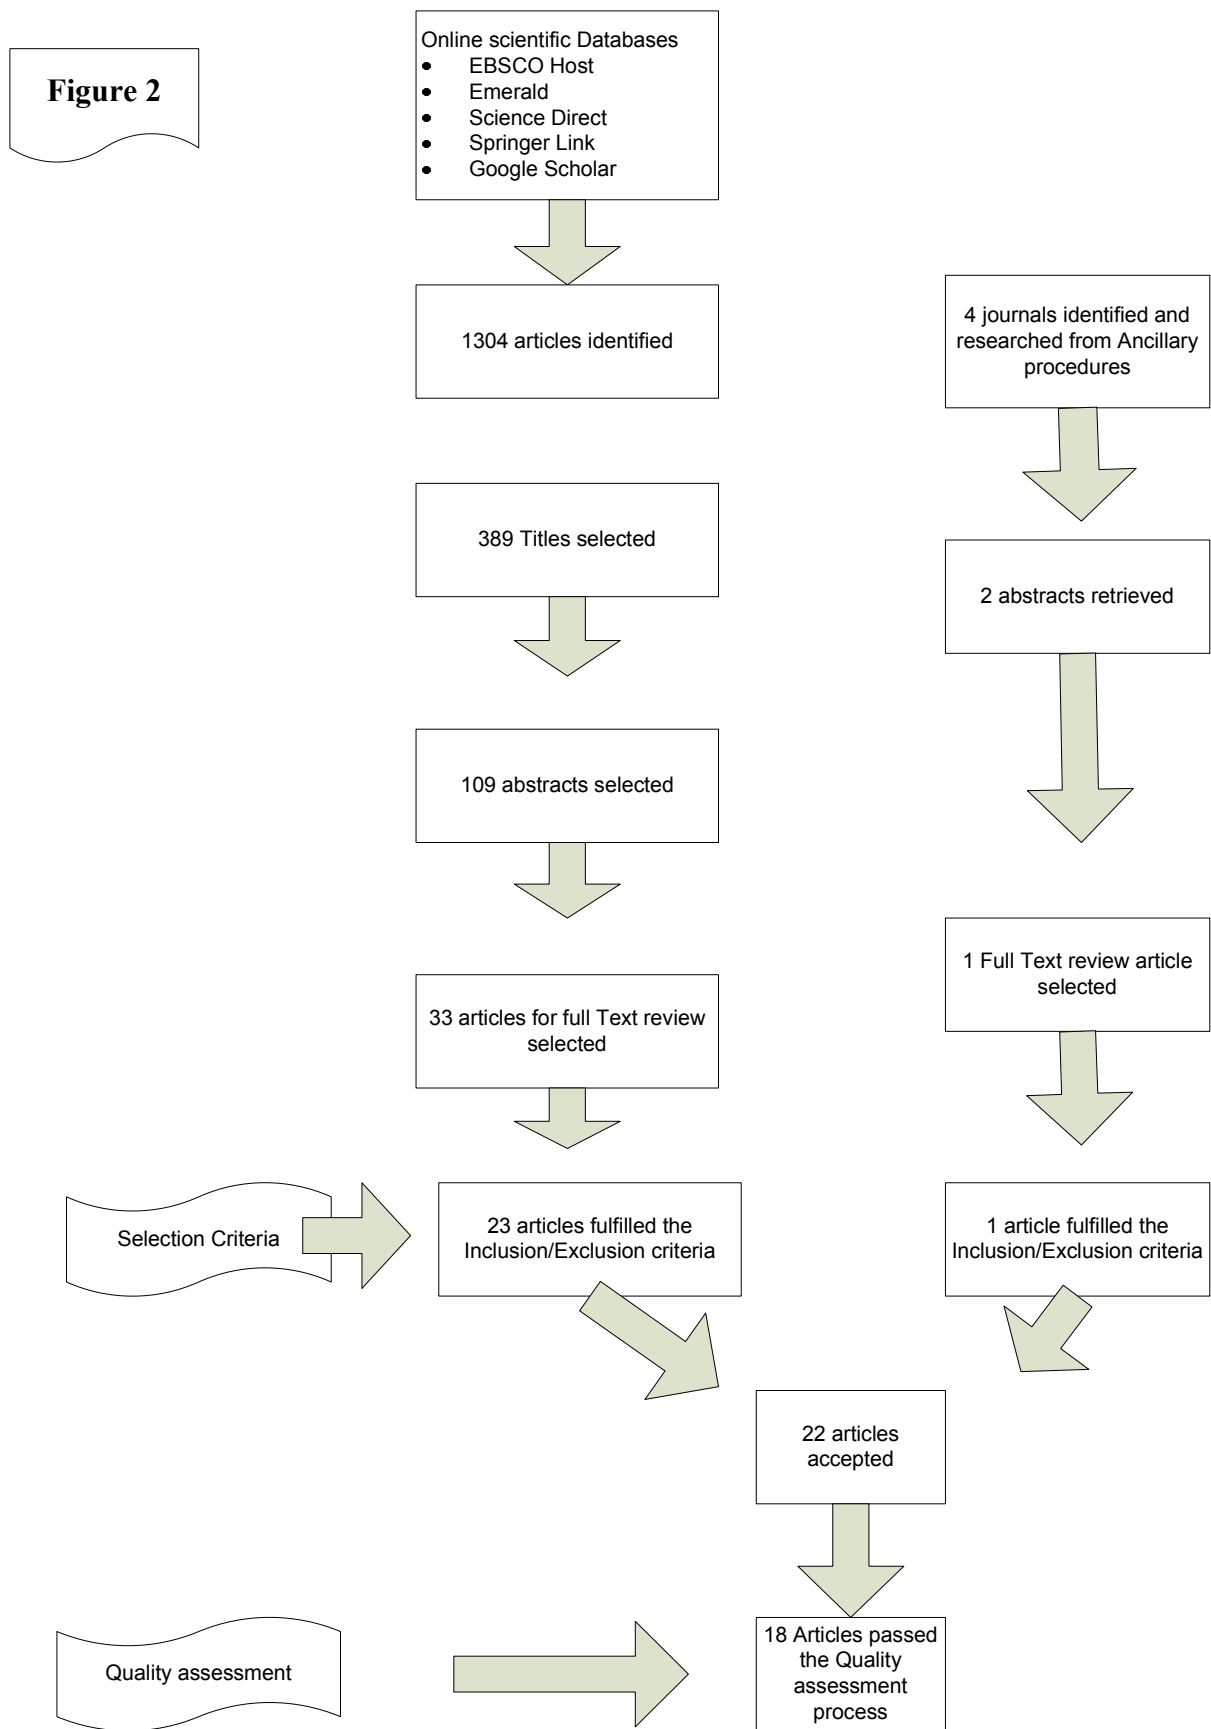

Credibility reflects the researchers appropriate academic qualifications in order to be able to undertake the research project along with the writing style of the paper (Caldwell et al., 2010). In addition, this study measures credibility of the research papers according to the ranking of the journal into which they are published. The selected studies will pass the Quality assessment only if they are published within journals that are included at the Harzing quality list of journals. The reason for selecting Harzing quality list of journals relays on the fact that is based on the analysis and ranking of 19 business and management official journal rankings (Mingers and Harzing, 2007). By applying

Harzing quality list of journals as a credibility measure, the quality of this paper will raise because it will include studies published within the best journals worldwide. Furthermore, apart from the articles, this study also included grey literature that met all the Quality criteria except their inclusion in the Harzing quality list of journals.

Integrity

Integrity is translated on how robust is the research study and if there is a strict adoption of the chosen research process. It can be measured by evaluating if the methodology adopted by the researcher of the study, is identified and justified (Caldwell et al., 2010).

From the Quality assessment process, 18 out of 22 studies have passed. The other four studies were rejected because their Grade was lower than twelve. Figure 2 illustrates the selection of the remained studies from the initial process selection until the Quality Assessment process.

Data Extraction

In this systematic review, a developed data extraction form was used in order to extract the data from the selected studies and to document the data extraction process. Regarding the elements that have been extracted from the studies concern:

- General details: Title of the paper, Author's name and publication details.
- Features of the study: methodological approach, population characteristics, sample size.
- Key results.

This process is done through a data extraction form that reduces human error and documented this process (Magarey, 2001; Tranfield et al., 2003; White and Schmidt, 2005). Table 2. illustrates the developed data extraction form along with the data extracted from each of the selected studies.

Table 2. Data extracted from the selected studies

Number of study	Title	Author/s	Publication details	Year of publication	Methodology adopted	Population characteristics	Sample size	Key results
1	The effect of fit and dominance in cause marketing communications	Sridhar Samu, and Walter Wymer	<i>Journal of Business Research</i> , Volume 62, Issue 4, Pages 432-440	April 2009,	Quantitative approach	students	2 studies: Study 1: 240 Study 2: 120	Perceived fit and dominance for the brand and the cause are success factors for a CRM campaign
2	Consumer perceptions of cause related marketing campaigns	Dirk C. Moosmayer, Alexandre Fuljahn	<i>Journal of Consumer Marketing</i> , Volume: 27, Issue: 6, Pages 543-549	June 2010	Quantitative Approach	students	306 students	The impact of gender and donation size towards a CRM campaign
3	Brand credibility in cause-related marketing: the moderating role of consumer values	Enrique Bigné-Alcañiz, Rafael Currás-Pérez, Isabel Sánchez-García	<i>Journal of Product & Brand Management</i> , Volume: 18, Issue: 6 Pages 437-447	June 2009	Quantitative Approach	consumers of insurance and personal hygiene products	595 consumers	Brand credibility of CRM campaign through cause-brand fit and altruistic attributions

4	Modeling strategic management for cause-related marketing	Shu-Pei Tsai	<i>Marketing Intelligence & Planning</i> , Volume: 27 Issue: 5 pp. 649-665	February 2009	Quantitative Approach	consumers	690 consumers	prior brand experience, making positive motivational attribution about the donor brand emerge, constructing persuasive messages Evaluation of campaign, Internal locus of causality, Stability of efforts, Controllability of outcome, are positive factors for CRM success
5	Overcoming skepticism towards cause related claims: the case of Norway	Sangeeta Singh, Lene Kristensen, Erika Villaseñor	<i>International Marketing Review</i> , Vol. 26, (3), pp. 312-326	February 2009	Quantitative Approach	Students, staff and people of campus from two universities in Norway	100 people	repetition of the CRM claim, familiarity towards the CRM claim, providing

								truthful information that increases credibility and familiarity with the CRM campaign.
6	The effect of strategic and tactical cause-related marketing on consumers' brand loyalty	Douwe van den Brink, Gaby Odekerken-Schröder, Pieter Pauwels	<i>Journal of Consumer Marketing</i> , Vol. 23, (1), pp.15–25	January 2006	Quantitative Approach	Students from a western European university	240 students	long-lasting CRM campaigns linked to the product that shows the lowest level of consumer involvement. and the adoption of strategic cause-related marketing campaign results to its successfulness regarding brand loyalty
7	Effects of price premium and product type on	Saroja Subrahmany an	<i>Journal of Product & Brand</i>	2004	Quantitative Approach	young Chinese Singaporeans.	128 young Chinese	specifying the amount donated to the cause, cause-

	the choice of cause-related brands: a Singapore perspective		<i>Management</i> , Vol. 13, (2), pp. 116-124				Singapore ans.	linked brands are factors for increased CRM success.
8	Cause-related marketing: how generation Y responds	Yanli Cui, Elizabeth S. Trent, Pauline M. Sullivan, Grace N. Matiru	<i>International Journal of Retail & Distribution Management</i> , Vol. 31, (6), pp. 310-320	2003	Quantitative Approach	Students from two American universities	389 students	Females, social science majors from academic background, annual income, previous donation activity, type of cause (disaster), and long term/frequent campaigns are factors for CRM success.
9	The Effects of Corporate Commitment and Cause Commercialization in Cause-Related Marketing	Yoojung Kim; Jung Lim; Sejung Marina Choi	<i>Advances in Consumer Research - North American Conference Proceedings</i> ,	2010				a company's commitment to CSR through resources invested by a company in its CRM program,

	.		Vol. 37, p834-835					including the duration of the CRM, are factors leading to positive CRM outcomes
10	The influence of gender, social cause, charitable support, and message appeal on Gen Y's responses to cause-related marketing	Hyllegard, Karen; Yan, Ruoh-Nan; Ogle, Jennifer Paff; Attmann, Julianne	<i>Journal of Marketing Management</i> , February 2011, Vol. 27 (1-2) pp. 100-123,	February 2011	Quantitative Approach	Gen Y college students	562 Gen Y college students	the amount of the charitable support is clearly communicated, female gender, and Gen Y's involvement in a social cause (e.g. volunteerism) are success factors towards a CRM campaign
11	Cause-Related Marketing (CRM): The Influence of Donation Proximity and Message-Framing Cues on the Less-	Grau, Stacy; Folse, Judith	<i>Journal of Advertising</i> , Vol. 36 (4), pp. 19-33	December 2007	Quantitative Approach	consumers	2 studies: study 1: 141 participants, study 2: 166 participant	local donations and positive message framing serve as effective variables for CRM success

	Involved Consumer						s	
12	Portraying the Cause Instead of the Brand in Cause-Related Marketing ADS: Does it Really Matter?	Lafferty, Barbara; Edmondson, Diane	<i>Journal of Marketing Theory & Practice</i> , Vol. 17, (2), pp. 129-144	April 2009	Quantitative Approach	nonstudent consumers	495 nonstudent consumers	brand photo has a greater effect on purchase intentions of the CRM campaign than the cause photo. brand familiarity is also a CRM success factor
13	To donate or not to donate? Product characteristics and framing effects of cause-related marketing on consumer purchase behaviour	Chang, ChunTuan	<i>Psychology and Marketing</i> , Vol. 25, (12) pp. 1089-1110	December 2008	Quantitative Approach	students	960 part-time undergraduate students	Donation magnitude/ product price fit, product type (eg. frivolous, hedonic) donation framing in absolute dollar value are CRM success factors
14	Tickled Pink: The Personal Meaning	Anne Brodericki,	<i>Journal of Marketing Managemen</i>	June 2003	Qualitative approach	customers	15 customers	emotional level of individual

	of Cause Related Marketing for Customers.	Amandeep Jogi and Tony Garry	<i>nt</i> , Vol. 19, (5-6) pp. 583-610					involvement and the credibility of the partner organization are important CRM success factors
15	The Effects of Prior Impressions of a Firm's Ethics on the Success of a Cause-Related Marketing Campaign: Do the Good Look Better While the Bad Look Worse?	Strahilevitz, Michal	<i>Journal of Nonprofit & Public Sector Marketing</i> , Vol. 11, (1), pp. 77-92	February 2003	Quantitative Approach	students	2 studies: study 1: 76 undergraduate business students Study 2: 76 undergraduate business students	Firms perceived as ethically neutral have positive effects on a cause-related marketing campaign
16	Consumer Response to Harmful Products with Cause-	Chun-Tuan Chang, Sun Yat-sen	<i>Advances in Consumer Research</i> - North American	January 2009				hedonic products as a product type and product-cause fit are important

	Related Marketing: Influences of Product-Cause Fit and Product Type		Conference Proceedings, Vol. 36, pp.793-794					factors for a successful CRM campaign
17	The role of brand/cause fit in the effectiveness of cause-related marketing campaigns	Pracejus, John W.; Olsen, G. Douglas	<i>Journal of Business Research</i> , Vol. 57, (6), pp. 635-640	2004	Quantitative Approach	consumers	329 respondents	Brand / cause fit is an important factor for CRM success
18	Consumer Responses to Corporate Social Responsibility (CSR) Initiatives: Examining the Role of Brand-Cause Fit in Cause-Related Marketing	Nan, Xiaoli; Heo, Kwangjun	<i>Journal of Advertising</i> , Vol. 36, (2), pp. 63-74	June 2007	Quantitative Approach	students	100 undergraduate students	Brand / cause fit is an important factor for CRM success

Synthesis

Narrative synthesis

The synthesis approach that is adopted in this study is the narrative one. The rationale for selecting this kind of synthesis relies on the fact that it retains the flexibility of the traditional literature reviews which allows the inclusion of a wide range of types of evidence and review questions. Furthermore, according to the ESRC guidance, the narrative synthesis has the potential to develop a more transparent and sophisticated synthesis than in the past and the steps for conducting it are clear and straightforward (ibid.).

Socio-demographic variables

The first category that has been identified through the literature review has the name: socio-demographic variables and incorporates factors that are related with the socio-demographic characteristics of consumers. These factors intend to identify those consumers who are more sensitive in front of a CRM campaign and thus, to be targeted from practitioners in order to have successful CRM results.

From the literature review it is found that gender plays a crucial role for CRM effectiveness. Moosmayer and Fuljahn, (2009), state that consumer response to social marketing activities are influenced by gender and it is based largely on differences in their socially attributed roles. In other words, men and women have different values, role behaviors and attitudes and through their research study, they have found that women have more positive perceptions towards a CRM campaign. Accordingly, Cui et al., (2003), and Karen et al., (2011), through their research studies came up with the same conclusion and emphasized the fact that brands targeting women have greater opportunities to undertake a successful CRM campaign.

Moreover, Cui et al., (2003), identified three more socio-demographic factors that lead towards a successful CRM campaign and are related with: the academic background, the annual income and prior donation activities of the consumers. Regarding the academic background of the consumers, social sciences interact more positively towards a CRM campaign than consumers with natural science majors. As regards to the annual income, families that have medium to high incomes are more positive with a CRM offer and lastly, the same positive attitude occurs with consumers that made prior donation activities. Broderick et al., (2003), and Hyllegard et al., (2011), came up with the same results regarding consumers' prior donation activities. They stated that a key success factor an individuals' consumption in a CRM campaign is the consumer's level of psychological involvement with charitable organizations. Thus, people who support the act of giving to charities as personally relevant and important may be more likely to respond in cause related purchasing.

CRM design and structure

This category concentrates all the identified success factors that are related with the design methodology and the structure of a CRM campaign. As a starting point, Singh et al., (2009), through their research activity, found that repeating claims helps in overcoming consumer skepticism towards CRM offers and thus, promote CRM success. Consumers usually use simple buying heuristics

in their decision-making process due to the fact that they are not willing to go through all the alternatives the market has to offer. Thus, through repeating CRM claims a company can gain familiarity among consumers and create positive attitudes by making the brand or the company a part of the customers' evoked set of alternatives (Chang, 2008). In other words, when customers become familiar with a CRM offer, they perceive the message as one they have knowledge of, and thus consider it more honest and truthful. Consequently, the knowledge a consumer has about a company or a brand, affect his or her attitude towards the company's products or services and help create positive feelings towards the organization (Brown and Dacin, 1997, as cited in Singh et al., 2009). Lafferty and Edmondson, (2009), agree with Singh et al., (2009), and they add that the greater the familiarity is, the more extensive the associations are in the brain, and thus the more easily that brand will be accessed from memory. In addition, the authors through their research findings introduce another CRM success factor, the use of the brand photo ad, that has a positive effect on attitude toward the CRM alliance.

In addition Grau and Folse (2007), referred to the donation proximity of a CRM campaign which deals with the distance between the donation activity and the consumer, and can be divided as local, national, or regional (Varadarajan and Menon 1988). Through the results, it is shown that when CRM campaigns emphasizing specific donations distributed to communities and implemented locally, have positive results. Furthermore, another CRM success factor found by the researchers has to do with the positive message framing which serves as effective message cues to produce favorable CRM outcomes, a success factor with which Tsai's (2009) research results seems to align. Moreover, another key success factor of CRM refers to the donation framing of the CRM offers, in the form of a dollar value per unit which are found more effective than those as a percentage of the sale price (Subrahmanyam, 2004; Chang, 2008). Hyllegard et al., (2011), came up with the same results and they suggested that consumers are more likely to form positive attitudes towards a CRM offer when the amount of the charity is clearly communicated.

Chang (2008), refers at another one CRM success factor, related with the product type. Specifically, the CRM offers related with frivolous products are more effective than those bundled with practical products. Chang, and Sen, (2009), move in the same wave and state that a CRM campaign is more likely to be effective in promoting hedonic products than utilitarian ones. In addition, another CRM success factor is the low donation magnitude. Chang (2008), states that consumers accept a CRM offer easily when the donation magnitude is perceived as low than when it is high. Furthermore, one more CRM success factor stated in the literature review relates with the product price. Low-priced items have more success within a CRM campaign than high-priced items (ibid.). Moreover, Cui et al., (2003), came up with another success factor of CRM practice: the type of cause. Disaster can have more positive results on a CRM campaign than an ongoing cause. Therefore, causes related with disasters or people in need as a result of a disaster have positive outcomes in the success of a CRM campaign. In addition, Brink et al., (2006), referred to another CRM success factor, the set up of a long-lasting CRM campaigns. Subrahmanyam (2004), states the same success factor and adds that frequent support leads to positive evaluation of the CRM campaign by the consumer.

Continuing, Kim et al., (2010), introduced a new CRM success factor, the company's commitment to CSR. Through the past research it is suggested that the amount of resources invested by an organization in its CRM program, including the duration of the CRM campaign, affects consumer perceptions of the organization's overall commitment to a social cause. The results shows that an organizations strong CSR commitment, leads consumers to ascribe more altruistic and less self serving motives to a company's CRM activity, and to hold more positive perceptions of and favorable attitudes than towards a weaker CSR activity of another company.

Also, one of the most important CRM success factors is brand / cause fit that can cause positive impact on consumer choice (Pracejus et al., 2007). In CRM, brand/cause fit originates from multiple sources. A brand could fit with a social cause if both serve a similar consumer base, or fit could be high if a brand and a social cause share alike values. Regarding brand/cause fit, several scholars conducted research that confirm this success factor (Pracejus et al., 2007; Chun-Tuan Chang, Sun Yat-sen, 2009; Samu and Wymer, 2009). Lastly, cause dominance is also an important success factor, due to the fact that it leads to higher audience responses, suggesting that the ideal combination is high perceived fit and cause dominance. The research study conducted by Samu and Wymer, (2009), also confirm that cause dominance led to higher values of consumer positivism towards a CRM campaign than brand or equal dominance, showing thus the power of the cause. Consequently, the results of these studies affirm Authenticity that is analyzed in the next subsection, as a crucial category of CRM success.

Authenticity

The category of Authenticity relates to the perceived trustworthiness and honesty of the CRM campaign by the consumers. Thus, this category, is structured by factors that influence the above mentioned values of the consumers. One of the success factors belonging to this category is brand credibility. Alcaniz et al., (2009), define brand credibility in the context of CRM as the extent to which consumers perceive that the brand communicates honesty and goodwill in terms of trustworthiness and has the necessary skills and experience to colligate with the specified social cause. According to Varadarajan and Menon, (1988), and Webb and Mohr, (1998), as cited in Alcaniz et al., (2009), this reasoning suggests that altruistic attribution is a pointer which helps consumers to evaluate honesty, sincerity and good faith of the brand's social commitment, and will positively influence the CRM campaign. Broderick et al., (2003), seem to agree with Alcaniz et al., (2003), and they also highlight the importance of the brand/company credibility to customers and their overall positive view in Cause Related Marketing campaigns.

Another factor that has to do with perceived values is the ethical characterization of a company. Drumwright (1996), as cited in Strahilevitz (2003), has indicated that a factor which affects the effectiveness of a CRM campaign is whether customers perceive the Cause-Related Marketing relationship to be beneficial or exploitative towards the charity. In his research paper, the author examined whether the effectiveness of a Cause-Related Marketing campaign is influenced by the ethics of the organization involved. In other words, the author examined if the firm is perceived as a "ethical," "unethical," or "neutral" and what is the outcome from these perceptions upon the CRM

campaign. The results showed that companies initially perceived as ethically neutral gained the most from a CRM campaign (ibid.).

Furthermore, Tsai (2009), referred to another key success factor for conducting a CRM campaign, called the positive motivational attribution about the donor brand, and refers to the consumer's perception that the donor brand is motivated thus, it performs the CRM campaign with more altruism than egotism. Specifically, when the perception of altruistic-orientation is higher, it causes positive motivational attribution about the brand. Hereupon, the customers feel stronger moral pleasure for participating in the CRM campaign or stronger moral displeasure for their non participation. In parallel, positive motivational attribution can be achieved through the three dimensions of the causal attribution theory discovered by Weiner et al. (1991), as cited in Tsai (2009): 1. Locus of causality: the perceiver's belief that the cause of a behavior or event comes from internal factors (within the actor) or external factors (in the external environment). 2. Stability: the perceiver's belief that a behavior or event happens either frequently or infrequently. 3. Controllability: the perceiver's belief that the actor can or cannot control the consequence of an event or behavior. In the context of a CRM campaign, it is possible to conceptualize positive attribution of the donor brand's motivation through the three dimensions of charity behavior: 1. Internal locus of campaign causality: driven by a real concern of the donor brand for the beneficiaries. 2. Stability of campaign efforts: not a single shot but a recurrence of charity that the donor brand has been performing or has already done for the society. 3. Controllability of campaign results: with a gratifying consequence within the donor brand's competence to achieve. Towards this end, positive motivational attribution has direct impact on purchase intentions of consumers when they are dealing with a CRM offer (ibid.).

Experience

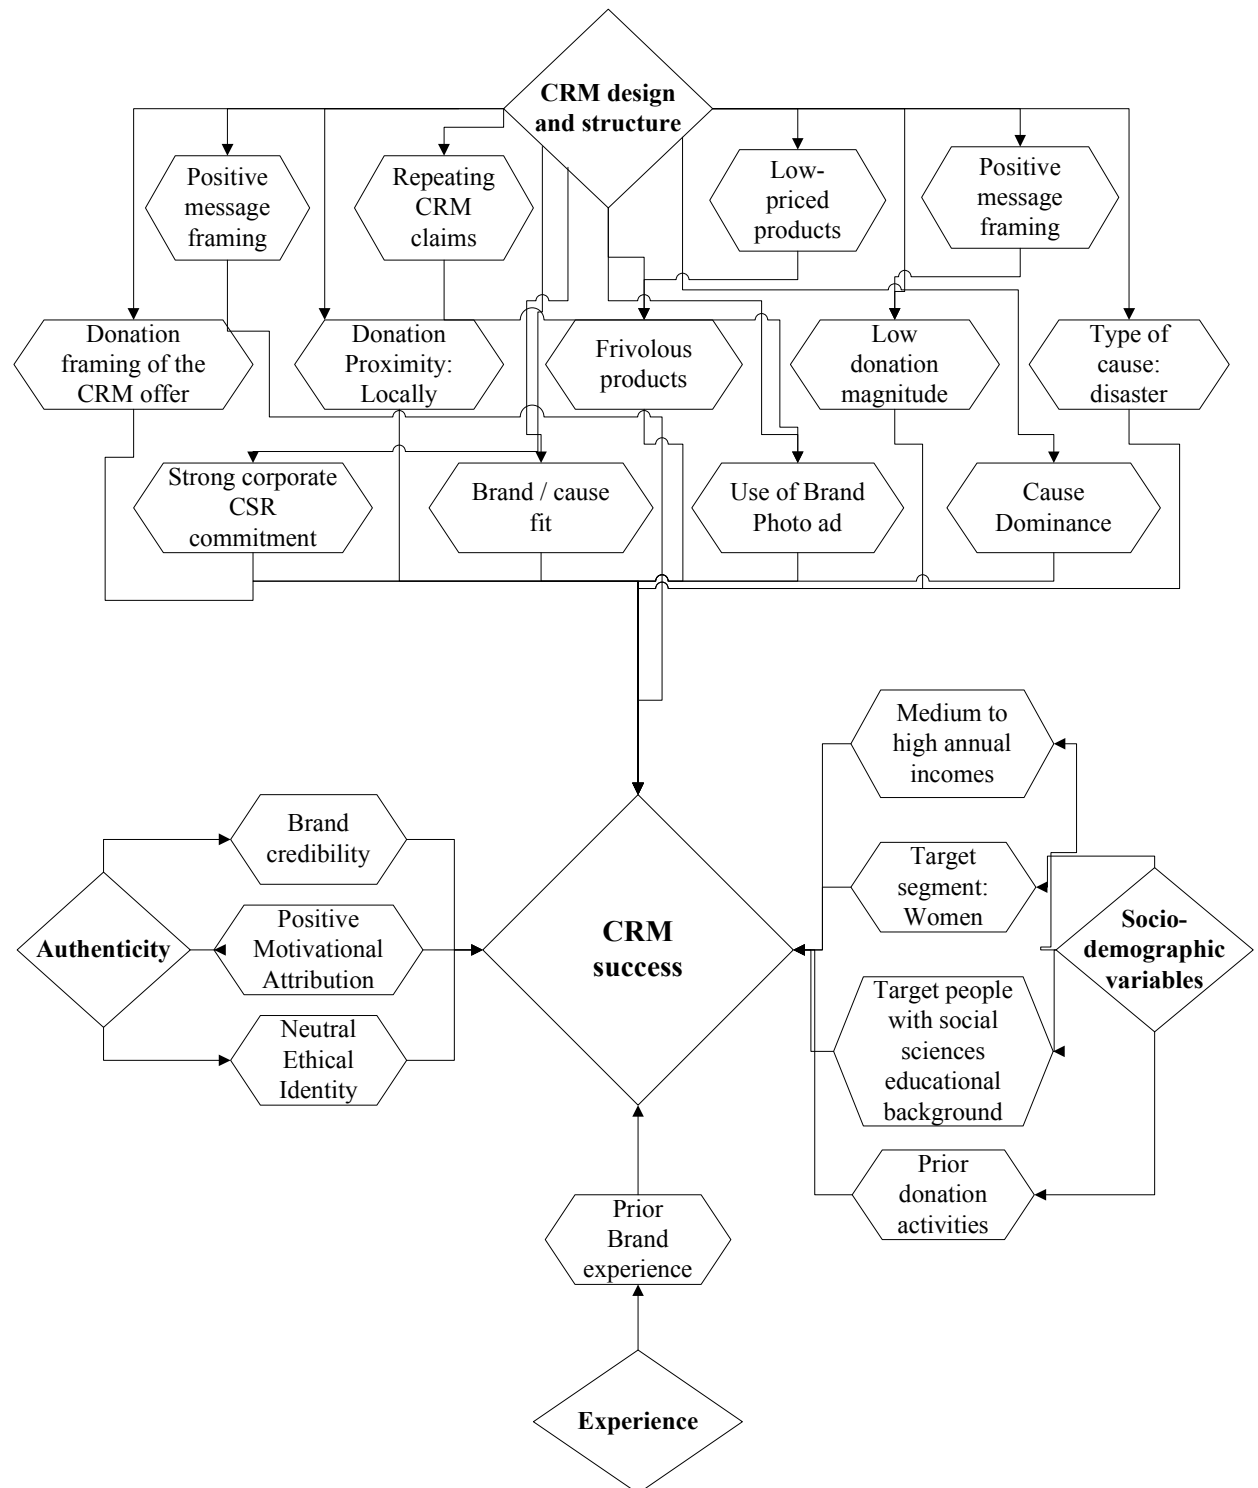

Lastly, this category comprises with a single factor that involves experience. According to Tsai (2009), various scholars found that prior experience (confirmation bias), exert influence in a higher degree than a systematic processing of freshly availed evidence (diagnosticity). Various scholars such as, Johnson (2001), Nickerson (1998), Wiley (2005), Holbrook et al., (2005), and Pronin and Kugler (2007), as cited in Tsai (2009), conducted several experiments regarding on how prior experience retrieved from memory creates impact on responses to persuasion attempts and they found that the power of mental antecedents created by prior experience affects the rendition of newly availed evidence, which results to unfavorable or favorable responses. Hereupon, as regards the concept of Cause Related Marketing, prior brand experience has a greater weight on positive outcomes than a brand that has recently introduced in CRM activities.

Initial conceptualization of the CRM success Index

The literature review findings, and especially the CRM key success factors identified above, allow their elaboration and figural representation through a conceptual framework illustrated in figure 4. The framework integrates and interrelates all the identified factors that constitute the CRM success index. Specifically, the framework lists 21 success factors that are divided

according to their relevance into four main categories that are combined together in order to form the vehicle towards the CRM success.

Figure 3: A preliminary conceptualization of the CRM success index

Limitations

The present study does not analyze in depth all the variables comprising the CRM success index due to the existence of a word limit. In addition, the CRM success index developed needs to take into consideration demographic and cultural parameters as these influence CRM success factors in order to be applicable in general.

Conclusion

In the present study, a thorough review of the existing literature on cause related marketing has been conducted in order to identify the key factors that lead to CRM success. From the review, 21 CRM success factors have been identified and documented into four main categories, according to their area of influence. Moreover, from the literature scoping, it has been revealed that no research on the concentration and documentation of CRM success factors has been done until now. It is suggested that further research should focus on testing the CRM success index through case studies. As far as concerns the practical implications of a CRM success index, practitioners will have a guide for doing successful CRM campaigns. Thus, in terms of the financial perspective, money savings towards unsuccessful CRM campaigns will be eliminated and companies will gain all the fruitful outcomes that the CRM practice has to offer.

Abstract

This paper examines the relation between intellectual capital (IC) and organizational performance in local governments (LGs) in Greece. Existing research literature argues that public organizations seem to be more intellectual capital idiosyncratic than private sector organizations. Therefore, it is expected that effective intellectual capital management would have a positive effect on their performance. However, empirical evidence in this field is lacking. We address this issue within the context of two intellectual capital epistemological views proposed by Mouritsen (2006); the IC1-ostensive view and the IC2-performative view. We employ a dual approach in our research by combining published and survey data. We have gathered financial information through accrual accounting financial statements in order to measure inferred intellectual capital (according to IC1-ostensive view). Additionally, we have collected data suitable for analyzing the perceived intellectual capital through a structured questionnaire addressed to a sample of Greek LGs (according to IC2-performative view). Our sample refers to 92 LGs. Our empirical evidence advocates the existence of significant positive relations among the sub categories of intellectual capital. Further, data analysis reveals that the sub categories of intellectual capital are related with improved performance measured both with financial ratios and perceptions of performance. Therefore, our empirical findings hold irrespectively of the intellectual capital epistemological view and offer corroborating evidence that LGs with high IC perform better than low IC LGs.

Keywords: Intellectual Capital, Financial Performance, Local Governments, Greece

Introduction

The sunrise of knowledge economy has increased the economic significance of intangible assets for the operational performance of organizations (McGrattan and Prescott, 2007). Initially, research efforts for establishing empirical relationships of intangibles with operational performance and subsequently with market performance focused on specific types of intangibles associated, primarily, with advertising and research and development (R&D) expenses (e.g. Hirschey and Weygandt, 1985; Chauvin and Hirschey, 1993; Sougiannis, 1994; Lev and Sougiannis, 1996; Eberhart *et al.* 2004). Progressively, the relationship of intangibles with operational performance started to be examined

under the prism of human capital (Hanson, 2004; Pantzalis and Park, 2009) or organizational capital (Lev *et al.* 2009).

A growing number of recent research efforts examines the economic significance of intangibles within the context of a broader and more abstract concept, that of intellectual capital (Steward, 1991). Intellectual Capital (IC) is a broad concept including the knowledge and the learning capabilities of an organization. It is manifested as the synergy of knowledge resources associated with the human assets (i.e. human capital), the organizational structures (i.e. structural or organizational capital) and the external social partners (i.e. customer, or relational or social capital) of an organization.

Existing empirical research has, primarily, focused on investigating the relations between IC and operational and financial performance of profit seeking organizations. The relationship of IC and intangibles with operational and subsequent market performance has been confirmed across different industrial settings, national economies, firm characteristics and other environmental or organizational contingencies (e.g. Lin and Edvinsson, 2008). At the same time, an emerging literature argues that public organizations are intellectual capital idiosyncratic and, thus, effective intellectual capital management is expected to improve the efficiency of the public sector organizations as well (Kong and Thomson, 2006; Kong, 2007; Kong and Prior, 2008; Kong, 2010). This strand of literature can be viewed through the lances of New Public Management, in the sense that intellectual capital is a source of economic efficiency for public sector organizations. However, empirical evidence for the relation of intellectual capital with the operational efficiency of public sector organizations is lacking.

The scope of this study is to analyze the relation between intellectual capital and performance within the context of the public sector organizations and Local Governments in particular. In order to attain a more holistic approach to this investigation the aforementioned relationship is examined under the two principal intellectual capital epistemological views recognised by Mouritsen (2006). These are the IC1-ostensive view and the IC2-performative view. Our analysis is based on a sample of 92 Greek local governments.

We believe that our study is timely by taking into account the financial problems faced in the public sector in Europe and in Greece in particular. Unrevealing the relations between IC and financial performance is expected to have useful implications for public sector management.

We believe that our study contributes to literature in several aspects. Firstly, we attempt to apply in practice the two epistemological views of IC as recognised by Mouritsen (2006). Therefore we adopt a dual approach in our research by combining financial statements and survey data in order to operationalize and measure IC under the two different IC approaches. Secondly, we propose an approach in order to assess the level of IC sub-domains (i.e. human capital, organizational capital and social capital) in local governments by using accrual based financial data. Our approach is innovative in the sense that tries to adapt to the idiosyncratic characteristics of local governments that deviate from those of private sector companies. Finally, we develop a categorization scheme to distinguish local governments according to their IC intensity.

The remaining of the paper is organized as follows. Section 2 presents the background and Section 3 the theoretical framework, the research objectives and the hypotheses of the study. Section 4 analyses the methodology of this research initiative. In Section 5 we present the empirical results. The last section of the paper includes our conclusions.

Background

This section provides the theoretical background for the study. Initially, the term intellectual capital is defined by reviewing a variety of theoretical propositions (Mouritsen, 2006; Swart, 2006; Martín-de-Castro *et al.*, 2011). Then, the idiosyncratic role of intellectual capital in public sector is analyzed.

Definition of Intellectual Capital

The term intellectual capital is usually employed by the research community as a synonym for intangible assets (Steward, 1991) which can be transformed to economic value. Yet, there is not a common accepted unified definition for intellectual capital.

Table 1
Definitions of Intellectual Capital

Author(s)	Intellectual capital definitions
Galbraith (1969)	The difference of an organization's market value and book value.
Bontis (1996)	The difference between the market value of the company and the replacement cost of assets.
Brooking (1996)	The combination of market assets, human-centred assets, intellectual property assets, and infrastructure assets.
Sveiby (1997)	The gap between market and book value of the firm.
Edvinsson and Malone (1997)	The gap between a firm's market value and its financial capital (book value of a firm's equity).
Nahapiet and Ghoshal (1998)	Knowledge and knowing capability of a social collectivity.
Granstrand (1999)	Essentially comprises all immaterial resources that could be considered as assets, being possible to acquire, combine, transform and exploit, and to which it is possible to assign, in principle, a capitalized value.
Dzinkowski (2000)	Intellectual assets, knowledge assets, total stock of knowledge-based equity possessed by a firm.
Teece (2000)	Includes knowledge, competence and intellectual property. Also includes other intangibles such as brands, reputations, and customer relationships.
Bontis et al. (2002)	Represents the stock of knowledge that exists in an organization at a particular point in time.
Subramaniam and Youndt (2005)	The sum of all knowledge firms utilize for competitive advantage.
Martínez-Torres (2006)	Includes those intangible assets of an organization that are not recorded in financial statements but which may constitute 80% of the market value of the organization.
Reed et al. (2006)	Basic competences of intangible character that allow creating and maintaining competitive advantage.
Cabrera and Bontis (2008)	The knowledge assets that can be converted into value. Is a matter of creating and supporting connectivity between of sets of expertise, experience and competences inside and outside organization.
Chang et al. (2008)	Represents knowledge-related intangible assets embedded in an organization.
Hsu and Fang (2009)	The total capabilities, knowledge, culture, strategy, process, intellectual property, and relational networks of a company that create value or competitive advantages and help a company achieve its goals.

Source: Martín -de-Castro et al. (2011).

In the endeavour to clarify intellectual capital, related literature demonstrates a proliferation of theoretical propositions and possible reporting frameworks for visualising intellectual capital to both internal and external agents. A diversity of theoretical propositions for the nature of intellectual capital is observed within the relevant literature (Swart, 2006; Martín-De-Castro *et al.*, 2011). Yet, by reviewing Table 1, which presents various definitions of intellectual capital, we can draw some conclusions. Firstly, intellectual capital refers to three dimensions; the organizational knowledge of the human assets, the organizational structures and the external social partners of an organization. Secondly, intellectual capital is transformed to economic value through organizational action. Thirdly, intellectual capital is related to the existence of competitive advantage because intellectual capital

enhances the environmental responsiveness of the firm. The ability to manage knowledge for improving environmental responsiveness is associated with organizational learning (Argyris and Schön, 1996). For the purposes of this study, we define intellectual capital as the stock of organizational knowledge and the collective ability to transform this knowledge to action by leveraging organizational learning phenomena.

As already mentioned, intellectual capital is usually analysed to, at least, three dimensions: human capital, structural capital and relational (or social capital) (Martín-de-Castro *et al.*, 2011). Human capital refers to the knowledge, capabilities and behaviours of the human factor (Cabrita and Bontis, 2008; Hsu and Fang, 2009). Structural capital includes the knowledge incorporated into technological infrastructures (e.g. Edvinsson and Malone, 1997; Sveiby, 1997) and organizational forms (Chang *et al.* 2008); and the ability to improve it. Relational capital which remains rather under explored relatively to the other two aforementioned dimensions of intellectual capital (Swart, 2006; Martín-de-Castro *et al.*, 2011), concerns the knowledge and the ability of an organization to manage its relations with external social partners to create economic value. Customers, suppliers, allies, other social agents as well as corporate reputation can be considered as variables associated with external environment. In the case of local governments and public organizations relational capital is referred as social capital. The three dimensions of intellectual capital are highly interrelated. Human capital is an input to structural and social capital. Structural capital is an input to social capital. Finally, the interaction of intellectual capital with the environment goes through social capital.

The implied causal relationship between intellectual capital and organizational performance (Lev *et al.* 2009) and the absence of sufficient information within the context of traditional financial accounting paradigm (Canibano *et al.* 2000) stimulated the development of a number of intellectual capital reporting frameworks (see e.g. Kaplan and Norton, 1992; Brooking, 1996; Edvinsson and Malone, 1997, Roos *et al.*, 1997, Sveiby, 1997; Bontis *et al.*, 1999; Andriessen, 2005). Intellectual capital reporting frameworks are classified as: (a) return-on-assets, (b) market capitalization, (c) balanced scorecard, and (d) direct measurement methods. The information provided by intellectual capital reporting frameworks is market oriented, i.e. it is addressed to stakeholders external to the organization. Yet, intellectual capital reporting frameworks have been developed within the context of management control systems. Existing research initiatives for developing and analysing intellectual capital reporting frameworks are primarily oriented towards private sector (see e.g. Kaplan and Norton, 1992; Brooking, 1996; Edvinsson and Malone, 1997, Roos *et al.*, 1997, Sveiby, 1997; Bontis *et al.*, 1999; Andriessen, 2005). They emphasize on the provision of qualitative information that is not accounted for in traditional financial statements in order to access the effects of intellectual capital on economic performance.

Intellectual capital in Non-Profit Sector

Intellectual capital has been mainly studied within the context of the private sector (Kong, 2010). However, the rise of the new management paradigm for public sector organizations and the idiosyncratic nature of the public sector triggered research initiatives to investigate intellectual capital

within its context. More specifically, the changes in the public sector since 1980s, such as the extensive use of commercialization, the increased levels of competition and the demand for improved efficiency in service delivery, posed requirements for a new management philosophy for public organizations usually described with the umbrella term of New Public Management (Hood, 1995). New Public Management (NPM) dismantles the distinction between private and public sector by proposing ideas borrowed from the conceptual framework of private administrative practise (Power, 1997). NPM provides a theoretical rationalization for intellectual capital, as a private sector oriented metaphor, to be viewed as a new conceptual framework for public strategic management (Kong, 2007; Kong and Prior, 2008; Kong and Thomson, 2006).

Preliminary research initiatives indicate that the role of intellectual capital in non-profit sector is more critical than in the case of private sector. Ramírez (2010) argues that the growing significance given by literature to the application of models for intellectual capital management in the non-profit sector is due to the fact that intangibility is even more present than in the case of private organizations. The intangibility of the public sector organizations concerns their goals, production process and their outputs. Public organizations tend to have multiple objectives of non-financial nature (Ramírez, 2010). Moreover, the public sector has always been human capital-intensive in its production process (Serrano *et al.*, 2003). Finally, public sector organizations focus on intangible outcomes (Wall, 2005).

Theoretical Framework, Research Objectives and Hypotheses Development

The research objective of this study is to investigate the relationship between intellectual capital and performance within the context of the public sector. The relationship of intellectual capital with operational performance has been documented in the private sector (e.g. Lev *et al.*, 2009) albeit not extensively. In our study we choose a typical public sector setting, that of local governments to test the relation between intellectual capital and performance. As local governments are more intellectual capital intensive than private organizations (Cinca *et al.*, 2003, Kong, 2007; Kong and Prior, 2008) we expect that this relation will be evident as well.

This leads to the following hypothesis:

H1: In the case of local governments, Intellectual Capital is positively correlated with performance.

In our study, we operationalize the value of Intellectual capital under the two prisms that correspond to the two different epistemological views developed by Mouritsen (2006). Mouritsen (2006) distinguishes two central themes within intellectual capital (IC) research: IC1-ostensive view and IC2-performative view. IC1-ostensive research stream adopts a positivistic view and argues that intellectual capital can be analyzed to its components (i.e. human, organizational and relational capital) and the contribution of these components to organizational performance can be measured in terms of their implications on financial fundamentals (e.g. risk and returns, market-to-book, etc.). On the other hand, IC2-performative research stream recognises that intellectual capital is part of a configuration of knowledge management and, consequently, the nature of intellectual capital is,

idiosyncratically, defined within the specific organizational context and its effects on performance are realised by interpreting its role on making organizations capable of performing towards endogenously defined values. IC2-performative research stream emphasises on narratives, qualitative information and descriptions.

Under the prism of IC1 ostensive research stream, the positive effects of intellectual capital on the performance of local governments can be measured in terms of improved financial performance. Yet, IC1 ostensive stream has not developed common accepted unified metrics for measuring the value of the intellectual capital of an organization (see, e.g. Bontis, 1998, Swart, 2006). Only inferences of the economic value of intellectual capital can be derived which are expected to be homeostatic to its latent true value. For this reason, consistently with the IC1 ostensive perspective, we use the term “inferred intellectual capital” to denote the value of the intellectual capital that could be captured through publicly available financial information reported in financial statements.

Following hypothesis H₁, it is expected that higher values of inferred intellectual capital would be positively correlated with financial performance. Further, as IC1-ostensive research stream theorizes intellectual capital as the sum of discrete but interrelated components (e.g. human capital, structural capital, social capital), it is expected that all these components of inferred intellectual capital affect financial performance in a positive manner. Summarizing the above analysis, the following hypotheses are derived:

H₁₁: In the case of local governments, Inferred Intellectual Capital and its Components are positively correlated with Financial Performance.

Financial performance is assessed in terms of efficiency, liquidity and debt management. The criteria used for the selection of these dimensions are that they constitute both commonly encountered and distinctive aspects for financial performance assessment. Thus, from hypothesis H₁₁, the following hypotheses are derived:

H_{11.1}: In the case of local governments, Inferred Intellectual Capital and its Components are positively correlated with efficiency.

H_{11.2}: In the case of local governments, Inferred Intellectual Capital and its Components are positively correlated with liquidity.

H_{11.3}: In the case of local governments, Inferred Intellectual Capital and its Components are positively correlated with debt management.

Adopting the IC2-performative epistemological view, the research question of the relationship between intellectual capital and performance should be examined by interpreting its role on making organizations capable of performing towards endogenously defined values. Decoding the intra organizational role of intellectual capital requires analysing the perceptions of the internal agents of the organization towards perceived intellectual capital. Perceived intellectual capital, in contrast to inferred intellectual capital, reflects the qualitative characteristics that internal agents attribute to the intellectual capital. Further, perceived intellectual capital is evaluated by its ability to make

organizations capable of achieving endogenously defined values. This implies that IC2-performative epistemological view opposes to the direct linkage between intellectual capital and financial performance and attempts to visualise the effects of perceived intellectual capital on perceived performance using narratives, qualitative information and descriptions. Perceived performance refers to what extent internal agents believe that the perceived intellectual capital serves organizational goals. Perceptions are views that do not necessarily correspond to reality.

In the case of local governments, IC2-performative epistemological view is valuable in examining H₁ hypothesis from a multifaceted perspective. Empirical research documents the diversity that exists in terms of the awareness and the perceptions of non-profit organizations regarding intellectual capital (e.g. Scheimer and Samkin, 2008, Guthrie *et al.*, 2009, Benevene and Cortini, 2010). Public sector is characterised by lower motivation to adopt new management practises, bureaucracy and less urgency to quantify economic values than private sector (Cinca *et al.*, 2003). These idiosyncratic organizational contingencies of public sector formulate an unfriendly internal environment for intellectual capital cultivation. Under these conditions, inter organizational perceptions towards intellectual capital have significant implications on the organizational behaviour, attitudes and abilities of these organizations to manage the available intellectual capital for creating organizational value. Yet, the relationship between perceived intellectual capital and its perceived effects on performance has not been consistently investigated in literature. Nevertheless, we expect that the factors synthesizing perceived intellectual capital are positively associated with perceived performance. This is because this relationship is existent on the collective cognitive maps of the members of the local governments and that higher (lower) levels of perceived intellectual capital are associated with higher (lower) levels of perceived performance. The level of perceived intellectual capital can be only captured through analysing the views of the actors in local governments. Therefore as this type of information is not reported in financial statements, it should be collected through survey instruments. Based on the aforementioned analysis, the following hypothesis is stated:

H₁₂: In the case of local governments, Perceived Intellectual Capital and its Factors are positively correlated with Perceived Performance.

Perceived performance is analysed in terms of cost, quality and quantity of the services provided by local governments to the local communities. Thus, from hypothesis H₁₂, the following hypotheses are derived:

H_{12.1}: In the case of local governments, Perceived Intellectual Capital and its Factors are negatively correlated with Perceived Cost of Services Provided by Local Governments.

H_{12.2}: In the case of local governments, Perceived Intellectual Capital and its Factors are positively correlated with Perceived Quality of Services Provided by Local Governments.

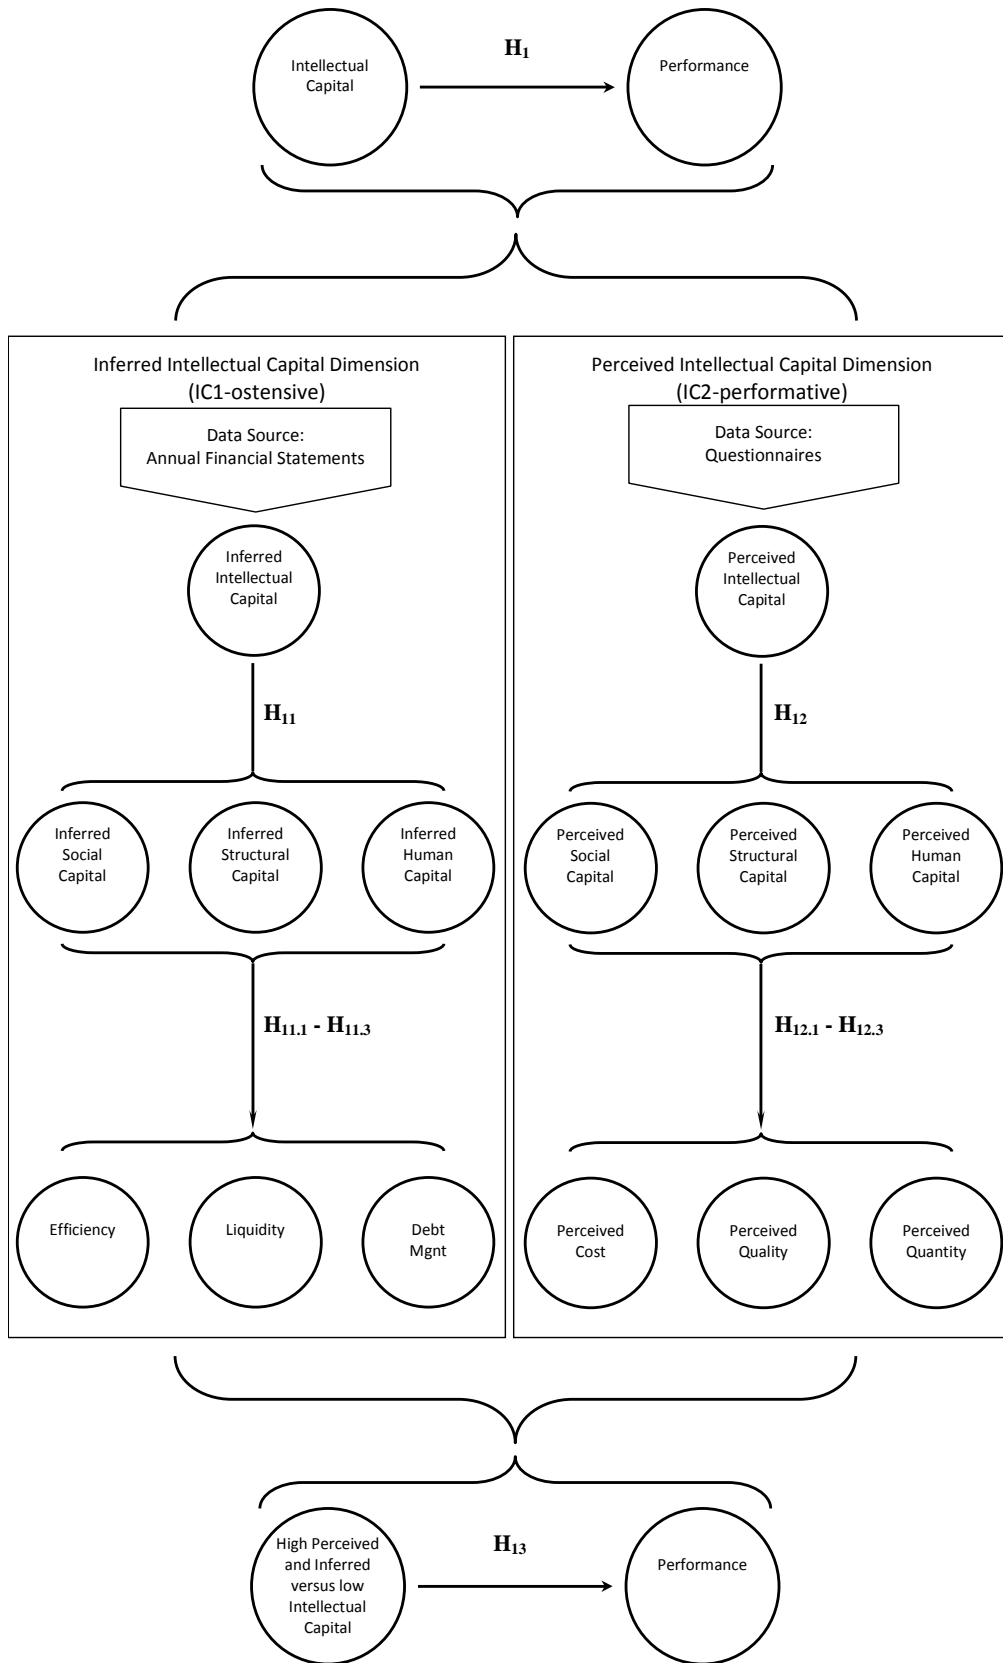

Figure 3: Research Hypotheses

H_{12.3}: In the case of local governments, Perceived Intellectual Capital and its Factors are positively correlated with Perceived Quantity of Services Provided by Local Governments.

Both inferred intellectual capital and perceived intellectual capital are theoretical constructs that allow studying the relationship between intellectual capital and performance under the two different epistemological views. Since each of the above theoretical constructs examines different perspective of the organization's reality, a more holistic approach is required in order to capture the breadth of the interaction between intellectual capital and performance.

A local government may be classified in a different rank in terms of its inferred intellectual capital and its perceived intellectual capital. For simplicity reasons, local governments may be classified as high or low intensive in terms of either their inferred or perceived intellectual capital. This categorization creates a matrix of four quarters in which all local governments can be plotted to. Figure 2 is a graphical presentation of the above classification.

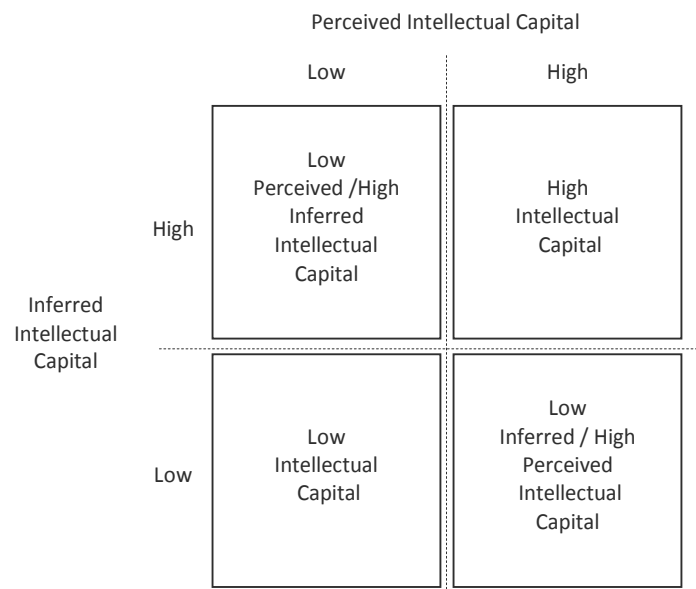

Figure 2: Classification of Local Governments According to the Different Dimensions of Intellectual Capital

Local governments with high both perceived and inferred intellectual capital are classified as high intellectual capital local governments. Local governments with low both perceived and inferred intellectual capital are classified as low intellectual capital local governments. These two groups represent local governments which are classified uniformly under both IC1-ostensive and IC2-performative views. Therefore there is unanimity in local government categorization irrespectively of the IC theoretical perspective. For all other local governments the two theoretical views (IC1-ostensive and IC2-performative) result into different categorizations. Therefore their classification is reliant on the theoretical view employed; they can be classified either as low (high) perceived or high (low) inferred intellectual capital intensive.

Using the aforementioned classification schema and the implied positive effect of intellectual capital on performance the following hypothesis is derived:

H13: Local governments with high Intellectual Capital show better performance both financial and perceived than local governments with low intellectual capital.

Methodology

In the present study, the relation between intellectual capital and performance is examined under the two different epistemological views of the intellectual capital research, the IC1- ostensive and IC2- performative. In order to accommodate the differences in intellectual capital quantification as well as the methodological requirements considering the nature of data, variables employed in the analysis and data processing dictated by the two intellectual capital viewpoints, we adopt a twofold methodological approach.

Under IC1-ostensive research stream, we calculate inferred intellectual capital by using data found in the annual financial statements of local governments. Moreover, financial statements data is used in order to calculate financial ratios commonly used to evaluate the financial performance of an organization.

Under IC2-informative research stream, we calculate perceived intellectual capital by using data gathered through questionnaires in a field survey. The questionnaire serves a dual scope; firstly to write down the perceptions of local governments in terms of several propositions related to intellectual capital within the local government and secondly to gather information in relation to the perceived level of performance.

Definition of Variables for the Inferred Intellectual Capital

This section analyses the proxy measures used to visualize the components of the inferred intellectual capital using the financial statements data of local governments. These proxy measures rely only merely on measures that have been previously proposed within the strand of existing intellectual capital reporting literature. The reason is that the measures encountered in literature have been analysed through the lens of the private sector and, they therefore correspond to measurement techniques with a strong market orientation, which does not fit to the public sector (Guthrie *et al.*, 2009). Inferred intellectual capital is analysed into inferred human capital, inferred organizational capital and inferred social capital.

Inferred Human Capital

Human capital includes knowledge, skills, innovativeness and the ability to response effectively at task performance (Edvinsson and Malone, 1997, Martin-de-Castro *et al.*, 2011). Under the assumption of a homogeneous production function, differences on the level of human capital are associated positively with productivity differentials (Aliaga, 2001, Becker, 1964) and, for a given level of resource consumption, with abnormal production.

We consider two main inputs in the production function of local governments: capital and labour. As a proxy of capital the amount of total assets is used, whereas as a proxy of labour we use the number of employees. A local government with higher levels of human capital is expected to record higher average per employee productivity.

Assuming that there is a homogenous Cobb-Douglas production function across the local governments of the research site, the inferred human capital of j local government IN_HC^j is measured in terms of the abnormal output Q^j over the number of employees N^j .

$$IN_HC^j = \frac{Q^j}{N^j} \quad (1)$$

Abnormal output Q^j is the estimation error of the following OLS model:

$$\log(S^j) = \log(a_0^j) + a_1^j \log(TA^j) + a_2^j \log(N^j) + e^j \quad (2)$$

where:

S^j denotes revenues from own operations of the j local government,

TA^j corresponds to the total assets of the j local government, and

N^j is the number of employees in the j local government.

We use revenues from own operations as a surrogate for output. Local governments are service-oriented organizations and thus the level of revenues represents the output for a given fiscal year. Revenues correspond to the sales of goods and services as well as the taxes imposed by local governments to citizens and businesses. We exclude government subsidies from revenues, as subsidies are granted to local governments on the basis of a set of political and social criteria that are not directly controlled or affected by the actions of local governments (e.g. population, location).

Inferred Organizational Capital

According to Subramaniam and Youndt (2005) organizational capital is defined as the institutionalized knowledge and codified experience residing within and utilized through databases, patents, manuals, systems, and processes. Prior literature uses selling, general and administrative (SGA hereafter) expenses as an accounting fundamental associated with organizational capital (see, e.g. Edvinsson and Malone, 1997, Roos and Roos, 1997, Lev et al., 2009). The underlining rationale is that the normal operation of each organization requires a minimum level of SGA expenses and the remaining part represents investments on developing organizational capital. This rationale has been heavily used in the IC private sector literature.

Following, the same paradigm, the inferred organizational capital IN_OC^j of the j local government is measured in terms of abnormal SGA expenses scaled by the number of employees:

$$IN_OC^j = \frac{AB_SGA^j}{N^j} \quad (3)$$

where:

AB_SGA^j denotes the abnormal SGA expenses of the j local government, and

N^j is the number of employees of the j local government.

Using the number of employees as a measurement variable for the level of SGA expenses in a local government, the level of abnormal SGA expenses AB_SGA^j of the j local government is defined as the estimation error of the following OLS model:

$$\frac{SGA^j}{TA^j} = b_0 + b_1 \frac{N^j}{TA^j} + e_{AB_SGA}^j \quad (4)$$

Both dependent and independent variable of the OLS model of Eq. (4) are scaled with the total assets TA^j of the j local government. The reason is to take into consideration the size effect of the local government on the level of SGA expenses.

Inferred Social Capital

The third component of intellectual capital refers to the ability of an organization to absorb, exploit and explore new knowledge from its environment so as to obtain and sustain competitive advantage positions (Martin-de-Castro *et al.*, 2011). Within the context of private sector, it is referred as relational capital. However, the term social capital seems more appropriate to describe the third component of the intellectual capital of the local governments due to their social oriented physiognomy.

High levels of social capital indicate that the local government has increased ability to obtain economic benefits on behalf of its citizens. Local governments provide monopolistic services to the local communities and their relationship with their citizens can be viewed within the context of an agency model. Citizens represent the principal site which supply their local government with capital through taxation, bear risk in case that local government fails to serve local community and construct incentives ranging from social acceptance of specific policies to the approval of economic benefits obtained by public servants. Local government represents the agent site that makes decisions on behalf of the citizen relying on superior knowledge about the social environment. This superior knowledge is the social capital.

Within the context of the above agency model, local governments are expected to maximize citizens' economic welfare. The internal economic value of the services provided, the economic sacrifices required to produce and to deliver services, equals the cost of goods sold. The higher the levels of social capital indicates that local government has increased ability to absorb, exploit and explore new knowledge from its environment in order to provide better and, thus, more valuable services.

Abnormal levels of cost of goods sold for a given quantity of services indicate that local government either provides to the citizenry services of higher internal economic value or operates inefficiently. A local government is efficient if the abnormal revenues exceed the abnormal cost of goods sold. In that case social capital enables local government to improve its efficiency and to reserve higher levels of economic wealth for its citizens.

Based on the aforementioned analysis, the inferred social capital of j local government IN_SOC^j is measured as the difference between abnormal own revenues from operations AB_S^j and abnormal cost of goods sold AB_COGS^j scaled with the number of employees of the j local government N^j :

$$IN_SOC^j = \frac{AB_S^j - AB_COGS^j}{N^j} \quad (5)$$

Abnormal cost of goods sold AB_COGS^j is the estimation error of the following OLS model:

$$\frac{COGS^j}{TA^j} = c_0 + c_1 \frac{P^j}{TA^j} + e_{AB_COGS}^j \quad (6)$$

where

$COGS^j$ denotes the cost of goods sold of the j local government, and

P^j is the population of j local government.

Both dependent and independent variables of the OLS model of the Eq. (5) are scaled with the total assets TA^j of the j local government.

Abnormal own revenues from operations AB_S^j is the estimation error of the following OLS model:

$$\frac{S^j}{TA^j} = d_0 + d_1 \frac{P^j}{TA^j} + e_{AB_S}^j \quad (7)$$

where S^j denotes revenues from own operations of the j local government, and

P^j is the population of j local government.

Both dependent and independent variables of Eq. (5) are scaled with the total assets TA^j of the j local government.

Eq. (5) can, alternatively, restated in terms of the estimations errors of the estimated OLS models of Eqs. (6) and (7):

$$IN_SOC^j = \frac{e_{AB_S}^j - e_{AB_COGS}^j}{N^j} \quad (8)$$

Definitions of Variables of Financial Performance

Various financial ratios can be employed in order to measure the financial performance of a local government. The ratios used in this study correspond to ratios used in traditional financial analysis to evaluate (i) profitability, (ii) liquidity and (iii) debt management.

The financial ratio selected to evaluate the profitability of local governments is the following:

- Return on Assets: the ratio of net income over total assets for a given fiscal year.
- The financial ratios that are used to evaluate the liquidity of a local government are the following:
- Liquidity: the ratio of current assets over current liabilities.
- Total Assets Turnover (Total Sales Revenue): the ratio of total revenues (own revenues plus subsidies) over total assets.

- Plant, Property, Equipment Turnover (Total Sales Revenue): the ratio of total revenues over Plant, Property and Equipment.
- Total Assets Turnover (Own Revenues from Operations): the ratio of own revenues from operations over total assets.
- Plant, Property, Equipment Turnover (Own Revenues from Operations): the ratio of own revenues from operations over Plant, Property and Equipment.

Finally, the financial ratios that are calculated in order to evaluate the quality of debt management of a local government are the following:

- Liabilities over Total Assets: the ratio of liabilities over total assets.
- Debt over Total Assets: the ratio of long-term debt over total assets.

Definition of Factors Identified for the Perceived Intellectual Capital

This section analyses the factors that constitute the perceived intellectual capital. These factors emerged from an analysis of the answers obtained through the questionnaire that was developed for the purpose of the study. The survey instrument, requested the respondents to express on a Likert scale the extent of their agreement (where 5 corresponded to totally agree) or disagreement (where 1 corresponded to totally disagree) on sixty one (61) statements. A translated copy of the statements included in the questionnaire is found in the appendix. The selection of the statements was based on previous literature properly adjusted for the setting of local governments and Greek reality. The questionnaire has been pilot tested in one local government where we sought at spotting unclear questions or sources of possible misunderstanding. The statements corresponding to different intellectual capital sub-dimensions were scattered in the questionnaire. Moreover there were six (6) reverse coded statements. The questionnaire was addressed to 340 randomly selected local governments out of the 577 that are obliged to issue accrual accounting financial statements. The questionnaire was addressed to the Mayor of the local government. A total of 92 local governments participated in the survey by returning completed questionnaires. Thus, the response rate of our research study was 27%. The field study took place during the summer of 2010. A non-response bias analysis did not reveal any statistically significant differences between early and late respondents.

The questionnaires were mainly answered by either the Mayor or the Vice Mayor (25%) or the Officer of Administrative Services (64%). The experience of the respondents was indicative of their knowledge regarding local government operations. The 33% of respondents had working experience in the local government for 6-10 years while 51% had more than 11 years of experience.

The answers that we received were grouped together so as to create factors that are coded as (i) perceived human capital (factors HC_1 to HC_6), (ii) perceived structural capital (factors SC_1 to SC_4), (iii) perceived social capital (factors SOC_1 to SOC_4) and (iv) perceived performance (factors Qual., Quant. and Cost). A Cronbach's Alpha test was used to assess the validity of the identified factors. Table 2 presents a brief summary of the factors, their definition and the Cronbach's Alpha value for each factor.

Table 2:
Factors Identified for Perceived Human Capital, Perceived Structural Capital, Perceived Social Capital and Perceived Performance

<i>Perceived Human Capital</i>			
<i>Code</i>	<i>Factor Name</i>	<i>Definition</i>	<i>Cronbach's Alpha</i>
HC_1	Knowledge & Skills	The knowledge, experience and skills of the human resources to perform required tasks (Statements 1, 4, 28 and 44).	0.751
HC_2	Learning, Adaptation & Human Resource Development	The ability to renew available knowledge, experience and skills of the human resources through individual learning, informal and formal organizational processes (Statements 7, 9, 36 and 49).	0.751
HC_3	Synergy with Environment	The ability of human resources to collaborate effectively (i) within the organizational boundaries of the local government and (ii) with agents operating within the social and economic environment of the local government (Statements 8, 10, 45, 52 and 59).	0.771
HC_4	Commitment	The commitment of human resources towards the organizational goals and values of the local government (Statements 13, 18, 23 and 31).	0.673
HC_5	Motivation	The level of motivation of human resources of the local government (Statements 2, 20, 26 and 38).	0.667
HC_6	Satisfaction	The level of satisfaction of human resources at task performance (Statements 5, 32, 34 and 55).	0.681
<i>Perceived Organizational Capital</i>			
<i>Code</i>	<i>Factor Name</i>	<i>Definition</i>	<i>Cronbach's Alpha</i>
OC_1	Knowledge Management	IT investments and the available codified knowledge of the local government and the collective ability to manage for serving the goals of the organization (Statements 12, 37 and 53).	0.683
OC_2	Innovation	Orientation towards the adoption of new management systems and the development of innovative culture amongst employees of the local government (Statements 6, 19 and 40).	0.775
OC_3	Internal Integration	Management policies aiming to improve the integration of human resources with the organization of the local government (Statements 22 and 51).	0.671
OC_4	E-governance	The intensity of electronic services for supporting the operation of local governments (Statements 57 and 58).	0.698
<i>Perceived Social Capital</i>			
<i>Code</i>	<i>Factor Name</i>	<i>Definition</i>	<i>Cronbach's Alpha</i>
SOC_1	Knowledge of Social Environment	The available knowledge sources outside local governments (Statements 3, 15, 17 and 39).	0.698
SOC_2	External Integration	The level of social integration of the local government with local community (Statements 11, 33, 35 and 46).	0.737
SOC_3	Economic Relations	The intensity of economic integration of the local government with local economy (Statements 21, 25, 42 and 48).	0.737

SOC_4	<i>Collaboration with Central Government</i>	<i>The level of collaboration of the local government with central government (Statements 43, 60 and 61).</i>	0.616
SOC_5	<i>Communication</i>	<i>The level of communication of the local government with its external environment (Statements 14, 24, 30 and 56).</i>	0.634
SOC_6	<i>Social Culture</i>	<i>Efforts devoted for the creation of social culture (Statements 41, 47, 50 and 54).</i>	0.763
<i>Perceived Organizational Performance</i>			
<i>Factor</i>		<i>Definition</i>	
<i>Code</i>	<i>Name</i>		
<i>Qual.</i>	<i>Quality</i>	<i>The quality of services provided by local government to its social environment (Statement 16).</i>	
<i>Quant.</i>	<i>Quantity</i>	<i>The quantity of services provided by local government to its social environment (Statement 27).</i>	
<i>Cost</i>	<i>Cost</i>	<i>The cost of services provided by local government to its social environment (Statement 29).</i>	

The factors presented in Table 2 are consistent with the intellectual capital theory. According to Martin-de-Castro et al., (2011) human capital is an amalgamation of knowledge, abilities (including learning and collaboration) and behaviours (including motivation, commitment and thus satisfaction). The following factors for perceived human capital are defined: Knowledge & Skills (HC_1), Learning, Adaptation & Human Resource Development (HC_2), Synergy with Environment (HC_3), Commitment (HC_4), Motivation (HC_5) and Satisfaction (HC_6). As far as organizational capital is concerned, Subramaniam and Youdnt (2005) define it as the institutionalized knowledge and codified experience residing within and utilized through databases, patents, manuals, systems, and processes. The factors recognized in the case of organizational capital are Knowledge Management (OC_1), Innovation (OC_2), Internal Integration (OC_3) and e-governance (OC_4). Knowledge Management and Innovation refer to the codified knowledge, the ability to manage this knowledge and the supporting IT infrastructure. In order local governments to efficiently manage organizational capital they must support its dissemination within organizational boundaries. A necessary condition for this to happen is the existence of Internal Integration (OC_3). Finally, special reference is made to the ability of local governments to employ IT infrastructure for supporting their operations, that is, e-governance (OC_4). Definitions for social capital approximate those for relational capital. Chang et al. (2008) argue that relational capital represents the knowledge embedded in the relationships with the outside environment. The first factor of social capital is defined as Knowledge of Social Environment (SOC_1). However, the ability of a local government to utilize the available Knowledge of Social Environment depends on the level of its integration with its social environment. Three different aspects of integration have been recognized: social (External Integration SOC_2, Communication SOC_5 and Social Culture SOC_6), economic (Economic Relations SOC_3) and governmental (Collaboration with Central Government SOC_4).

Additional empirical evidence provides support for the theoretical validity of the factors described above. Recognizing the distinct factors within each dimension of perceived intellectual capital is a

process that enables its study in a systematic way. Moreover, the factors found in each dimension of perceived intellectual capital are expected to be positively correlated with each other since they all constitute fundamental elements of a broader entity (i.e. either perceived human capital or perceived organizational capital or perceived social capital) and operate with the same teleological way. Tables 3, 4 and 5 provide empirical evidence that the factors of perceived human capital, perceived organizational capital and perceived social capital are positively correlated at 1% statistical significance level. Further, each of the dimensions of the perceived intellectual capital is expected to be positively correlated with the other two. This is empirically verified by the correlation statistics that are presented in Table 6.

Definition of Factors of Perceived Performance

Except for the factors identified in relation to perceived intellectual capital, factors proxying for the perceived organizational performance of the local governments were calculated as well. Local governments, primarily, provide services to the citizenry. Assessing the performance of a service oriented organization is a multidimensional and difficult task. For simplicity reasons, the emphasis was given on three basic dimensions, those of, quantity, quality and cost. The factors that constitute the perceived performance are therefore: the perceived Quality of services (Qual.), the perceived Quantity of service provision (Quant.) and the perceived Cost of services rendered (Cost). These factors correspond to the self assessment of local governments in respect to the level of quantity, quality and the cost of the services provided. The values of these perceived measures were retrieved from the questionnaire where local governments made their (self) assessments.

Results

This section presents the empirical results of the study. Initially, the relationship between inferred intellectual capital and inferred financial performance as it is assessed in terms of efficiency, liquidity and debt management is discussed. Secondly, the relationship of perceived intellectual capital with perceived performance is examined. As a final step, the empirical relation between intellectual capital and performance is examined irrespectively of the theoretical perspective on intellectual capital (i.e. IC1-ostensive view or IC2-performative view).

Inferred Intellectual Capital and Financial Performance

The data used to calculate the inferred intellectual capital is based on public available information included in the financial statements of Greek local governments. Local governments in Greece that satisfy specific size or revenue criteria are obliged to publish yearly audited financial statements that mainly include a Balance Sheet and a Profit and Loss Account. Our data is obtained by the financial statements published at the end of 2008 and corresponds to the fiscal year of 2007. Data about the employees in local governments corresponds to the same period and was retrieved by the National Statistical Authority. Population information refers to the 2001 census.

Table 7 presents the results of the estimated OLS models of Eq. (2), Eq. (4), Eq. (6) and Eq. (7). Further, Table 8 presents basic descriptives of the ratios used to evaluate the financial performance of local governments and summary statistics of the basic variables retrieved by the OLS models.

Inferred human capital and inferred social capital seem to be positively correlated with Return on Assets at 1% and 5% significance level respectively. All three components of inferred intellectual capital are positively correlated with turnover ratios at 1% level of significance but they are no correlated with liquidity. Furthermore, they are positively correlated with Liabilities over Total Assets and Debt over Total Assets ratios at 1% significance level.

Summarizing the aforementioned analysis, inferred intellectual capital seems to be positively correlated with both efficiency and liquidity but presents no correlation with debt management. This indicates that the presence of inferred intellectual capital improves efficiency and turnover ratios without undermining the financial structure of local governments.

Table 7: OLS Estimations and Residuals Statistics

This table presents the OLS estimations and the residuals statistics for the following OLS estimated models:

$$\log(S^i) = \log(a_0) + a_1 \log(TA^i) + a_2 \log(N^i) + e^i$$

Model 1,

$$\frac{SGA^i}{TA^i} = b_0 + b_1 \frac{N^i}{TA^i} + e_{AB_SGA}^i$$

Model 2

$$\frac{COGS^i}{TA^i} = c_0 + c_1 \frac{P^i}{TA^i} + e_{AB_COGS}^i$$

Model 3 and

$$\frac{S^i}{TA^i} = d_0 + d_1 \frac{P^i}{TA^i} + e_{AB_S}^i$$

Model 4

Perceived Intellectual Capital and Perceived Performance

The correlation between the factors of each dimension of the perceived intellectual capital and the perceived organizational is presented in Table 10. It seems that the effects of perceived intellectual capital on perceived performance are realised through the provision of superior quality services and to a lesser extent through cost savings. Further, the presence of a high level of perceived intellectual capital seems not to be associated with the level of the quantity of service provision.

Within the context of perceived human capital, all factors are positively correlated with the perceived quality of the services rendered at 1% level of statistical significance with the exception of the factor entitled Commitment (HC_4) which is, also, positively correlated albeit at 5% significance level. The factors Synergy with Environment (HC_3) and Satisfaction (HC_6) present the highest correlation values with perceived quality of service rendering relatively to the other factors of the perceived human capital. A possible reason for that is that the level of synergy with environment and the satisfaction of human assets are both critical factors that mediate so as the core dimensions of perceived human capital (i.e. Knowledge & Skills and Learning, Adaptation & Human Resource) to be transformed into improved performance. As far as the relationship between perceived human capital and perceived cost is concerned, only the factors Learning, Adaptation & Human Resource Development (HC_2), Synergy with Environment (HC_3) and, Satisfaction (HC_6) exhibit negative correlations with perceived cost of service provision. Negative relations mean that human IC is related with cost savings. Finally, there is no significant correlation between the factors corresponding to perceived human capital and those related to perceived quantity of service provision.

A similar pattern in terms of the existing correlations is observed in the case of the two other dimensions of perceived intellectual capital as well. Both perceived organizational and perceived social capital have no correlation with perceived quantity of service provision. However, they exhibit a positive correlation with perceived quality of service rendering and a negative correlation with perceived cost of service provision.

More specifically, in the case of perceived organizational capital, the factors Knowledge Management (OC_1) and Innovation (OC_2) have the strongest positive correlation with perceived quality at 1% significance level. Contrary to the relations revealed in relation to the factors corresponding to perceived human capital, the factors capturing the essence of perceived organizational capital are all negatively correlated with perceived cost. That can be interpreted as a positive contribution of intellectual capital on resource consumption and efficiency improvement. Moreover, the factor Internal Integration (OC_3) exhibits the strongest negative correlation with that of perceived cost amongst the other factors of perceived organizational capital.

In the case of perceived social capital, the factors External Integration (SOC_2) and Collaboration with Central Government (SOC_4) have the strongest positive correlation with perceived quality and the strongest negative correlation with perceived cost at 1% significance level amongst all other factors of perceived social capital. However, the factors Knowledge of Social Environment (SOC_1), Economic Relations (SOC_3) and Social Culture (SOC_6) of the perceived social capital are negatively correlated with perceived quantity.

The aforementioned analysis implies that in the case of local governments perceived intellectual capital is positively correlated with perceived performance. More specifically, the perceived intellectual capital is positively correlated with perceived quality of service rendering across all factors that correspond to the three sub domains of intellectual capital. Nevertheless, perceived intellectual capital is in some cases negatively correlated with perceived cost. Moreover, perceived intellectual capital is only sparsely correlated with perceived quantity. The lack of correlation of perceived intellectual capital with perceived quantity of service rendering does not undermine the overall conclusion that the perceived intellectual capital is correlated with performance. A plausible explanation for that is that the quantity of services required by citizens is stable and, thus, the utility that citizens obtain by those services is mainly affected by their quality. Thus, local governments may employ the available intellectual capital so as to offer services of higher quality to their citizens.

Intellectual Capital and Financial Performance

This section attempts to examine the relationship between intellectual capital and financial performance irrespectively of the epistemological view used in studying intellectual capital (i.e. IC1-ostensive and IC2-performative). By analysing the results of each epistemological view without taking into consideration the results of the other limits the generalization of the research findings. It is therefore required to examine the empirical findings presented on previous paragraphs under an integrated perspective. For this reason, for each component of intellectual capital (i.e. human capital, organizational capital, social capital), we categorise local governments as high or low intensive for each dimension (i.e. inferred versus perceived). The median values of inferred human capital, inferred organizational capital and

Pearson correlations about the diagonal; spearman correlations below the diagonal.

** and ** indicate statistical significance at 5%, and 1% levels respectively.*

inferred social capital are used as corresponding critical values for classifying local governments as high (above or equal to median value) versus low (below median value) intensive for each IC sub category. In the case of the factors of perceived intellectual capital a two stage procedure is followed in order to separate local governments as high versus low. Initial, for each dimension of perceived intellectual capital (i.e. perceived human capital, perceived organizational capital and perceived social capital) the numerical values of the related factors are added to formulate a total score. Then, the median values of the total score of perceived human capital, perceived organizational capital and perceived social capital are used as critical values for classifying local governments as high (above or equal to median value) versus low (below median value) intensive.

To examine the relationship of intellectual capital with both financial and perceived performance, we compare the mean values of financial ratios and factors of perceived performance of the high IC group and the low IC group. The test is performed by using the 2 independent-samples t test. Therefore, we define three pairs of two independent samples (high IC LGs and low IC LGs) for each IC subcategory i.e. human capital, organizational capital and social capital.

High human capital local governments seem to perform better than low human capital ones as far as turnover ratios are concerned at 1% significance level. Further, high human capital is equated with improved perceived quality of the services provided by local governments at 1% level of significance (Table 11).

The relationship of organizational capital with financial performance and perceived organizational performance is examined in Table 12. Organizational capital seems to improve total assets turnovers at 1% level of significance and the perceived quality of services rendered at 4% level of significance.

Finally, social capital seems to have effects on efficiency, turnover ratios and perceived organizational performance. More specifically, local governments with high social capital report higher mean values for Return on Assets and Plant, Property and Equipment turnover ratios at a, at least, 3% level of significance. As far as perceived organizational performance is concerned, social capital is equated with higher levels of perceived quality but with lower levels of perceived quantity and perceived cost of the provided services (Table 13).

Conclusions

The research motivation of this study was to analyse the relationship of intellectual capital with organizational performance within the context of local governments.

We have analysed intellectual capital from two epistemological stances recognised by Mouritsen (2006): IC1-ostensive view and IC2-performative view. We proxied for inferred intellectual capital which is consistent with IC1 –ostensive view by using information retrieved by accrual accounting financial statements. We assessed perceived intellectual capital of local governments that is compliant with IC2 - perspective view by using survey data collected through questionnaires. We built a classification scheme that allocates local governments to a matrix according to their scores in terms of the two intellectual capital views. Within this matrix local governments that are considered intellectual capital intensive under both views are distinguished from those that are less intellectual capital intensive.

Empirical evidence indicates that intellectual capital is equated with improved financial and perceived performance. This has been confirmed irrespectively of the theoretical view adopted for the study of intellectual capital. More specifically, intellectual capital seems to improve the efficiency and turnover ratios without creating serious debt management issues. Further, local government officers positively associate perceived intellectual capital with perceived quality and negatively with perceived cost of the services rendered.

Our study therefore verifies that the positive relation between IC and financial performance hold in the public sector as well. Apart from that, our findings have significant practical implications for the public sector especially at this period in time where there is a need for all efforts to be motivated towards performance improvement and 3Es (efficiency, effectiveness and economy) attainment.

However, our results are subject to the following limitations. Firstly, our analysis is based on a sample of Greek municipalities. Therefore there is always the question whether the results can be generalized to the entire population. Secondly, we have used some proxies in order to operationalize inferred IC. There may be other proxies that could better encapsulate inferred IC through the information presented in financial statements. Finally, the statements used in the questionnaire are considered suitable for addressing the scope of our study.

Nevertheless, the reliability of answers gathered is subject to the limitations embedded in any field study.

The above research findings might be the starting point for various other research initiatives. A replication of this study to local governments in other European countries would improve our understanding on the way IC is translated into financial performance. Moreover, further research is required to recognize and analyze the organizational mechanisms that enable local governments to realize economic benefits from intellectual capital. This knowledge will improve the management of intellectual capital and will contribute towards the implementation of New Public Management in local governments. Another important research issue is to analyze in a more explicit way how local governments perceive the relationship of intellectual capital with performance. This would enable the recognition of behavioral issues that are responsible for the lack of motivation on behalf of public sector organizations to exploit their available intellectual capital for improving their performance.

Appendix: Questionnaire

Questionnaire consists of 61 statements. The response scale for each statement was from (1) totally disagree to (5) totally agree. The questionnaires indicated with R where reverse coded.

Statements:

1. Local government personnel have sufficient capabilities to successfully perform their duties.
2. Local government personnel are willing to perform their duties.
3. Citizenry is a source of knowledge and skills for local government.
4. Local government personnel are sufficiently experienced for the execution of their duties.
5. Local government personnel are satisfied with the working environment.
6. Local Government management minds for the introduction of innovative management styles.
7. There is a medium term (2-5 years) training programme for local government personnel.
8. Local government personnel rely on their peers when they need help.
9. Local government cares for the training of the new employees.
10. The level of cooperation among the local government employees is high.
11. Citizenry and local organizations (e.g. athletic organizations, social associations, local businesses, citizen associations, etc.) cooperate for the implementation of local government decisions.
12. Local government utilizes the experience of municipal employees with several years in service.
13. Local government employees directly abide by local government decisions.
14. Local government offers citizenry and local businesses direct information and support for the activities they want to develop.
15. Local Government gets the necessary information and know-how for the support of its operations by the Ministry of Interior.
16. The quality of services would be improved if they were assigned to a private company (R).
17. Suppliers constitute a source of know-how for the Local Government.
18. Some employees, in order to hide their deficient productivity, negatively affect the performance of their peers (R).
19. Local Government rewards employees performing actions that improve its operations.
20. Local Government personnel want to actively participate in decision making.
21. Local government financial health is directly related with the financial health of the businesses in the area.
22. The level of cooperation between the Local government personnel and the local organizations is high.
23. Local government personnel are willing to undertake more responsibilities.
24. Local government offers services through the internet.
25. The financial survival of a considerable number of local businesses relies on local government expenditures.
26. Local government personnel seek moral recognition from their social surroundings.
27. The quantity of services offered by the Local government could be considerably increased (R).

28. The educational level local government personnel is higher to what needed for tasks execution.
29. Citizenry considers local tax burden to be excessive (R).
30. Local Government uses both local and national Media as a means of communication with the citizens.
31. Local Government personnel feel responsible for the success of the Local Government programmes.
32. Local Government personnel are satisfied with the duties assigned to them.
33. The cooperation of Local Government with the Ministry of Interior for local government policy issues is satisfactory.
34. Some employees express their dissatisfaction on a systematic basis (R).
35. Citizenry participates actively in decision-making.
36. Local Government personnel have the ability to adjust to the changes that take place in their working environment.
37. Local Government utilizes the experience and the capabilities of local organizations (e.g. athletic organizations, social associations, local businesses, citizen associations, etc.) to improve its operations.
38. Local Government personnel want to get specific and precise directions for performing their tasks.
39. Local authorities are a source of knowledge for Local Government.
40. Local government encourages its personnel to cooperate and share knowledge and experiences.
41. Local Government cares about the promotion of culture within the local society.
42. The financial health of the majority of citizenry is influenced by local government expenditure.
43. Local Government is effectively supported by the central government in order to confront problems.
44. Local Government is familiar with new technology and internet use.
45. Local government personnel and citizenry cooperate successfully.
46. Suppliers are consistent with their contractual obligations.
47. Local Government cares for the quick integration of immigrants in the local community.
48. Local Government employees are encouraged to take initiatives.
49. The financial health of the local government is directly related with the financial health of the citizenry.
50. Local government has in place and implements a short term yearly programme for personnel training and education.
51. Cultural and educational expenditure corresponds to a significant percentage of local government expenses.
52. Local government encourages the participation of employees in decision-making.
53. The quality and the quantity of service provision could be substantially improved if tighter control was in place (R).
54. Local government personnel mind to be informed about changes in the legislation and the statutory framework.
55. Local government employees are willing to openly express their views.
56. Local government employees are satisfied with the level of safety in their working environment.

57. Both citizenry and local businesses are consistent with their financial obligations towards the local government.
58. Citizenry uses the internet to submit their complaints.
59. Local government implements e-governance programmes.
60. Local government personnel cooperates with citizenry in harmony.
61. Local government cooperates with relevant Ministries for financial issues in a satisfactory manner.

THE ROLE OF SICILY IN THE MARITIME TRAFFIC OF AGRI-FOOD PRODUCTS IN THE MEDITERRANEAN BASIN

Crescimanno, Maria¹; Galati, Antonino²; Siggia, Dario³

Abstract

This paper shows the results of a survey on trade flows to agri-food products among Sicily and the non-EU countries of the Union for the Mediterranean, through maritime transport. The aim of this paper is to outline the role that Sicily plays in respect of trade in agricultural products through the maritime mode considering its strategic location in the Mediterranean basin. Political reference scenario is that of the Union for the Mediterranean and EU Mediterranean Transport Policy (motorways of the sea).

The work contains an analysis of the evolution of maritime trade in agri-food of Sicily, in the main ports of departure and arrival, with non-EU countries of the Union for the Mediterranean, estimated on the basis of data provided specifically by the Customs Agency of the Italian Ministry of Economy and Finance.

The relative geographical orientation index has allowed to estimate the geographic specialization of the island, compared to Italy, in the maritime trade of agri-food products with non-EU Countries bordering the Mediterranean Sea.

The results highlight how Sicily, thanks to its particular geographical position is one of the most specialized partner in the maritime trade with the other Mediterranean countries. These trades are gradually increased over the last decade, both in terms of absolute value and in relative terms, concerning the traffic of agri-food products. It is evident, therefore, as the creation of motorways of the sea linking Sicily with the coastal countries of the South and East of the Mediterranean could constitute an further factor of economic integration.

Keyword: Agri-food trade; Maritime traffic; Euro-Mediterranean Policy; Sicily.

Introduction

By the declaration signed by 43 States and the European Commission, is launched in Paris in 2008, the Union for the Mediterranean with the desire to pursue a dialogue between North and South banks already started, first with the agreement of Barcelona (1995) and subsequently with the European Neighbourhood Policy (2004) a complementarity and cooperation. The Paris Declaration defines a new regional plan of action identifying six priority projects considered strategic to reunite Europe and Africa to Countries bordering the Mediterranean (Aliboni, 2008). The development of motorways of the sea and terrestrial, with

the aim of supporting the movement of goods and persons, integrating the system of transport of the European Union with the countries of the South, is the priority objective of the new policy in the field of transport. The interest for the motorways of the sea was established following the recognition of the centrality of the Mediterranean for the traffic of goods not only among countries but also for international maritime trade with the Far East. The Mediterranean is, in fact, one of the areas in which the transit of goods by sea, crossing the Suez Canal, the strait of Gibraltar and the Bosphorus, is the heaviest (Vallouis, 2010). In this context, the creation of a trans-Mediterranean transport network is considered one of the factors capable of promoting euro-Mediterranean integration, contributing to the socio-economic development of coastal countries, from European, Middle Eastern ones, to those in Africa and the Balkans.

In this context, Italy and particularly Sicily, can play a strategic role by exploiting their geographical location in the Centre of the Mediterranean, assuming the function of catalysts of maritime trades involving both countries of the South and East Mediterranean, both Asian countries. Motorways of the sea, as well as designed, may, therefore, represent preferential corridors to intensify the exchange of goods between the two shores of the Mediterranean, contributing to accelerating the integration process, which we should have to have already in 2010 by the creation of the Free Trade Area but that it is still hard to materialize. In this context, the agri-food trade, cannot remain outside the process of integration, especially in order to the strong similarity and completion of the Agriculture of the two shores of the Mediterranean (Crescimanno, 2007). On these considerations, the present work that aims to outline the role that Sicily plays in the context of maritime trade of food products with non-EU countries of the Union for the Mediterranean and to verify if the location of the island at the Centre of the Mediterranean could have a strong commercial vocation towards the area of reference. On the basis of the results of this study we highlight the opportunities that the new euro-Mediterranean policy can provide, as concern the transport, first of all through the creation of motorways of the sea corridors, which would contribute to the consolidation of preferential flow of trade between the two shores of the Mediterranean, in particular in Sicily.

Methodological approach

In order to define the reference background of the sea traffics of the agro-food products between Sicily and the extra EU Countries of the Union for Mediterranean, we have referred to the data suitably provided by the Office of Economic and Fiscal Studies - Custom Agency of Rome concerning the trade volumes, expressed in customs value and quantity, passed in the main harbours of the Island and in the origin and destination Country. The partners taken into account are the Countries which underwrote the institutive document of the Union for the Mediterranean and Albany, Algeria, Bosnia-Herzegovina, Croatia, Egypt, Jordan, Israel, Lebanon, Libya, Morocco, Tunisia, Turkey and Montenegro in particular, to which Serbia joins, whose datum appears, for the whole reference period, related to the Montenegro's one.

The data showed in this paper, in particular, refer to the 2001-2010 period and to the group of agro-food goods (chapter 01-24 of the customs tariff of integrated use), entering and going out from 8 of the Sicilian harbours (Augusta, Catania, Marsala, Palermo, Pozzallo, Siracusa, Termini Imerese and Trapani).

Beginning from available data, we have analyzed the market quota (market of share) hold by Italy and Sicily comparing with the extra EU Countries of the Union for Mediterranean, allowing to draw the map of the main trade partners.

Then, to appreciate the importance of the maritime traffic in the whole agro-food exchange area, the relationship between the volumes exchanged by Sicily by sea with the Countries of the Union for the Mediterranean and the ones with the rest of the world has been calculated, in this case for the 2000-2009 period, compared with the same relationship concerning the whole agro-food exchange (which comprehends the several transport systems), analyzed through the data bank of the National Institute of Agricultural Economics Research (INEA).

Finally, to identify the Countries of the Union for the Mediterranean with which the maritime traffics of agro-food products from and to Sicily are more intensive, the Relative Geographical Orientation Index has been used (Iannone, Varrone, 2006; Lombardi, 2000) which allows, in this case in particular, to measure Sicily's specialisation, compared to Italy's one, and then to calculate the more or less propensity of the island to deal with the Countries of the reference area. More specifically, the index used allows to estimate how much Sicily trade weight is higher than Italy's one in the same reference context. The indicator is calculated normalizing the quota of Sicily's mutual exchange - meant as sum of exports and imports towards a specific Country on the trade volume with the whole reference area- for the corresponding quota of Italy's maritime exchanges from and to the same Countries.

An index value above (under) one indicates a higher (lower) geographical concentration of Sicily's trade flows with the extra EU Countries of the Union for Mediterranean, than the trade flows with Italy. This kind of analysis, in particular, allows to verify the trend effects caused by the market differentiated growing and particularly evident in the foreign trade (Lombardi, 2000; Mori, Rolli, 1998).

$$I_{jt}^{Sicily} = \frac{X_{jt}^{Sicily} + M_{jt}^{Sicily}}{X_{Medt}^{Sicily} + M_{Medt}^{Sicily}} \bigg/ \frac{X_{jt}^{Italy} + M_{jt}^{Italy}}{X_{Medt}^{Italy} + M_{Medt}^{Italy}}$$

Where, I_{jt}^{Sicily} is Relative Geographical Orientation Index of Sicily in the maritime traffic to/from the j countries at the time t , X is export value, M is import value, j is a country, Med are the Mediterranean partners and t is year of reference (2001, ..., 2010).

The index, obtained starting with the trade volumes expressed in customs value, has been calculated for each of the Mediterranean partner and for the years of which we had the statistic datum.

3. The Euro-Mediterranean Policy scenario

Since 1972 the Mediterranean Policy of the European Union has caused deep changes, due, firstly, to the changes in the strategic aims of the Union and the neighbouring areas and, secondly, to the fact that they haven't achieved the aims of the Euro-Mediterranean partnership plan and of the latest European Neighbourhood Policy (Galati, 2010).

The enterprise of an Union for the Mediterranean comes from the awareness of the importance that the Euro-Mediterranean policy has got in the European communitarian cohesion, weakened firstly by the enlargement of the European Union towards the neighbouring Middle-East Europe Countries, and secondly by the introduction in the European Neighbourhood Policy of the East-Europe and Caucasian Countries, causing a stronger and stronger rejection of the North-African and East partners, influencing the home political balance of the European Union itself (Aliboni, 2008).

The Union for Mediterranean opens, then, a new political phase which, as it was written in Rome Declaration in December 2007, it doesn't intend to *"replace the cooperation and dialogue procedures in which the Mediterranean Countries have been associated, but to complete them, giving them a further impulse in a complementary and cooperation spirit with all the existing institutions"*. In other words, the Declaration of Barcelona (1995) and the Neighbourhood Policy in 2004, keep on maintaining their central position, but a bigger dynamism is given to them.

The 13th July 2008 the Euro-Mediterranean Heads of State and the Prime Ministers met in Paris and launched officially the *"Process of Barcelona: Union for the Mediterranean"* with a declaration underwritten by 43 Countries and the European Committee, laying the foundations for a new policy addressed to a strategic area for the EU both from political and trade point of view, but well-grounded on the *acquis* of the Process of Barcelona.

With reference to the Euro-Mediterranean partnership, two new important elements concerning the new geo-political configuration of the area and a new institutional structure are introduced.

About the first matter, the geo-political configuration appears completely new because it is addressed not only to the Northern-Africa Countries and to the Near East (Algeria, Palestine, Egypt, Jordan, Israel, Lebanon, Morocco, Syria, Tunisia, Turkey), but to other countries of the Southern Europe which don't take parts in the EU and, in particular, to the area of the West Balkans (Croatia, Bosnia-Erzegovina, Montenegro and Albany) and some Mediterranean Countries left out before, as Monaco and Mauritania. This fact led to the loss of centrality of the Northern-Africa and the Near East Countries, kept until the summit in Paris, involving a strong heterogeneity concerning requirements and aims, not always the same, of this new

geo-political area which can be a strong obstacle to the Euro-Mediterranean cooperation process.

Another innovative element concerns the institutional structure of the Union meant as Inter-Government Organization headed by a Coo-Presidency (a President from the EU and one from the Partner Countries) and by a Secretariat which deals with the policies and the plans passed by the Union for the Mediterranean. This involves the passage from a European Union policy coordinated by the Presidency to an inter-government Policy in which the EU is one of the members and not the only one to take decisions, reducing, that way, the role of the Committee and giving more emphasis to the inter-government principle (Zallio, 2008). The aim is to give an answer to the lack of mutual and equal relationship so much emphasised but never realized in the Mediterranean policy of the European Union.

The Union for the Mediterranean works on two pillars. The first provides, as we have already said, a joined participation of the European Union and its partners, while the second is based on the focalization of some strategic aims shared by the Euro-Mediterranean citizens, and partly provided in the Communication of the European Committee in 2008 – COM (2008) 319 final-, through which the Union for Mediterranean should give a tangible foundation to the Euro-Mediterranean solidarity and to its views of political cooperation (Aliboni 2009).

The priority projects regarding the second pillar, in brief, concern six significant matters of strategic interest as environment, transport, solar energy, civil protection, higher education and the entrepreneurial development. The following enterprises have been found, in particular: fight against the Mediterranean pollution; sea and land highways; civil protection; development of alternative energies; education and research; Mediterranean enterprises for business development.

The implementation of maritime and land highways represents one of the major initiatives identified in the Union for the Mediterranean with the desire to give new impetus to the euro-Mediterranean policy in a spirit of complementarity and cooperation. The project originated with the aim of improving the movement of goods and people through the integration of the transport system between the two shores and within countries of the South it is considered one of the necessary conditions for achieving economic and social integration, has long advocated, and especially for the success of the planned free trade area, scheduled for 2010, but who have not yet realized.

The motorways of the Sea and the Euro-Mediterranean integration process

The word sea highways appears for the first time in the White Book of the European Transport Policy - COM(2001) 370 final- in which, among the several enterprises in view, the development of sea short-distance connections between the harbours of the European Union Countries is particularly emphasised, identifying just in the sea highways a competitive alternative to the land transport, heading among the several systems, looking at the question

through a transport system which can be met from the economical, social and environmental point of view (Foschi, 2004). The need to ensure mutual ways, in particular, is due to the necessity to solve some gaps of the European transport system related to the strong imbalance among the several transport systems, to the traffic in the main transport routes, but above all to the consequences of the environmental pollution due to the several transport systems.

Nevertheless, in the integration process of the Euro-Mediterranean transport system, the sea highways have got a different role, not concerning the need to reduce the road traffic anymore, but, as we can see in the Blue Paper (Blue Paper, 2005), the necessity to improve the service quality and to reduce the environmental impact.

According to these considerations, we have to distinguish the Mediterranean highways, which link up two of the European Union harbours on the Mediterranean sea, and the trans-Mediterranean highways which, instead, link up the harbours of the Coast Countries (Weigert M., 2010).

In the last years, the European Union attention towards the Euro-Mediterranean cooperation about transport has become higher and higher. In the Declaration underwritten in Barcelona in 1995, the importance of an efficient transport system was considered necessary to reach the Euro-Mediterranean partnership aims and to create a Free Trade Area in particular. The necessity of a reform in the transport system of the Mediterranean Partner Countries and the introduction of this aim among the national economical settlement programs, was later confirmed again in the Meeting of Lisbon and Helsinki in 1997, where the principles for the development of a multi-way transport network and for efficient transport services were established. The establishment of a Euro-Mediterranean Transport Forum in 1998, with the aim to increase the cooperation in the transport sector, led to work out a regional action plan concerning all the transport modalities without any distinction. Referring to the carriage by sea, in particular, for the period 1999-2001, 11 projects concerning the harbours management and the manipulation of dangerous goods were defined. Later, in 2001, the Euromed Transport project passed by the European Committee, aimed to create an integrated multi-modal transport system on regional-scale in order to encourage the cooperation with the South-Mediterranean Countries.

The European Neighbourhood Policy itself started up in 2004 after the enlargement of the European Union to the Middle-East Europe Countries and, in particular, towards two Mediterranean islands, Cyprus and Malta, has offered to its neighbouring partners some cooperation opportunities through bilateral action plans about transport as well, favouring the integration of the transport networks. The transfer of the trans-European transport network towards the neighbouring countries led to the determination, by the High Level Group, of transport corridors and priority projects along these routs.

The importance of transport short sea shipping appears in the Blue Paper (Blue Paper, op.cit.), on the transport system integrated Euro-Mediterranean, conceived with the desire to remove obstacles to the development of the transport system determining the transition from a fragmented system to a well harmonized and integrated. In particular, the axis 3 of the plan carefully the shipping as arrangements can ensure a continuous flow of goods connecting the different modes of transport, and identifies the motorways of the sea preferential corridors to strengthen the multimodality in the region.

The tangible carrying out of the sea highways project assumes, however, the solution of the regional transport infrastructural gaps and, in particular, it requires: *“measures to improve the quality of infrastructure and services in ports, to ensure good connections from the ports to their hinterland but also to stimulate more frequent and reliable shipping services are essential. Good intermodal connections between ports and the road, rail and inland waterway networks are also necessary”*(Blue Paper, op.cit.).

The guidelines contained in the Blue Paper and previously supplied by High Level Group have been formally adopted at the Ministerial Conference in Marrakech on December 2005 and subsequently included in the Regional Transport Action Plan for the Mediterranean Region 2007-2013 (RTAP), developed in 2007. With special reference to transport infrastructure, the objective of the RTAP is to modernize existing structures, rather than creating new ones, improving logistics services afforded to them, taking into account the different conditions of development of countries in the area. In particular, the project 21 of the RTAP deals specifically with the motorways of the sea recognizing their importance for the entire Mediterranean region, in particular to create conditions for a real Euro-Mediterranean integration which, however, can not in any way be realized without the enhancement of other modes of transport, port, road and rail.

A specific project for motorways of the Sea, the MEDA-MoS launched in 2006 in the context of EuroMed Transport, identifies two MoS pilot projects aimed at widening the trans-European transport network to the West Mediterranean area and East Mediterranean area region. The goal is to create an effective network of intermodal freight transport between the two sides in a perspective of integration and cohesion of the transport networks between the Mediterranean's countries. Implemented are planned 11 projects of motorways of the sea, which Sicily is actually out of, linking the ports of Southern and Eastern Mediterranean with those of the Mediterranean countries of the European Union; of the works planned, 5 motorways of the sea would connect some of the Mediterranean partner countries with the Italian ports of Trieste, Genoa and Livorno.

The maritime exchanges of Sicily's agro-food products with the extra EU Countries of the Union for Mediterranean

Italy's trade relationships with the Countries of the Southern and Eastern side of Mediterranean Sea have straightened in the last years because of the geographical nearness which characterizes the Countries of the area taken into account, and also of a growing demand for Mediterranean agriculture products which the neighbouring partners are able to offer in the European market at sometimes competitive prices.

Since earliest antiquity, the maritime modality has served as a channel for trade both between the countries bordering upon it and later, with refinement of navigation techniques, with the other regions of the world (Quéguiner, 1979).

Italy, during the last decade (2001-2010), has significantly developed the maritime traffic of agro-food products with the Countries of the Southern and Eastern side of Mediterranean Sea, doubling the trade volume both from quantity and value point of view. In fact, the quantities exchanged have passed from 455,6 thousand tons in 2001 to more than a million in 2010 and the corresponding value, in the same period, has raised from 436,5 millions Euros to 714,7 millions Euros, recording, respectively, a yearly average growth rate of 12,1% and 6,4 %.

Italy's privileged partners are, in order, Turkey (25,4%), Israel (21,9%), Tunisia (16,9%), Morocco (13,4%) and Egypt (12,0%), which currently (2010) cover the 89,8% of the maritime agro-food traffics with the whole area.

Like the national trend, Sicily also has better developed its role of logistic platform for exchanges of agro-food products by sea with the other Coast Countries, though its weight from the national point of view don't go over the 11% in the reference period, for the inadequacy of the port structures as well. The maritime traffic of agro-food products from and to the extra- EU Countries of the Union for the Mediterranean has reached in 2010 a volume of 96,2 thousand tons compared with the 9 thousand tons of 2001, recording a yearly average growth rate of 96,9% a lot over the national one, highlighting, therefore, a growing tendency of the Island to deal with the Countries of the area. From the customs value point of view the dynamics are positive as well. In fact, they have passed from 18,3 million Euros of 2001 to a value of 63,4 millions Euros in 2010, recording, in the reference decade, a yearly average growth rate of 24,7%, in this case above the same national datum too.

Besides, by analysing the data, we can notice that the mutual maritime agro-food exchange between Sicily and the extra-EU Countries of the Union for Mediterranean shows a higher weight than what we found considering all the transport systems (Figure 1), giving importance to this system for the exchanges between the two areas. We can see, therefore, that maritime exchanges of agro-food products of Sicily with the Countries taken into account have recorded in the reference period a growing trend with an effect on the exchanged volumes, on the whole, which goes from 15,9% in 2000 to 26,6% in 2009.

Figure 1 - Relationship between maritime traffic and total trade in agri-food products among Sicily and the Mediterranean partners

Source: Our elaboration on Data Warehouse Custom Agency, Rome and INEA, Rome.

For what the main partner Countries are concerned, Tunisia represents the most important reference market, having in 2010 the 58,7% of the value of the maritime traffics on the whole, keeping its leadership in the reference period. Also Turkey is important, whose trade with Sicily represents the 16,7% of the exchanges with the whole area, and Morocco as well (8,4%). More in details, in the reference decade Turkey's importance grows both in goods supplying and market in the agro-food sector but, on the contrary, Tunisia and Morocco's weight is lower, countries that in 2001, had respectively the 72,6% and the 16,4% of Sicily's maritime traffics with the whole area.

With reference to the trade volumes of the agro-food products passed in the Sicilian harbours (departure and arrival harbours) (Figure 2), in the decade 2001-2010, for the quantities dealt with, Pozzallo's port is the most operative, which is in the Southern Sicily with the 45,9% of the volumes passed in the ports of the Island, followed by Catania (22,5%); on the other hand, as for the value, Palermo's port, with the 42,3% of the exchanged volumes with the whole area, and Trapani's one (30,5%) are important. This asymmetrical distribution between quantities dealt with and product value is due to the kind of the goods exchanged and consequently to its unit value.

Figure 2 - Maritime traffic of agri-food products among sicilian ports and major Mediterranean countries partners - Average period 2001-2010

Source: Our elaboration on Data Warehouse Custom Agency, Rome.

The leaving and the arriving goods in Palermo's port, in particular, are exchanged almost exclusively with Tunisia which, in the decade 2000-2010, covers the 77,4% of the maritime agro-food trade. The situation of Catania's port is different: it shows a higher value in the exchanges with Morocco (43% of the amount) and Turkey (28,9%). The exchanges of agro-food products of Pozzallo's Port are carried out above all with Serbia and Montenegro. (36,0% of the amount) and a bit less with Morocco (19,4%) and Croatia (18,3%). In the end, about Trapani's Port, the analysis underlines that the maritime exchanges of agro-food products are catalyzed almost completely with Tunisia (94% of the total trade).

Geographical specialization of Sicily

The analysis of Sicily's geographical specialization in maritime traffics of agro-food products with the extra-EU Countries of the Union for the Mediterranean compared with Italy's one, has been carried out by calculating the relative geographical orientation index.

The indicator highlights, for 2010, value higher than one for Algeria, Serbia, Montenegro, Tunisia and Lebanon, towards which Sicily shows a higher propensity to exchange agro-food products than Italy does (Figure 3a and 3b). Turkey shows, on the contrary, values below one, though it has got considerable quotas of the maritime traffic in the whole (16,7%), and Egypt, with which the maritime traffic of agro-food goods is rather more modest than the trade volumes concerning the national territory. Algeria shows the highest index, considering that the maritime traffics with Sicily represent the 52,4% of the national exchanges. Also for Serbia and Montenegro the Sicilian trade specialization is higher than the Italian one (4,9): the volumes exchanged between the two areas represent, in fact, the 43,3% of the corresponding Italian maritime traffics. Tunisia and Lebanon are other important trade partners, with which Sicily shows a significant tendency to trade, even considering the importance that the maritime exchanges with these Countries themselves have got in the national background.

Figure 3a - Relative Geographical Orientation Index of Sicily with the main Mediterranean partners

Source: Our elaboration on Data Warehouse Custom Agency, Rome.

The indicator trend shows, in the whole, in the last decade an increase of the tendency of Sicily, compared with the Italy's one, to trade agro-food products with the area, though some Countries show wavering index values, since they are related to the trend of the maritime exchanges and consequently to the corresponding mutual exchange quotas. More specifically, reading Algeria's index, it shows an increasing specialization of Sicily in the reference period. As far as Serbia and Montenegro are concerned, the time analysis, shows an increasing geographical specialization of the Island in the agro-food trade, though in the reference period we can observe a strong variability related to strongly wavering maritime traffics values. About Tunisia, we can notice, on the whole, a growing tendency to trade which seems particularly noticeable in the period 2000-2002, but it goes roughly reducing in 2003, when it starts having an increasing trend again. Sicily's maritime exchanges with Lebanon, though covering a low quota of the traffics with the entire area (0,6%), are important from the national point of view (24,2% of the national traffics value). The trend of the relative geographical direction index, in particular, shows, on the whole, an increasing specialization of Sicily, although since 2005 we can notice a descending trend of the index value, highlighting a progressive loss of the regional specialization for the agro-food productions exchanged with the Country.

Figure 3b - Relative Geographical Orientation Index of Sicily with the main Mediterranean partners

Source: Our elaboration on Data Warehouse Custom Agency, Rome.

Turkey, Morocco, Croatia and Egypt, moreover, as we have already underlined, are important trade partners, with which Sicily doesn't show, concerning 2010, a geographical specialization, compared with Italy, even if the Countries themselves have got considerable market quotas. While in the maritime traffics with Turkey and Egypt, in particular, Sicily seems to be de-specialized, also because of a low weight which the maritime traffics with the two Countries cover in the national traffics system, for Morocco and Croatia, we can see, in the whole, a fall-off of the tendency to trade since 2002.

Conclusion

In the last few years the Euro-Mediterranean transport policy has repeatedly emphasized the importance of maritime transport and in particular the motorways of the sea for the Euro-Mediterranean integration process and the success of the free trade which in 2010 is still difficult to take place. The Union for the Mediterranean, recognizing the importance of an integrated transport system between North and South shores, considered the motorways of the sea as a part of a package of six priority initiatives.

The commercial relations between Italy (especially Sicily) and the other Mediterranean partners are now well established for decades, due to, firstly, the geographical proximity between the countries of the area, secondly, to growth of Cross-application of agro-food. As to trade, maritime transport has always been the primary way of connection between the two sides, especially in the last decade, but especially from Italy to Sicily, which has a significant increase in maritime trade products agro-food partners with neighbors. In this scenario, Sicily has played a role significant during the above years, but a marginal one in cooperation of its geographical position. The reasons could be found through a further investigation traced to point out the inadequate port infrastructure, the lack of logistics services in ports of the island, which created a low frequency of maritime links with neighboring partners. These

factors, seen as a whole, are likely to marginalize further Sicily on in the great maritime trade of the Mediterranean basin.

The results of the analysis highlight that the presence of Sicily within Italy has significant role, especially with some partners of the southern and eastern Mediterranean, particularly with Algeria, Serbia and Montenegro, Tunisia and Lebanon. In the last decade a consolidation of geographical specialization respect to Italy turns out to occur. With other partners, such as Turkey, Morocco, Croatia and Egypt, it is clear, however regard to that Sicily is more specialized than Italy as a whole. Finally, the position of Sicily in the circuit of the motorways of the sea connecting the countries bordering one southern and eastern shores of the Mediterranean could be an important opportunity for the economy of the Island.

EVALUATION OF SCALABILITY AND PERFORMANCE OF SOLARIS TRUSTED EXTENSIONS USING CONTAINERS VIRTUALIZATION TECHNOLOGY

Daci, Genti; Vrenozaj, Enid

Abstract

Server and system administrators have been concerned about the Techniques on how to better utilize their computing resources. Today, there are many technologies in use for this purpose, which consists of running multiple applications and multiple operating systems on the same hardware, like VMWARE, Linux-VServer, VirtualBox, Xen etc. These systems try to solve the problem of resource allocation from two main aspects: running multiple Operating system instances and Virtualizing the operating system environment. Our study presents an evaluation of scalability and performance of an operating system virtualization technology known as Solaris Containers, with the main objective on measuring the influence of a security technology known as Solaris Trusted Extensions. Solaris Trusted Extensions provides today a special configuration of the Solaris operating system aiming in providing multi-level security functionality. We will study its advantages and disadvantages and the overhead that it introduces to the scalability of the system's main advantages. To evaluate performance, we benchmark a number of metrics using the AIM benchmark. We calculate these benchmarks and effects on the entire OS, for the global Container, a non-global Container, and a large number of concurrently running non-global Containers.

Keywords: Solaris Containers, Virtualization, Trusted Extensions, Kernel Based Virtual Machines, Virtual Operating Systems.

Introduction

During the latest years, a lot of projects have been looking on virtualizing operating system environments, such as FreeBSD Jail, Linux-VServer, Virtuozzo etc. This virtualization technique is based in using only one underlying operating system kernel. Using this paradigm the user has the possibility to run multiple applications in isolation from each other. The basic idea can be normally described as running groups of processes that cannot be interrupted by others in different virtual environments.

Solaris Containers are built on the same paradigm, offering virtualization on the operating system-level. Solaris approach on Virtualization, extends its virtual operating system environment to include many more features of a separate machine, such as a per-Container console, dedicated system log, packaging database, run level, identity (YP, NIS), and IPC facilities. They make it possible to run more than one instance of the operating system into the same kernel. Many of the resources of our Server architecture are usually not properly and efficiently used, like CPU cycles, RAM, storage etc. With this technology we can better utilize these resources and make them useful for the entire.

These Containers act as completely isolated virtual machines within a computer aiming to reduce costs in both hardware and system administration. Furthermore, the Solaris Containers mechanism can provide protection through compartmentalization for separate virtual machines on a single physical machine. It is cheaper to install and to configure, because only a single copy of OS is involved, compared to several OS instances in the case of Xen. Furthermore, it is not limited for high-end systems compared to logical partitioning. Moreover, the granularity of resource allocation is fine-grained than the logical partitioning. In comparison to virtual machine monitors, Solaris Zones reduces performance overheads and reduces the cost of administration because there are no multiple operating system instances in a system.

Operating Systems

Solaris/OpenSolaris are Operating Systems, which make them the main building blocks of computer systems, and provide the interface between user applications and computer hardware. An operating system is a program that acts as an intermediary between the user of a computer and the hardware. The purpose of it is to provide an environment in which a user can execute programs in a convenient and efficient manner. As stated by Silberschatz (2002) Solaris is a multiuser, multitasking, multithreading operating environment, developed by Sun Microsystems. Solaris is a Unix-based operating system introduced by Sun Microsystems in 1992 as the successor to SunOS. Solaris is known for its scalability, especially on SPARC systems, and for its features such as Zones, DTrace and ZFS. The majority of it's codebase is now open source software via the OpenSolaris project. Watters (2005) explained that OpenSolaris is an open source operating system based on Sun Microsystems' Solaris. It is derived from the Unix System V Release 4 codebase, with significant modifications made by Sun since it bought the rights to that code in 1994. It is the only open source System V derivative available.

Containment Strategies

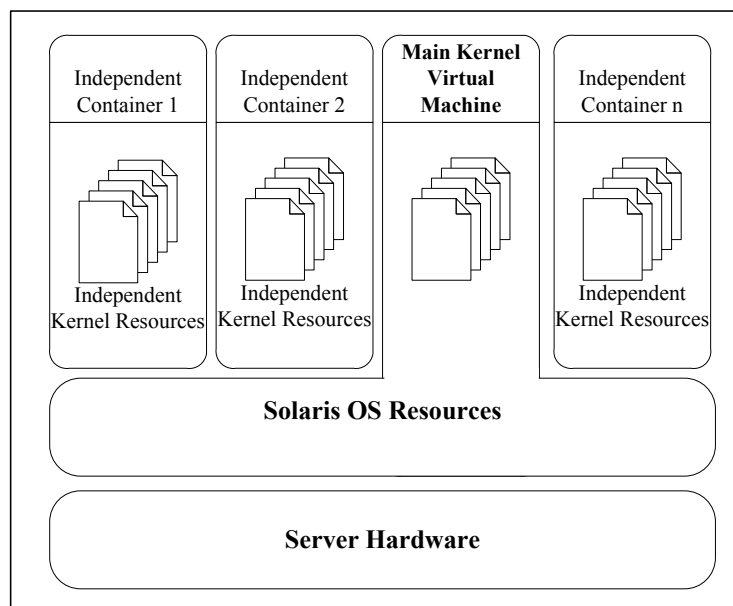

A Solaris Container is a runtime environment for applications. Parts of the container are Solaris 10 Resource Manager and Solaris Zones. Zones isolate application components from one another even though they share the same instance of the Solaris OS. The container establishes limits for resource consumption, such as CPU, memory. Sun's BrandZ technology is used to run Linux applications on the Solaris Operating System. Linux applications run unmodified in the secure non-global zone environment. This enables the developing, testing, and deploying of Linux applications on Solaris. Related Containment Technologies on other operating systems are: chroot (Unix OS), FreeBSD jails , Systrace, AppArmor, Xen and VMWare.

AIM (Advanced Integration Matrix)The AIM Multiuser Benchmark, also called the AIM Benchmark Suite, is a job throughput benchmark widely used by UNIX computer system vendors. AIM is a program written in C that forks many processes called tasks, concurrently

running random set of subtests called jobs. There are 53 kinds of jobs, with different aspect of the operating system, such as disk-file operations, process creation, user virtual memory operations, pipe I/O, and compute-bound arithmetic loops. Each subrun reports a metric of Jobs completed per minute, with the final report for the overall benchmark being a table of that throughput metric versus number of tasks. A given system will have a peak number of tasks N at which the jobs per minute is maximized. Either N or the value of the jobs per minute at N is the metric of interest. The peak performance is the highest jobs/minute the system achieved. The sustained performance is the square root of the total area under your performance curve up to the point of crossover. The point of crossover is that point at which the Jobs per Minute/User Load = 1.0. The JTI (job timing index) rating is the worst case JTI.

Solaris Zones

Solaris Zones are a component of the Solaris Container environment. A zone is a virtualized operating system environment created within a single instance of the Solaris Operating System. When creating a zone, we produce an execution environment where processes are isolated from the rest of the system. This isolation prevents processes that are running in one zone from monitoring or affecting processes that are running in other zones. Even with superuser permissions a process cannot view or affect activity in other zones. A zone also provides an abstract layer that separates applications from the physical attributes of the machine, like physical device paths. We can create a maximum number of 8192 zones on a system. There are two types of non-global zone root file system models: sparse and whole root. The sparse root zone model optimizes the sharing of objects. The whole root zone model provides the maximum configurability.

Kernel Virtualization Technology using the Container approach

The commands to install, boot, halt, uninstall and clone non-global zones are `zoneadm`, `zonecfg` and `zlogin`. The cycle of zones is: Configured → Incomplete → Installed → Ready → Running.

Advantages and Disadvantages

Zones are used for systems that integrate a number of applications on a single server. Its advantages are the lower cost and complexity of managing numerous machines. They enable more efficient resource utilization of the system. Other advantages are the isolation that this technology introduces to the services and also the security. We have a higher level of security using Zones because in case of an attacker breaking into the zone, he cannot break into the other non-global zones or into the global zone. So a zone is completely isolated and it is transparent from the rest of the system. It communicates with the rest of the system through networking API. A zone does not need a dedicated CPU, a physical device, or a piece of physical memory. These resources can be multiplexed across some zones, or allocated using the resource management feature. Some disadvantages are that the zones need some extra resources, like file system usage, processor cycles and memory usage.

Isolation and Security

Solaris Zones partitioning technology, provides a means of virtualizing operating system services to create an isolated environment for running applications. This isolation prevents processes that are running in one zone from monitoring or affecting processes running in other zones. Basic communication between zones is accomplished by giving each zone IP network connectivity. An application running in one zone cannot observe the network traffic of another zone. This isolation is maintained even though the respective streams of packets travel through the same physical interface. The applications are also prevented from monitoring or intercepting each other's network traffic, file system data, or process activity. Actions taken by a zone administrator in a non-global zone do not affect the rest of the system.

Design and Implementation

The test and experiments are based on the following hardware system configuration:

Toshiba Satellite A110, PSAB0E-00F00MGE, Genuine Intel ® CPU T2250 @ 1.73 GHz, Physical Memory 1527 MB (Kingston DDR2 PC2-5300 1024MB, Samsung DDR2 PC2-4300 512MB), RealTek RTL8139/810x Family Fast Ethernet NIC, Western Digital WDC WD2500BEVS-00UST0 ATA 250 GB (8MB buffer size), 51GB ZFS partition.

And the operating system and software characteristics are like below:

SunOS 5.11 snv_101b i86pc i386 i86pc Solaris, which is OpenSolaris 2008.11 but this are also applicable to Solaris 10, AIM (advanced integration matrix) benchmark v7 and v9 Caldera International, Inc.

We will make our experiments based on the creation, installing and booting of zones. The goal of the experiments is to minimize the overhead introduced by the zones regarding to memory, storage and processing power. The first part consists in the configuration and the installation of a zone. We estimate the zone creation with the time and du utility to measure the disk usage. We create the zone in the following way:

```
zonecfg -z zone1 "create; set
zonepath=/zones/zone1; set autoboot=true; add net; set address=192.168.0.1/24; set
physical=rge0; end; commit; exit"
```

Next we install the zone and estimate it with: *time zoneadm -z zone install*

And then we get the results of the package info and the disk usage with *pkginfo* and *du-hs*.

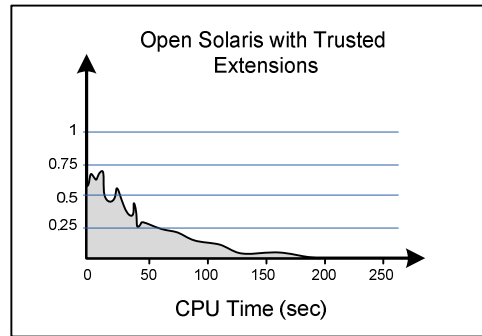

When installing a zone by default the whole directory tree is copied to the non-global zone thus increasing the installation time and also the disk usage. In order to decrease this we use specified directories by the global zone directory tree by inheriting them.

```
zonecfg -z zone1 "create; set
zonepath=/zones/zone1; set autoboot=true; add
inherit-pkg-dir; set dir=/usr; end;add inherit-
pkg-dir; set dir=/sbin; end;add inherit-pkg-dir;
set dir=/bin; end;add inherit-pkg-dir; set
dir=/platform; end; add inherit-pkg-dir; set
dir=/lib; end;add net; set address=192.168.0.1/24; set physical=rge0;
end; commit; exit"
```

Again with the same method we will show that in this way the overhead introduced by the creation and installation of zones is lower than the first one. The next experiments that we will make are based on AIM benchmark and show the performance of the system as a whole and the overhead introduced by zones. The benchmarks will evaluate the performance of a multiuser system (aim7) for example a server, and of a single user system (aim9) based on a number of tests, like arithmetic tests, disk/fs I/O tests, IPC, function calls, algorithmic tests etc. Firstly we will execute the benchmark only on the global zone without any non-global zone installed. And then the benchmark will be executed on the global zone with the running non-global zones.

Results

The results of the AIM benchmark in the two cases without and with Trusted Extensions running, are presented below.

Average CPU Time tests on the containers without and with Trusted Extensions enabled

Jobs per Minute load tests on containers without and with Trusted Extensions enabled on them

System load tests on containers with and without Trusted Extensions enabled

Conclusion

Based on the results of the tests and experiments we can say that the sparse zone installation gives a lower overhead to the system in terms of disk usage, memory and processing power. The number of packages that the zone requires to be installed, the time needed for the zone to be installed also the storage that the zone consumes are lower. Approximately the rates of time, package and disk usage between sparse zone and whole root zone are 18/23, 1/9 and 1/3. These rates vary on the configuration of the sparse zone. The performance and the overhead that a zone introduce to the system based on the benchmark is at this rates: Peak = 976.5/993.5, Sustained = 344.4/365.6, Minimum JTI = 91/92. Also from the singleuser benchmark (aim9) results we can say that the values of the tests differ very little from each other and we can conclude that in this way we have achieved a better utilization of hardware and operating system without affecting the overall performance of our system. We have shown that with this virtualization technology we can make use of all of our resources and thus achieving a higher processing power.

While the virtualization technology using Solaris Containers provides fair isolation between independent containers, there exist many security threats which can affect the isolated container itself. These threats are not discussed on this paper and remain the same as for the non-virtualized systems which are managed by Operating System developers and implemented by System administrators through patches and system upgrades. The weak points of Containment strategies consists on implementation of virtualized device drivers using a lower software layer of Operating System which implements the sharing of Server resources among individual containers and thus opening a vulnerability issue for all Containers. This makes our Containers, even with Trusted Extensions enabled, susceptible to service denial attacks and degradation of financial services offered by the Server.

THE IMPACT OF MIGRATIONS: CAN URBAN PLANNING BE A TOOL TO SOLVE THE SOCIAL PROBLEM OF INTEGRATION?

de Biase, Claudia¹

¹Department of Cultura del Progetto, Architecture Faculty. Second University of Naples, Via San Lorenzo, abbazia di San Lorenzo ad Septimum - 81031 Aversa (CE), Italy. Email: claudia.debiase@unina2.it

Abstract

Immigrants, coming to Italy from different origin countries, demand for a new kind of city characterized by public spaces, services and places of worship able to satisfy their specific needs. It derives that integration, the main social problem in nowadays societies, necessary passes through the act of urban planning.

Starting from available data, provided for example by Caritas-Migrantes, ISTAT, ISMU, CENSIS, about immigrants in Italy, about their distribution over Italian Regions and about their settlement in different cities, the main focus of the present work is on normative aspects and on new project proposals connected to the housing problem.

In the last part, the case of the Campania Region, characterized by a great amount of immigrants and by the proposal of new urban policies included in the "Piano Casa", represents a new intriguing proposal to foster immigrants' urban integration.

Introduction

Migrations, as noticed by Sartori (2002), have determined an *over-diversity* in cities due to language, traditions, religion and ethnicity. As known, multi-ethnic cities aim to guarantee the co-existence of diversities; inter-ethnic cities, instead, aim to integrate these diversities. To achieve integration in inter-ethnic cities is not easy and urban planning plays a very important role.

Urban planning has to change urban spaces by considering:

- Migrations to the destination country;
- Settlement in urban areas.

Migrations imply a new kind of city depending on the evolution of immigrants' needs in time and on heterogeneity of ethnic groups.

Immigrants' needs evolve in time: when they arrive in the destination country they try to satisfy their urgent needs; after that they have care needs; eventually they show needs related to settlement in the area (Palidda, 1996).

As noticed by Secchi (1999), it is necessary to consider groups heterogeneity since it affects choices about urban spaces to live in: for example, the Moroccans live in different urban areas from the Chinese, because of their culture and religion, their socio-economic conditions and

their mores. As notice by Beguinot, the complex mosaic of immigrants “creates a complex demand for shelter, services, public spaces, places of worship, and opportunities for self and group realization” (2009, pg. 61).

According to Beguinot (2006), several questions can rise up: How do immigrants use urban spaces? Can urban planning facilitate co-living between immigrants and local people?

To be sure that different spaces can be used by different ethnicity (Perrone, 2010; Sandercock, 2004), urban planning must organize the co-living, must plan the use of urban spaces and must rule relations between spaces and people, by referring to the residential aspects, including all the primary services like housing, education, etc. (Bergamaschi et al., 2009). In other words, urban planning cannot exclude social dynamics embedded in the urban context and cannot ignore further implications (Beguinot, 2004; La Cecla, 1998).

For this reason, the final aim of the present work is to underline the importance of urban planning tools to foster integration (Clemente and Esposito, 2008; Sciortino and Colombo, 2004; Stalker, 2003; Martiniello, 2000).

Empirical Evidences from Italy

Urban planning activity requires starting from data about the amount of ethnic groups in Italy (Novak, 2007) where migrations are a very relevant phenomenon. The reasons of this are the political changes happened in east Europe in 1991 and the regularization procedures by Italian government both in 1995 and 1998.

The most numerous ethnic groups in Italy (Caritas-Migrantes, 2010, pg. 13) are Rumanians (887.763), followed by Albanians (466.684), Moroccans (431.000 nearly) and Chinese (188.352). Rumanians and Albanians have grown up consistently in the last ten years (in 1990 Albanians were 1.853 and Rumanians were 7.494; in 2009 Albanians were 466.684 and Rumanians were 887.763).

The Chinese case is very peculiar since they have economic resources able to guarantee an easier and faster establishment in Italy and a sort of protection by co-ethnic people. As a consequence Chinese people can easily assume co-ethnic people as employees and make their community bigger and bigger.

Despite differences in the amount of ethnic groups, there is no predominant ethnicity in Italy (ISTAT, 2008): immigrants came from all over the world. This is the reason why it is possible to define Italy as the destination of “policentrismo migratorio” (migratory polycentrism stands for the most numerous ethnic group and its incidence on the total amount of immigrants to Italy), that means that each 10 people, 4 are European, 3 are Africans, 2 are Asiatics and 1 is American.

In reference to the cities where immigrants decide to settle, it is important to underline that immigrants have changed their destination over the years: in the '60 and '70 immigrants went

in the North-west regions of Italy (Torino- Milano-Genova) because of the so many big firms working there; in the last decades immigrants went in the North – east regions of Italy, where many new small firms work (Harris, 2000; Carchedi, 1999; Sassen, 1999; Tonizzi, 1999).

Nowadays, as noticed by ISMU (2010), most of the 5 millions of migrants living in Italy are settle in the North Regions. In the last ten years, the presence rate has grown of nearly 13-14% per year, that is 3-4% points higher than national average.

Latest data about immigrants' presence in Italy are shown in Table 1.

<i>Italian Areas</i>	<i>2007</i>	<i>2008</i>	<i>2009</i>
<i>North-west</i>	35.6	35.1	35
<i>North-east</i>	26.9	27	26.6
<i>Center</i>	25	25.1	25.3
<i>South</i>	8.9	9.1	9.3
<i>Islands</i>	3.6	3.7	3.8
<i>Total</i>	100	100	100

Table 1: Immigrants' distribution over Italian Areas
(Source: Caritas Migrantes, 2010, pg. 13)

By splitting the above data, it emerges that most of immigrants settles in Regions like Lombardia, Veneto, Emilia Romagna e Marche, where employment rates are higher. However, Roma and Milano urban areas are still the most common choice for immigrants (Caritas-Migrantes, 2010, pg. 482 ss.).

As noticeable by the above data, the South regions still keep their importance in the migration phenomenon, especially the Campania region, that is the driver among these regions. In the '90 there were 31.801 immigrants in the Campania region, in 2000 they were 68.159, in 2009 they were 147.057 (Caritas, pag. 464).

The Campania case is very peculiar because many criticalities characterize this Region. Irregular immigrants are not considered in the estimation (Pugliese, 1996); it means that immigrants should be more than 147.057. Moreover, it sounds strange that immigrants settle in a very poor region, where unemployment rates for local people are very high (ISMU).

The Way Immigrants Settle in Italy

As noticed by ISTAT (<http://www.istat.it/>), different ethnic groups follow different paths to settle in destination countries.

The hypothesis of different ethnic groups living in the same place finds its best example in cities that are places where similarities, contradictions and differences - age, ethnic group, gender, social class, religion and culture - can mix and influence each other.

According to Secchi (1999), a multiethnic city is: “a place where you can find a co-presence of thousand of social figures and metropolitan tribes [...] a multi-different city [...], a thousand dialects crossroads, where the concepts of belonging, citizenship, representation, identity, change”. The co-existing of individuals with different stories and needs mainly deals with the urban dimension and determines a strong influence in defining, modifying and using spaces.

Each ethnic group, in fact, lives a city in a different way, according to its time and ways of living by determining new spatial forms and new ways of co-living.

Generally speaking, different ethnic groups settle in the different ways (Signorelli, 1996; Beguinot, 2005). According to Lanzani (1998), immigrants’ settlement depends on ethnic needs and activities; immigrants use the urban space according to this and so they settle in specific parts of cities.

Philippines and Peruvians (whose number of women is higher than that of man) settle close to the work place, especially in the city center or in rich urban areas. This happens because Philippines and Peruvians women work as family’s help or because rich urban areas are very close to the poor ones (as it is in Naples).

The Chinese ethnic groups follow a “residential pattern” (<http://www.michelucci.it/>) characterized by extreme concentration (Fondazione Michelucci, 1996). In Toscana and Lombardia Regions this pattern has been intensely evident. In Toscana Region, for example, Chinese people live in the same building where they work. As a result these building are very crowded and unsafe in reference to working and living conditions (Ceccagno, 2003). Two very important consequences are linked to the Chinese residential pattern: the first is the continuous changing of the building structure, where spaces are always adapted to new emerging needs booth living and working (<http://www.michelucci.it/>). The second instead, is the change of the house concept. House is no more a private place where families stay together, but it is an always-changing place responding to always changing needs (<http://www.michelucci.it/>).

In Lombardia region, instead, Chinese people have created a strong Chinese community in the Canonica-Sarpi area (Bellaviti et al., 2001). Chinese houses are located very close to working laboratories and to point of sales of Chinese goods (<http://www.cestim.it/>). In contrast to the well-known Chinatown model (Cologna, 2002, pg. 31 ss), the Canonica-Sarpi area is highly characterized by ethnic services and non-ethnic services are not allowed at all.

Eventually, Moroccans immigrants instead settle in urban areas where their families already live.

Of course, immigrants’ process of settling depends on social and cultural identity of each group and, at the same time, on the opportunities offered by the destination area, especially by the house market, that strongly affect the result of the migration process (Melotti, 2004;

Bordignon, 2003). Urban planners must satisfy this new housing demand. Governments determine the rules for co-living, but technicians must receive immigrants needs and to translate them in new spaces (Petrella, 2003).

The Housing Problem: Normative Aspects and Project Proposals

Housing, at very low price, concerning poor Italian people and immigrants as well, includes several criticalities like educational and working aspects that fall in the social sphere of actions and are part of political responsibilities (Reggiani, 2000, pg. 5).

The housing problem is one of the most important one when talking about urban planning. House, in fact, represents the most important parameter to measure life-quality of immigrants in Italy (Zincone, 2000; Zincone, 2001). Studies published by Fondazione Silvano Andolfi (2003), in fact, define space and time as the most important parameters to measure life-quality (Pergolotti e Gianferrari, 2004). By space they refer to both public and private spaces where interaction with others take place; by time they refer to free time and to the way it is spent (Fondazione Silvano Andolfi, 2003, pg. 68 ss. ; Tosi, 1993). House, which can mix space and time, determines a more or less intensive integration in the urban areas (Berti, 2003).

Despite the importance of houses to reach integration, immigrants have to face many difficulties to find a house when they arrive in Italy. They can aspire to houses to which local people are not interested in any longer (<http://www.unq.edu.ar>).

For this reason the analysis needs to start from a normative perspective to get to practical proposals. The premise to the analysis is that normative aspects do not always fit to emerging specific needs (Fondazione Silvano Andolfi, 2003, pg. 86 ss.).

The Testo Unico 268/98 that establishes social houses, collective or private, by offering national contributions to Regions for immigrants' and local poor peoples' residences renewal.

In the paragraph 4, art. 40 of Testo Unico 268/98 it is established that collective or private houses are provided to Italians and immigrants, who are waiting for an ordinary house. This kind of house is an effective response to immigrants seeking houses, but it is not appropriate.

Another very important point of the Testo Unico 268/98 (art. 40, paragraph 5) deals with regional contributions to renew only residences for immigrants. It is established that Regions can finance the renewal of public building only for regular immigrants, who have the permission of stay in Italy.

Moreover, the Testo Unico determines that immigrants have to be considered like Italians are in reference to public housing: brokerage services, housing rentals and subsidized credit are guaranteed to both immigrants and local people (art. 38 paragraphs 4-6).

The law n. 189/2002, so called "Bossi-Fini", still keeps the main part of the precedent articles, but does not establish any kind of financing to local authorities to renew public

building. It derives that immigrants have to face several difficulties to find a house and local authorities can destiny only residual resources to public housing problem.

The straight consequence of the above public policy is that, somehow, immigrants are considered as a new kind of poor people; it means that immigrants can be recipient of public houses since they are considered as new poor and not as new Italian people. This phenomenon recalls what happened in the '50s when working people of south regions of Italy moved to the north and they were compelled to live in public houses in the fringe areas. Some questions forcefully arise: is the housing problem only due to social classes problems? Is ethnicity a secondary aspect of the housing problems?

Actually, the housing problem is not economic but, above all, it is a cultural one, linked to origin countries. As underlined by Culotta (2004, pg 123 ss.), it is important to consider different housing solution in the origin countries. Arabian, Iranian or Moroccan houses have a main entrance that does not allow visiting people to see inside the house. Houses are developed around a open-sky area to get brightness.

According to this, Forno (2004, pg.139 ss.) maintains that the Italian way of building houses is different, and so it cannot be adapted to immigrants' needs. New houses for immigrants should be built according to the way of living in the origin countries, in order to make the integration easier and houses comfortable. Consequently, when planning new neighborhoods immigrants must be considered among the recipients of housing public offering (Tumielli, 2010; Cesareo and Bichi, 2010; Parra Spiani et al., 2010).

Such a mess about housing problem can only be solved by mixing public policies and private projects and by referring them to all the people seeking houses, including immigrants as a standing alone group.

Conclusions

The overview of national policies (Grandi and Tanzi, 2007), as shown in the above sections, does not provide a very optimistic picture but it seems that new initiatives have been at least proposed. The "Piano Casa", approved in 2009, stimulates social housing for several social groups and immigrants are one of them.

Of course, the "Piano Casa" is different from region to region.

Among several differences, it seems extremely interesting to focus on the "Piano Casa" in Campania, the region that has half of immigrants in the South of Italy. The "Piano casa" in Campania is interesting since it represents the final point of a process started in the last years. In 2005, in fact, some urban programs offered houses for immigrants only (especially houses that were confiscated to the organized crime, see <http://resources.regione.campania.it>). In 2006, the project Caracoles, in the MIRA project, was launched to offer estate brokerage services to immigrants. In 2007, social inclusion was promoted, through: a) reception,

information and brokerage services; b) working and housing inclusion; c) cultural integration and peaceful co-living (L. 11/07 art. 35).

The “Piano Casa” (L. 19/09 and L. 1/2011) represents the last phase of the social integration process. Up to now, the most innovative aspect of this urban planning tool is theoretical more than practical. Even if immigrants are not considered as beneficiary of specific actions, for the first time immigrants’ integration does not pass for a specific urban element (house, church, park, etc. etc.) but is considered as a whole in which all the urban elements coexist. In the end it clearly results (in Social residential guide line – 572/2010) that housing must be correlated to human relationships to create a decent context where immigrants and local people can live together.

EXPLORING INTERRELATIONSHIPS AMONG MORALE, SATISFACTION AND COMMITMENT FROM A POSITIVE PSYCHOLOGY PERSPECTIVE: EVIDENCE FROM GREECE

Dimitriades, Zoe S.¹

¹University of Macedonia, Thessaloniki, Greece. E-mail: zd@uom.gr

Abstract

The purpose of the paper is twofold: (i) to contribute to commitment research by exploring the dual nature of normative commitment (Meyer et al, 2006; Meyer and Parfyonova, 2010) in a Greek setting; and (ii) to examine the mediating role of morale in the 'job satisfaction – organizational commitment' relationship, within a positive organizational behavior (POB) framework.

A total of 331 questionnaires were completed by bank employees. Data were analyzed via confirmatory factor analysis (CFA), reliability-, correlation-, and mediation analyses. Results reveal that: (i) a two-dimensional model of organizational commitment –characterized by a moral duty mindset and an indebted obligation mindset- fits the data better than the traditional three-component model, providing support to Meyer et al's (2006) and Meyer and Parfyonova's (2010) propositions; (ii) a moral duty mindset of organizational commitment is strongly associated with morale and job satisfaction; whereas, an indebted obligation mindset is relatively less strongly associated with job satisfaction and morale, in line with Meyer and Parfyonova's (2010) suggestions; and (iii) morale fully mediates the 'job satisfaction - organizational commitment' relationship – in line with expectations.

Keywords: happiness at work; organizational commitment; morale; job satisfaction; Greece.

Acknowledgement

The author wishes to express her true appreciation to Professor Nancy Papalexandris, of Athens University of Economics and Business, for her kind assistance with data collection in Athens.

Background

In recent years, the field of positive psychology has emerged to bring awareness to the role of psychology in making life more fulfilling, enhancing human functioning, and increasing happiness (Fisher, 2009; Schiffrin and Nelson, 2010; Seligman, 2002). Specifically, "The consideration of positive psychology in the work context raises some interesting questions about the relationship between satisfaction in life and at work. How does work contribute or take away from individual happiness? And, can organizations use learnings from positive

psychology to enhance employee well-being and performance?" (Money, Hillenbrand and da Camara, 2008, p. 24-25).

Although many definitions of happiness have been used in the literature, "ranging from life satisfaction and an appreciation of life to momentary feelings of pleasure" (Lyubomirsky, King and Diener (2005, p. 816), in the present research the term 'happiness' is used to describe "positive subjective experiences" (Schiffrin and Nelson, 2010, p. 34). Research has suggested that increasing happiness has multiple benefits. For example, Lyubomirsky et al (2005) presented evidence that positive affect is associated with multiple positive outcomes including better performance ratings at work, higher salaries, and improved health (Schiffrin and Nelson, 2010, p. 33).

Happiness-related constructs in organizational research vary in terms of: (a) the level at which they are seen to exist; (b) their duration or stability over time; and (c) their specific content (Fisher, 2009, p. 386). Most 'happiness constructs' in organizations are conceptualized at the *person* level, "where all the variance of interest occurs between individuals" (Fisher, 2009, p. 386). "Happiness-related constructs usually defined and measured at person level include dispositional affectivity, job satisfaction, affective commitment, and typical mood at work".... "The most frequently studied construct – in the family of constructs related to happiness at work- is by far job satisfaction, followed by organizational commitment" (Fisher, 2009, p. 388). *Unit-level* constructs describe the happiness of collectives such as teams, work units, organizations. Examples of unit-level happiness-related constructs include morale, unit-level engagement, group mood, group affective tone; and group task satisfaction (Fisher, 2009, p. 385; Peterson, Park and Sweeney, 2008, p.20).

The vast majority of happiness research has focused on *individual*-level variables (e.g., job satisfaction) rather than *group*-level constructs (e.g. morale) – "the acknowledged weak link of positive psychology" (Peterson et al, 2008, p. 20). A literature review of happiness-related constructs in Greece revealed ten studies on job satisfaction; eleven studies on organizational commitment; and none on morale. Moreover, previous studies examined either job satisfaction in relation to organizational commitment; or job satisfaction in relation to morale (see discussion below). No studies were traced exploring potential inter-relationships among these three constructs. Aiming to extend the commitment literature and happiness research, the present investigation explores the mediating role of morale in the job satisfaction-organizational commitment relationship in the relatively under-researched Greek context from a positive psychology perspective.

Conceptual Framework

Organizational Commitment

Conceptualizations

Commitment is a central concept in psychology (Morrow, 1993); it can be defined as a willingness to persist in a course of action (Cooper-Hakim and Viswesvaran, 2005, p. 241). Psychologists have devoted voluminous efforts to studying commitment in the workplace (Cohen, 2003; Cooper-Hakim and Viswesvaran, 2005). Several forms of commitment have been proposed, measured and tested for correlations with important outcomes: *organizational* commitment; *job* commitment; *career* commitment; *occupational* commitment; *union* commitment, etc.

Organizational commitment has been conceptualized in a number of ways (Swales, 2002) - not all of which are directly relevant to happiness (Fisher, 2009). "For instance, continuance or instrumental commitment involves staying with an organization because of the inducements offered or because of a lack of viable alternatives rather than because membership is valued or pleasant. In contrast, commitment based on personally identifying with the organization's goals and values and being affectively attached to the organization would be considered part of happiness at work" (Fisher, 2009, p. 388).

Indeed, Meyer and Allen (1984) proposed that a distinction be made between *affective* and *continuance* commitment, with affective commitment denoting an emotional attachment to, identification with, and involvement in the organization; and continuance commitment denoting the perceived costs associated with leaving the organization. Allen and Meyer (1990) later suggested a third distinguishable component of commitment, *normative* commitment, which reflects a perceived obligation to remain in the organization (Meyer, Stanley, Herscovitch & Topolnytsky, 2002).

Operationalizations

The Organizational Commitment Questionnaire (OCQ) developed by Mowday, Steers, & Porter (1979) was the commitment measure of choice for many years (Fischer, 2009). This scale was designed to tap the extent to which: (i) employees identify with and accept the organization's goals; (ii) are willing to exert effort towards organizational goal accomplishment; and (iii) strongly desire to remain part of the organization. The OCQ is regarded as predominantly assessing the *affective* dimension of organizational commitment (Fisher, 2009; Mowday, 1998).

In the 1980s and early 1990s several alternative models of commitment, all of which were multidimensional, were developed (Wasti, 2007). Of these, the *Three-Component-Model* (TCM) by Meyer and Allen has gained substantial popularity (Bergman, 2006). Meyer and Allen and their Associates (1990; 1993) developed the affective (ACS), continuance (CCS), and normative (NCS) commitment scales to measure these components.

The three-component model appears to have received considerable empirical support in the North American context (Meyer et al, 2002). However as noted by Bergman (2006), in US and Canadian studies, neither the 8-item (Allen and Meyer, 1990) nor 6-item (Meyer, Allen and Smith, 1993) NCS has been shown to have a high degree of discriminant validity with the ACS. Both versions of the scale tend to be highly correlated with the ACS - .77 for the 6-item and .54 for the 8-item version (p.648).

In non-western cultures, the NCS and ACS tend to be even *more* highly correlated (Jaros, 2007; Wasti, 2007). For example, Ko, Price and Mueller (1997) tested Meyer and Allen's (1991) model in Korea. "The three scales had acceptable reliability and convergent validity, but the AC and the NC scales lacked discriminant validity and the construct validity of NC and CC were questionable" (Wasti, 2007, p.5). Likewise, Lee, Allen, Meyer and Rhee (2001) used back-translated versions of Meyer, Allen, and Smith's (1993) scales in Korea and obtained results similar to Ko et al. (1997).

In line with previous findings, Cooper-Hakim and Viswesvaran (2005) meta-analysis also state that "there is substantial overlap between affective and normative organizational commitments" (p. 252). On the basis of these considerations, Meyer, Becker and Van Dick (2006) suggested that *normative* commitment might have 'two faces': one reflecting a 'moral imperative' and the other an 'indebted obligation'. "Therefore, although there is a need for further empirical validation of the dual nature of normative commitment, we believe that there may be a benefit to distinguishing between two basic forms of commitment within our integrative model. The first, which we refer to as *value-based commitment*, includes affective commitment and that aspect of normative commitment that reflects obligation to achieve valued outcomes. The second, which we call *exchange-based commitment*, includes continuance commitment and that aspect of normative commitment that reflects an obligation to meet other's expectations" (Meyer et al, 2006, p. 673).

Furthermore, an ongoing debate in the commitment literature relates to whether continuance commitment is uni-dimensional or bi-dimensional, consisting of two sub-components: low perceived alternatives to the current organization, and high personal sacrifice associated with leaving (Meyer et al, 2002, p. 24). Contrary to Meyer et al (2002), Ko et al (1997) argued that lack of alternatives should be treated as an antecedent to continuance commitment rather than a component of commitment. Results reported by Wasti (2003) supported the operationalization of continuance commitment as high perceived costs associated with leaving.

In sum, it may be argued that while the dominant approach to OC is multi-dimensional "there is controversy about the contribution of some of its dimensions to the understanding of commitment. Overlap between the two dimensions (e.g. normative and affective commitment) and unclear dimensionality in another dimension (e.g. continuance commitment) are some of the causes for the ambiguity in the current approach to OC"

(Cohen, 2007, p. 137). Future investigations can contribute “by refining the operationalization of the components, particularly CC and NC” (Wasti, 2007, p. 6).

Commitment Research in the Greek Context

Although Greece is represented in most major studies of cross-cultural variation (Hofstede, 1980; 2001; House et al, 2004), “organizational commitment is rarely reported from a Greek perspective” (Markovits, Davis and van Dick, 2007, p. 78). Indeed, only *eleven* studies were identified in the Greek commitment literature: Bellou (2008, p. 778), examining “the way that psychological contract breach affects employee turnover intention and civic virtue, after taking into consideration the mediating role of organizational commitment and the moderating role of coping with changes”; Bourantas, (1988, p. 121), addressing “the relation between the leadership styles, need satisfaction and the organizational commitment of Greek managers”; Dimitriadis (1988), exploring the link(s) between work commitment and individual success among Greek private- vis-à-vis public sector managers; Giannikis and Mihail (2008), examining organizational commitment among full-time and part-time retail employees; Markovits and Associates (2007; 2008; 2010), investigating ‘job satisfaction-organizational commitment’ links among public and private sector employees; Sahinidis and Bouris (2008, p. 63), addressing “the relationship between perceived employee training effectiveness and job satisfaction, motivation and commitment”; Simosi (2010, p. 301), exploring “the role of social socialization tactics on the relationship between task- and organization-related information (socialization content) and newcomers’ affective commitment to their work organization”; Simosi and Xenikou (2010, p. 1598), examining “the nature of relationships between organizational culture and leadership behaviours in affecting employees’ commitment to their work organization”; and Vakola and Nikolau (2005, p. 160), addressing “the linkage between employees attitudes towards organizational change and two of the most significant constructs in organizational behavior; occupational stress and organizational commitment”.

As illustrated in Table 1, the majority of existing studies adopted the Meyer et al’s (1993) six-item measure.

06	Simosi & Xenikou (2010)*	6	5.51	1.80	0.85	3	5.49	1.42	0.74	4	4.40	1.57	0.80	
	Simosi & Xenikou (2010)**					2	4.58	1.79	0.71					

Note: 7-point response format. *High-sacrifice **Limited alternatives

Inter-correlations among commitment components are reported in Table 3. Two points appear to be worth noting. The first relates to the high correlation between affective and normative commitment (with the exception of the Simosi study). Although correlations ($r = 0.66$ to $r = 0.73$) reported by Markovits et al (2007; 2008; 2010) are in line with meta-analytic correlations ($\rho = .77$) reported by Meyer et al (2002, p. 29), they may be interpreted as potentially denoting a conceptual overlap between these two commitment components. The second point worth noting relates to continuance commitment and its relationship to affective commitment. Thus, while in North American studies the correlation between affective and continuance commitment was *opposite* in sign (Meyer et al, 2002, p. 29), in Greek studies affective and continuance commitment were *positively* correlated. Moreover, only the *high-sacrifice* aspect of continuance commitment was significantly positively correlated with the affective and normative components.

Table 3. The Three-Component-Model (TCM) in the Greek Context:
Inter-correlations among commitment components

	<i>r</i>												
	Markovits (2007)			Markovits (2008)			Markovits (2010)			Simosi (2010)

CC- LA										-0.14*	0.03ns	0.26**	-

Note: CC-HS = High Sacrifice Continuance Commitment; CC-LA = Low Alternatives Continuance Commitment

Since none of a/m studies explicitly addressed the issue of dimensionality of organizational commitment in the Greek context, the present research represents an attempt to fill this void via comparing the traditional three-component model [comprising affective-, normative-, and continuance commitment] with a two-component model proposed recently by Meyer et al (2006), comprising value-based and exchange-based commitment.

Satisfaction-Commitment Links

The importance of job satisfaction (see discussion below) and its relationship with organizational commitment has been acknowledged for many years (Markovits, Davis, Fay and Van Dick, 2010). Meyer et al's (2002) meta-analysis provide substantial insight into this

relationship. Although job satisfaction has traditionally been considered as “one of the most powerful predictors of organizational commitment, in public and private sector contexts” (Markovits et al. 2010, p. 178), Meyer et al (2002) consider job satisfaction a correlate of commitment “because there is no consensus concerning causal ordering” (p. 22) – for a review of conflicting findings see Meyer (1997).

Contributing to the debate concerning causality, Markovits et al (2010) propose that “reciprocal relationships exist between forms of organizational commitment and elements of job satisfaction. A satisfied and happy employee tends to be committed to the organization, returning back to the organization this positive affect via commitment and the concomitant organizationally relevant outcome identified earlier” (p. 178).

Job Satisfaction

Conceptualizations

From the perspective of research and practice, the most focal employee attitude has been job satisfaction (Saari and Judge, 2004). In his seminal 1976 review of the job satisfaction literature, Locke observed that more than 3,300 scholarly articles had been published on the topic of job satisfaction (Cole and Cole, 2009). Whereas, the Harter, Schmidt and Hayes’ (2002) search yielded another 7,855 articles having been published between 1976 and 2000 (Cole and Cole, 2009).

One of the most frequently-used research definitions of job satisfaction is by Locke (1976), who defined it as “.... a pleasurable or positive emotional state resulting from the appraisal of one’s job or job experiences (p. 1304). It is an attitudinal variable that has been explored both as an overall evaluation of the job (global satisfaction) and as a cluster of attitudes relating to different aspects of the job (facet satisfaction) (Markovits et al, 2010, p. 178; Saari and Judge, 2004, p. 400).

Operationalizations

Recently, Fisher (2009) in her comprehensive review entitled “Happiness at Work” argued that “there has been a history of mismatch between the definition of this construct and its measurement”..... “Widely used instruments such as the Minnesota Satisfaction Questionnaire (MSQ, Weiss et al, 1967), the Job Descriptive Index (JDI, Smith et al 1969) and the Job in General Scale (Ironson et al, 1989) ask for descriptions and evaluation of job features rather than feelings about the job or emotional experiences while working. It has been demonstrated that these commonly used verbal measures do not capture affect very well, certainly not as well as a ‘faces’ scale of job satisfaction” (p. 388).

Satisfaction Research in the Greek Context

A review of the literature identified *ten* studies examining satisfaction in the Greek context: Antoniou, Davidson and Cooper (2003), investigating occupational stress, job satisfaction and health among male and female junior hospital doctors in Greece; Bellou (2009, p. 455),

examining “the impact of person-organization (P-O) fit on employee behavior” and testing “the mediating role of job satisfaction on these relationships” in three public hospitals; Bozionelos and Kiamou (2008), analyzing the effect of emotion work on emotional exhaustion and work attitudes in the Greek banking industry; Demoussis and Giannakopoulos (2007, p. 333), exploring “job satisfaction in private and public employment”; Gounaris (2008) analyzing the impact of internal marketing practices on employee job satisfaction in Greek luxury hotels; Manolopoulos (2008), addressing work motivation in the Greek public sector; Menon and Saitis (2006, p. 345), “comparing the satisfaction levels of pre-service and in-service primary school teachers with respect to school organization and administration; Nikolau and Robertson (2001), exploring the validity of the five-factor model of personality and its relationship to employee job satisfaction in occupational settings in Greece; Sahinidis and Bouris (2008, p. 63), investigating “the relationship between perceived employee training effectiveness and job satisfaction, motivation and commitment”; and Zampetakis and Moustakis (2011), examining the effect of managers’ trait emotional intelligence on group job satisfaction in public service organizations.

Satisfaction-Commitment Links

Following Markovits et al (2010), in the current study job satisfaction will be examined as a *predictor* of organizational commitment, since one of the aims of the present research is to shed some light on the job satisfaction-organizational commitment link by examining the mediating role of employee morale (see discussion below) in this relationship.

Morale

Conceptualizations

According to McFadzean and McFadzean (2005, p. 319), morale is an important factor in any organization. “For example, high morale can result in the achievement of organizational goals along with increased productivity, whereas low morale can result in high stress levels, active resistance, absenteeism, an increase in professional negligence, and poor professional behavior and performance (Andersson and Bateman, 1997; Castledine, 1997; Denney, 2003; Ford et al, 2003; Gilmore et al, 1996)”.

Yet, despite its importance to the organization, no agreed definition of morale actually exists (McFadzean and McFadzean, 2005). “For example, Guba (1958) suggests that definitions of morale tend to consist of two elements, that of communality of goals and a sense of “togetherness” and “belongingness”. His own definition of morale incorporates these ideas: morale is “a predisposition on the part of persons engaged in an enterprise to put forth extra effort in the achievement of group goals or objectives” (Guba, 1958, p. 198). This group aspect of morale is also reflected in Castledine’s (1997, p. 773) description of morale as “essentially ... a matter of ‘group spirit’ or cohesiveness” (p. 319). However, these definitions make no mention of individual morale (Evans, 1997, p. 832) – “an individual feature related

to beliefs about the future and anticipation of the extent to which the job will fulfill the individual" (Young, 2000, p. 161).

"As used today, morale is a cognitive, emotional, and motivational stance toward the goals and tasks of a group. It subsumes confidence, optimism, enthusiasm, and loyalty as well as a sense of common purpose. Morale is used to describe individuals as well as groups, a complexity that poses an ongoing challenge in attempts by social scientists to study it" (Peterson et al, 2008, p. 21).

Operationalizations

"Research to date has treated morale in unidimensional terms" (Peterson et al, 2008, p. 22)... typically relying on self-report measures. "These face-valid questionnaires are often very brief –sometimes but single items" (Peterson et al, 2008, p. 26). One popular measure has been the morale scale developed by Hart, Conn and Carter (1992) "to measure the degree of energy, enthusiasm, team spirit and pride that teachers perceived in their school" (Hart (1994, p. 114). This measure also was adopted by Young (2000) to assess teacher morale in Australia.

Morale-Commitment-Satisfaction Links

Morale-Organizational Commitment

Only one study was identified investigating the impact of supervisor-subordinate relationships upon the morale and affective commitment of nurses in Australia (Brunetto, Farr-Wharton and Shacklock, 2010). Specifically, in the Brunetto et al study, the following hypotheses were developed and tested via path analysis:

H1: There is a positive relationship between satisfaction with LMX (predictor variable) and nurses' subsequent perceptions of morale (outcome variable).

H2: There is a positive relationship between nurses' perception of morale (predictor variable) and their levels of affective commitment (outcome variable).

H3: There is a positive relationship between nurses' levels of satisfaction with LMX, their perceptions of morale (predictor variables) and their levels of affective commitment (outcome variable).

Results provided support for all three hypotheses, indicating "that both LMX and morale are important contributors to the affective commitment of nurses" (Brunetto et al, 2010, p. 218).

Job satisfaction-Morale

Apart from the prominent work of Guba (1958) and Evans and Associates in Warwick U.K. (Campbell, Evans, Neill and Packwood, 1991; Evans, 1997; Evans, Packwood, Neil and Campbell, 1994), research into satisfaction and morale has been scarce (Young, 2000, p. 160).

Guba (1958) stated: "Satisfaction and morale may be related to one another in these terms as a function of time. To state the case in more qualitative terms, if an individual has found past experiences satisfying, he is likely to anticipate satisfaction in the future, and we say that he has high morale. Similarly, if his past experiences have been unsatisfying, he is likely to be unwilling or to be unable to expend effort in the production of other acts that will be equally unsatisfying to him, and we say that he has low morale. Thus it is reasonable to postulate a high positive relationship between measures of satisfaction and morale in any stable situation, and it is this hypothesis that the present study proposed to test" (pp. 199-200). According to Guba, "high satisfaction must precede high morale in point of time". "Within the limitations of method the experiment seems to validate the hypothesis that there is a critical time and energy factor in morale and satisfaction" (p. 196).

In agreement with Guba, Evans (1997) postulated: "The distinction which I recognize between morale and job satisfaction is one of temporal orientation: I perceive satisfaction as present-oriented, and as a response to a situation, and morale as future-oriented, and anticipatory (see Evans, 1992a)" (p. 832).

Following Guba (1958) and Evans (1997), job satisfaction is considered a predictor of morale in the present investigation.

Morale Research in the Greek Context

No studies on employee morale were identified in the Greek context.

Hypotheses

Following the literature review above, a theoretical framework was developed in which one individual-level variable (job satisfaction) and one organizational-level variable (morale) are examined in relation to organizational commitment. In line with Markovits et al (2010), job satisfaction is considered a predictor of (value-based) organizational commitment. Following Guba (1958) and Evans (1997), job satisfaction also is considered a predictor of morale. Drawing on the Brunetto et al (2010) study, value-based commitment is seen as an outcome of morale.

Figure 1. *Employee Morale as a Mediator of the 'Job Satisfaction-Value-based Commitment' Relationship*

As stated earlier (see p. 4), continuance commitment has not been considered to be directly relevant to happiness (Fisher, 2009). However, Warr (2007) suggests that apart from active positive states (e.g. job satisfaction, affective commitment, job involvement, etc) that are reflected in pleasurable feelings, there are also passive positive states (for example, career prospects or money) reflected in feelings such as contentment and calm (p. 727). Exchange-based commitment may be seen as promoting these states.

Thus, the following two hypotheses will be tested:

H1: Morale will mediate the job satisfaction-value based commitment relationship.

H2: Morale will mediate the job satisfaction-exchange based commitment relationship.

Figure 2. *Employee Morale as a Mediator of the 'Job Satisfaction-Exchange-based Commitment' Relationship*

Method

Organizations, sample characteristics and procedure

The organizations participating in this study are seven retail banks located in the city of Athens. These organizations are all large financial corporations with national branch networks. They serve a similar mix of private and corporate customers, and provide a similar range of products and services - such as current and savings accounts, loans, mortgages, insurance, business advisory services, and automated cash withdrawal through their branch networks. Self-administered questionnaires were personally distributed by the research team to 415 employees in branches located in the cities of Athens and Thessaloniki. Participation was voluntary. By the cutoff date for data collection, 331 usable surveys were retrieved from the employees. The data were collected in early 2009.

The sample comprised 136 (41 percent) males and 195 (58 percent) females. Forty percent of the respondents were between the age of 18 and 34, and fifty six percent were between 35 and 54 years old. Little more than one-half (53%) of the co-opting employees held a university degree. Approximately one third of the respondents (33%) had tenures of 5 years or less, forty two percent had tenures between 6 and 15 years, and twenty seven percent had been with the bank for more than fifteen years.

Measures

Organizational commitment was measured using Allen and Meyer's (1990) 24-item instrument. It was decided to use the 8-item ACS, CCS and NCS (instead of the 6-item version) in order to tap both the social- and moral obligation aspects of normative commitment (see Meyer et al, 2002, p. 40). Responses to the scale items were elicited on five-point scales ranging from 5 (strongly agree) to 1 (strongly disagree). The questionnaire was originally developed in English and was translated in Greek, following a process of back translation.

Prior to data collection, a pilot study was undertaken to ensure content validity. On the basis of pilot results, the following three items were excluded: item: "I do not think that wanting to be a 'company man' or 'company woman' is sensible anymore" was described as being "*too American!!!!*" to be adequately translated into Greek. Further, it was mentioned that the content of the item: "I do not feel a strong sense of belonging to my organization" was "*too strong for Greek bank employees*". Lastly, the item "One of the few serious consequences of leaving this organization would be the scarcity of available alternatives" was considered (by interviewed employees) to be *irrelevant* (at the time of data collection - e.g. before the economic crisis). Descriptives are cited in Table 4.

To compare the traditional three-component model (Allen and Meyer, 1990) with an alternative two-component model (Meyer et al, 2006; Meyer and Parfyonova, 2010), *affective commitment* was tapped with the following items of ACS (Allen and Meyer, 1990): "I enjoy

discussing my organization with people outside it"; "I really feel as if this organization's problems are my own"; "I think that I could easily become as attached to another organization as I am to this one (R)"; "I do not feel "emotionally attached" to this organization (R)"; "This organization has a great deal of personal meaning for me"; "I do not feel like "a part of the family" at my organization (R)".

Following Meyer and Parfyonova (2010), *continuance commitment* was operationalized as perceived high costs associated with leaving via the following items of CCS (Allen and Meyer, 1990): "It would be very hard for me to leave my organization right now, even if I wanted to"; "Too much in my life would be disrupted if I decided to leave my organization now"; "One of the major reasons I continue to work for this organization is that leaving would require considerable personal sacrifice"; "It would not be too costly for me to leave my organization now (R)".

'*Internalized personal norms*', or the '*moral imperative*' aspect of *normative commitment* was assessed with the following items of NCS (Allen and Meyer, 1990): "One of the major reasons I continue to work for this organization is that I believe that loyalty is important"; "I do not believe that a person must always be loyal to his or her organization (R)"; "I believe in the value of remaining loyal to one's organization".

Normative commitment as 'indebted obligation', or '*social norms*', was measured by the following items of NCS (Allen and Meyer, 1990): "Things were better in the days when people stayed with one organization for most of their career"; "People these days move from one company to another too often"; "Jumping from organization to organization does not seem at all unethical to me (R)".

Responses to scale items were elicited on five-point scales ranging from 5 (strongly agree) to 1 (strongly disagree).

Morale was tapped using five items suggested by Young (2000): "There is good team spirit in this organization"; "There is a lot of positive energy in this organization; "The morale in this organization is high"; "Employees go about their work with enthusiasm"; "Employees take pride in this organization". Responses to the scale items were elicited on five-point scales ranging from 5 (strongly agree) to 1 (strongly disagree).

Taking into consideration Fisher's (2009) arguments regarding the validity of widely used satisfaction measures in happiness research, *satisfaction with the job* was tapped by the following single statement (Linz, 2003): "Most people working in this organization are fairly satisfied with their jobs". Responses to the scale items were elicited on five-point scales ranging from 5 (strongly agree) to 1 (strongly disagree). While the use of single-item measures for psychological constructs is typically discouraged, primarily because they are presumed to have unacceptable low reliability, a meta-analysis of single item measures of

overall job satisfaction found the overall mean correlation to be .67 (Wanous, Reichers and Hudy, 1997, p. 247). Descriptives are cited in Table 5.

Table 4. Three-Component Model Scale Items - Descriptives

	Mean	SD	α
Affective Commitment (AC)	3.34	1.02	0.88
"I would be very happy to spend the rest of my career with this organization"	3.11	1.15

Job Satisfaction		
"Most people working in this organization are fairly satisfied with their jobs"	2.60	0.86

Note: All variables are measured using a 5-point response scale. N = 331

Data Analyses and Results

Data Analyses

The factor structure of organizational commitment in the current sample was explored via confirmatory factor analysis (CFA). Whereas, mediation analyses were performed to test the mediational hypotheses.

Results

Confirmatory Factor Analysis

Confirmatory factor analysis (CFA) using the maximum likelihood estimation procedure in AMOS 7 was conducted to test, initially, a three-dimensional factor structure of organizational commitment - in line with the traditional three component model (TCM). The following criteria were used to judge acceptable fit: a chi-square-d.f. ratio less than 4; a root mean square error of approximation (RMSEA) equal to 0.08 or less; and comparative fit (CFI) and Tucker-Lewis (TLI) indices equal to 0.90 or greater (Johnson and Chang, 2006). Fit statistics are presented in Table 6.

As may be noted, model fit statistics indicated a *poor* fit of the three factor model to the data ($\chi^2 / d.f. = 3.42$; GFI = 0.84; CFI = 0.85; TLI = 0.83; and RMSEA = 0.09). Each item loaded significantly on its respective underlying concept. The magnitudes of the standardized loading estimates ranged between 0.12 to 0.86, and all loadings were significant (i.e. all t-values were larger than 2.00). However the correlation between affective and normative commitment was extremely high ($r = 0.93$), denoting that research subjects were unable to distinguish the two concepts.

Table 6. Confirmatory Factor Analysis (CFA) Results – Three Component Model (TCM)

Next, CFA was conducted to test a bi-dimensional factor structure of organizational commitment in line with propositions by Meyer and Associates (Meyer et al, 2006; Meyer and Parfyonova, 2010). As may be noted from Table 7, the fit of the model was now, marginally, acceptable ($\chi^2 / d.f. = 3.07$; GFI = 0.89; CFI = 0.91; TLI = 0.89; and RMSEA = 0.08). Each item loaded significantly on its respective underlying concept and all loadings were significant (i.e. all t-values were larger than 2.00). The magnitudes of the standardized loading estimates ranged between 0.54 to 0.87, with the exception of the three items tapping the social obligation aspect of normative commitment that had relatively low -yet statistically significant- loadings on exchange-based commitment. Moreover, the correlation between the two commitment components was now moderately high ($r=0.43$).

Descriptive statistics and inter-correlations

Means, standard deviations, reliability estimates and inter-correlations of job satisfaction, employee morale and the two organizational commitment components are presented in Table 8. As highlighted in Table 8, the mean level of job satisfaction is fairly low ($x = 2.60$, $s.d. = 0.86$). This is in line with previous longitudinal findings ($x = 2.60$, $s.d. = 1.14$) in the Greek context (for a discussion see Demoussis and Giannakopoulos, 2007, p. 338). The fairly low level of satisfaction with the job 'corresponds' to the relatively low level of morale ($x = 2.77$,

s.d. = 0.84) – in accordance with Guba (1958, p. 199). On the contrary, the mean level of exchange-based commitment is relatively high in the present sample ($x = 3.41$, s.d. = 0.69).

Table 8. Descriptive statistics and correlations

Variable	N of Items	Min	Max	Mean	s.d.	α	1	2	3	4
1Employee Morale	5	1.00	5.00	2.77	0.84	0.88	-			
2Job Satisfaction	1	1.00	5.00	2.60	0.86	-	0.66**	-		
3Value Comm.	9	1.00	5.00	2.88	0.87	0.91	0.71**	0.47**	-	
4Exchange Comm.	7	1.50	5.00	3.41	0.69	0.73	0.21**	0.11*	0.43**	-

Note: All variables are measured using a 5-point response scale with higher scores indicating higher levels of morale, satisfaction and commitment. $N = 331$.

** Correlation significant at the 0.01 level, * Correlation significant at the 0.05 level

These results are in agreement with previous findings in Greece regarding continuance commitment (see Table 2), and may be indicative of the particular nature of exchange-based commitment [comprising high-sacrifice continuance commitment and the social obligation aspect of normative commitment] in the Greek context. Interestingly, the level of value-based commitment [comprising affective commitment and the moral obligation aspect of normative commitment] is lower ($x = 2.88$, s.d. = 0.87) in comparison to previous findings in Greece in relation to affective/normative commitment (see Table 2). These findings may be due to industry characteristics (see McMurry, 1958).

Job satisfaction correlates 0.47 with value-based commitment – in accordance with meta-analytic findings reported by Cooper-Hakim and Viswesvaran (2005, p. 253) and Meyer et al (2002, p. 33). On the contrary, in the current research satisfaction with the job is also (marginally) positively related to exchange-based commitment ($r = 0.11$, $p = 0.05$). These findings may, at least in part, be due to Greek employees' preferences for *extrinsic* rewards (Epitropaki and Ganoudis, 2005; Manolopoulos, 2008).

Lastly, morale is significantly, strongly correlated with job satisfaction ($x = 0.66$, $p = 0.01$) and value-based commitment ($x = 0.71$, $p = 0.01$) – in line with Guba (1958, p. 199) and Fisher (2009, p. 389). Yet, contrary to theoretical arguments (Fischer, 2009, p. 388), morale also was – modestly- positively associated with exchange-based commitment ($x = 0.21$, $p = 0.01$) – indicating potential societal and/or industry effects.

Mediation Analysis

Mediation analyses attempt to identify the intermediary process that leads from an independent variable to the outcome or dependent variable (Muller, Judd and Yzerbyt, 2005). According to Judd and Kenny (1981) and Baron and Kenny (1986), to demonstrate mediation three different models should be estimated (Muller, Judd and Yzerbyt, 2005, p. 853):

$$Y = \beta_{10} + \beta_{11}X + \varepsilon_1 \quad (1)$$

$$M_e = \beta_{20} + \beta_{21}X + \varepsilon_2 \quad (2)$$

$$Y = \beta_{30} + \beta_{31}X + \beta_{32} M_e + \varepsilon_3 \quad (3)$$

and four conditions must be met (Muller, Judd and Yzerbyt, 2005, p. 853) :

- In Equation 1, there must be a significant effect of the independent on the dependent, or outcome, variable; that is, β_{11} should be significant.
- In Equation 2, there must be a significant effect of the independent variable on the mediator; that is, β_{21} should be significant.
- In Equation 3, there must be a significant effect of the mediator on the dependent (or outcome) variable, controlling for the independent variable; that is, β_{32} should be significant.
- In Equation 3, the residual direct effect of the independent variable on the dependent variable (β_{31}) should be smaller (in absolute value) than the overall effect of the independent variable on the dependent variable in Equation 1 (β_{11}).

The results of the three-step process are presented in Tables 9 and 10.

Table 9. Employee morale as a mediator of the job satisfaction – value-based commitment relationship

No.	Dep Var	Ind. Var	Beta	T-Value	Sig. T	F-Value	Sig. F	Adj. R square
1	VC	JS	0.47	9.667	0.000	93.442	0.000	0.22
2	EM	JS	0.66	15.916	0.000	253.331	0.000	0.43
3	VC	EM	0.71	13.853	0.000	169.777	0.000	0.51
		JS	0.00	-0.003	0.998			

Note: JS = Job Satisfaction; VC = Value-based Commitment; EM = Employee Morale

Sobel Test Statistic = 10.42, Prob. = 0.000

As can be seen from Table 9, the independent variable (e.g. job satisfaction) affects both the dependent variable (e.g. value-based commitment – beta = 0.47, p=0.01) and the mediator (e.g. morale - beta = 0.66, p=0.01). Moreover, the mediator affects the dependent variable (beta = 0.71, p = 0.01). Thus, the first three conditions of

mediation are met. Additionally, the effect of the independent variable (job satisfaction) on the dependent variable (value-based commitment) is equal to zero in the third equation, denoting that morale *fully* mediates the ‘job satisfaction-value-based commitment’ relationship (see Kenny, 2009) – in support of hypothesis H1.

The same procedure was followed to test the mediating effect of morale on the ‘job satisfaction – exchange-based commitment’ relationship. As noted in Table 10, job satisfaction both affects exchange-based commitment (beta = 0.11, p=0.05) and morale (beta = 0.66, p=0.01). Moreover, morale affects exchange-based commitment (beta = 0.24, p=0.01). Thus, the first three conditions of mediation are met. Additionally, the effect of the independent variable (job satisfaction) on the dependent variable (exchange-based commitment) is approximately equal to zero in the third equation (beta = 0.04, p = 0.54), denoting that morale mediates the ‘job satisfaction-exchange-based commitment’ relationship – providing support to hypothesis H2.

Table 10. Employee morale as a mediator of the job satisfaction –exchange-based commitment relationship

No.	Dep Var	Ind. Var	Beta	T-Value	Sig. T	F-Value	Sig. F	Adj. R square
1	EC	JS	0.11	2.091	0.037	4.370	0.037	0.01
2	EM	JS	0.66	15.916	0.000	253.331	0.000	0.43
3	EC	EM JS	0.24 0.04	3.358 -0.619	0.001 0.536	7.891	0.000	0.04

Note: JS = Job Satisfaction; EC = Exchange-based Commitment; EM = Employee Morale. Sobel Test Statistic = 3.26, Prob. = 0.001

Discussion and recommendations for further research

The purpose of the present exploratory investigation was twofold:

(i) to extend commitment research via contrasting the traditional *three*-component model (Allen and Meyer, 1990) with an alternative *two*-dimensional model, characterized by a *moral duty* mindset and an *indebted obligation* mindset (Meyer et al, 2006; Meyer and Parfyonova, 2010), in the Greek context; and,

(ii) to explore interrelationships among job satisfaction, morale and organizational commitment from a positive psychology perspective.

To the best of the researcher’s knowledge, this study was one of the first to test the propositions of Meyer and Associates (Meyer et al, 2006; Meyer and Parfyonova, 2010) concerning the operationalization of organizational commitment as a bi-dimensional construct, consisting of value-based commitment (comprising affective commitment and the moral obligation aspect of normative commitment); and exchange-based commitment

(comprising continuance commitment and the social obligation aspect of normative commitment). Findings appear to support these propositions, highlighting the dual nature of normative commitment in the sample studied. Moreover results seem to provide support to Markovits et al's suggestion that "the meaning of organizational commitment differs depending on the organizational context and environment in which it is assessed" (p. 178), highlighting potential industry and societal effects. Certainly, further research is needed to examine the "external validity of these results and relate them to specific organizational outcomes, such as job performance results and employment practices" (Markovits et al, 2010, p. 192).

Results also provide insight into the role of morale in understanding the job-satisfaction – organizational commitment relationship from a positive psychology perspective. Indeed, "Positive psychology has much to contribute to the understanding of morale. Research guided by positive psychology would need to focus on the positive outcomes attributed to good morale (Peterson, 2000). We hypothesize that morale and its components are healthy for groups and for individuals. After all, good relations with other people are a necessary condition for individual happiness (Diener and Seligman, 2002), and the psychological good life entails being a contributing member of a social community (Peterson, 2006). Other people matter, and it is through group life that people are most fulfilled" (Peterson et al, 2008, p. 29).

Assuming the findings reported in this study are replicated and supported by future inquiry, they suggest two practical possibilities: organizations could undertake various strategies to better manage their employees to produce greater happiness; or they could select employees who are genetically happy (Cropanzano and Wright, 2001). Indeed, "According to Seligman (2004), since only about 50% of happiness is genetic, people can be taught to be happy" (Friedman and Friedman, 2008, p. 4). If this is true, it has implications for HR practice as indicated by Atkinson and Hall (2011); Guest (2002); and Peccei (2004): "While an emergent body of research considers employee happiness in the psychology literature, there is little recognition of it as an important employee attitude within HR research where wellbeing tends to be allied with health issues (see, for example, CIPD, 2007). While our findings are clearly exploratory and preliminary in nature, we suggest that they surface a potentially important and under-researched attitude and that happiness merits further research" (Atkinson and Hall, 2011, p. 101).

Limitations

There are several limitations of this study. One limitation of the present study is that happiness is measured indirectly (via satisfaction, commitment and morale). Second, participant selection was based on convenience sampling. Hence, results cannot be safely generalized beyond the specific sample that was used. Still, however, findings may be useful for hypothesis generation. A third limitation results from the study's cross-sectional design. Fourth, results are based on self-report data, creating the potential for common-method

variance (Evans, 1985; McClelland and Judd, 1993). Another limitation might be the Greek translation of commitment items – which were “initially constructed in English for an English-speaking audience” (Markovits et al, 2010, p. 191). Following Markovits et al (2010), this research “decided to take the direct translation and back-translation approach, assuming the items and concepts to be “etic” (suggesting the concepts are universally applicable). Other researchers prefer more “emic” approaches and seek to develop measures that are culture-specific (Vandenberghe, 2003), which would be informative but renders comparisons of studies across different cultural contexts more difficult” (p. 191). A final limitation of the study is that the sample was drawn from one industry only – e.g. retail banking.

Contribution

Concluding, it is hoped that the current study: (a) advanced the fairly limited available evidence on the dimensionality of organizational commitment in the Greek context; (b) contributed to an enhanced understanding of the relationship between job satisfaction and organizational commitment, as mediated by morale; and (c) was a first attempt towards happiness research in Greece.

ASPECTS OF GOVERNANCE AT FOOD MANUFACTURING ESTABLISHMENTS IN THE GAZA STRIP: FIELD STUDY

El-Farra, Majed¹

¹Dean, Faculty of Commerce, Islamic U. of Gaza, Gaza, P.O. Box 108. Email:
melfarra@iugaza.edu.ps

Abstract

The purpose of this research is to study the aspects of governance at main food manufacturing establishments in the Gaza Strip. The study was considered seven dimensions which include, 1) board membership, 2) management of board affairs, 3) policies and procedures, 4) performance measurement, 5) aspects of board meetings, 6) financial management and control and 7) relationship with the general director. The study population was incorporated all Gaza's main food manufacturing establishments which employ 20 persons or more. The number of these companies was 20 establishments. The research was used a stratified random sample. The sample size was 100 persons. The sample was selected from board members, owners\investors and general directors. A questionnaire was used as a main tool for data collection.

The main conclusion of the study is that the governance aspect of the main food manufacturing establishments in the Gaza Strip is poor. However, the aspects of financial management and control and the relationship with the general directors are acceptable but it needs further improvement.

Large establishments tend to have relative better aspects of governance. They incline to be formal and with better human and financial capabilities.

Food manufacturing establishments need to give extra attention to their governance. The attention should be given to the overall dimensions of the governance including the development of policies and procedures, developing and balancing the relationship among business main stakeholders and financial management and control.

Introduction

Corporate governance has come to the forefront of academic, regulatory, and investor debate. Key in this debate is the role that corporate governance plays in the generation of economic returns to its owners and stakeholders (Soobaroyen and Sheik-Ellahi, 2008). Part of generating economic returns includes the ability to adapt to and confront periods of financial distress. Corporate governance may be referred to the relationship among the board of directors, top management, and the investors\owners of establishments in determining the direction and performance of organization (Wheelen and Hunger, 2006). Corporate governance is the process whereby organizations make important decisions; determine whom they involve and whom they cause to be accountable. In addition, taking decisions and

rendering of accountant- typically relies on the governance system, policies or framework. Corporations' bylaws should clearly state the roles and responsibilities of governance bodies (Petra, Steven et. Al, 2008). The corporate governance with its different parties (board of directors, top management and investors) should play a complementary role in identifying the establishment's direction, mission, objectives, strategies and policies (Wheelen and Hunger, 2006).

According to the Palestinian Central Bureau of Statistics (PCBS) (2010), Palestinian food industrial sector was considered one of the most important manufacturing sectors in the Palestinian industry. The total number of operating food manufacturing establishments in the West Bank and the Gaza Strip was accounted for (2179) establishments in year 2009, which represented (14.2%) of the total operating Palestinian manufacturing establishments (15340 establishments). The sector was employed (10803) workers in 2009, which represented (16.1%) of total Palestinian workforce (67055 persons) who were employed in the Palestinian manufacturing sector. The total operating manufacturing establishments in the Gaza Strip was accounted for (520) firms in 2009. This number reflects the significance to study and tackle this sector from various dimensions including governance dimension.

This study examines the aspects of corporate governance in terms of its, structure and role in the management and development of Gaza's large food manufacturing establishments from the viewpoints of selected stakeholders. The research question will be as follows:

What are the characteristics and roles of the governance in the Gaza's large food manufacturing establishments?

Study objectives

- Evaluate the characteristics of the governance in Gaza's large food manufacturing establishments.
- Study the effect of the organizational characteristics on aspects of the corporate governance.
- Propose some recommendations that may help manufacturing establishments to promote their managerial practices and performance.

Hypothesis

H1. There is a relative significant difference at level ($\alpha = 0.05$) in the impact of the components of governance on management performance of food manufacturing establishments in the Gaza Strip.

H.2 There is a significant statistical difference at level ($\alpha = 0.05$) in the Aspects of the governance at large food manufacturing establishments attributed to the experience of interviewees and size of establishments.

Methodology

This research employs descriptive and analytical methods involving both qualitative and quantitative approaches. The fieldwork was based on distributing a questionnaire. Both primary and secondary data sources were used. The data collection was done in the following manner:

1) Questionnaire specifically designed for this research. The close-ended questionnaire was used because, it is easy to answer, compare and analyze.

2) Academic work on the subject such as books, articles, reports and other library-housed materials were collected through library research and through the internet. Overall, this study relied on a variety of sources and used a selective method in gathering the relevant information from each source in order to benefit fully from all available sources.

Population and Sample

The study population includes all Gaza's large food manufacturing establishments which employ 20 persons or more. The overall food manufacturing establishments accounted for 520 firms in 2009 (see Table (1) below). Table (1) revealed that 72.3% of food manufacturing establishments employ 4 persons or less. While 18.6% employ 5-9 persons. Only 3.7% employ 20 persons or more. These characteristics revealed that Gaza's food manufacturing establishments were dominated by small establishments. The very small establishments were not considered because; size of establishment usually influences the management characteristics and performance. Small size establishments lean to personal relations, informal structure and informal planning and control.

A stratified random sample was used. The sample was selected from board members, owners\investors and general directors. It was difficult to reach a significant number of investors because they are unanimous. All large food manufacturing companies were private limited. The founders of the business are managers and owners. They rely on their personal relations in attracting investors. Those attracted investors are usually sleeping partners and unknown. The researcher noticed that none of the establishments recruit general directors from outside owners structure or their close relatives. The sample size was 100 persons. The questionnaire was distributed and collected in May 2011. The researcher considered all owners\general directors to answer the questionnaire. This was done because they have comprehensive information about the company (see Table 2). The researcher received 100 questionnaires. All of the questionnaires were entered the process of analysis. The response rate was 100%, because personal field visits were used to distribute and collect the questionnaire.

Table (1) Classification of food manufacturing establishments in the Gaza Strip by number of employees at year 2009.

District	Classification of establishments by employment size						TOTAL
	0-4	5-9	10-19	20-49	50-99	100+	
North Gaza Governorate	58	15	4	2	0	0	79
Gaza Governorate	172	45	17	9	1	0	244
Dier Al-Balah Governorate	47	21	5	4	0	1	78
Khanyounis Governorate	72	15	1	2	0	0	90
Rafah Governorate	27	1	0	1	0	0	29
Total	376	97	27	18	1	1	520
%	72.3	18.6	5.2	3.5	0.2	0.2	100%

Source: - Palestinian Central Bureau of Statistics (2010) - General Census Of Establishments, 2009 - Economic Core Results, Ram Allah, Palestine.

Table (2) Manufacturing distribution by population and sample size

Population and sample	Number of board members	Number of owners \ investors	Number of owners \ general directors	Number of general directors	Total
Population	100	140	20	-	160
Sample	50	30	20	-	100

Source: The population size were estimated based on data available in Table (1) and phone calls conducted with most of food manufacturing establishments with size of employment 20 persons or more.

Characteristics of food manufacturing establishments in the Gaza Strip

Age of establishments

Table (3) shows that most of manufacturing establishments their ages were more than 7 years. Large establishments have more experience and better chance to survive compared to small businesses.

Table (3) Research Sample by Age

Age of Food manufacturing establishments	Frequency	Percent
Less than 3 years	0	0
3 -7 years	0	0
Greater than 7 years	100	100
Total	100	100

Size of Establishments

Table (4) shows that the great majority (90%) of research sample employ 20 to 49 persons. Only 10% employ 50 persons or more. These results were expected since all companies which

employ less than 20 persons were excluded. Table (1) shows the different sizes of food manufacturing establishments in the Gaza Strip.

Table (4) Size of Establishments

<i>Firm's size</i>	<i>Frequency</i>	<i>Percent</i>
<i>20-49 employees</i>	18	90
<i>50 employees or more</i>	2	10
<i>Total</i>	20	100

Legal form of the Establishments

Table (5) indicated that research sample consists of private limited corporations and none of them was public corporation. This result was logic since the sample was only included large size companies which employ 20 persons or more. However, most of Gaza's establishments were small in nature. Probably because they rely on personal resources which were limited compared with public limited corporations which can raise more fund by issuing new stocks or borrowing from banks (El-Farra, 2006).

Table (5) Legal form of the Firm

<i>Legal form of the Firm</i>	<i>Frequency</i>	<i>Percent</i>
<i>Sole Proprietorship</i>	0	0
<i>Partnership</i>	0	0
<i>Private Limited establishment</i>	100	100
<i>Total</i>	100	100

Content Validity Reliability of the Questionnaire

Content validity examines the extent to which the method of measurement includes all the major elements relevant to the construct being measured. Two methods were used to achieve this type of validity: The Experts Validation and Pilot Study.

The questionnaire was evaluated by six experts in the field. As a result; six questions were modified but no questions were added or deleted.

Pilot study was conducted to assess reliability of the questionnaire. Thirty persons were chosen randomly from the study population and were asked to fill the questionnaire. Those questionnaires were not included in the research sample. These questionnaires were used for assessing the validity and reliability of the questionnaire.

Spearman correlation technique was used to confirm questionnaire's validity. The r value was 0.880 and sig. was 0.00.

Two methods were used for reliability assessment which employed the Split-Half Coefficient and the Cronbach's Alpha Methods. Split-Half Coefficient was 0.891 and Cronbach's Alpha was 0.911.

The questionnaire was developed in the final format and distributed to collect data from the field.

Research Importance

To the researcher knowledge governance of manufacturing establishments in Palestine has never been examined, partly because of lack of information and partly because of lack of fund and interested researchers in the field of governance. This is the first detailed study devoted specifically to the corporate governance in the Gaza Strip with particular application to food manufacturing sector. The study would contribute to the development of the corporate governance's performance in the private sector in the Gaza Strip. Further this research will help in filling the "literature gap" in the corporate governance research, particularly those within the field of manufacturing sector. The study will also help in providing better understanding of the managerial practices of the manufacturing establishments in the Gaza Strip.

Theoretical Framework

The industrial sector in Palestine

The evolution of the Palestinian manufacturing sector was obvious from the growing rate of its contribution to the Palestinian Gross Domestic Product (GDP). The manufacturing sector contribution to the GDP increased from (8%) during the Israeli occupation (1967-1994) to (16%) prior to the outbreak of the *Al-Aqsa Intifada* in September 2000 (Nofal, 2003). However, this rate was fallen to (14.6%) in 2003. This was attributed to Israeli measures including closures and the Israeli military siege on the Palestinian areas. In addition, Palestinian manufacturing sector suffers from high dependency on the Israeli economy. (Palestinian Central Bureau of Statistics, 2010).

Moreover, food and beverages industry contributed about (23%) of the total production volume in the manufacturing industries in Palestine. This rate reflects the importance of the food sector in Palestine in job creation and filling a large proportion of the Palestinian consumer needs. Also, the increasing importance of food manufacturing industries was linked very much with other economic activities, especially the agricultural sector. Food industries contributed to stimulation of agriculture. Food manufacturing sector increased the value-added of agriculture and diversification of agricultural crops. The growth of food industries through manufacturing food plays a role in raising the income of farmers and the development of rural areas (Naser, 2005)

Previous studies

Sahmiyah (2005) examined the development of sustainability criteria for Palestinian local NGOs. The study considered many criteria including, vision, mission, objectives, human resources and governance. The study concluded that governance was the second highest rank within the eight sustainability criteria of the Gaza's establishments with a relative weight of 82.7%. The first highest rank was Vision, mission and objectives with 85%. Abdul Latif (2002) argued that forming a board of directors or trustees at Palestinian establishments with clear authorities and responsibilities such as reviewing the general policies of the organization, its programs, its budget and its connections with the outside world is a key element of good governance on the organizational level and the internal and external relations. Gill, Flynn, and Reissing (2005) concluded that board members of Canadian establishments were highly satisfied with board culture, community representation, and financial stewardship. Friedman and Phillips (2004) examined three specific issues of governance: size of councils, their composition in relation to electoral process, and the development of inner councils or executive boards, within councils. Vinten (2002) in his study on the failure of Enron corporation proposed that board members should be properly inducted, trained and developed. In addition, the pros and cons of different types of corporate governance need to be explored and best practice disseminated. Parker, Peters and Turetsky (2002) concluded that corporate survival largely depends on discipline placed on managers. Discipline can come from the marketplace or it can come from inside the firm through corporate governance structures. The study said relative to distressed firms that corporate governance aspects influence the likelihood of firm survival. Soobaroyen and Sheik-Ellahi (2008) explored the influence of corporate governance on non-board business unit managers in relation to its perceived effects on managerial/organizational outcomes. The study concluded that managers who perceived the corporate governance adoption will have a positive impact on their performance via its effect on enhancing the credibility of the unit and the organization. Peters (2004) investigated in a UK survey, how the corporate governance "message" is cascaded through the rank and file. The study found that the respondents were critical of the managerial behaviors they observed in the organization, involving attempts at avoiding accountability for unsatisfactory performance and the absence of transparency within the organization. Shipley and Kovacs (2008) investigated the development of a set of good governance principles applicable to the oversight and operation of cultural heritage institutions. The study came up with a set of good governance criteria and principles including legitimacy and voice, direction, performance, accountability, and fairness. Petra, Steven et. al (2008) found that the presence of CEO duality reduces the likelihood of lower levels of performance-based incentives offered to CEOs. Additionally, the authors found that CEOs are more likely to receive lower levels of performance-based incentives when the majority of the compensation committee members serve on less than three other boards, and when the size of the board is less than or equal to nine members.

Hypotheses Testing

H.1 There is a relative significant difference at level ($\alpha = 0.05$) in the impact of the components of the corporate governance on the management performance of food manufacturing establishments in the Gaza Strip.

Board of directors membership

Table (6) illustrated weak aspects of the board of directors' membership at large food manufacturing establishments in the Gaza Strip. The total mean value of the field was 4.36, the proportional weight mean was 43.6% and sig. value was 0.00. Table (6) revealed that, the board of directors did not determine the required skills needed for its members, the board members were not diversified in their skills, they were not elected on a regular basis and their was no limit on terms that board members may stay in their positions. Establishments in the Gaza Strip were dominated by family businesses. Members of the board of directors are usually from family members or owners. Therefore, it was not necessary to be elected from qualified and skilled members (El-Farra, 2005). These aspects were very similar to the situation in the Arab world. Abed Elmajeed (2002) mentioned similarity in management characteristics among businesses in the Arab world. However, Table (6) revealed that the establishments had written documents which specify the number of the board of directors, where mean value was 8.1 sig. values was 0.00. This is because the Palestinian companies' law imposes on companies to identify the number of their boards in the establishment documents. Petra, Steven et. al (2008) *found that the presence of CEO duality reduces the likelihood of lower levels of performance-based incentives offered to CEOs*. Experts in corporate governance advice businesses to add more outsiders (people are not affiliated with the corporation) to the board of directors. This would improve the transparency of businesses, increase level of creativity and advance relationships with other businesses (Wheelen and Hunger, 2008).

Table (6) Aspects of Board of Directors Membership by using sign test

Number	Item	Mean	Proportional weight mean	P-value
1	The board determine the required skills for its members	3.0	30	0.00
2	The required skills are written and documented	3.2	32	0.00
3	The existing board has the required skills	6.9	69	0.00
4	The existing board is characterized by the variety of skills and specialization among its members	4.3	43	0.00
5	The establishment has a written document that specifies the number of the board members	8.1	81	0.00
6	The board is elected periodically as indicated in the internal bi-lows of the establishment	3.0	30	0.00
7	The board membership has a term limit of two turns then the board member become a general assembly member	2.0	20	0.00
	Total	4.36	43.6	0.00

Management of Board Affairs

Table (7) showed poor management of the board affair. The total mean score was 3.4, proportional weight mean was 34% and sig. value was 0.00. It was obvious from Table (7) that most establishments did not have manual that determine the roles and responsibilities of the board members, no clear plan for board meeting and job description was not there. In fact most of board members were inactive in setting business strategies and direction. Most companies in the Gaza Strip rely on few actors of the board members. In addition, the founders of businesses were acted as godfathers for business members. This is a typical management culture in the Arab world. The traditional family structure and social relations in Arab societies, contributed towards shaping the managerial behavior in Arab organizations. Sharabi (1988) in his book argued that the 'neopatriarchy' structure prevails in Arab society and reflects a traditional type of social structure. According to Sharabi (1988) Arab individuals belong to family, clan and religious sect. While the family, which represents a model of this social structure, is characterized by the dominance of the father, the subordination of younger to older, and females to males. Authority, domination and dependency are the basic internal relations of the patriarch structure of the family. The tradition type of Arab social structure may contribute among others in explaining the Arab managerial practices.

Table (7) Aspects of Management of Board Affairs by using sign test

Number	item	Mean	Proportional weight mean	P-value
	<i>The establishment has a board manual that determine the roles and responsibility of the board members, the general policies of the establishment, the internal bi-lows, etc.</i>	4.1	41	0.00
	<i>Each board member has a copy of this manual</i>	2.0	20	0.00
	<i>The board members understand their legal responsibilities</i>	5.0	50	0.00
	<i>The establishment has a written system for the appointment and removal of the chairperson</i>	4.3	43	0.00
	<i>The establishment has a written and clear job description</i>	5.4	54	0.00
	<i>The board meetings are held based on a clear plan</i>	3.4	34	0.00
	<i>There is a clear and written procedure for dealing with board members who consistently fail to attend meetings without good and convincing causes</i>	2.1	21	0.00
	<i>The board keeps and documents formal minutes of meeting that states the decisions that had been taken</i>	3.4	34	0.00
	<i>Total</i>	3.7	37	0.00

Policies and Procedures

Table (8) reflected weak policies and procedures at Gaza's large food manufacturing establishments. The total mean was 4, proportional weight mean was 40% and sig. value was 0.00. The great majority of businesses did not have a written mission or clear objectives. They did not have written policies, procedures, written code of conduct and code of ethics. The board members were not active in strategic planning for business development. El-Farra (2003) study manifested that managerial practices at Gaza's plastic manufacturing establishments were dominated with tactical practices and no concern was given to strategic dimensions. Palestinian establishments in Gaza are dominated with Entrepreneurship management style. Board of directors was uninvolved in strategic design and general directors were dominating management process. The board is willing to be used as a rubber stamp for top management's decisions. In addition, general director operates alone or some times with a team (Wheelen and Hunger, 2008; El-Farra, 2003).

Table (8) Aspects of Policies and procedures by using sign test

<i>number</i>	<i>item</i>	<i>mean</i>	<i>proportional weight mean</i>	<i>p-value</i>
	<i>The establishment has a written mission statement</i>	5.4	54	0.00
	<i>The board plays an active role in the strategic planning process for the establishment</i>	4.5	45	0.00
	<i>The establishment has a code of ethic and code of conduct</i>	3.0	30	0.00
	<i>The establishment has a conflict of interest policy</i>	3.4	34	0.00
	<i>The policies and the procedures of the establishments are written</i>	3.2	32	0.00
	<i>The organizational policies and procedures are available to staff and others with an interest in the organization</i>	4.3	43	0.00
	<i>The board has clear procedure for ensuring that the policies and the procedures of the establishment are being implemented</i>	4.0	40	0.00
	<i>Total</i>	4.0	40	0.00

Performance measurement

Table (9) disclosed that the board of directors did not practice its rule in measuring the performance of establishments in order to evaluate and control them. This is a very important rule that the board should play to enhance transparency at establishments. The total mean value was 4.3, proportional weight mean was 43% and sig. value was 0.00. It was clear from Table (9) that the board did not participate or reviews the annual plan of business. They did not measure the performance of business based on goals achievement. This result reflected poor rule the board of directors' play in the life of establishments in the Gaza Strip. In order to have a comprehensive monitoring and controlling system, organizations should have written objectives, structure, job descriptions, indicators for performance, qualified controlling team and suitable diversified controlling tools. Almost these requirements were not available at organizations in the Gaza Strip. This limitation was not only at private sector, public sector but also at a significant number of Palestinian NGOs (Kulab, 2004; Shaheen, 2007).

Table (9) Aspects of performance measurement by using sign test

number	item	mean	proportional weight mean	p-value
	The board ensure that the establishment measures its performance based on the determined objectives	5.3	53	0.00
	The board and establishment director review the determined objectives annually	5.5	55	0.00
	The establishment director discusses the results of the performance measurement with the staff	5.2	52	0.00
	The board discuss with the staff the establishment performance periodically	4.3	43	0.00
	The board measure its performance annually	3.2	32	0.00
	The board put an annual plan for its development	3.5	35	0.00
	The plan is implemented	3.0	30	0.00
	Total	4.3	43	0.00

Aspects of board meetings

Table (10) showed low regular meeting by the board. In addition, the board do not have prepared annual plan for meetings. Further more, the board meetings were not effective. Overall, the total mean value was 4.84, proportional weight mean was 48.4% and sig. value was 0.00. It is necessary to energize the board rule in the management of the establishments in the Gaza Strip. This would enhance the institutionalization among businesses in Gaza, which would reduce the high death rate among businesses and increase the life span of businesses (Ashour and El-Farra, 2002).

Table (10) Aspects of board meetings by using sign test

<i>number</i>	<i>item</i>	<i>mean</i>	<i>proportional weight mean</i>	<i>p-value</i>
	<i>The board meets periodically</i>	3.2	32	0.00
	<i>The number of meetings is suitable to the establishment needs</i>	6.7	67	0.00
	<i>The board agrees on annual plan for meetings</i>	4.3	43	0.00
	<i>The board meetings are organized and effective</i>	5.5	55	0.00
	<i>The decisions are taken through discussion and consensus</i>	4.5	45	0.00
	<i>Total</i>	4.84	48.4	0.00

Financial management and control

Table (11) revealed an acceptable financial management and control practiced by the board of directors in the Gaza Strip but it needs further development. The board was continuously received quarterly or semi-annual financial reports. It was ensured that the balance sheet and profit and loss account are prepared by the end of every financial year. In addition, the establishments were used external financial auditors. Further, the chairperson was met with the external auditor at least once a year. Moreover, the board was discussed the external auditor report. The overall mean score was 6.48, proportional weight mean was 64.8% and sig. value was 0.00. However, board members had low skills and experience to analyze and interpret financial reports, budgets and accounts. In addition, the board did not bother to ensure written procurement procedures. Overall the aspects of the financial management and control were much better than the other dimensions of the corporate governance. This because finance was the most crucial issue from investors viewpoints, where board members in Gaza are usually owners. In addition, their management skills to follow monitor and participate in setting business strategies were poor (see Table 8 and 9).

Table (11) Aspects of financial management and control by using sign test

<i>number</i>	<i>item</i>	<i>mean</i>	<i>proportional weight mean</i>	<i>p-value</i>
	<i>The board members have skills and experience to be able to analyze and interpret financial reports, budget and accounts</i>	3.9	39	0.00
	<i>The board ensures that the financial system that is used by the establishment is effective</i>	5.5	55	0.00
	<i>The board continuously receive quarterly or semi-annually financial reports</i>	7.7	77	0.00
	<i>The board makes regular comparisons between budgeted income / expenditure and actual income / expenditure</i>	3.2	32	0.00
	<i>The board receives regular written reports highlighting any exceptional items in the financial statements</i>	3.5	35	0.00
	<i>Balance sheet and profit and loss account and are prepared by the end of the financial year</i>	9.9	99	0.00
	<i>The board ensures that there are written and documented procurement procedures for the establishment</i>	5.3	53	0.00
	<i>The board ensures that procurement are carried out based on the procurement procedure of the establishment</i>	5.0	50	0.00
	<i>The establishment has external financial auditor</i>	8.8	88	0.00
	<i>The chairperson meets with the external auditor at least once a year</i>	9.5	95	0.00
	<i>The board discusses the external auditor report</i>	9.0	90	0.00
	<i>Total</i>	6.48	64.8	0.00

Relationship with the general director

The relationship between the board of directors and general directors were acceptable but it needs further development. Table (12) indicated that the board did not intervene in the daily management of the establishment. The general director participates in the board meetings. The relationship between the board of directors and the general director was characterized by understanding and cooperation. The overall mean value was 6.2, proportional weight mean was 62% and sig. value was 0.00. However, Gaza's establishments did not have written job descriptions for their general directors. In addition, general directors did not provide regular reports to the board. Moreover, the board did not follow or monitor the performance of the general director.

Table (12) Aspects of Relationship with the general director by using sign test

<i>numbers</i>	<i>item</i>	<i>mean</i>	<i>proportional weight mean</i>	<i>p-value</i>
	<i>There is a clear written job description for the general manager</i>	5.3	53	0.00
	<i>The board does not intervene in the daily management of the establishment</i>	7.0	70	0.00
	<i>The general director participates in the board meetings</i>	9.0	90	0.00
	<i>The general director submits periodic reports for the board</i>	4.5	45	0.00
	<i>The relationship between the board the general director is characterized by understanding and cooperation</i>	7.0	70	0.00
	<i>The board follows and monitors the performance of the general directors</i>	4.5	45	0.00
	<i>Total</i>	6.2	62	0.00

Overall aspects of corporate governance

Table (13) discloses that the aspects of the governance at Gaza's large food manufacturing establishments were poor. The total mean value was 4.48, the proportional weight mean was 44.8% and sig. value was 0.00. The lowest performance were in the management of board affairs, policies and procedures, performance measurement, board of directors membership and the aspects of board meetings respectively. The study did not agree with Sahmiyah (2005). Sahmiyah examined the development of Sustainability criteria for Palestinian local NGOs. He considered many criteria including, vision, mission and objectives, human resources and governance. Sahmiyah concluded that governance was the second highest rank within the eight sustainability criteria of the Gaza's establishments with a relative weight of 82.7%. Abdul Latif (2002) argued that forming a board of directors or trustees at Palestinian establishments with clear authorities and responsibilities such as reviewing the general policies of the organization, its programs, its budget and its connection with the outside world is a key element of good governance on the organizational level and the internal and external relations. Gill, Flynn, and Reissing (2005) concluded that board members of Canadian establishments were highly satisfied with board culture, community representation, and financial stewardship. Vinten (2002) in his study on the failure of Enron Corporation proposed that board members should be properly chosen, trained and developed. In addition, he stated that the pros and cons of different types of corporate governance need to be explored and best practice disseminated. Parker, Peters and Turetsky (2002) concluded that corporate survival largely depends on discipline placed on managers.

Table (13) overall aspects of the governance at large food manufacturing establishments in the Gaza Strip

Number	item	Mean	Proportional weight mean	P-value
1	Board of Directors Membership	4.36	43.6	0.00
2	Management of board affairs	3.7	37	0.00
3	Policies and Procedures	4.0	40	0.00
4	Performance Measurement	4.3	43	0.00
5	Aspects of board Meetings	4.84	48.4	0.00
6	Financial Management and Control	6.48	64.8	0.00
7	Relationship with the General Director	6.2	62	0.00
	Total	4.84	48.4	0.00

H.2 There is a significant statistical difference at level ($\alpha = 0.05$) in the Aspects of the governance at large food manufacturing establishments attributed to the experience of interviewees and size of establishments.

Experience of interviewees:

Table (14) shows that the sig. value of Mann-Whitney (0.154) revealed that no significant difference in the aspects of corporate governance attributed to experience of interviewees. This probably was attributed to the similarity in the experience of the establishments. Table (3) revealed that all selected establishments were with experience more than three years.

Size of establishments:

Table (15) revealed a significant difference in the aspects of governance among establishments in the Gaza Strip attributed to the size of establishments. Establishments with number of employees 50 persons or more tend to have better aspects of corporate governance compared with establishments which employ between 20 to 49 persons. The sig. value of the total score was 0.038. This difference is logic. Large establishments tend to be more efficient. In addition, their financial, human and managerial aspects lean to be more effective. On the other hand, small establishments tend to be informal in many aspects including in planning, organizing and control. Most of small businesses are managed and controlled by one person. Organizational structure and job description were not written. They rarely have board of directors (Ebert and Griffin, 2003).

Table (14) shows the differences in the aspects of corporate governance attributed to the experience of interviewees by using Mann-Whitney U test

<i>Dependent Variable</i>	<i>Experience</i>	<i>Mean</i>	<i>Sig.</i>
<i>Board of Directors Membership</i>	<i>5 years of less</i>	4.30	0.12

	<i>Total</i>	4.84	

Conclusions and Recommendations

First: Conclusions

The study concluded that the aspects of governance at Gaza's large food manufacturing establishments were poor; the proportional weight mean was 44.8%. However, large establishments tend to have relative better aspects of governance. They lean to be formal and with better human and financial capabilities.

The main characteristics of Gaza's governance were as follows:

- a. Poor aspects of the board of directors' membership. It was revealed that, the board of directors did not determine the required skills needed for its members, the board members were not diversified in their skills.
- b. Poor management of the board affair. Most Gaza's establishments did not have manual that determine the roles and responsibilities of the board members. They did not have a clear

plan for board meeting and job description was not there. Most of board members were inactive in setting business strategies and direction.

c. Weak policies and procedures were noticed at Gaza's large food manufacturing establishments. The great majority of businesses did not have a written mission or clear objectives. They did not have written policies, procedures, written code of conduct and code of ethics. The board members were not active in strategic planning for business development.

d. The board of directors did not practice its rule in measuring the performance of establishments. The board did not participate or reviews the annual plan of business. They did not measure the performance of business bases on goals achievement.

e. Lack of regular meeting by the board of directors. The board did not have prepared annual plan for meetings.

f. There was an acceptable financial management and control practiced by the board of directors but it needs further development. The board was continuously received quarterly or semi-annual financial reports. It was ensured that the balance sheet and profit and loss account are prepared by the end of every financial year. The establishments use external financial auditors.

g. A satisfactory relationship between the board of directors and general directors were found but it needs further development. The board did not intervene in the daily management of the establishment. The general director was participated in the board meetings. The relationship between the board of directors and the general director was characterized by understanding and cooperation.

Second: Recommendations

The study recommends the following:

- Food manufacturing establishments need to give extra attention to their governance. Good governance is a key for the success of any business. The attention should be given to the overall dimensions of the governance including, policies, procedures, developing and balancing the relationship among business main stakeholders and financial management and control.

- Add more members to the boards from people who are not affiliated with the establishments. This would reduce level of bias and enrich business ideas for development.

- Separate the positions of general directors and members of board of directors so that general director cannot unduly influence the board's meetings and agenda. This should improve the board's ability to properly evaluate top management.

- Use a committee composed of outsiders to nominate potential new directors. This will help to ensure that potential members are not friends of top management

- Nominate people to the board who have knowledge and skills valuable to the board and who have expertise of value to business.

COULD A NEW THEORETICAL FRAMEWORK ON INTERCULTURAL COMPETENCE LEAD TO EFFECTIVE TRAINING METHODS?

Englezou, Maria¹

¹DBA Student, University of Gloucestershire

Abstract

The purpose of this paper is to develop an initial theoretical framework based on a thorough literature review in an attempt to capture a spherical meaning of what is it really needed in order to become Intercultural Competent.

Through synthesizing the literature, Intercultural Competence has been interrelated with other dimensions which are regarded important to be considered in order to be able to suggest a training method that will lead to the desired outcome of achieving a high level of Intercultural Competence.

Introduction

Facing the demands of the 21st century, it is evident that companies continually embrace the global market and as a result a highly competitive environment for multinational companies does exist.

The new era of globalization is the long-term importance of creating intercultural training opportunities for business people and students. Failure or success of the twenty-first century international managers and their teams depend on their changed decision-making, taking into account that they are no longer surrounded by their own nationals and their decisions cannot be only based on their common sense and best precedents (Yoshida, 2002). A large percentage of corporate success depends on being in position to provide employees with intercultural competence, helping them to develop effective and appropriate behavior with foreign culture members (Graf and Mertesacker, 2009).

Developing interest in researching Intercultural Competence

In the past twenty years research on intercultural competence has flourished in a variety of contexts such as international students, expatriates and doctors in sensitivity programs etc.

There are three types of assessment tools being utilized. The first type has been developed before 1996 where many researchers have been developing their own scales for survey research and this is the direct type. The other two types are the indirect and the combined assessment design which are not so common as the direct type and this is perhaps due to their nature being time-consuming in collecting and analyzing direct assessment data (Sinicrope, Norris and Watanabe, 2007).

A major short-coming when using indirect assessment tools can be the fact that often participants have little experience in intercultural situations and are asked for self-reports of

specific behavioral choices in hypothetical situations. Despite though this drawback and other methodological disadvantages, indirect assessment tools still remain the most widely used form of assessment due to their nature and availability. This continuous persistence in use could in fact help in further improvement for each individual assessment tool.

On the other hand the direct type has its own drawbacks since many times authentic scenarios can be difficult to be elicited and portfolios can be subjectively represented. The most important drawback for the combine type it is the fact that they take much longer to be done than the indirect type.

It is obvious that for the combined type one has to weight the advantage of gaining in-depth knowledge and understanding contrasting with the addition of the disadvantages of the indirect and direct type altogether.

Need for the right selection of training procedures

In addition to the right selection of assessment tools, it is also crucial to be able to develop the right training e.g. for international students and potentially future international managers, in order to facilitate and achieve high standards for people's competencies. Being able to provide international students with knowledge on general dimensions on which most cultures differ and possible impacts that these differences can have, then students will be able to communicate more effectively and hopefully guided in paying more attention in their similarities as well. Being aware of expected norms and behaviors of different cultures may lower anxiety and encourage more appropriate behaviors according to the situation (Caligiuri and Tarique, 2005).

Need for a finalized global framework

A major problem arises though, since researchers have not concluded in one global framework which can capture the spherical meaning of Intercultural Competence and its related constructs. This is one of the major reasons why the body of knowledge in intercultural training has not been able yet to impact this field and this is due to the fact that researchers have not agreed yet on the implementation of their findings.

For example an overgeneralization of cultural differences within a proposed framework can indeed lead to a gap between the skills being learned and the application of these skills in organizational practices.

It has to be noticed here that an investigation of the various trainings available should take place relative to the short-term and long-term benefits offered to individuals. Long term benefits can be a direct result of a short-term intervention. The problem arises in cases where a long-term intervention may only have short-term benefits. This can be seen in cases where an individual has learned to be competent within a particular cultural setting but in fact he/she is not capable of shifting that knowledge and uses it appropriately in other cultural settings (Caligiuri and Tarique, 2005).

Research aim

The aim of this research is to develop a theoretical framework which in effect will be able to capture the whole meaning of Intercultural Competence and as such be able to propose the need for tailored training programs which can have a long-lasting effect.

Research Objectives

- Through literature review, learn what it has been already researched in the area of Intercultural Competence.
- Investigate whether there are important factors affecting both negative and positive with their presence the development of Intercultural Competence.
- Identify the gap in existing knowledge.
- To create a new theoretical framework based on existing knowledge and take it a step further.
- Propose a new training procedure based on the study's findings.

What is Intercultural Competence?

As it is described by Hammer (2009, p.3), "intercultural competence is the capability to accurately understand and adapt behavior to cultural difference and commonality. It reflects the degree to which cultural differences and commonalities in values, expectations, beliefs and practices are effectively bridged, an effective environment is achieved, and specific differences that exist in any organization are "addressed" from a mutual adaptation perspective".

It has been suggested by Friedman (2008, as cited in Ashdown, 2010) that "posing questions about one's own cultural underpinnings does not come naturally because culture is taken for granted. Cultural competence is in essence the ability to generate appropriate strategies of action unconsciously, but intercultural competence is the ability to consciously explore one's way of thinking and acting so as to actively construct an appropriate strategy" (Ashdown, 2010).

Motivation for developing this intercultural competence is being triggered by unsuccessful intercultural interactions that are filled with clashes of worldviews. The reality of being part of a global community suggests that managers should be in position to identify and exploit cultural differences in order to act according to each situation in the most appropriate way. Prior knowledge and ways of acts could then become integrated in new other-world understandings in order to create a dynamic multicultural perspective (Ashdown, 2010).

The development of the need of being Intercultural Competent

It has been reviewed by Collard (2007) that mono-cultural assumptions of colonial and national leadership cultures that have been stated in the past are now frequently

inappropriate for diverse populations. The global era now is witnessing the emergence for creating a cross cultural theory and also research paradigms which could combat cultural blindness and develop cultural sensitivities.

It is now accepted that within post-colonial, multi-cultural groups there the potential for interactive effects between their values and societal norms.

Recent perspective views culture as dynamic, ever-changing, multi-layered and complex. This perspective acknowledges that all cultures are constantly subject to change. The key point to bear in mind is that cultures are in constant change and adaptation. Any generalization which can possibly ignore this complexity will inevitably lead researchers in the wrong direction and most probably to unhelpful training methods (Collard, 2007).

In recent years many attempts have been made in order to investigate leadership scholars' approaches which are more attuned to intercultural dynamics (Collard, 2002; Merchant, 2004; Collard and Wang, 2005 as cited in Collard, 2007). Based on this notion, a study held by Wang (2004, as cited in Collard, 2007) investigated the reactions of Chinese leaders on their changing conceptions of learning and leadership. The statements of participants clearly indicated that these Chinese leaders are not frozen in a static inherited culture as older theories assumed. It has to be noted that some of the participants were extremely critical about their cultural inheritance. At the end of the study participants views have been realigned and accommodated understandings that knowledge can be indefinite and contestable and that a learner can be an active constructor of knowledge. It is obvious that once more the subjectivity of our understandings indicate a level of change that may be obscured by cross-cultural frameworks. This evidence indicates that a change which has been stimulated by direct experience, such as new course, may be more effective than a change at a conceptual level such as a theory. The conclusion of this study is that if the above findings are true then it is an important learning for any educational program in any nation which seeks the promotion of cultural adaptability (Collard, 2007).

As such leaders have to value diverse epistemologies and acknowledge that there are multiple culturally based learning procedures (Collard, 2007).

Cultural interactions are seen as being composed by what each individual brings to their social, educational, organizational, ethnic, national and also international encounters. As such this perspective is now attuned to the post-modern conceptions of learning and knowledge, where individuals are seen as active constructors of their own explicit values and knowledge. Besides this perspective, intercultural competence is also redefined, referring to the individual's capacity to recognize different cultural values and be in position to incorporate alternative frames of reference into knowledge construction (Paige, 2004, as cited in Collard, 2007).

Researchers place also importance in adding into the inter-cultural perspectives the cognitive ability that enables them to transform prior frameworks into new perceptions of “inter-culture” (Davis and Cho, 2005, as cited in Collard, 2007).

A question have been made by Chapman (1998, as cited in Collard, 2007) in relation to our understanding of leadership in intercultural contexts and this is whether leaders are passive transmitters of dominant leadership cultures and practices or are they constantly changing and reconstructing their knowledge?. If that is the case courses which teach intercultural competence will equip them to operate with sensitivity when in “alien terrains”. And also when viewing leaders as learners then there is in effect, the potential for innovation and change (Collard, 2007).

Expatriates Success

Expats have also attracted the attention of researchers since they do not only need to be intercultural competent but they also need support on how to adjust in living in another country. A study held by Mansour and Wood (2010) did test the training that was provided to US and European expatriates in Morocco. The design of the study dealt with subdividing the skills needed in order to be successful in a foreign country into three categories of skills: maintenance of self, interpersonal skills and cognitive skills. The success of multinational organizations often depends of the success of these expatriates and although there is an increasing number in the researches devoted in this area, still there is reluctance in translating research findings into practice. The question that remains is to whether existing intercultural training programs do adequately prepare expatriates to operate successfully. The need to develop even more “sensitive” training programs in order to provide the best skills possible to expatriates, is when the gap between cultures is big enough in order to cause maladjustment (Mansour and Wood, 2010).

There are consistent evidences that show the failure rate of expatriates when not being able to adjust adaptively and also there is consistent evidence on a positive relationship between expatriates adjustment and job performance (Bennett et al. 2000; Harzing 1995; Cavusgil et al. 1992; Kraimer et al. 2001; Takeucki et al. 2005, as cited in Mansour and Wood, 2010).

An important issue which has been raised is that the difficulty in expatriates training is the fact that the theory behind is yet to be fully developed. And this inconsistency is created by not having a conclusive theory to base a training method further creates complications on how to implement an effective training method (Mansour and Wood 2010).

In line with the framework of the **Intercultural Developmental Inventory** which deals with moving from ethnocentrism towards ethno-relativism it has been stated that perceived ethnocentrism of the host country nationals’ has a significant negative correlation with the expatriates adjustment.(Mansour and Wood 2010).

The results of this study have shown that locals and expatriates co-workers played a key role for the expats adjustment. This is consistent with the results of previous studies (Black and Gregersen, 1991; Black 1988 as cited in Mansour and Wood, 2010). This evidence shows that expatriates should be trained also on how to create a network in the host culture in order to be able to create social engagements with the host nationals (Mansour and Wood 2010).

Although culture shock could be the source of many stress-induced reactions the results of this study have shown that culture shock did not seem to have an impact on the study's respondents. One explanation could be the fact that respondents had previous contact with the host nationals or another explanation could be the fact that these expats receive help by the locals (Mansour and Wood 2010).

Culture Shock

Culture shock can be caused when people face a new cultural pattern which is different from their own. For example the differences between high and low context cultures can cause misunderstandings and maladaptive behaviors due to the fact that people cannot understand their differences (Xia, 2009). When people face unfamiliarity and change their own psychological adjustment is influenced and can cause symptoms of depression, anxiety and feelings of helplessness (Xia, 2009).

Need for Practical Experience

In another study held by Ashdown (2010) the focus is placed on the fact that management training should include theory that involves practical experience in order that managers will be guided to compare similarities between their own contexts and cross-cultural settings and as a result gradually design conceptual bridges between different contexts (Ashdown, 2010).

Negotiating reality can enable managers to deal with cross-cultural interactions among diverse groups of people. And also they will be able to recognize and use cultural differences as a resource for learning and designing effective actions according to each context (Ashdown, 2010).

While many programs have been excellent in introducing students to cultural concepts, becoming aware of cultural differences and adapting to new situations, they do not systematically identify, or prepare students to develop and use cultural learning strategies (Cohen, Paige, Shively, Emert, Hoff, 2005).

As such the fundamental purpose of the research program held by Cohen et al. (2005, as cited in Cohen, Paige, Shively, Emert, Hoff, 2005) was to test the efficacy of the "Maximizing study abroad guide" on whether it actually provides students with the required knowledge in order to enhance language learning and promote intercultural skills. An experimental research design had been delivered that examined the strategy being used, language

acquisition and intercultural development at two different points in time and also compare students who used the guide to those who did not (Cohen, Paige, Shively, Emert, Hoff, 2005).

With respect to cultural learning the work of Kolb (1984, as cited in Cohen, Paige, Shively, Emert, Hoff, 2005) had been very influential on the design of the learning strategy. That is, effective learning involves experience, reflection, conceptualization and experimentation. Students were encouraged to approach culture by utilizing a learning cycle which involved participation in the culture by active experience, making sense of what they are experiencing through reflective observation and abstract conceptualization. Interaction plays an important role in this learning cycle because through active involvement acquiring knowledge becomes inevitable (Cohen, Paige, Shively, Emert, Hoff, 2005).

The overall results of this study had shown a discrepancy between the quantitative data and the qualitative ones. It has to be noticed though that there was a number of individual items that had shown that there was a positive effect on the group who had used the study guide both language-wise and culture-wise. One possible explanation given, is that time constrained the number of strategies that the students could have used. Many students did indeed report that they were pressed for time during study abroad. Several students also commented that if they had more time they would have used the strategies to a greater extent in order to further improve their learning. A suggestion given for future research is an ethnographic study to take place, since it would likely provide rich insights into how and why students use specific strategies and be able to effectively triangulate data collection methods (Cohen, Paige, Shively, Emert, Hoff, 2005).

In another paper held by Graf (2004) it has been mentioned that most of the training conducted is not theoretically substantiated and one reason for this is the lack of articulated theory of intercultural competence underlying the various designs and techniques in use (Graf, 2004).

The purpose of this study was to assess different intercultural training designs based on two dimensions: didactic and experiential learning, gather evidence for the benefit of the presented training designs and be able to draw conclusions for how to design intercultural trainings. On one hand didactic approach allows for a cognitive understanding of what is being taught and on the other hand the experiential approach to training is based on the assumption that people learn best through their experiences (Graf, 2004).

Although the findings suggest that culture general training tend to be more favorable this could be due to the fact that Germans and Americans who were participating in the research do not essentially need different competencies when working with individuals of another culture. It has been concluded that a "one-size-fits-all" approach might not be effective, as various aspects of the training need to be tailored in order to fit the culture and the organization (Graf, 2004).

Also, the experimental design is the one that is being recommended because through experience individuals are getting feedback on doing the role-plays and this allows the enhancement of the knowledge about other cultures, experiencing also emotions and getting along with prejudices and learn to re-act appropriately in various educational settings. Didactical sessions can come as a supplement and they are appropriate for improving knowledge about other cultures because they are insufficient on their own to develop the emotional and the behavioral dimension of intercultural competence (Graf, 2004).

One potential problem in the design of an intercultural training is the increasing demand for short-term trainings. Although these short-term trainings can be effective in increasing awareness it has to be considered that acquiring intercultural competence is a much more complex and long-term process. In general the cognitive component of intercultural competence can be developed within a short period of time, but the ability to manage biases and stereotypes and become able to develop the appropriate behaviors have to be trained gradually in order to have a long-term effect as well (Graf, 2004).

IDI Intercultural Development Inventory

A validated assessment tool belonging in the indirect type of assessing Intercultural Competence is the IDI which has been developed by Dr. Mitch Hammer and it is based on the Developmental Model of Intercultural Sensitivity (DMIS) originally proposed by Dr. Milton Bennett. The IDI is a cross-culturally valid and reliable assessment tool (Hammer, 2009).

There are several assumptions which are underlying the DMIS and these are related as to how the DMIS can be measured by the IDI. Most importantly, it is suggested that, the intercultural sensitivity model captures the individual's experience of cultural difference, not objective behavior. It is also suggested that, intercultural sensitivity is being viewed in developmental terms and it is conceptualized as a continuum ranging from a more ethnocentric to a more ethno-relative worldview. Having this structure it is implied that, progression along the continuum can be facilitated through training and education (Hammer, Bennett, 1998, 2001).

In a study held by Hammer et al. (2003) different analyses took place in order to test the reliability and validity of the IDI. Overall, the results of the confirmatory factor analysis which was carried out as part of the development of a revised IDI tool, indicated that a five-factor solution provides a good fit to the data. In addition, in a direct comparison of the five-factor solution with both the original model of intercultural sensitivity proposed by Bennett (1993b) and a two-dimensional, more global model, the five-factor was found to be superior (Hammer et. al., 2003).

In an attempt to further provide analyses of the IDI, an effort was undertaken – after establishing the validity and reliability of the 50-item IDI – to develop a total IDI score grounded in the DMIS theory such that lower scores reflect more ethnocentric orientations and higher scores reflect more ethno-relative world views (Hammer et. al., 2003).

Teaching sensitivity on cultural difference was the purpose of a teacher action research held by O' Durocher (2007). The purpose was to deliver teaching of subjective culture in the foreign language classroom. Bennett's model was compared and contrasted with other approaches to teaching culture, its strengths and weaknesses were discussed and suggestions for implementing the model were presented. In this study it is pointed out that Bennett's model provides a good blueprint for intercultural communication training. It has also been said that there is a gap in Bennett's model, that is, the fact that it does not address, at least not explicitly, the relationship between language and culture (O' Durocher, 2007).

Other interrelated constructs

High vs. Low Context Cultures

The cultural framework proposed by Edward Hall states that all cultures can be situated in relation to one another through the styles in which they communicate. High and low context communication assumes great significance when people from different categories interact and therefore contributes to trust building or the lack of it. As stated in *Understanding Cultural Differences* (Hall and Reed, 1983, p.85) "A high-context communication or message is one in which most of the information is already in the person, while very little is in the coded, explicit, transmitted part of the message. A low-context communication is just the opposite; that is, the mass of the information is vested in the explicit code". For example, low-context people such as Germans and Nordics will require explicitness about how they are to proceed. On the contrary, high-context people such as French, Indians and Japanese will leave a lot unsaid, paying their colleagues the compliment of assuming they know the situation. It is important to note here that, high-context people speak more but they say less and low-context people speak less but every word counts (Lewis, 2006).

Related with the cultural framework proposed by Edward Hall, a study was held by Donghoon, Yihang & Heung Soo (1998) which compared Chinese, Korean and American cultures. Based on the findings of this research study, it was reported that Hall's description of the characteristics of high- and low-context cultures can indeed be empirically confirmed. Overall, the results have shown that the three cultures differ in a way that is consistent with Hall's cultural framework. More specifically, the American subjects have shown to exhibit tendencies that are consistent with low-context cultures. On the other hand the Chinese and Korean subjects have shown to exhibit tendencies that are consistent with high-context cultures (Donghoon, Yihang & Heung Soo, 1998).

Emotional Intelligence

The other construct that is taken into consideration is Emotional Intelligence. Emotional Intelligence has been defined as the ability to recognize and regulate emotions in ourselves and others (Goleman, 2001). A lot of interest has been placed in measuring Emotional Intelligence because scientists became aware of its crucial importance in many areas such as

job success and leadership, life satisfaction, healthy psychological adaptation, positive interactions etc (Stys and Brown, 2004).

Based on Stone's (2006) proposed model of Intercultural Effectiveness (Stone uses the term Effectiveness instead of Competence) - which includes: knowledge, skills, emotional intelligence, motivation, openness, resilience, reflectiveness and sensitivity – it would be interesting to test whether students who score high on measures of Emotional Intelligence would also score high on Intercultural Competence.

In the study held by Tang, Yin and Nelson (2010, p.12) the results were consistent with a conceptual framework differentiating one culture from another. As it was expected, regarding emotional intelligence, the Taiwanese sample of academic leaders tended to use a less assertive communication style as well as an indirect communication style in order to maintain group harmony.

A strong significant relationship was found for the Taiwanese sample between challenging the process and their Emotional Intelligence's skill of assertion, and this finding seems to be in accordance with previous studies on influence tactics. Different cultures might possibly impose assertion in different ways. The use of Assertiveness varies according to the different types of strategies being employed by each culture (Tang, Yin and Nelson 2010).

Overall, from the comparisons among the two cultures, the strong correlation between EI and leadership practices implies that emotional intelligence was perceived as an underlying competency for effective academic leadership in both cultures. It has been also stated that in order to be able to lead effectively, high emotional intelligence is a required skill in order to have a sense of self-awareness, being able to manage their own emotions and also those of others and lastly to be able to lead in accordance with the cultural expectations of their organizations (Tang, Yin and Nelson 2010).

Personal Character Traits

It has been found that successful and well-adjusted international assignees tend to share certain personality traits. These characteristics enable individuals to be open and receptive in learning the norms of other cultures and be able to adjust themselves according to new environments. Individuals who are assertive and exhibit the characteristic of openness tend to establish interpersonal relationships with people from different cultural backgrounds much more easily than non-assertive individuals (Caligiuri and Tarique, 2005).

In the study held by Bird, Mendenhall, Stevens and Oddou (2010, p.1) progress in describing the relationship of intercultural competence and global leadership's effectiveness and performance, is still impeded due to the various domains of intercultural competence not being clearly stated and as such not being validated.

Perhaps the absence of a comprehensive formulation of intercultural competence can be due to the fact that attempts have been made across a wide range of disciplines such as

psychology, international management and education. Another reason of this complexity might be the fact that intercultural competence it is often described as involving affective, cognitive and behavioral competent and further distinguished between stable and dynamic components. Working without a global framework can lead to a-theoretical, survey-oriented, conceptual mapping studies that they often reproduce similar findings which are described with different terminologies. Such attempts are not entirely unproductive but special attention should be placed in order for more refined empirical and theoretical research to continue. Within the contents of this study, the broad definition has been retained and the relevant content domain has been defined in terms of the stable competencies – which can also be defined in terms of personality traits or predispositions (Bird, Mendenhall, Stevens and Oddou, 2010).

After careful consideration and gaining insight on what is actually needed in order to become intercultural competent it has been decided that both quantitative and qualitative data should be used in order to achieve the desired outcome of the proposed framework. Data will be taken before and after the application of a training method in order to compare the results and possible effects of the training method.

The new framework that is being proposed by the current study should be tested in order to see its effect and whether it could indeed offer a long-term solution to the current problem of being able to master intercultural competence.

The research questions (RQ) and hypotheses (H) that have been developed are the following:

RQ1: How do individuals realize the need of becoming Intercultural Competent?

RQ2: Do individuals identify any practical implications in relation to a training method?

RQ3: How do individuals behave when faced with the idea of changing existing practices and also changing existing behavioral choices?

H1: It is expected that high-context individuals will score high on Intercultural Competence questions.

H2: It is expected that low-context individuals will score low on Intercultural Competence questions.

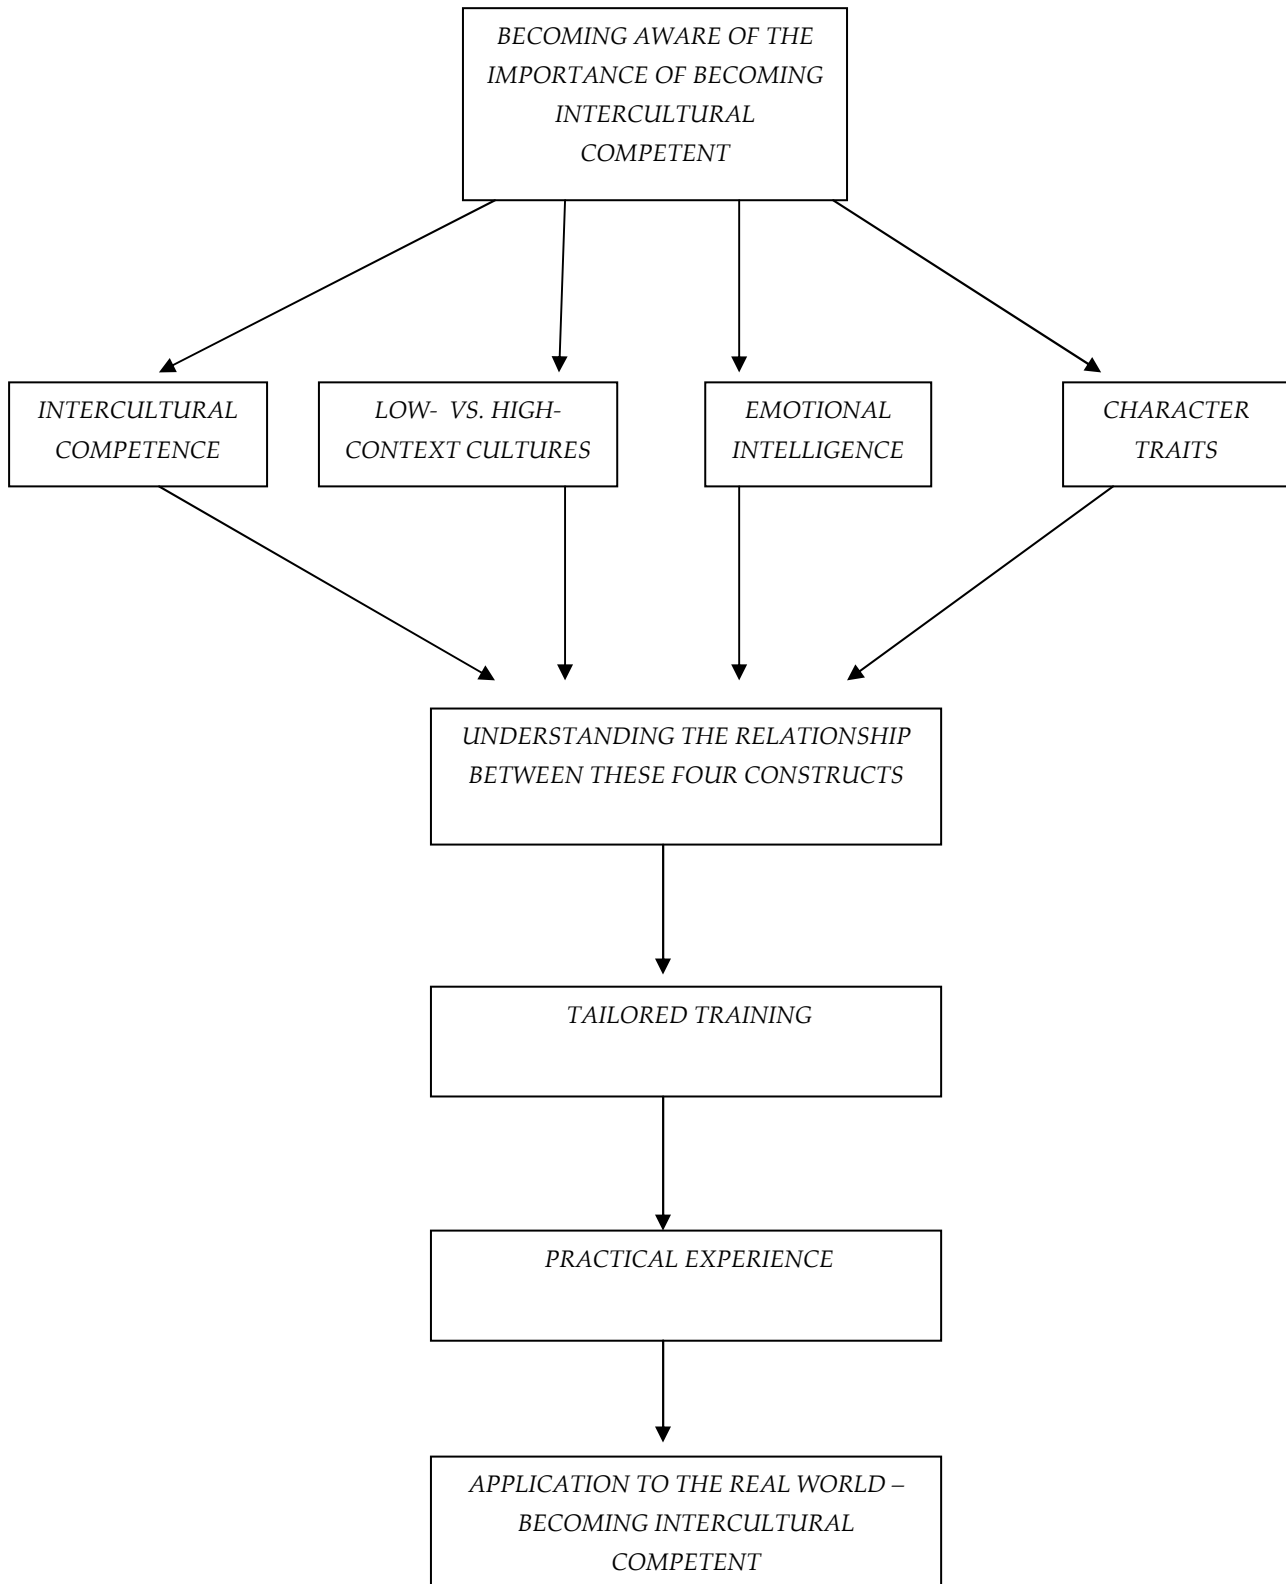

H3: It is expected that individuals scoring high on Emotional Intelligence will score high on Intercultural Competence questions.

H4: It is expected that individuals scoring low on Emotional Intelligence will score low on Intercultural Competence questions.

H5: It is expected that individuals scoring high on Specific Character Traits will score high on Intercultural Competence questions.

H6: It is expected that individuals scoring low on Specific Character Traits will score low on Intercultural Competence questions.

The new proposed framework:

Conclusion

Taking into serious consideration the previous research work which has been analyzed in section 4, it is evident that the gap in knowledge appears due to the fact that the different attempts to identify Intercultural Competence were made from a variety of different schools of thought which were based on one point of view each time. This fact limits the horizon of identifying what is actually needed in order to become intercultural competent.

The problem that arises is that a finalized and spherical framework on Intercultural Competence has not yet been defined.

An attempt has been made with this study to have a wider view on what skills are actually needed in order to become intercultural competent taking into consideration different aspects that could affect a person's personality and behavior.

It is also a must, that long-term effects are the final goal of delivering this framework and not just a short-term intervention which could be applied only for a specific incidence.

The most important part that is being proposed with this new framework is the addition of the construct of emotional intelligence, the difference between low and high context cultures and character traits. Differences between these will lead to a different and tailored training according to the person's needs.

The first part of the framework focus on becoming aware of what is intercultural competence and why it is important in today's globalized century. Understanding the relationship between intercultural competence and the other 3 constructs and also considering possible interrelationships between them.

Learning should then come through practical experience and lastly applying what it has been learned in the real world.

INTER-CULTURAL COMPETENCE AS A KEY SUCCESS FACTOR FOR SALES PERFORMANCE OF FRONT LINE EMPLOYEES: THE CASE OF THE BANKING INDUSTRY IN CYPRUS

Erasmia, Leonidou¹; Kaufmann, Hans Rudiger²

¹DBA Student, University of Gloucestershire. Email: erasmialeo@hotmail.com

²University of Nicosia, Cyprus. Email: kaufmann.r@unic.ac.cy

Abstract

In the current highly competitive market, with events such as the recent global recession, banking institutions have to enrol with the changes of the environment and utilize to the fullest extent possible all of their key components. As such, among the most precious elements a bank possesses is the front line workforce that interacts on a daily basis with the end customer. However, in the banking industry of Cyprus, appraisals undertaken by a banking institution in order to evaluate the sales performance of its front line employees showed a considerable weakness. Based on an extensive and systematic review of the literature, this article introduces three new factors regarding the sales performance of front line employees, inter-cultural competence, Problem Solving Approach (PSA) and negotiation skills. Lastly, front line employees should learn to sell through communicating rather than persuading, which calls for a searching need in the field of relationship developmental skills. Hereupon, through its synthesis and the introduction of those new elements into a new synthesized conceptual model, that is what this paper aims to fulfil.

Keywords: Sales performance, Bank, Front line employees, Inter-cultural competence, Cyprus, Emotional Intelligence

Introduction

Today's financial environment is frequently characterized as competitive and unstable. Financial providers must be flexible because everything is changing so rapidly. Due to the financial crisis, which started the first quarter of 2007 (Goddard, Molyneux and Wilson, 2009) consumers changed the way they behave.

This global (Akinbami, 2010) phenomenon has tremendous impact also on Cyprus. Cyprus has an important - strategic geographical position and has always been the reason for many wars, as many empires tried to dominate Cyprus (Dinkov and Stoyanov, 2005). Accordingly, existing theories on sales performance and sales process may not apply in the reality of Cyprus. New approaches should be explored in order to have theories applicable to the idiosyncratic conditions of Cyprus. As it is shown from a bank's annual results there is a need of developing new approaches for the front employees

helping them being more efficient. practice. Existing approaches seems to be insufficient and is rather urgent because, as cited by Cook and Hababou (1998), Deloitte and Touche stated that “In the future, the banking branches that do succeed will likely function more as sales centres than service outlets”.

There are a lot of articles on sales performance but only a few focuses on the front line employees working in a Bank (Singh, 2000). The current paper seeks to identify those factors, which when integrated can achieve success in sales. This “gap” will be investigated through a series of steps. The remainder of the study consists of the following sections: Firstly, the author will try to give some basic Definitions of the concepts involved and then proceed to the Search Strategy, including the sources and focalization. The articles which will result from the election criteria will be eventually “synthesized” at the end, trying to identify what has been written and tested on this topic (Tranfield, Denyer and Smart, 2003).

Background

Systematic review of past research is an important part of this doctoral journey towards the creation of a conceptual framework, linking inter-cultural competence with front line employees’ sales performance in the banking sector in Cyprus.

Research aim and Objectives

The Research aim is as follows:

The aim of this research is to develop a conceptual framework relevant to the link of front – line employees’ sales performance with inter-cultural competence in the Banking Sector in Cyprus. Specifically, this paper aims to develop a conceptual framework in order to promote better sales performance for the front line employees in the banking sector in Cyprus. Trying to serve academic and practitioner communities, the explored hypothesized explanatory variables will, at a later stage, be validated by empirical research in the banking sector in Cyprus.

The Research objectives are as follows:

- a. To systematically review the literature on the synthesis of concepts relating to front line employees’ sales performance in the banking sector in Cyprus.
- b. To investigate if correlations exist between relevant concepts.
- c. To develop a conceptual framework as a result of synthesizing pre - existing knowledge
- d. To test the developed conceptual framework in the banking industry in Cyprus.
- e. To adjust the framework in the banking industry in Cyprus, and to produce new knowledge contributing in this way to both theory and practice.

The objectives a to c, examine the ground basis of theory and thus, confirm existing knowledge. Furthermore, objectives d to e, contribute to theory and professional practice at a doctoral level.

Literature Aim and Objectives

Aim

The aim is to provide «collective insights through theoretical synthesis» (Tranfield, Denyer and Smart, 2003, p. 220) into the field of the banking sector in Cyprus, linking front - line employees' sales performance with inter-cultural competence.

Objectives

- To systematically review the existing researches on sales performance of front line employees and the importance of inter-Cultural competence
- Synthesize performance of front line employees on sales along with inter-cultural competence.
- Try to explain sales success by multivariate analysis

Defining Front line employees

Front line employees have to anticipate customer's wishes with high quality service and at the same time be efficient and productive, satisfying the organization (Singh, 2000). They are the link between the bank and customer (Stephenson and Kiely, 1991; Font, 1993).

Defining Employee Performance and Sales Performance

“Performance can be described as an umbrella term for all concepts that considers the success of a company and its activities” (Tangen, 2004, p. 40). In the case of front line employees' performance, productivity and quality are two different elements, influenced by different factors. Quality connects with customer interaction, which requires emotional and laborious efforts; and productivity, is the “backroom” work and the transactions with the customers (Singh, 2000).

Personal selling is communicating information trying to persuade a prospective customer to proceed to a buy of something – a good, service, idea, or something else (Futrell, 1992). One of the oldest paradigms in the profession of selling is the “seven steps of selling” proposed by Dubinsky (1980) which the following are included: the “prospecting”, “pre-approach”, “approach”, “presentation”, “overcoming objections”, “close” and “follow up”. Later on, these techniques evolved to methods more close to a relationship approach (Moncrief and Marshall, 2004)

Defining Emotional Intelligence

During the last years, emotional intelligence has puzzled a lot of researchers, who have tried to define, explain and measure it. Goleman (2001) claims that most researchers agree on the core dimension of emotional intelligence, which is about the ability to “recognise and regulate emotions in ourselves and others” (Cherniss & Goleman, 2001, p.14) In this definition we can also find also the four major emotional intelligence domains: Self-Awareness, Self-Management, Social Awareness, and Relationship Management. In this paper, emotional intelligence will be studied within the parameters of the sale's

performance of front-line employees in the banking sector in Cyprus. A specific skill, the inter-cultural competence skill, will be under the Emotional Intelligence's domain as it has to do with the social competence in the "Social Awareness", and the communication under the domain of "Relationship Management".

Defining the concept of Motivation.

Motivation is one of the main factors contributing to increased performance, thus a provided definition is essential for the later study. According to Barrick and Ryan (2003), Motivation is the decisive effect which determines the project someone puts effort in, the level of effort, stamina and persistence he or she will show to achieve his goals (Barrick & Ryan, 2003). The same authors claimed that Motivation is the link between aspects of sales Representatives' job performance and conscientiousness. Moreover, Salovey and Mayer (cited in Goleman, 1998) added that motivation is one of the five basic emotional and social competences.

Task

According to Motowidlo, as cited by Barrick and Ryan (2003), there is differentiation between task knowledge and task skill. The first one refers to the knowledge of principles and procedures related to the operational functions, whereas task skill is the skill required for accomplishing a particular task.

Defining the Local Culture

According to Hofstede (1980) Culture is the mental programming a group of people share and which differs from the mental programming another group of people have in common. The "national norm", which comprises the common beliefs, is not easy to change as it is in every function of a society (Hofstede, 1980).

The current study associates itself with the third Dimension of Hofstede theory, the "Individualism – Collectivism" as it explores the way people comprehend and react to specific situations in specific geographical location regarding the way they are nurtured by society. According to Hofstede, in countries with high individualism, there is greater independence among individuals, whereas in countries with high collectivism, there are stronger bonds between people. European countries differ from one another; even though they are presumed to be collectivistic (Segalla et al., 2006).

According to the research upon the influence of regional culture on sales force recruitment is an "Under-researched" area and there are a lot of elements, which need to be examined (Rouzie's et al., 2003). There is a need for the production of new approaches and theories, as "theories reflect the cultural environment in which they were written" (Hofstede, 1980, p. 50).

The current study will focus on the culture of Cyprus. Cyprus belongs to the same culture group as Greece. The reason is the geographical proximity, common traditions, language, national origin and religion (Dimitratos et al., 2011). Nevertheless, it is a challenging endeavour when it comes to

anthropological observations and behaviours. There might be a need for a differentiated approach, as far as Cypriot culture is concerned.

Defining intercultural competence

Intercultural competence includes cultural awareness, cultural sensitivity and cultural adroitness. Cultural awareness is about knowing what effects a person's behaviour will have on others. Also, it includes the understanding of characteristics of other cultures and accordingly adopting the behaviour. Cultural sensitivity is when someone is open-minded and does not judge, because he or she tries to understand and respect values of other cultures. Cultural adroitness is to know what to do in order to communicate effectively avoiding offending anyone (Chairsrakeo and Speece, 2004). People not sharing the same culture, have different and sometimes "incompatible values, norms, relationships and communication styles" (Chen-ya and Mattila 2010, p. 330). This, of course, increases the chances of misunderstanding, according to Furnham and Bochner (1986) and Hall (1959), as cited by Chen-ya and Mattila.

Methods

Search Strategy

Search Strategy adopted – elaboration

The author of this study chose to proceed with a combined search strategy, applying both manual and automated search. Manual search in the library targeted on definitions. For the examination of topics relevant to the current study's topic, automated search was conducted.

Specification of the search terms

During the creation of the present literature review, the author used the following English search terms:

- Emotional Intelligence AND sales* OR selling
- Success AND sales* OR sell*
- Intercultural AND service OR sell* OR sales*
- Performance AND salesperson
- Personal AND selling

*The asterisk was used in order to increase the amount of articles, allowing the following variables:

Sales* = sales, salespeople, salesperson

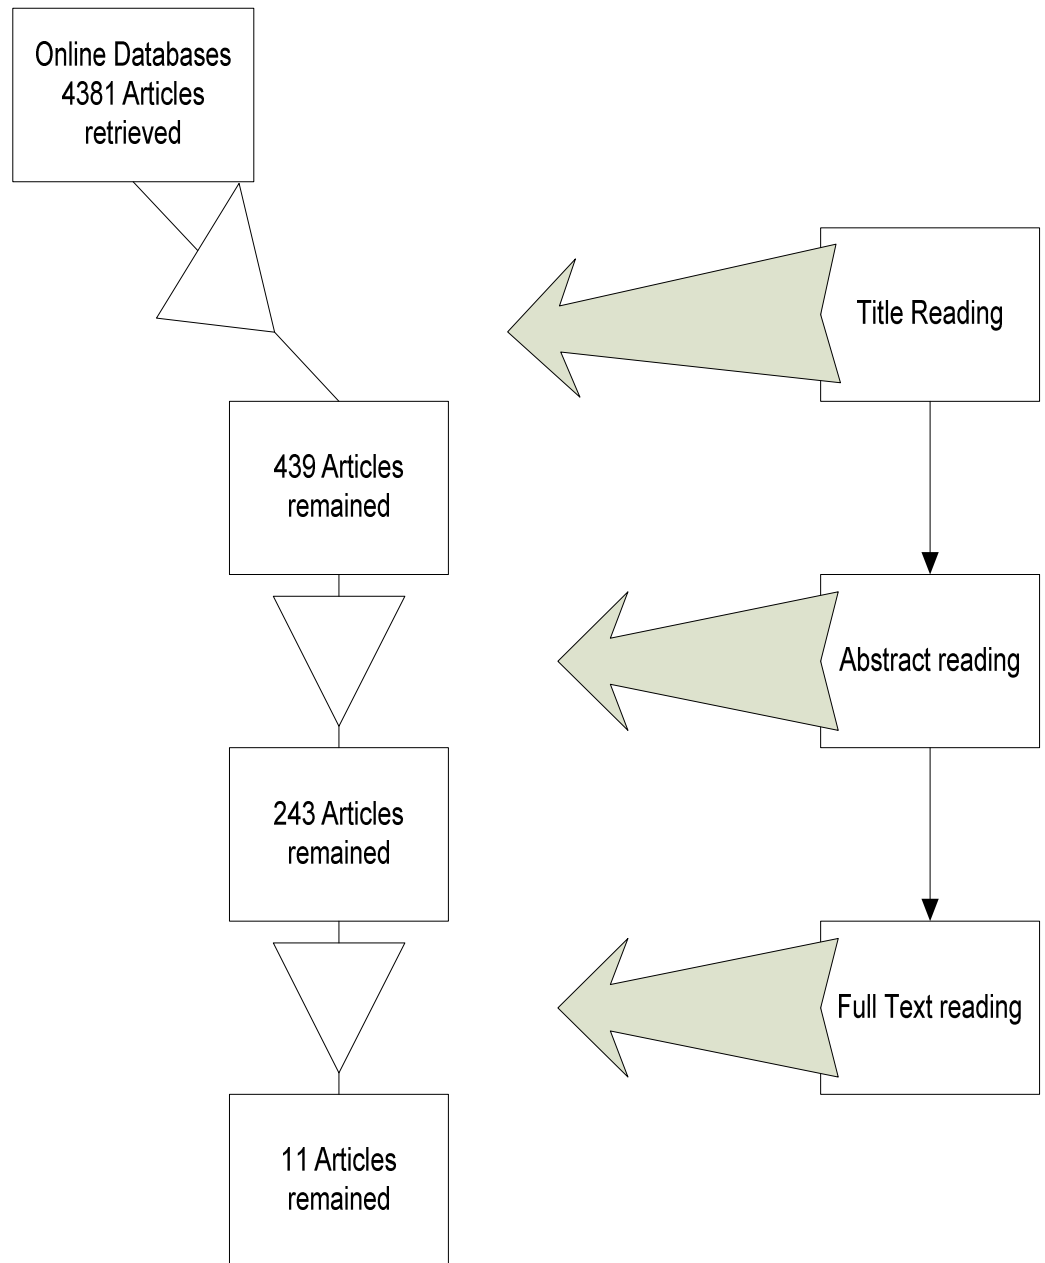

Sell* = selling, seller

Resources used for automated search

The present study based its search on online electronic databases and internet search engines. Same search terms were used in all electronic databases, in order to ensure that every available relevant article was going to be examined. In this way the author increases the possibility of an intensive and thorough search.

- EBSCO Host: <http://web.ebscohost.com>
- Emerald Insight: <http://www.emeraldinsight.com>
- Science Direct: <http://www.sciencedirect.com>
- Google Scholar: <http://scholar.google.com>
- Reuters <http://www.reuters.com>

The sum of the results retrieved from the literature search are shown in Figure 1 below:

Figure 1

Specification of time frame the search was limited to

Sales models have been in the body of literature for ages. The author decided to set the time frame from 1985-present. The reason is because in 1985 Churchill et al. (1985), regarded as pioneers in their field,

conducted a meta-analysis using 116 articles, trying to find the determinants of sales performance detected until then. In addition, this article was published in the Journal of Marketing Research, ranked as top in the Harzing list.

Ancillary search procedures

Besides the automated search, the author tried to find relevant sources through the references of articles retrieved. That enables the researcher to read into the topic and ensures that the author will be informed about influential writers in the field and important definitions and models developed by them.

Selection Criteria

Authors should include in the review, only studies which meet all the inclusion criteria. Those criteria were clarified in the review protocol (Tranfield and Smart, 2003).

Time : As the table illustrates, time frame includes studies from 1985 onwards, for the reason mentioned above.

Language : Studies written in other language except English were excluded, as the author could only comprehend literature written in English.

Focus : Selling Process is a complex topic affecting the performer, the receiver and the person who evaluate the selling process. The current study deals with employee's perspective, so studies not referring to employers, were excluded. The focus needs to be specifically on how employees deal with and perceive the selling process.

Methodology adopted: The author included research papers conducted with both qualitative and quantitative research approaches. The topic of the current study is dealing with social skills, cultural and inter-cultural competences, which can be well examined through the qualitative approach, as it allows in depth investigation giving the chance to people express and justify their selves. On the other hand, since it also investigates those factors, which help the selling process, a quantitative approach allows the examination of correlations and analysis

Quality Assessment

A Quality Checklist was generated in order to measure the quality of the selected studies, and it comprises the following elements: Validity, Credibility, Integrity and Reliability.

Validity

Validity measures the success of the study to cover its research topic. Specifically, it focuses on the study's success to measure what it intends to measure.

Credibility

Credibility measures the degree to which the research of the article is believable and how credible the author's qualifications are to undertake the research topic. In addition, credibility is also measured by the writing style of the article, if it is academic and scientific.

Integrity

Integrity focuses on how robust the research study is and if the chosen research process is strictly adopted. It can be measured by evaluating if the methodology approach adopted in the study is identified and has a rationale of the choice made (Caldwell et al., 2010; Coughlan, et al., 2007).

Reliability

Reliability focuses on the consistency and the degree to which the study can be replicated and how generalizable the results are. However, reliability cannot be measured, it can only be hypothetically assumed (Collis & Hussey, 2003; Caldwell et al., 2010).

Figure 2

Data Extraction

After the process of selecting the studies to be included in the review and after passing them through the quality assessment process, the following data were extracted from the selected studies:

- Publication details: Title of the paper, Author's name, year of publication.
- Features of the study: methodology adopted, population characteristics, sample size.
- Key findings.

This process was implemented and documented through a data extraction form that minimizes as much as possible the human error (White and Schmidt, 2005; Tranfield et al., 2003). Table 2 illustrates the data extraction form along with the data extracted from each of the selected studies.

Table 2. Data extraction form –Summarized data from the selected studies

Nr	Title	Author/s	Publication details	Year of publication	Methodology adopted	(Population) Characteristics	Sample size	Key results
1	A grounded theory model of service providers' stress, emotion, and coping during intercultural service encounters	Chen-ya Wang and Anna S. Mattila	Managing Service Quality, Vol. 20, No 4, 2010, p.p. 328-342	2010	Semi-structured qualitative interviews	Female and Male Caucasians, Asians, Asian-American. Ages: 20-45 Service encounters	9 Female 4 Male	Intercultural interacting can be frustrating for service encounters. Lack of intercultural sensitivity may lead to avoidance of the customer
2	Success in Selling – The Current Challenge in Banking	Bill Stephenson and Julia Kiely	International Journal of Bank Marketing Vol. 9, No 2, pp. 30-38	1991	Semi-structured qualitative interviews	Senior managers from NatWest, Barclays, Lloyds, Midland and Abbey National	10	Sales Culture: Driving force for future success the movement to individual ability

(12 Firms) Average age from sales: 35 and ITs: 30.	From sales people: 30 Male 31 Female From salespeople in IT sector: 26 Male 24 Female	Certain competencies like social skills, differ between sales people and IT employees.

Synthesis

Synthesis development

The changing role of front line employees

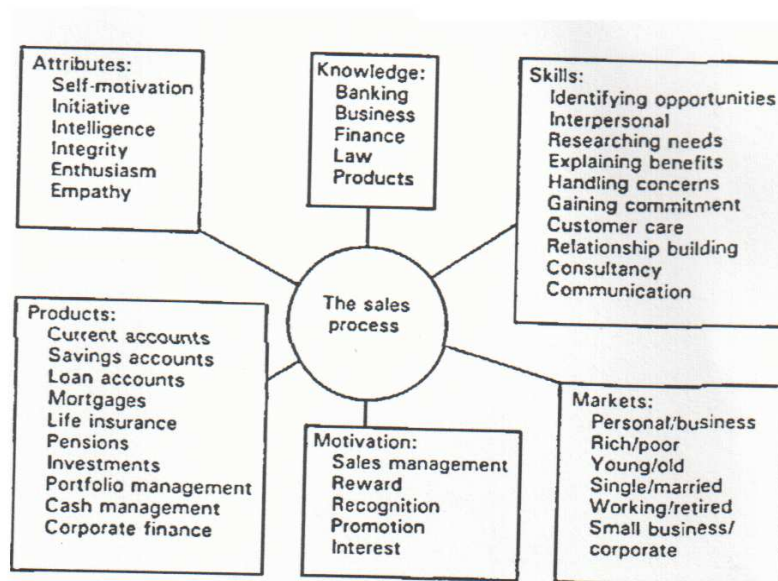

Banks have already realized that to succeed in today's demanding and competitive arena, they need to be flexible and change their focus from the "institutional image" to individuals' abilities, taking advantage of the people working face-to-face with customers (Stephenson and Kiely, 1991).

The advancement of the technology and customers' increased financial sophistication has inevitably changed the way bank's branches are organized. Since the "back office"- transactional- activities have been automated, staff can focus on the interaction with the customer. Today, branch office is the "delivery and selling point" and front line employees become advisors and through advising proceed to cross selling. That's exactly what clients look for. Front line employees should satisfy clients and at the same time make sure that they will make profit for the bank. This requires communications skills, as they will absorb and transfer information and then accordingly suggest and advice.

Stephenson's & Kiely's Model: "Factors Influencing Selling Process in the banking sector"; Missing skill?

Most of the skills have already been discussed and are incorporated in various selling models. Stephenson and Kiely (1991) created a model illustrating the "Factors Influencing Selling Process in the banking sector". As shown in Figure 3, sales process is surrounded by the factors influencing it. The factors are categorized in six groups. First category is "Attributes", second category is "Knowledge", third category is the one concerning the "Skills", fourth group is the group of "Motivation", fifth category is "Products" and sixth relates to "Markets". The last three categories concern the organization, whereas the first three concern the service encounters (Stephenson and Kiely, 1991). This is a rather complete model, but as they stated, "motivating and managing a branch staff in selling brings with it a totally different set of challenges from that of dealing with direct sales forces" (Stephenson and Kiely, 1991, p. 38). Thus, the existing model of sales and other models of sales need to be adjusted when it comes to branches. Employees having constant contact with foreign customers, something very frequent in Cyprus' reality, presume an important factor missing from the model, the skill of inter-cultural sensitivity. Chen and Starosta (1996), as cited by Chairsakeo and Speece, stated that inter-cultural competence is a sine qua non for the efficiency, due to the globalization and the need for intercultural selling (Chairsakeo and Speece, 2004).

Figure 3: Stephenson's & Kiely's Model

The importance of Inter-cultural competence

The above skill is highlighted in the research Wang and Mattila (2010), even though it does not focus on sales but in service provider's perspective, especially when having to deal with customers coming from different cultures. According to the article, there are two ways of coping. On the one hand, dealing with the problem; on the other hand avoiding the problem. According to the interviews, employees interacting with customers from different cultures need to be good in understanding the body language and be patient. Otherwise, it can get very frustrating for the customer and provoke again avoidance (Wang and Mattila, 2010). Inter-cultural sensitivity is a skill that strengthens performance when dealing with international customers or prospect customers. Authors encourage further research in various service industries on this subject (ibid.).

Examples of other Social emotions-importance of inter-cultural understanding

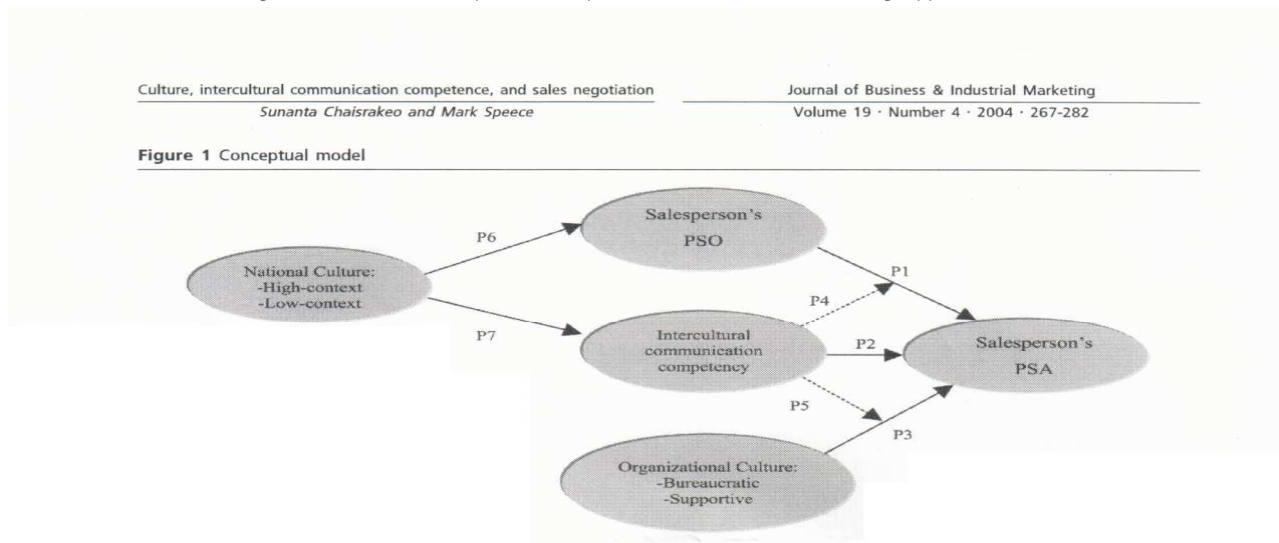

Almost a decade before, Willem Verbeke and Richard P. (2003) discussed indirectly the previously mentioned skill of inter-cultural awareness but actually focused on personal selling. Social emotions affect personal selling. When salespeople are not aware of other cultural norms, they might easily offend and provoke negative results to their sales performance when it comes to foreign customers. According to the authors, social emotions have not been examined in detail within the selling literature, compared to other emotions. The authors encourage further research on other social emotions because a lot of them have not been studied in the sales literature, such as pride. Social emotions are correlated to intercultural skills, since the authors stress that the results of people's behaviour depends on the culture wherein the

study is undertaken (Verbeke and Bagozzi, 2003, p. 256). So, what happens on the case where different cultures need to be synchronized?

Correlation between inter-cultural and negotiation skills

As mentioned previously, studies suggest that when selling something to people coming from different cultures can be tricky. Chairsraeko and Speece (2004), after doing in depth interviews with sales representatives having international experience, reached a conclusion, that during a selling process with foreign customers or not, employees need good negotiation skills. This factor is likely to fall into the category of the factor missing from Stephenson's and Kiely's model, inter-cultural competence. Negotiation is divided into two styles: the first is the problem – solving approach and the second the competitive approach (Chairsraeko and Speece, 2004). According to Vida's (1999) competitive approach, employees tend to persuade client using inappropriate tactics. Front line employees working in a Bank should sell through communicating rather than persuading, which is obvious in other selling industries. This communicative procedure includes a passive approach, like giving information (Font, 1993). The first style ensures a long-term relationship and employees are actuated by cultural aspects as it has to do with in depth communication (Chairsraeko and Speece, 2004, p. 267). In this style, employees tend to adapt their behaviour trying to focus on the customer's needs gathering as much information as they can. This leads to the observation, that inter-cultural communication competency actually affects sales performance, because a failure to communicate right with international clients, may lead to loss of possible sales (Chairsraeko and Speece, 2004). Negotiation depends also on the cultural context. In high-context cultures, similar to collectivist cultures, people express a lot in non verbal manner, whereas in low-context cultures, like in individualistic cultures, people expect formal communication with the verbal expression (Chairsraeko and Speece, 2004). Cross-cultural negotiations include being open and sensitive to others. Inter-cultural competence includes cultural awareness, cultural sensitivity and cultural adroitness, characteristics, which according to Zakaria (2000) are at one point inherent and on another point learnt. People who have these attributes are likely to be more successful in cross-cultural sales negotiations as with inter-cultural competence they are able to approach and solve problems.

Figure 4: Chaisrakeo & Speece Conceptual Model on Problem Solving Approach

Both cultural and relationship development skills needed

Another research emphasizing on the need of new approaches in the selling functions is the one conducted by Marshall et al. (2003). This research confirms what was mentioned at the beginning of this synthesis, where Font (1993) stated that employees should absorb information and promote products accordingly. This is happening among others, within the framework of “relational and consultative sales approaches” (Marshall et al. 2003, p. 246). The traditional sales process model needs to be updated as most of the research took part in the “era dominated by transactional selling models” (Marshall et al. 2003, p. 254). Now there are some skills and knowledge required which differs from the traditional success factors. In the article the authors refer to previous success factors stated by Lamont and Lundstrom (1977), for instance personality and personal characteristics, such as capability and adaptability. They also referred to Weitz et al. (1986), who concluded that knowledge structures and acquisition skills amplify success in sales. Nowadays, what is relatively new is what Macintosh et al. (2003) stated, that there is a need of relationship developmental skills (Marshall et al. 2003) After the survey was conducted, the results showed that skill – based factors were at high importance, with first and foremost the listening skills, something already proven by Castleberry and Shepherd (1993) and Ramsey and Sohi (1997) (Marshall et al. 2003). The second factor refers to the “follow up” skills, but with the extra effort in the relational approach. The third factor refers to the adaptive performance, already known by Weitz et al. (1986). The fourth factor refers to the “Tenacity-sticking with a task”, the fifth refers to the skill of being well – organized and the sixth factor refers to the verbal communication skills; lastly, the proficiency level of interacting with people, already acknowledged in the relational and consultative models of selling of Rackham and DeVincentis (1999). The survey affirmed that a good salesperson must have traditional capabilities.

Cultural factors – closely related to sales performance

Cultural factors related to sales performance are once more proved by Jaramillo and Marshall (2003), who conducted a research and published an article in 2003 on sales performance in the banking sector. This study aimed to identify the success factors in sales of banking products and services in Ecuador. At the beginning, the authors suggest that researchers in the past have found correlation between culture and sales performance, due to the existence of different perspectives and perceptions. And that was of course connected with the previous mentioned theory of Hofstede, individualism and collectivism. The authors mentioned a cross – cultural study in Australia and Hong Kong that found differences in perceptions of personal selling. Furthermore, the same authors have referenced to DeCarlo et al. (1999) statement, that culture also effects the salesperson perception and thus the intrinsic/extrinsic motivation, something relevant to the present study (Jaramillo and Marshall, 2004). The gap covered in the mentioned study, was the exploration of selling techniques in the Hispanic salespeople and is highly relevant to the recent study, as Cyprus culture is also high context culture. The sample was from two large privately-owned Ecuadorian banks and the selling techniques used in this study were based on the one of Dwyer et al. (2000). The results showed that the best predictors of performance are five out of the seven stages of selling procedure: “Prospecting”, “Approach”, “Sales presentation”, “Closing” and “Follow-up service” (Jaramillo and Marshall, 2004, p.20). Regarding the limitations and suggestions for further research, the authors pointed out that other variables may affect the sales performance in the banking sector, for instance personality or motivation. Importantly, things may vary among units. They suggest the consideration of these limitations in future research in other countries for further comparison (Jaramillo and Marshall, 2004, p. 23).

A couple of years later, another rather interesting study conducted by Jaramillo et al. (2005) was investigating the relationship between organizational commitment and job performance, and how this is affecting sales employees, bearing in mind also the cultural influence. The results of this meta-analysis stated that organizational commitment explains only the 6% of salespeople’s job performance (Jaramillo et al. 2005). They included an important statement of Churchill et al.’s (1985), that “none of the predictors by themselves account for a greater variance in performance – less than 10% on average”. Another factor mentioned in the study, was the self-motivation which was connected to job commitment. A self-motivated person will show the “in” and “extra” role performance maintaining a positive attitude (Jaramillo et al. 2005). Another important finding is that this positive relationship is stronger in collectivistic cultures, as job performance is influenced by individuals’ values (ibid.). These findings confirm that culture has an effect on performance and that a lot of predictors must be taken into consideration in order to examine performance.

Figure 6 : Marchall et al. table of success factors for professional salespeople

Table 2

Sales managers' importance ratings of success factors for professional salespeople

Success factors	Mean	S.D.
<i>Highest level of importance</i>		
Listening skills	6.502	0.683
Follow-up skills	6.358	0.772
Ability to adapt sales style from situation to situation	6.321	0.687
Tenacity-sticking with a task	6.107	0.924
Well-organized	6.084	0.889
Verbal communication skills	6.047	0.808
Proficiency in interacting with people at all levels of a customer's organization	6.000	0.991
<i>Second level of importance</i>		
Demonstrated ability to overcome objections	5.981	1.085
Closing skills	5.944	1.109
Personal planning and time management skills	5.944	0.946
Proficiency in interacting with people at all levels of your organization	5.912	0.994
Negotiation skills	5.827	0.975
Dresses in appropriate attire	5.791	1.063
Empathy with the customer	5.723	1.074
Planning skills	5.685	0.966
Prospecting skills	5.673	1.209
Creativity	5.670	0.936
Ability to empathize with others	5.549	1.105
Skills in preparing for a sales call	5.526	1.219
Decision making ability	5.502	1.023
<i>Third level of importance</i>		
Evidence of working through unexpected problems	5.467	0.991
Ability to interpret customers' body language	5.447	1.233
Previous customer contact experience	5.432	1.225
Displays appropriate body language	5.419	1.193
Written communication skills	5.405	1.093
Effective use of data in presentations	5.359	1.198
Patience	5.186	1.273
Good sense of humor	5.158	1.052
Leadership skills	5.149	1.198
Ability to communicate technical product information	5.146	1.322
History of past sales successes	5.038	1.387
<i>Fourth level of importance</i>		
Aptitude for learning technical product specifications	4.887	1.383
Previous sales experience	4.841	1.290
Excellent references	4.827	1.493
History of past business successes	4.780	1.375
Skills in calculating prices and/or profitability	4.673	1.376
History of speaking before groups	4.598	1.331
Potential for moving into sales management	4.581	1.441

Table 2 (continued)

Success factors	Mean	S.D.
<i>Fifth level of importance</i>		
Specific industry knowledge	4.484	1.600
Ability to conduct research on industry competitors and trends	4.439	1.365
History of preparing and presenting formal business proposals	4.379	1.293
Attractive physical appearance	4.322	1.301
Previous formalized sales training	4.186	1.344
Past experience in team selling	4.150	1.403
Good driving record	4.112	1.609
Word processing skills	4.074	1.375
Four-year college degree	4.065	1.725
<i>Sixth level of importance (these items are below the scale midpoint)</i>		
Ability to coordinate schedules of support personnel	3.962	1.466
Database management skills	3.888	1.270
Grade point average	3.772	1.238
History of leadership positions in college organizations	3.721	1.622
Spreadsheet skills	3.679	1.369
Took a personal selling class in college	3.659	1.692
Clean credit report	3.651	1.747
Mechanical skills for setting up displays and demonstrations	3.474	1.456
Proficiency in using the Internet	3.249	1.440
Computer graphics skills	3.160	1.326
History of membership in college organizations	3.116	1.437
Played sports in college	2.629	1.532
Plays golf	2.233	1.293

All items were scaled as follows: 1 = of no importance at all in hiring decisions, 7 = of the utmost importance in hiring decisions.

Low percentage of each predictor of sales performance

Churchill et al. (1985) showed that each predictor has on its own on average 4% association with the salesperson's performance. Thus, models of the factors determining salesperson's performance should

include multiple variables. The Personal Variables include the intra-individual characteristics, like age, height, sex, weight, race, appearance, education, marital status, club memberships (Churchill et al., 1985). Moderator variables, product and customer type effect the strength of the relationship between salespeople's performance and the major determinants, which are according to the research: aptitude, skills, motivation, role, personal factors and organizational/environmental factors (ibid.). The findings indicate that in terms of the average size of their association with sales performance, role variables come first, second skills, then motivation, fourth personal factors, aptitude and lastly organizational/environmental factors. The authors stated that, since the type of product is so influential, researchers should be careful with the differentiation of sales jobs (ibid.). That's why investigating an adjusted model in the banking sector and in specific in the front line service, is better than reaching to conclusions based on generalization of the existing variables. Churchill et al. suggest that "theoretical models which hypothesize multiple determinants – and categories of determinants – of sales performance are probably on the right track" (Churchill et al., 1985, p.117). The variables included in this model are also included in the model Stephenson and Kiely (1991) suggested. The last model further adds the "Role" and "Organizational/Environmental factors".

Emotional Intelligence

Going through the existing body of literature on sales representative another important component emerges, emotional intelligence, which is also missing from the two previously mentioned models of Churchill et al. (1985) and Stephenson and Kiely (1991). Individuals working as sales representatives need the qualities of emotional intelligence, such as self-worth and self-acceptance (Manna and Smith, 2004). Treasure (2002) as cited by Manna and Smith (2004), pointed out three factors, which create high-quality commercial relationships. The first one is cultural awareness; the second one is value exchange and the third one communications. The research showed that communication skills, negotiation skills, emotional intelligence and presentation skills and the differentiation of personality types are very crucial for salespeople (Manna and Smith, 2004). This affirms the previous mentioned skills and adds another one, that of emotional intelligence.

Yildirim (2007) refers to McClelland (1998), who said that success depends on the combination of competencies. The author suggests that the main clusters of competencies should be determined (Yildirim, 2007). The model of Emotional Intelligence provides insight of the competencies included in each cluster. His research studied both salespeople and IT employees. Results comparing the difference between salespeople and IT employees showed that social skills are clearly higher in salespeople (Yildirim, 2007), confirming again the importance of this factor.

Table III. Structure matrix for emotional competencies

Notes: * $p < 0.05$; ** $p < 0.01$; Box's $M = 407.1$; $F = 1.96$; $p = 0.00 < 0.01$; Canonical Correlation = 0.85; Wilks' Lambda = 0.27; $p = 0.00 < 0.01$; Percentage of cases correctly classified: 93.7 percent; Functions at Group Centroids: for Salespeople 1.45; for IT -1.77

Conceptual Framework

In conclusion, the existing models discussed before could be synthesized and expanded according to the changes and new demands (Figure3). Emotional Intelligence incorporates self-awareness, self-management, and social-awareness social-skills. All these clusters could replace Attributes, which refer to Emotional Intelligence, and Skills from Stephenson's and Kiely's model (1991). Furthermore, the skill of inter-cultural competence, negotiation skills along with Problem Solving Approach, could be added to Yildirim's (2007) table (according to Goleman's framework of competencies) under the "social-skills". On the other hand, a couple of factors should be excluded from Stephenson's and Kiely's model (1991), such as Mortgages, Investments, portofolio management and Corporate business, as those do not apply to front line employees' job specifications.

The new model is more likely to apply to Cyprus' environment and to front line employees in the banking sector. Cyprus' location is very strategic, as it is a "cross-road" between three continents: Asia, Africa and Europe and is the third largest island in the Mediterranean Sea located just 40 miles south of Turkey. Furthermore, Cyprus' low taxation attract a lot of foreigners to visit and settle as financiers and investors. This whole situation results in the existence of a big number of wealthy multicultural individuals, or even better, prospect customers.

Limitations

The present study focuses on one specific country and the conceptual framework has been adjusted according to Cyprus' characteristics. For Cyprus, the inter-cultural competence is very important due to reason explicated previously. Thus, this conceptual framework should be validated again when trying to find those factors influencing the performance of front line employees in another country. Furthermore, the study concentrates on a specific unit of the banking sector and thus the constructed model should be differentiated when measuring another department's selling process. Moreover, due to the limitation of words, important theories and aspects are not investigated in depth. Further investigation is needed to cover the topic area.

Conclusion

In the current study, the researcher tried to approach the topic of the selling process of front line employees in the banking sector in Cyprus through a systematic literature review. Firstly, the topic was introduced and the reason for initiating this study was justified. Consecutively, there was a thorough explanation of research aim and objectives, as well as of the literature aim and objectives, followed by the definitions of the most important elements concerning front employees selling process. Through the Search strategy, Selection criteria and Quality Assessment, the author tried to make sure that this study could be repeated step by step and possible error or omission could easily be traced and corrected.

Finally, going through the selected articles, a model has been synthesized, adopting various elements from other models and abstracting other elements not suitable to the selling process of the front line bank's employees in Cyprus. Elements like intercultural competence, Problem Solving Approach and Negotiation skills have been added to a basic selling process model concerning the banking sector. The development of this model will be tested in banking sector in Cyprus, contributing in this way to theory and practice.

Abstract

New models and management approaches are being searched in today's economic world where the borders are removed and people are trying to live with economic crises. Neither governments nor private sectors are being able to control the markets. Economic and social problems are growing rapidly and the countries are going bankrupt like businesses. Under these circumstances third sector foundations are giving opportunity to market failures and looking for solutions by social entrepreneurship. In this paper reasons for the market failures have been discussed and third sector and social entrepreneurship are offered as a solution for today's economic problems.

Keywords: Market Failures, Third Sector, Social Entrepreneurship

Introduction

Regulating the markets is implementation of the classic economic view's internal dynamics. However, to gain functionality, the neoclassic market system has been changed with the view of defending governmental needs and trying to explain reasons of market failures and at this point criticizing the classical view. By reviving the economy's market failures, the classic view has paved the way in terms of interferences of limited governmental market economies functionality. In terms of expressing welfare economics, it is necessary to discuss the activity of markets and government. A fundamental goal of this study is looking at the role of well-functioning markets within a nation-state with an active economy and robust corporate involvement, instead of a more historic and accepted economic model, which places emphasis on the government as the centre of the economy.

This study is focused on whether or not it is possible to correct market failure by using social entrepreneurship as a form of social transformation.

Social entrepreneurship is becoming more important every day as problems are gradually increasing. The practice and perceptions taking place at the market level should be used to solve social problems. To fill the gaps, the transformation of a reactive organization structure to a social entrepreneurial organization of third sector is necessary.

Market Failures

One of the most widely accepted definition of market failure belongs to Charles Wolf. Wolf (1989) defines market failure as markets' failures in generating economically optimum and socially desirable outputs.

Economists also define market failure as the opposite of theoretically and ideally operating economy (Crampton, 2007). At the same time; market mechanism's incapability of providing pareto efficient distribution in itself or maximizing social utility and its failure in ensuring efficiency are defined as market failure (Unsal, 2010).

Pareto optimal realization; requires efficiency achievement in production, alternation and general. Lack of efficiency in these three cases; expresses that pareto optimum and sources are not used effectively in economy, resource allocation is not optimal and the maximum level of welfare can not be provided. Accordingly; cases in which marginal social costs can not be equalized with marginal social benefits show that market failures have come out. In such cases in which markets fail to provide economic efficiency, maximization of public welfare can also not be achieved. Market failures can be discussed in two ways. First one is market failures arising in static economies and the second is market failures that come out in dynamic markets. Market failures in a static economy are evaluated for the cases where there is no economic growth or progress and these are failures created by economic externalities, the emerging imperfect competitive markets, public goods, asymmetric information existence (<http://www.tisk.org.tr/yayinlar.asp?sbj=ic&id=71>) or undesired income distribution (Zerbe and McCurdy, 1999). Besides, monopoly owners show tendency to cause loss of social welfare retrenching the output and increasing the price. The comparison of external cost production in consequence of an economic activity and economic activity in pareto optimal reveals the fact that market output is subject to excessive externality (spill-over). Because the related information ranges asymmetrically among economic operators, markets fail in performing an efficient production. As to public properties, they provide positive externality and also have the characteristics of non-rivalness and non-excludability in their consumption. Once the product is brought into public use, we cannot prevent people using the benefits offered and also the realized profit obtained by one of the users does not lessen another's profit. For example; once highways have been constructed, the beneficiaries of them cannot be restricted. For the reason that production cost of a product cannot be compensated because of nonseparable feature of the product economists emphasize that no one will desire to produce that product. Furthermore, by reason of the fact that the product is unrivalled, cost of its consumption by an additional user will be zero. And the price that is adopted in order to prevent its usage by another person will cause deactivation (Crampton, 2007). Besides; dynamic market failures are considered as the failures caused by both macro imbalances and factor markets which cannot be fully operated and also non-existing financial markets (<http://www.tisk.org.tr/yayinlar.asp?sbj=ic&id=71>).

On the purpose of rectifying market failures, the governments in developed and developing countries, interfere in markets by applying some sets of rules to regulate the markets. In this regard; the concept of market failure has been firstly begun to be used in order to explain the need for increased government expenditures (Zerbe and McCurdy, 1999).

In the cases where markets cannot be disciplined, intervention of the state may be regarded as necessary. That does not mean that a constructive intervention of the state in operation of the economy will always bring to a successful conclusion. And states do not give guarantee in respect of acting more ideally than the prospective behaviors of enterprises (Baumol and Blinder, 2000). In addition, transaction costs that are created by market regulations carried out by intervention of the state should provide further added value than the profit obtained in consequence of market regulations. States are not always excellent. When intervention of the state provides important benefits in the areas such as inflation, environmental deterioration or public property supply, sometimes it can be difficult or impossible to determine the optimal level of state intervention. In such circumstances, no intervention may be more beneficial due to the danger of excessive intervention. (Baumol and Blinder, 2000). When viewed from this aspect; regulations are considered as doubtful cases. Market failures, that are named as cases in which markets fail in resource allocation, constitutes an economic reason for intervention of the state in the economy. Interventions made by the state in order to clear market failures may cause public failures. Increasing interventions of the state or concentrated interventions of the public sector in markets with the aim of overcoming market failures caused the emergence of “state’s failure” or “public failure” literatures weakening functionality of the market mechanism. Public failures imply that the states whose tasks and functions have overgrown fail in performing the required functions. Public failures emerge due to the fact that there is no connection between cost and revenue and as institutions having no aim or their non-economic aims and as differential externality (Tosun, 2007). Many arguments brought up for overcoming market failure legitimize intervention of the state, yet on the other hand; results of the state intervention may not raise the expected effect.

These arguments made either in the academic field or in practice lead the third sector to participate more actively in markets and expand its sphere of influence. In addition to activities carried out by the government in areas where they remain incapable, the third sector with its support given to these two sectors has become an important social dynamic.

Increasing Role of the Third Sector in Markets

The third sector is an area that participates actively in the process of finding efficient and long-term solutions for social problems and works in various fields for directing political agents to develop new policies for carrying these solutions into effect on this basis, in which organizations, founded voluntarily without state supervision carry on business (TUSEV, 2006).

Nowadays we are undergoing a change from a welfare mixture with superiority of the state towards a sense of welfare where the state and even voluntary sector are at the center. Voluntary agencies have come out with the reason that the state remains incapable of satisfying social needs of the public in terms of efficiency and productivity. In this sense, non-governmental non-profit organizations, established at national and international levels by the citizens for voluntarily assisting the state in the areas where the government fails in providing efficiency and remains ineffectual, have appeared as the third sector. Yet, the third sector should be considered as an alternative to neither the state nor the private sector but as a complement of them. The third sector is a sector that voluntarily orients property ownership, dynamism, efficiency and creativeness of the citizens to civil services and offers social services without any profit making purpose. Organizations, changing their center of attention from charity purposes into performance and responsibility, are increasing in number within the third sector. Voluntary agencies in the third sector maintain their existence and developments by means of reliability, credibility and image supports (Gökbunar and Erdal, 1997).

In recent years it has been accepted that in addition to the state, families, voluntary agencies and public sector organizations are also supposed to play an active role in providing social welfare. Besides, the fact that voluntary agencies are able to offer more efficient and affordable service than many public institutions in reaching the poor is asserted. In this regard, areas of social responsibility go beyond the responsibility of the state and people anymore may relive their suffering by the agency of miscellaneous voluntary associations (Arpacı and Karakılçık, 2009).

Distribution of an important part of public wealth by means of the third sector considering need priorities to the community may contribute to creating a social market economy model by decreasing conflicts among social classes seen in the systems depending upon the private sector. In this context, third sector organizations, may lead a totalitarian social development by effectively transferring part of the income belonging to high income groups to low income groups (Arslan, 2008).

For creating a sustainable social economy, the third sector should be engaged in activities corresponding to social needs and try to find solutions in order to maintain these activities. And this steers third sector organizations into innovation and also encourage them to present creative and innovative implementations.

Increasing social problems and their ability to affect people from all corners of the world by creating a butterfly effect cause an increase in third sector organizations. At the same time, domains of the said problems and sustainable solution seeking necessitate these organizations to be managed with an entrepreneurial approach (Stull, 2009). It is seen that third sector organizations acting with this awareness invigorates the social economy further providing important social benefits.

Market failures play an important role in expanding activity and influence areas of the third sector. These failures may be seen not only in offering product and service in adequate quality having social and

environmental effects but also in employing disadvantaged groups in labor market and the organization type oriented to this (Haugh and Kitson, 2007).

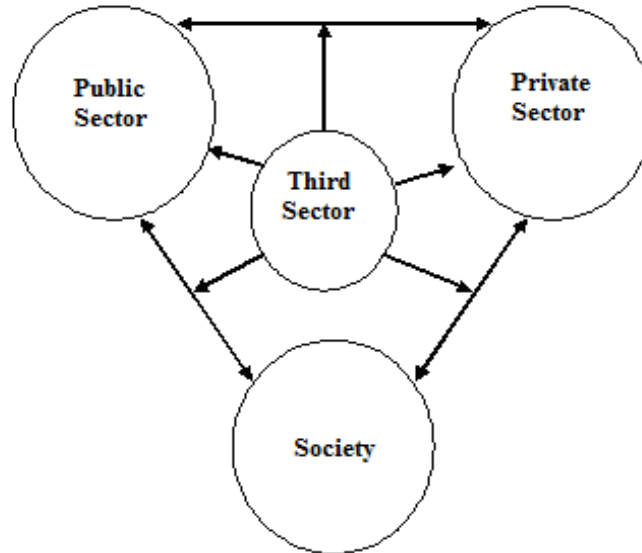

Figure 1. Influence Area of the Third Sector

As seen in Figure 1: the third sector has an important effect on both public and private sectors and also the society as it also affects the relation between them. In one sense, the third sector accelerating blood circulation and dynamizing the market among the actors in the market, causes increase in the said interaction volume with its increased area of influence.

One of the most important impacts created in the market by third sector organizations is moving market functioning to a fair ground and contributing to sustainability of the institutions having social sensitivity by means of advertising. Third sector organizations of high standing in the eyes of society, owing to “social income” they have, press upon the market for being accountable, out of unfair competition, environmentally respectful and answerable to their stakeholders. This regulation provided by third sector organizations, gives opportunity to generate efficient solutions determining institutional failures within a short time and minimize unpredictable problems as far as possible.

It is seen that there have occurred important developments in the third sector in Turkey especially within the last decade. Besides; the government encourages cooperation between the private sector and the third sector by means of tax policies. Many corporations anymore name third sector organizations as ‘strategic partners’ and once this relationship is established, increases social acceptance of the corporations. In consequence of the studies done (Oruc and Sarıkaya, 2010; Sarıkaya and Oruc, 2010) it is seen that the biggest and most popular corporations in Turkey regard the third sector as a competitive advantage and they make long-term cooperation with third sector organizations in the subjects such as

education, health, culture, art, sport and social welfare. These establishments also gradually become more professional and have a further voice in social subjects with the solutions they offer.

As a conclusion, third sector organizations carrying business on behalf of society, both provide a social added value and make contribution to the markets for being operated sustainably and effectively distributing the social benefit received in accordance with their mission. Especially with social entrepreneurship activities that have come to the forefront in recent years, this efficiency increases further (Sarikaya, 2010).

Market Failures and Social Enterprise

Keynesian economy, argues that the private sector may cause ineffective macroeconomic output at times and for this reason the public sector should intervene with an active policy in such cases. Keynes believed in mixed economy that involves the state and public sectors having great shares and a dominating private sector. In today's world, governments fail in bringing social welfare at the level provided within the frame of the Keynesian model. Governments have less income to distribute for the reason that they have basic importance in terms of countries' infrastructure and in addition they sell the assets also providing revenue stream under government ownership. Under many circumstances, even the income received from income tax has been reduced. Newly increased tax may raise incomes, yet probably this will not find favor politically. Technological developments in health services have raised the rate of expectations regarding human life in a way aggravating the problem further and created a demand to be satisfied at high-prices. All of these social problems have contributed to reveal a set of social tendency, organizational structuring and personal initiatives gathered under the same roof by name of "social entrepreneurship" (Roper and Cheney, 2005).

There is no definition that has reached consensus upon social entrepreneurship grounding on the fact that entrepreneurship may mostly aim at gaining social benefit rather than maximizing personal benefit. Various approaches about concept are available (Tan et al., 2005). One dimension of these approaches is at the point of implementation area. In addition to the approaches that identify social entrepreneurship with third sector organizations, some approaches arguing that the public sector may also undergone a social entrepreneurship also come into question. Yet; when regarded in the sense of social economy, it will be more pertinent to discuss social entrepreneur within the scope of the third sector.

With its general meaning; it is possible to define social entrepreneur as "forming social economic structures, relations, institutions, organizations and applications that generate and maintain social benefits" (Alan, 2000).

The expectations and needs of society continuously increase and undergo a change. Markets may remain incapable of fulfilling these needs or generating specific goods or services. Furthermore; states do not take the necessary step at this point. So third sector organizations as social entrepreneurs undertake a

significant role for satisfying these social expectations and make a great contribution on behalf of sustainable development (Sud et al., 2009).

Social entrepreneurship aims at using entrepreneurial methods in solving social problems and fight against the said problems. In this sense, there take place many social entrepreneurs playing a role in community and economic development (Parkinson and Howorth, 2008).

One of the most significant factors in emergence of social entrepreneurs is market failures. For example failures of commercial enterprises in satisfying social needs such as public properties also create a need for social enterprise. This failure of commercial entrepreneurs in the market turns out to be an opportunity for social entrepreneurs and generates an area of activity (Austin et al., 2006). In one sense; a market solely built on the basis of commercial enterprises, fails in responding the needs as required and this results in market failures of both the public and private sectors.

Some market failures of the public and private sectors in today's market are as follows (Uluyol and Danacı, 2009):

- Failure of the private sector insufficiently producing the goods and services that will cause social and environmental effects,
- Not providing employment to people disadvantageous in the matter of finding a job in traditional markets,
- The fact that public sector remains incapable of solving social problems,
- Failure in reaching people from all strata equally in terms of service distribution.

With social entrepreneurship; activity areas assumed by the government such as poverty, health care, education, environment, economic development have begun to be mentioned with third sector organizations. Criticisms of the Neoliberals herein claim that it originates from state failures (Arpacı and Karakılıç, 2009). In one sense, areas which were regarded as the fundamental duty of government in the past, are converting into activities in which third sector organizations have become more active because of the fact that the responsibility areas of government have narrowed and because of gaps in the market.

Social entrepreneurs are persons or organizations attempting with the aim of determining and dealing with the social problems they regard as significant. Social entrepreneurs develop programs in regard to solving the determined social problem; supply them determining the source and labor required for these programs and they also coordinate and manage these programs by use of modern management techniques (Korosec and Berman, 2006). On the other hand, they try to increase the awareness of society intended for the existing problem and call the attention of social actors in this regard.

Social entrepreneurs in our day emerges both as an organization created by the social economy and a type of activity in social area. The basis of social entrepreneurship is to provide social benefits

innovatively and creatively by providing financial sustainability (Birch and Whittam, 2008). In this sense, social entrepreneurship is extremely important in terms of economic revival and social dynamism.

Social entrepreneurship is neither a fully charitable institution nor a fully commercial organization. Fully charitable organizations continue their existence and carry out their activities by use of donations and charities and benefits from volunteers. And social enterprises may receive bequest, earn income in the market conditions and take loans. Besides; they can also employ wage-personnel in addition to volunteers (Herman and Rendina, 2001). Therefore, social enterprises are organizational forms having the features of both organizations and aiming a sustainable social added value.

Social enterprises, especially in a period where markets suffer from lack of resource and are deprived of satisfying the fundamental needs of society create resources and distribute them to the society within the frame of social needs. So they have a significant function on the point of facilitating market movement and removing inconveniences occurring in the market.

In this sense, third sector organizations having a strong leadership and social entrepreneurship, play a more effective role on the point of filling in the areas left unattended by the organizations of private sector and expand the influence area of the said institutions (Crampton et al., 2001).

Although social entrepreneurship in Turkey is a new one both academically and in practice; it has made significant progress especially through the effect of international cooperation. For example, the British Council has begun to implement a regional project to establish partnership between England and Turkey in the area of social entrepreneurship since 2009-2010. The Project aims at providing a platform in order to make third sector organizations having a social mission create difference in its vicinity, and contribute to a positive social upheaval by means of enterprise, innovativeness and creativeness. Social Entrepreneurship Project developed by the British Council and executed by the partnership of TUSEV (Third Sector Foundation of Turkey), has been established with the intention of working on common problems together with social entrepreneurs and social enterprises aiming at creating permanent solutions for social problems, sharing experiences and developing solutions. This Project that also offers opportunity for information exchange with other implementing countries, intends to take firm steps for developing social entrepreneurship in Turkey (<http://www.tusev.org.tr/content/default.aspx?c=77&s=157>).

Conclusion

Sustainability is one of the most frequently used concepts in today's markets. Sudden fluctuations in the market sweep away many corporations, regardless of how big or small they are and this generated negative atmosphere has global impact. This interaction, increases concerns in economic and social terms, either states or private sector organizations search new solutions.

Solutions that are searched in social subjects ignoring the human element will not be long termed. Third sector organizations maintaining human efficiency is the most important treasury of our World and highlight significant projects either in the national or international arena. These organizations going beyond 'clearing the garbage' created by market failures, both contributes to sustainable development of societies and assist with efficiency and sustainability of private sector organizations by means of the social enterprises they have executed.

As a consequence, third sector organizations serving as important glues in the markets and converting the increasing interaction into social added value, through social entrepreneurship activities, have become significant actors of social dynamism with more effective, innovative and creative solutions on the points where states and markets remain incapable. Societies making good use of this dynamism, will overcome fluctuations in the market with less damage, recover in a short time and turn the existing dynamism into sustainable development.

Abstract

The current paper makes use of event study methodology to scan whether horizontal mergers alter the value of the acquiring firm. Two models have been estimated in order to examine the biased of the findings with the use of different models. However, both AAR and CAAR obtained from both models were on average the same indicating that results are unbiased to model choice. In general the results indicated that in most markets are efficient since no significant effect on the return was found. The results are more in line with the European studies where they also found insignificant returns for the bidder firms. In terms of event window the study utilised several different windows so as to examine also the biased of the results on the the span of the event period. Again the study found no evidence of cumulative and abnormal return in any event window, apart for only one merger. In this specific merger the study found evidence of cumulative and abnormal returns only when event window was quite small. At a longer window the abnormal returns seems to disappear. The latter provided evidence of market inefficiency in the short run for the given market, which in turns suggest that investors can gain abnormal returns with the use of publicly available information.

Keywords: Mergers, Event Study, Market Efficiency, Airline Industry

Introduction

The wave of M&A in the world over the recent years emerged due to numerous different factors, all of which have brought about an increased competition amongst all organisations that covers every kind of industry. Nowadays the pressure that it is put on businesses is tremendous as they are faced with a more rapid pace of product introductions as well as a quite noticeable change in the market in general.

One of the industries that have been consolidated though mergers is the airline industry. The deregulation initially, and latter the process of privatization have promoted significant changes in the structure of the airline industry, initially in the US and a decade later the European market. New types of carries have enter the industry offering lower fares rising the levels of competition, higher fuel prices increased the cost of services produced. All this had as a result a boom in Mergers and Acquisition in the airline markets. Literature tried to evaluate those mergers from different perceptive. A bulk of literature suggests that firms merged in order to increase cost efficiency where other support the hypothesis of market

power and scale economies. Irrespective of the motives behind the M&A's in the airline market studies aimed to evaluate their effect on the shareholders values. Most of the prior literature showed evidence of abnormal returns for the shareholders of both the bidding and the target firms around the merger announcement.

Based on the aforementioned the current study aims to determine the reaction on stock prices to announcements of airline mergers in both Europe and US with the use of event study methodology.

An overview of the Airline Industry

Nowadays the airline industry through changes in national deregulation and international agreement has become gradually more global. However that was not the case three decades ago. Deregulation emerged firstly in the US market. Anderson et al. (2005) indicated four major changes in the US airline industry. The first one is the instruction of low cost carriers that led to increase competition. This piloted to the second one, the decline of airfares. However, even though the fares had decrease the study indicated a variability of fares across the market. The last change was the introduction of the hub-and-spoke system. Given the deregulation process that emerged in 1978 the airline industry has faced numerous financial problems that lead to bankruptcies of numerous companies as well as large merger wave (see figure 1). In regards to bankruptcies, in the earlier years those affected smaller carries, whereas in the last decade four of the largest airlines firms declare bankruptcies, namely Delta, Northwest, United, and US Airways (GAO, 2008). Those four companies have engaged into the majority of mergers. The sustainability of the industry came forth from the growth of existing companies as well as from the entry of new airline companies within the market.

With a ten year delay deregulation emerged in the European airline market, where full deregulation came forth in 1997. The important changes that emerged from the deregulation process were that airlines could work between two member states through their home state and they can also operate domestic flights in any other member state. Additionally all restriction in regards to routes, prices and frequencies have been abolished. Last but not least the merger wave in Europe came forth from the removal of cross-border mergers with the EU (Cento, 2009). Following the delay of deregulation in Europe the merger picked up in the last decade. Lufthansa and KLM have engaged into the bulk of European mergers, whereas the later has become the biggest European carries after the merger with the Air France.

One of the most noticeable events that further promote the globalisation of the airline industry was the Open Skies agreement between the US and the EU. The agreement was finalised on the 30th March of 2008 and has removed previous government. In accordance with Cento (2009) this agreement is an important positive factor for the future of the airline industry on a global level. The author concentrates on the three elements which he considered to be the most important factors emerged out of this treaty.

- All EU airlines are classified as “community air carriers”
- Companies can flight from and US and EU at any airport at any destination
- EU airlines can use US airports as a stopover point for flights to third countries

Literature Review

The primary assumption of the relevant literature is that improved stock performance (ex ante studies) or improved profitability and cost efficiency (ex post studies), are the best indicators of true performance increase, that is, creation of economic wealth. Based on the proposed measure of wealth creation the performance effect of mergers in the relevant literature is primarily evaluated with the use of two different approaches.

The first approach attempts to evaluate the effect of the merger of performance indirectly by analysing the reactions of the stock market to merger announcements. The methodology utilised under this approach is called event study. The second approach tries to follow a direct assessment by analysing the effects of mergers in as far as this can be estimated from internally generated accounting data through the use of accounting ratios or more complex methodology such as production and profit functions, so called ex post studies. Ex post studies usually compare profitability and cost data for merging firms with a control group of less acquisitive or non-merging firms and/or with the history of the merging firms themselves.

Many studies prefer the first approach on the notion that accounting figures can be manipulated to show a company in the best possible manner, and even when there is a minimum of manipulation, historical accounting data can still give a misleading picture for the company’s performance. For example earning per share does not show whether a company is making a return above its cost of capital, which is one of the targets of any corporation.

Many studies prefer the first approach on the notion that accounting figures can be manipulated to show a company in the best possible manner, and even when there is a minimum of manipulation, historical accounting data can still give a misleading picture for the company’s performance. For example earning per share does not show whether a company is making a return above its cost of capital, which is one of the targets of any corporation.

Ex ante studies, define the announcement of a merger as an event in the stock price history of the merging firms. The effect of this event is estimated by assuming that changes in the share prices of the merging firms, after controlling for movements in the market in general and the systematic risk of the firms under consideration represent the value of the event (Kothari and Warner, 2007).

This methodology is based on the principal assumption that markets are efficient. A market is said to be efficient when stock prices fully reflect all available information and thus stock prices are correctly priced at all times (Fama, 1970). He argues that in an active market that includes many well-informed investors; stock prices will reflect all the information available. As a result, no analysis - be fundamental or technical - can be expected to result in better long-term stock-picking performance. Thus, buying and selling securities in an attempt to outperform the market will effectively be a game of chance (random walk) rather than skills.

Based on this assumption, prior to an event there exist a normal relationship between a given firm's stock returns and the market returns (Khotari and Warner, 2007). If this relationship is altered around the time of the event this is characterized as an abnormal movement that is considered to be unique to the given event (Pautler, 2001). If markets are efficient, then an announcement of a merger or acquisition will be immediately incorporated in the share price. A positive reaction to the announcement will be reflected with an increase in stock prices whereas a negative one will be mirrored by a decrease in the stock price.

The present study concentrates on event study methodology. Thus it is important to examine the evidence of the prior literature so as to compare those results with the current paper. Apart from the empirical evidence examine past studies can be helpful in developing the methodology of present study. Several studies have utilised the event study methodology to evaluate the effect of a merger announcement on the stock price in the airline industry. Eckbo (1983) and Stillman (1983) found evidence of positive statistically significant abnormal returns during the event period. Knapp (1990) examined 9 US airline mergers in the year 1986. His result indicated significant abnormal returns for both the target and the acquired company's shareholders for 20 days prior and 10 days following the merger announcement.

Their results are supported by Signal (1996). Signal used US data for the period 1985-88 and examined 27 airline merger incurred at that given period with available; out of the 27 only 14 had available market data. The results showed the significant positive cumulative and abnormal returns and the result were found to be unbiased to the span of the event period. In line with the aforementioned studies are the results of Zhang and Aldridge (1997). Utilizing Canadian data for mergers that took place between 1992 and 1993 they found evidence of significant abnormal returns for the shareholders of both the bidding and the target firms.

Flouris and Swidler (2004) evaluated the effect on the stock price after the announcement of American Airline to take over the Trans World Airlines. They applied the Capital Asset Pricing Model to evaluate expected returns and with an event window of sixty days their result indicated that the market had preserved negatively the takeover announcement since the equity value of the acquirer has declined by 32%.

The literature regarding the European Airline industry is limited. Friesen (2005) examined the effect of the merger between the Air France and the KLM on the shareholders value. The study employed the market model and the results indicated insignificant abnormal returns for shareholders of the bidder firm and significant abnormal returns for the shareholders of KLM. In the same line were the results of Mukim (2010). Mukim also examined the merger between Air France and KLM with the use of a four day window and as well as for the whole data period, he found insignificant negative abnormal returns for the shareholders of Air France and significantly positive returns for the shareholders of KLM.

Methodology

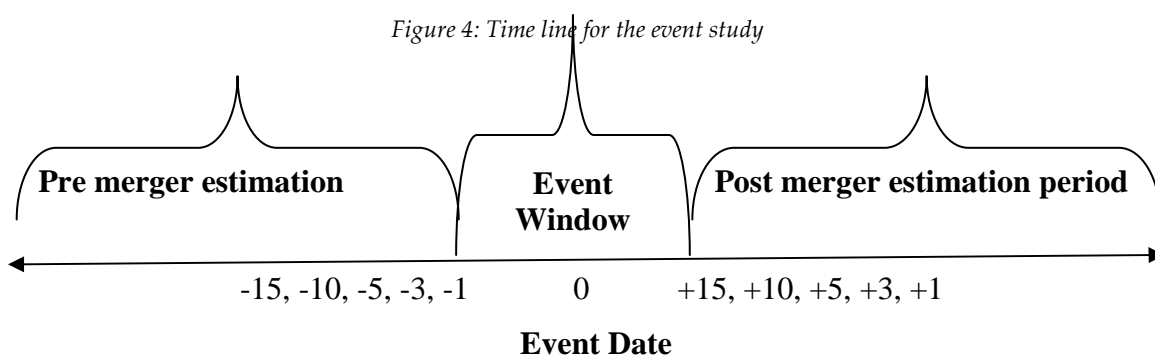

According to Pilloff and Santomero (1998) the methodology of “events study” is, among those considered in the literature, the one that better allowed analysing the problem of value creation or destruction. This methodology is the only that allowed to measure, in a direct way, the impact of mergers and acquisitions in value creation or destruction for the stockholders. In essence, the researches of events studies measure the abnormal returns (based on price changes) of the acquiring firm (bidders) or of the acquired firm (targets) or both, by comparing with the portfolio of stocks representing the market (Rhoades, 1994).

Essentially, the event study analyzes the stock return of acquiring firm or target firms, or both, relative to a portfolio of stocks representing the market. Differences in returns of the acquiring firm or target firm relative to market returns are usually calculated over a period ranging from one day to many days or weeks leading up to and following the “event” of the merger announcement. In making the calculation, the researcher aims to determine whether the announcement of the merger causes the stock return of the acquiring or target company to perform differently than the general market return for stocks (see Rhoades, 1994). In event studies, differences in the stock returns between acquiring firms or target firms and the market are used as estimates of “abnormal” or “excess” returns. To examine the validity of those abnormal returns, statistical tests are performed.

Weston et al (2001) states the methods to calculate the Abnormal Returns, which is through a “clean” period and the average daily return for the organisation is estimated for this period. These are the mean adjusted method which assumes a constant ex-ante stock price, the market model a one-factor model which is based upon the CAPM (Sharpe, 1963), and the adjusted market model method. Nevertheless, over the short-horizon window the sensitivity of the results to the methodology used is low, i.e. for most cases the results are similar independently of the methodology used.

Following Gong (2009) the first step in the event study is to define the event of interest and of up most importance is to define the event date. The event of interest is the merger between two airlines companies whereas the event date is considered to be the announcement date.

The next step is to identify the event window as well as the estimation window. Seiler (2004) labelled the Event Window as being “the number of trading periods examined preceding and following the event date” (pg. 424). Additionally, in regards to the estimation window Seiler stated is “defined as being the period of time over which no event has occurred. It is used to establish how the returns on the stock should behave in the absence of the event” (pg. 424). Following the literature the current study uses different event windows, -15 to +15, -10 to +10, -5 to +5, -3 to +3, and -1 to 1 days before the event date (0). The reasoning for using different event windows is because the literature is not consistent. Some studies argue that the effects of events do not rapidly incorporate into stock prices (McWilliams and Siegel 1997). On the other hand Fama suggested that ‘Short-horizon tests represent the “cleanest evidence we have on efficiency” (Fama, 1991, p.1602).

Before estimating the expected returns, the next step is to calculate the daily returns, the percentage change in daily prices. Since stock returns are known to follow a log normal distribution (Seiler 2004), following Hays (1998) the returns of security i at time t can be calculated:

$$R_{it} = \frac{P_{i,t} - P_{i,t-1}}{P_{i,t-1}} \quad \text{Equation 1}$$

where

$R_{i,t}$ = return of security i for day t

$P_{i,t}$ = Daily Stock Price for security i for day t

To eliminate estimation biased on the model used the current study utilised two different models to calculate expected returns, the Capital Asset Pricing Model (CAPM) and the market model. The first is an ex ante model based on the work of Sharp (1963) and Linter and it is based on a one-period, mean variance theory of equilibrium returns whereas the second is an ex post model which is based upon a proposal by Markowitz (1959)

In accordance to Hays (1998) CAPM is the most robust and most frequently used method in event studies. This procedure consists of estimating an Ordinary Least Square (OLS) regression of the organisation's return time-series against the market index. The calculations

must involve a period not included in the event period to prevent the event from influencing the normal performance model parameter. This is known as the estimation window. In accordance with the CAPM and the Market Model the expected return R_{it} for firm i in time t is given by [Hays (1998), Friesen (2005), Piskula(2011)]:

$$\text{Model 1: CAPM} \quad R_{it} - R_f = \alpha_i + \beta_i (R_{mt} - R_f) + \varepsilon_t \quad \text{Equation 2}$$

$$\text{Model 2: Market Model} \quad R_{it} = \alpha_i + \beta_i R_{mt} + \varepsilon_t \quad \text{Equation 3}$$

where,

R_{it} = actual returns to bank stock i at time t

R_f =risk free rate of return

α_i = ordinary least squares (OLS) estimated of the intercept of the estimate model.

β_i = OLS estimate of the market model slope coefficient reflecting change in the market return relative to the return on the company i .

R_{mt} = actual return of the market at time t

ε_t = Statistical error.

The next step is to identify the abnormal returns. In order to calculate the abnormal return it is important to calculate the alpha and beta of equation 2. Abnormal return is the difference between the realised return and expected return [Hays (1998), Friesen (2005), Gong (2009), Piskula(2011)]. That is:

$$AR_{it} = R_{it} - (\alpha_i + \beta_i R_{mt}) \quad \text{Equation 4}$$

where,

AR_{it} = abnormal return to stock i at time t

R_{it} , α_i , β_i and R_{mt} are as defined above in equation 2.

Under the CAPM α_i & β_i are estimated by running a regression of R_{it} & R_{mt} over an appropriate estimation period. These estimated parameters are then substitute equation 2 to calculate expected returns $E(R_{it})$ for each organisation where

$$E(R_{it}) = \alpha_i + \beta_i R_{mt} \quad \text{Equation 5}$$

where,

$E(R_{it})$ = expected return on stock i for time t

Thus we can re-write equation 3 as follows (Flouris and Swidler, 2004):

$$AR_{it} = R_{it} - E(R_{it}) \quad \text{Equation 6}$$

If the merger event is concentrated to create additional value for the shareholders then AR must be positive. It will be zero if the effect of the merger is neutral (Sudarsaman, 2003). In the case where the precise event date not being known due to leakage of information, or when the event is spread over a time interval the abnormal returns are accumulated. After computing the abnormal returns for all securities in the sample, the average of abnormal returns (AAR_t) should be calculated during the test period. The average abnormal return and its variance are given by (Wu and Ray, 2005):

$$AAR_t = \frac{1}{N} \left[\sum_{i=1}^N AR_{it} \right] \quad \text{Equation 7}$$

$$V(AAR_t) = \frac{1}{N^2} \left[\sum_{i=1}^N \hat{\sigma}_i^2 \right] \quad \text{Equation 8}$$

where,

AAR_t = average of abnormal return for day t

N = number of securities in the sample

$\hat{\sigma}_i^2$ = estimated variance for firm i

Finally, in accordance with Gong (2007) following the assumption of time-series independence, the average cumulative abnormal return from event time the AR's are added over the time period being studied, from initial $t = 1$ through to the final $t = T$ as seen below in order to determine cumulative abnormal return.

$$CAAR_{iT} = \sum_{t=T1}^T AAR_{it} \quad \text{Equation 9}$$

$CAAR_{it}$ and AAR_{it} need to be tested for their statistical significance using the t-test. The t-test is for AAR_{it} is:

$$AAR_{it}, t-stat = \frac{ARR_{it}}{\sigma_{it}} \quad \text{Equation 10}$$

For the merger to have an effect on the shareholder value the average abnormal return must be found statistically significant (Gong, 2007).

The t-test is for $CAAR_{it}$ is:

$$CAAR_{it}, t-stat = \frac{CARR_{it}}{\sigma_{it}} \quad \text{Equation 11}$$

For the merger to have an effect on the shareholder value the average abnormal and the cumulative abnormal returns must be found statistically significant (Gong, 2007).

Data

The data employed in this paper are the daily stocks of the acquirer company together with the stock market index of the airline under question. In terms of the risk free rate for calculating the CAPM the 3 months Treasury Bills rate is used.

The table below presents a list of the mergers under examination

Table1: M&A Details

<i>Date</i>	<i>Acquirer</i>	<i>Target</i>	<i>Country of Acquirer</i>	<i>Country of Target</i>	<i>Transaction Value at Announcement</i>
10-Feb-05	<i>Deutsche Lufthansa</i>	<i>AG Amadeus Global Travel Distribution SA</i>	<i>Germany</i>	<i>Spain</i>	5182053300
15-Aug-05	<i>Skywest Inc</i>	<i>Atlantic Southeast Airlines Inc</i>	<i>US</i>	<i>US</i>	425000000
21-Jun-07	<i>Air France – KLM</i>	<i>Martinair-Holland Mv</i>	<i>France</i>	<i>Netherlands</i>	<i>Stocks</i>
14-Apr-08	<i>Delta Airlines Inc</i>	<i>Nortwest Airlines Corp</i>	<i>US</i>	<i>US</i>	3100000000
03-May-10	<i>United Airlines</i>	<i>Continental Airlines</i>	<i>US</i>	<i>US</i>	3200000000

Empirical Results

In this paper we apply event study to determine whether M&A activity generates a significantly positive value for the acquiring firm. Since the target firms' data are not available after M&As, this paper only focuses on the change of shareholder's return of the acquirer firm. The study is based on 5 M&As in European and North American airline industry between 2005 and 2010.

Firstly the firm's specific coefficients were estimated with the use of equation 2 and 3. Then with the used of the estimated coefficients of both equations two sets of abnormal returns and cumulative abnormal returns were calculated for the individual M&A event. As stated above the idea of the event study methodology is that markets are efficient and thus investors are rational. This in turn suggests that the effect of any announcement should be incorporate in the stock price rather quickly. Since stock prices are considered to be rational indicators of expected returns, investors' response through prices signifies their perception in regards to

the merger. If shareholders believe that the merger would increase the value of the firm then there would be positive abnormal returns. On the opposite side if shareholders consider that the merger would be unprofitable and thus decrease the value of the firm then there would be negative abnormal returns (Diepold et al 2006).

Tables 2 and 3 represent the results. As already mentioned, two models have been estimated so as to examine the bias of the findings with the use of different models. At a glance it is evident that both AAR and CAAR obtained from both the market model and the CAPM are practically the same. This suggests in turn suggests that choice of the model do not produce any bias in the results.

In general the study's findings indicated mixed results, since some mergers were conceived as having a positive effect on the value of the shareholders and thus produced positive AAR and CAAR and some negative effect on the value of the shareholders and thus produced negative AAR and CAAR. Nevertheless, opposing to most US literature, in all cases in all event windows, apart from one case, none of the results were found to be statistically significant. The results are more in line with the European studies where they also found insignificant returns for the bidder firms [Friesen (2005) and Mukim (2010)]. Some probable explanation for the insignificant abnormal returns as Mei and Sun (2008) pointed out the bidder firm might have prior ownership into the acquired firm. For that reason the benefits of the merger are already incorporated in the share price. Additionally, in some of the mergers there was a huge difference in the firms' size. If this is the case, then the addition of the target to the bidder's value is small compared to the total. Finally, in accordance Weston, Siu et al. (2001) the insignificant abnormal returns for the bidder firms' are consistent with a competitive corporate control market in which companies earn usual returns in their business.

In terms of event window the study utilised several different windows so as to examine not only the effect of the mergers on the shareholders' wealth but also to evaluate the dispute in the literature in regards to the subject market. More specifically Ebnet and Theuvsen, (2007) stated that in cases of M&As the information concerning the evaluation of the target firms usually are made known over a long period. However, current results indicated the opposite. In more detail only one merger was found to provide abnormal returns for the shareholders but only when event window was quite small. At a longer window the abnormal returns seem to disappear. More specifically, the merger between Air France -KLM and Martinair-Holland is found to generate negative cumulative and abnormal returns for the shareholders of the acquirer in both models. These results provide evidence of market inefficiency in the short run for the given market, which in turn suggests that investors can gain abnormal returns with the use of publicly available information.

Table 2: AAR and CAAR from the Market Model

Conclusions

The current paper utilized event study methodology to examine whether merger and acquisitions alter the value of the acquiring firm. The study concentrated only on the bidder firms due to data unavailability in regards to the target firms and it was based on 5 M&As in European and North American airline industry between 2005 and 2010.

Two models have been estimated in order to examine the biased of the findings with the use of different models. However, both AAR and CAAR obtained from both models were on average the same indicating that results are unbiased to model choice. In general the results indicated that in most markets are efficient since no significant effect on the return was found. The results are more in line with the European studies where they also found insignificant returns for the bidder firms [Friesen (2005) and Mukim (2010)].

In terms of event window the study utilised several different windows so as to examine not only the effect of the mergers on the shareholders wealth but also to evaluate the dispute in the literature in regards to the subject market. Again the study found no evidence of cumulative and abnormal return in any event window, apart for only one merger. In this specific merger the study found evidence of cumulative and abnormal returns only when

event window was quite small. At a longer window the abnormal returns seems to disappear. The latter provided evidence of market inefficiency in the short run for the given market, which in turns suggest that investors can gain abnormal returns with the use of publicly available information.

EVALUATING THE SATISFACTION OF INTERRAILERS WITH REGARDS THE SERVICES AND ACTIVITIES RENDERED IN ITALY, GREECE AND CROATIA

Fernandes, Carolina Dinis¹; Sarmiento, Manuela²

¹Master's Degree in Human Resources Management at Lusíada University

²Full professor of Management, Coordinator of BSc and MSc Tourism courses, Director of the Research Centre of Tourism, Innovation and Services

Abstract

Tourists are often confronted with a large quantity and variety of services and activities aimed at satisfying their every quest and dream of getting to know new places and people of different backgrounds. Tourist Organizations know all too well that just satisfying the basic necessities of the client, it's fundamental that the client feels completely involved in order to gain his full satisfaction.

Youth Tourism is a segment of tourism that has recently experienced accelerated growth; it is well known market segment in global travel. In Youth Tourism InterRails a well-known form of travel primarily because of the cost vs. quality, this makes this sort of travel very appealing to young travelers.

A present investigation analyses backpacking with the objective of defining and comparing the satisfaction of InterRailers regards the quality of services offered in Italy, Greece and Croatia, four main tourist activities were analyzed namely transportation, accommodation, catering and local tourist entertainment. For the purpose of this investigation two scientific methods of observation were used: direct observation and inductive natural quantitative exploration. This study was based on 70 enquiries and 10 interviews done on InterRailers travelling between the dates of the 4th December 2009 and the 13th March 2010 respectively.

The application of descriptive and multivariate statistics allowed us to extract diverse conclusions to our study, it is important to emphasize that substantial differences in InterRailer satisfaction concerning the transportation service and local tourist entertainment, however the same difference did not occur in relation to accommodation and catering, in all three destinations.

Keywords: Tourism, Satisfaction, Service, Quality, Backpacking, InterRail

Introduction

Tourism in the last decades has turned itself into one of the most dynamic industries around, from both an economical and socio-cultural point of view. Consumers are faced with a large quantity of services meant to meet all their needs. However, organizations are aware that meeting consumer needs solely is not enough; consumer satisfaction is met by making a consumer feel drawn into an experience with emphasis on quality.

A client determines the quality of a service depending on the grade of satisfaction drawn from having his expectations met. Therefore, to satisfy a client it is necessary to first have a profound knowledge into his needs, second, possess and pursue the process of effectively and consistently meeting those needs.

Two decades ago, researchers suggested a new term to describe the style of travel exercised by youth, based on the liberty of choice and the use of economical services, the term was *backpacker*. The growth of this segment, with its distinct behavioral patterns, drew some authors to think and research this segment, intrinsic aspects as well as extrinsic aspects were analyzed, InterRail stood out, as an extremely attractive form of transportation.

Concept of Tourism

Tourism is probably the activity that best characterizes contemporary societies; it is a collective practice a stimulant. At the basis of tourism we find a string of processes that are both diverse and complexes, their manifestation is sub-adjacent and allow each and every individual to become a tourist (Leme & Neves, 2007). Tourism is a phenomenon that refers the following:

“Movement of people in their own country or crossing national borders. Reveals the presence of various elements, interaction and relation of individuals and groups, human comprehension, sentiments, perceptions, motivations, satisfaction, pressures rejections and the notion of pleasure, that lead to great changes in society” (Marujo, 2008, p.14).

In its complexity and multiplicity, according to Ramos (1996, p.83)

“Affects people, the location and culture of a country or region (...) it is a phenomenon with multiple characteristics that has increasingly come to assume significant importance in various levels, in the relations between regions, countries and continents”.

Therefore, tourism is an agent for social change that affects all the factors linked with the culture of societies: norms values ideologies and beliefs. It is considered an activity that enables people to interact by sharing cultural, social and economic diverse experiences (Mazon, 2001).

Turistic Activities

Based on their importance, some activities are crucial to tourism, without them it would not be possible to structure tourism into an economically viable activity, touristic consumption is fundamental to other activities that rely directly on it for subsistence, the main tourist activities are classified as follows (Cunha, 2009):

- **Transportation:** tourism, by definition, presupposes dislocation and as result, transportation automatically becomes crucial to tourism. For all its attraction, a location or region cannot develop touristically without accessibility to other forms of transportation. The existence of ports, railways, roads and air routes lead to the

development of tourist destinations. For the harmonious development of tourist destinations the actual transportation method is just as important as the infra-structure that makes that form of transportation possible.

- **Accommodation:** the importance of accommodation is derived from the definition of a tourist; the visitor spends at least one night at the location visited. Therefore, it is easy to conclude that although some tourist attractions exist without accommodation, it is not possible to structure a successful tourist destination without some or other form of accommodation. Making accommodation available to tourists is considered touristic, for lucrative purposes or not accommodation is essential for tourist destinations, without accommodation these would simply not exist.
- **Catering:** is of extreme importance as it meets the needs of the tourist, a variety of establishments prepare and provide food and beverages to the tourist, these establishments can be classified as restaurants.
- **Tourist Entertainment:** these attractions are of prime importance to the tourist product, of a region. Without these attractions there wouldn't be a need for any of the other services, and tourist destinations as we know today simply wouldn't exist.

Youth Tourism

Backpackers have been described in many ways; Hampton (1998) notes that these tourists generally do independent tours survive with little economic resources, use local transport, take all their belongings in backpacks and avoid crowds whilst trying to discover new sites.

The concept of youth was first defined in 1985 by the UN general Assembly, within the framework of the International Year of Youth as the age group between 15 and 24 years. However, the same House added that, in addition to the statistical definition of the term youth referred to above, the sense of the word youth varied in different societies throughout the world and that the definitions of youth had changed continuously in response to the fluctuations of the political circumstances, economic and socio-cultural (Youth at the United Nations, 2009).

In turn, to Giaretta (2003), in his studies he has chosen the age group composed of individuals between eighteen and thirty-five years of age to define tourism of youth. For the author, the tourism of youth and tourism

“Practiced by a homogeneous group of young people, with the marked characteristics by age group, life style and state of mind, which triggers a series of sub-segments divided into several types of tourism” (page 8).

Backpacking

An alternative form of tourism, usually a youth tourist or backpacker. This term defines the style of travel economic and independent, practiced by young people from throughout the

world who seek to learn about natural attractions and cultural in greater number of destinations, with high degree of interaction between the travellers themselves and the people of local communities, usually in long journeys (Oliveira, 1998, 2000). Swarbrooke e Horner (1999) argued that the backpackers can be considered as a true market segment of international tourism.

Origen e Characteristics of Backpacking

Even prior to appear the words backpacker, Cohen (1972 apud Kotler, Bowen & Makens, 1999) had defined the tourist as a drifter (without tourism) in a rather similar to what we refer to the backpackers:

"Type of international tourists that adventure in locations distant from the traditional routes. Doesn't have a fixed route or agenda planned and without any well-defined purpose of travel (...) usually they stay in youth hostels or campsites in the company of friends (...)" (p.662).

The term *backpacker* was thus introduced to tourist study by an Australian Philip L. Pearce, in 1990, and has often been used to define the segment of travelers who have a style of travel independent, flexible and economical, for long periods and who seek to know several destinations on the same journey.

The segment *backpacker* presents a series of characteristics that make it possible to differentiate it from the other. Cohen (1973 apud Kotler, Bowen & Makens, 1999) was one of the first to characterize the market for independent travelers and young people, at the time known as drifters, dividing them into travelers permanent or temporary. Permanent Travelers, according to the author, follow a style of life which is totally focused on travel, in general, remaining "on the road" for many years, while the temporary only travel for a short period of time and then return to their daily lives. This last definition of travelers seems closer to the current *Backpacker*.

According to Loker-Murphy (1995), the reasons that lead the tourists to choose this type of trip, *backpacking* are the economic point of view, an opportunity to get to know other people and to become better acquainted with the reality of the country, the extension of the time travel, independence, flexibility, convenience and ease, prior experience as *backpacker* and recommendation from other people.

Swarbrooke, Horner (1999) cite as characteristics of travel for backpackers: the independence, instead of the acquisition of travel packages; the desire to keep the expenses to the lowest level possible; the trend of trying to escape from the local traditional tourist and the possibility of extending the duration of the trip in addition to the common period of two weeks of vacation.

The backpackers are different than the other tourists because they are not fans of the package tour trade, by traveling with a limited budget, because of difficulties related to the lack of time related to the extension of the route to be followed and by traveling to see the maximum possible, going beyond the tourist attractions common to experience and learn more about the country being visited; it also mentions that the tourists backpackers require certain social skills, behavior more open and tolerant in front of different cultures.

Definition of Backpacking

The backpackers are often open to experience the local way of life, citing the meeting with the people as a motivation. Its activities, second Loker-Murphy and Pearce (1995) focus mainly on nature, culture or adventure. These characteristics are related to the fact that the backpackers traveling more than other tourists, the demand for attractions unusual or unexpected experiences with the tight budget that many backpackers are needed is in good part related to the long duration of their travel (Loker-Murphy & Pierce, 1995).

Although the backpackers have been described in many ways, Hampton (1998) notes that these tourists are generally seen as independent tourists who survive with little economic means, using local transport, carrying all their belongings in the back, avoiding crowds and discovering new places. In short, Visser (2004) describes the tourists backpackers as a sub-sector of tourism international economic characterized by tourists with characteristics that include communication networks, demand for affordable accommodation and a parallel structure for restaurants and services support (Hampton, 1998).

It presents itself to the characteristics used by Loker-Murphy and Pearce (1995) to define backpackers, usually spend at least one night of travel in hostels and youth hostels, while traveling, express a preference for housing, while traveling, follow an agenda of travel flexible, emphasize the importance of the meeting with other travelers, prefer long periods of holidays and emphasize participative activities and informal.

In spite of the tourist backpacker é have been defined in various ways by academics, according to their main characteristics, it is worth pointing out that a more precise definition of the term backpacker é must, of necessity, have a content less practitioner. This is because, although some of the traits are common to most of these travelers, others represent only characteristics of travelers.

The heterogeneity of the segment and what the brand and, therefore, must be taken into account when the attempt to define (Loker-Murphy, 1995; Mohsin & Ryan, 2003). Thus, a more appropriate definition for backpacker would be:

“Young People of any age, who are carrying out, basically, independent travel and economic - avoid the mass tourism and luxury, they stay in lodgings economic, discuss prices

when possible and use the infrastructure of services (restaurants, communications, transport), which allows them to, often, a closer contact with the population visited and the style of life in the region".

Travelling in Europe by Rail

Currently, the European Union (EU) has a rail network of 210 000 km and offers a large number of international passenger transport services. There are 5 000 km of lines of great speed in various countries, with trains reaching 320 km/h, making rail transport more competitive and, therefore, more attractive, with a view to opening for international passenger transport services (Official Website of the European Union, 2009).

What is an Interail Pass?

By the discoveries that allows for and by unique experience that normally provides, the InterRail is a product for any age and a pivot in the curriculum of a young man; and a pass of international train (personal and non-transferable), available to citizens of any nationality (with six months' residence in a European country) with which young people with less than 26 years old may travel through Europe by train in 2ND class (Trains of Portugal, 2009a, 2009b; Free to explore Europa, 2007; Young, 2009).

This pass allows still travel to special prices or with reductions in certain shipping companies (Trains from Portugal, 2009b; InterRail.net, 2009; Eurail 2009a).

You can travel with the InterRail pass in the countries of Europe: Germany, Austria, Belgium, Bosnia and Herzegovina, Bulgaria, Croatia, Denmark, Slovakia, Slovenia, Spain, Finland, France, Great Britain, Greece, Hungary, Holland, Italy, Luxembourg, Macedonia, Montenegro, Norway, Poland, Portugal, Czech Republic, the Republic of Ireland, Romania, Serbia, Sweden, Switzerland and Turkey (Trains, Portugal, 2009c).

Types of Passes

Currently, there are two kinds of InterRail pass:

InterRail Global Pass

THE InterRail Global Pass allows free transit between the 30 countries of the area InterRail: Germany, Austria, Belgium, Bosnia and Herzegovina, Bulgaria, Croatia, Denmark, Slovakia, Slovenia, Spain, Finland, France, Great Britain, Greece, Hungary, Holland, Italy, Luxembourg, Macedonia, Montenegro, Norway, Poland, Portugal, Czech Republic, the Republic of Ireland, Romania, Serbia, Sweden, Switzerland and Turkey (Trains, Portugal, and 2009c).

InterRail One Country Pass

THE InterRail One Country Pass allows travel freely in the (s) Company (s) of railways in only one country; it may be acquired for it doesn't matter. The acceding countries with the

exception of the following: Bosnia-Herzegovina and Montenegro, Belgium, the Netherlands and Luxembourg are included in the Benelux Pass that includes the 3 Countries, the Pass to Greece can include the boats Superfast Ferries and Blue Star Ferries of maritime company ATTICA, which makes the connection between Italy and Greece, in which case designated by Greece Plus. THE InterRail One Country Pass considers the travel in the countries and railway companies adhering to them are valid, not being granted reductions in other countries.

Client Satisfaction

One cannot minimize the importance of customer satisfaction. Without client, the service company has no reason to exist. All the service companies need to define and measure proactively to the satisfaction of the customer. Expect that the customers are complaining to identify problems in the system of service provision or measure the progress of the company with regard to the satisfaction of the customer on the basis of the number of complaints received and a naive approach (Gerson, 1998).

The level of satisfaction of a client or homogeneous group of customers depends not only on the extent to which the attributes of a product meet the needs of the customers as also depends on the expectations of customers face to the overall performance of the product (Pires & Santos, 1996).

Although there are a variety of alternative definitions, the definitions most popular are satisfaction or dissatisfaction of client and comparison of the expectations of the customer with regards their perceptions. This comparison is based on what the marketing professionals call model of breakage of expectation (expectancy disconfirmation model). Saying in a simple way, if the perceptions of a client meet their expectations, it is said that the expectations were confirmed and the client is satisfied.

There are two types of breakage of expectation. It is a real perception fell short of what was expected, the result will be a drop of expectation negative, which results in dissatisfaction of the customer and can trigger the negative publicity mouth to mouth and/or the defection of the client. On the other hand, there is a drop of positive expectation, when the perceptions exceed our expectations, result it the satisfaction of the customer (Hoffman & Batenson, 2006).

Measuring Client Satisfaction

Before measuring anything, we must know what we are measuring and why. The first benefit of a measurement program is that it gives a person immediate feedback that is objective and with meaning.

It may also be the basis for a system of rewards that can only succeed if based on given objective and quantifiable. The benefits of measuring quality and customer satisfaction can be summarized in five topics (Gerson, 1998; Hoffman & Batenson, 2006):

- Providing the people with a sense of achievement and fulfillment, translates in good customer service.
- Giving people a performance standard that should try to achieve, will lead them into improving and increasing the customer satisfaction.
- Offering immediate feedback, especially when the client is to measure the action of the supplier.
- Say what must be done to improve the quality and customer satisfaction and how to do it (this information may also come directly from the client).

In qualitative and quantitative methods of collection the process of identification and weighting of the attributes is used as well as the collection and processing of information. The methodologies used are different depending on the size of the work and the types of desired results. Also the techniques and media for the collection of information vary depending on the type of methodology used (Pires & Santos, 1996).

- **Qualitative Research:** the quality of the research takes understanding subjectively the customer experience when buying or using your product or service. There are no rigid measurements in qualitative research. **Qualitative Investigation:** The quality of the research takes understanding subjectively the customer experience when buying or using your product or service. There are no measurements are rigid in qualitative research.
- **Quantitative Investigation:** quantitative research and objectives are measurable. We obtain the data according to a standard pre-determined. To complete the research, we performed statistical analyzes on the data, for **Quantitative Investigation:** quantitative research and objectives are measurable data according to a standard pre-determined. To complete the research, we perform statistical analyzes on the data, to determine the degree of satisfaction of the clients and the assessment made by these the quality of the service.

Quality of Service

The quality of a service, second Teboul (1999) is created at each point of interaction involving the provider of the service, the worker and the client. For this author, in the process of interaction, the quality of the service is a function of 3 elements: (1) the expectations that involve the clarification that should be provided and their control;(2) the delivery of results expected of professional practice, the standards or behaviors seized or acquired and (3) the perception that involves the control of the service given the client's perception of making the necessary adjustments.

Also Kellogg, Youngdahl and Bowen (1997), on the basis of a conceptual model of the chain of values of the service, show the importance of consumer behavior, influencing, positively or

negatively affect the quality of the service in the various stages of the value chain and the relationship that these behaviors have on the perceived value of the service and the level of satisfaction. Highlighting not only how consumers co-guarantee service quality during the process but also the need to determine and specify what the client feels as costs are incurred. That is, although not always economic costs are entailed, they express themselves through various forms of stress that also contribute to the quality of service received.

Tools used to Measure Quality

There are a variety of tools to measure the quality and customer satisfaction and many of them can be used jointly. However, there are seven tools for measuring the quality (Gerson, 1998): evaluation tests, graphs of Pareto, histograms, and diagrams of correlation, and diagrams of cause and effect, control charts and stratification. There are other measurement techniques that can be used, as for example, brainstorming (this is not as well a measuring technique but a way of generating creative ideas to the continued improvement of the quality), graphs, flow charts, to process, analyze SWAT and benchmarking (After measuring levels of customer satisfaction, we must analyze the results so that we can implement the improvements suggested by the polls or carry out the follow-up directly with the customers to expose their views. This analysis and follow-up will also give personal particulars as to the efficiency of its performance, setting references which will make it easier to measure exactly the performance of future services (Gerson, 1998; Mowforth & Munt, 1998).

Methodology

This research, exploratory in nature, examines backpacking to define and compare the InterRailers satisfaction with the quality of services in Italy, Greece and Croatia. For this research we built up, at random, a sample of 70 individuals (36 female and 34 male gender, 51 Portuguese nationals, 19 of other nationalities) who along its route had passed through Italy, Greece and Croatia.

For this research were used two scientific methodologies: direct observation, through the ethnographic work carried out in 11 countries (Italy, Greece, Croatia, Bosnia, Serbia, Bulgaria, Turkey, Romania, Hungary, the Czech Republic and Germany) and 18 cities (Rome, Bari, Ancona, Florence, Igoumenitsa, Corfu, Split, Hvar, Ploce, Sarajevo, Belgrade, Sofia, Istanbul, Bucharest, Timisoara, Budapest, Prague and Munich) and the inductive of a quantitative nature based on 70 surveys obtained between December 14, 2009 and March 13, 2010 through InterRailers of different nationalities that, in their journeys had travelled in the above-mentioned countries.

Results

The word statistics can be attributed to different meanings. In the broadest sense, refers to a discipline whose fundamental objective is the collection, compilation, analysis and interpretation of data. The goal of statistical inference, based on the analysis of a limited set of

data (a sample) aims to characterize the whole from which such data was obtained (Pinto Coelho, Cunha and Legatheaux Martins, 2008).

Internal Consistency of the Scales Used

The index alpha (α) estimates how uniformly the items contribute to the sum of the weighted instrument, ranging on a scale of zero to one. This property is known as internal consistency of the scale and the alpha (α) may be interpreted to mean coefficient of all the estimates of internal consistency that they would all possible divisions of the scale were made (Cronbach, 1951).

In general, an instrument or test is classified as having reliability appropriately when the $\alpha \geq 0,70$ (Nunnally, 1978). That is then followed by the consistency of the scale used. The instrument used to assess the satisfaction of InterRailers on the 4 tourist activities and consisting of a scale consists of 14 items for the transport, 17 for accommodation, 18 for the restoration and 20 for the tourist attractions in accordance with the methodology proposed by Likert scale consisting of five).

Inferential Statistics

The statistical inference (statistical or inductive) is composed of a set of analytical techniques used to identify and characterize relationships between variables. It aims to extrapolate the results (obtained with the descriptive statistics) thereby allowing people to uncover characteristics based on known information about one or more samples drawn from this population. Thus, the statistical inference allows us to draw conclusions and make inferences that go beyond mere description of the information (Pinto Coelho, Cunha and Legatheaux Martins, 2008).

Taking into account that dependent variables (tourist activities: transport, accommodation, catering, and tourist attractions) and independent variables (destinations: Italy, Greece and Croatia), we calculated, initially, the average of each sample using the following tests to check if there were significant differences in the averages for the satisfaction of the dependent variables between the 3 destinations:

Transportation

In the descriptive level, the average rating for the satisfaction of InterRailers was 3.4142 for the quality of Italian transportation, 3.0880 for the quality of Greek transportation and 3.1149 for the quality of Croatian transportation (Table 1.1). The highest average value refers went to Italian transportation.

Table 1.1: Descriptive Statistics (transportation).

Descriptive Statistics			
	Mean	Std. Deviation	N
Italian Transports	3,4142	0,62695	70
Greek Transports	3,0880	0,59650	70
Croatian Transports	3,1149	0,53273	70

In this case, it is necessary to verify the assumption of normality before executing the parametric test of ANOVA because when the samples have a size greater than 30, this procedure is needless (Maroco, 2003).

The output presented below (Table 1.2), is related to the sphericity test by Mauchly (Mauchly's Test of Sphericity), plus an assumption that needs to be verified to be able to use parametric test for more than two matched samples (ANOVA for repeated measurements). The Mauchly sphericity test measures the equality of variances of differences between treatment levels.

In this case, once the $\text{sig}=0.147 > \alpha=0.050$ for the test of sphericity does not reject the H_0 . It is then that there is sphericity as soon as we can apply the test for paired samples (ANOVA for repeated measurements) (Table 1.3).

Table 1.2: Mauchly's Test of Sphericity (transportation).

Mauchly's Test of Sphericity ^b							
Measure: MEASURE_1							
Within Subjects Effect	Mauchly's W	Approx. Chi-Square	df	Sig.	Epsilon ^a		
					Greenhouse-Geisser	Huynh-Feldt	Lower-bound
Factor1	0,994	3,841	2	0,147	0,947	0,974	0,500

Tests the null hypothesis that the error covariance matrix of the orthonormalized transformed dependent variables is proportional to an identity matrix.

a. May be used to adjust the degrees of freedom for the averaged tests of significance. Corrected tests are displayed in the Tests of Within-Subjects Effects table.

b. Design: Intercept
Within Subjects Design: factor1

Table 1.3: Test of Within-Subjects Effects (transportation).

Test of Within-Subjects Effects						
Measure: MEASURE_1						
Source		Type III Sum of Squares	df	Mean Square	F	Sig.
Factor1	Sphericity Assumed	5,041	2	2,521	9,979	0,000
	Greenhouse-Geisser	5,041	1,894	2,661	9,979	0,000
	Huynh-Feldt	5,041	1,947	2,589	9,979	0,000
	Lower-bound	5,041	1,000	5,041	9,979	0,002
Error (factor1)	Sphericity Assumed	34,353	136	0,253		
	Greenhouse-Geisser	34,353	128,823	0,267		
	Huynh-Feldt	34,353	132,406	0,259		
	Lower-bound	34,353	68,000	0,505		

In this case, once the $\text{sig}=0.000 < \alpha=0.050$ rejects the H_0 . This means that there are significant differences in the averages for the satisfaction of InterRailers regarding the variable transport between the three destinations.

There are significant differences, it is still necessary to apply a multiple comparison test of averages (Table 1.4) to verify that averages between these differences occur.

Table 1.4: Pairwise Comparisons (transportation).

Pairwise Comparisons						
Measure: MEASURE_1						
(I) Factor1	(J) Factor1	Mean Difference (I-J)	Std. Error	Sig ^a	95% Confidence Interval for Difference ^a	
					Lower Bound	Upper Bound
1	2	0,344*	0,089	0,001	0,126	0,561
	3	0,317*	0,092	0,003	0,091	0,543
2	1	-0,344*	0,089	0,001	-0,561	-0,126
	3	-0,027	0,075	1,000	-0,211	0,157
3	1	-0,317*	0,092	0,003	-0,543	-0,091
	2	0,027	0,075	1,000	-0,157	0,211

Based on estimated marginal means

*. The mean difference is significant at the 0,05 level.

a. Adjustment for multiple comparisons: Bonferroni.

In this case, there are significant differences in the satisfaction of InterRailers between the quality of transport in Italy and Greece ($\text{sig}=0.001 < 0.050$) and the quality of transport between Italy and Croatia ($\text{sig}=0.003 < 0.050$).

Accommodation

In the descriptive level, the average rating on the satisfaction of InterRailers was 3.6684 for the quality of Italian accommodation, 3.7707 for the quality of Greek accommodation and 3.5874 for the quality of Croatian accommodation (Table 1.5). The highest average value was related to Croatian accommodation.

Table 1.5: Descriptive Statistics (Accommodation).

Descriptive Statistics			
	Mean	Std. Deviation	N
Italian Accomodation	3,6684	0,62440	70
Greek Accomodation	3,7707	0,58980	70
Croatian Accomodation	3,5874	0,63109	70

In this case, it was necessary to verify the assumption of normality before executing the parametric test of ANOVA because when the samples had a size greater than 30, this procedure and needless (Maroco, 2003).

The output presented below (Table 1.6), is related to the sphericity test Mauchly (Mauchly's Test of Sphericity), plus an assumption that needs to be verified to be able to use parametric test for more than two matched samples (ANOVA for repeated measurements). The Mauchly sphericity test measures the equality of variances of differences between treatment levels.

In this case, since the $\text{sig} = 0.099 > \alpha = 0.050$ for test of sphericity, the H_0 is not rejected. It is said that there is sphericity and then we can apply the test in paired samples (ANOVA for repeated measurements) (Table 1.7).

Table 1.6: Mauchly's Test of Sphericity (accommodation).

Mauchly's Test of Sphericity ^b							
Measure: MEASURE_1							
Within Subjects Effect	Mauchly's W	Approx. Chi-Square	df	Sig.	Epsilon ^a		
					Greenhouse-Geisser	Huynh-Feldt	Lower-bound
Factor1	0,908	6,497	2	0,099	0,915	0,939	0,500
Tests the null hypothesis that the error covariance matrix of the orthonormalized transformed dependent variables is proportional to an identity matrix.							
a. May be used to adjust the degrees of freedom for the averaged tests of significance. Corrected tests are displayed in the Tests of Within-Subjects Effects table.							
b. Design: Intercept							
Within Subjects Design: factor1							

Table 1.7: Test of Within-Subjects Effects (accommodation).

Test of Within-Subjects Effects						
Measure: MEASURE_1						
Source		Type III Sum of Squares	df	Mean Square	F	Sig.
Factor1	Sphericity Assumed	1,164	2	0,582	2,467	0,089
	Greenhouse-Geisser	1,164	1,831	0,636	2,467	0,094
	Huynh-Feldt	1,164	1,879	0,620	2,467	0,092
	Lower-bound	1,164	1,000	1,164	2,467	0,121
Error (factor1)	Sphericity Assumed	32,086	136	0,236		
	Greenhouse-Geisser	32,086	124,495	0,258		
	Huynh-Feldt	32,086	127,766	0,251		
	Lower-bound	32,086	68,000	0,472		

In this case, once the $\text{sig}=0.089 > \alpha=0.050$ does not reject the H_0 . Does this mean that there are no significant differences in the averages of satisfaction of InterRailers regarding the variable accommodation between the three destinations.

Catering

In descriptive levels, the average rating of satisfaction of InterRailers was 3.9689 for the quality of the Italian catering, 4.0484 for the quality of Greek catering and 4.0597 for the quality of Croatian catering (Table 1.8). The highest average value of Catering went to the Croatian Catering.

Table 1.8: Descriptive Statics (catering)

Descriptive Statistics			
	Mean	Std. Deviation	N
Italian Catering	3,9689	0,57818	70
Greek Catering	4,0484	0,49393	70
Croatian Catering	4,0597	0,51787	70

In this case, it is not necessary to check the assumption of normality before performing parametric test of ANOVA because when samples are larger than 30, this procedure is pointless (Maroco, 2003).

The output presented below (Table 1.9), is related to the sphericity test Mauchly (Mauchly's Test of Sphericity), plus an assumption that needs to be verified to be able to use parametric test for more than two matched samples (ANOVA for repeated measurements). The Mauchly sphericity test measures the equality of variances of differences between treatment levels.

In this case, once the $\text{sig}=0.200 > \alpha=0.050$ for the test of sphericity does not reject the H_0 . It is then that there is sphericity as soon as we can apply the test for paired samples (ANOVA for repeated measurements) (Table 1.10).

Table 1.9: Mauchly's Test of Sphericity (catering).

Mauchly's Test of Sphericity ^b							
Measure: MEASURE_1							
Within Subjects Effect	Mauchly's W	Approx. Chi-Square	df	Sig.	Epsilon ^a		
					Greenhouse-Geisser	Huynh-Feldt	Lower-bound
Factor1	0,122	139,057	2	0,200	0,532	0,534	0,500

Tests the null hypothesis that the error covariance matrix of the orthonormalized transformed dependent variables is proportional to an identity matrix.

a. May be used to adjust the degrees of freedom for the averaged tests of significance. Corrected tests are displayed in the Tests of Within-Subjects Effects table.

b. Design: Intercept
Within Subjects Design: factor1

Table 1.10: Test of Within-Subjects Effects.

Test of Within-Subjects Effects						
Measure: MEASURE_1						
Source		Type III Sum of Squares	df	Mean Square	F	Sig.
Factor1	Sphericity Assumed	0,333	2	0,167	1,842	0,162
	Greenhouse-Geisser	0,333	1,065	0,313	1,842	0,179
	Huynh-Feldt	0,333	1,068	0,312	1,842	0,179
	Lower-bound	0,333	1,000	0,333	1,842	0,179
Error (factor1)	Sphericity Assumed	12,128	134	0,091		
	Greenhouse-Geisser	12,128	71,338	0,170		
	Huynh-Feldt	12,128	71,539	0,170		
	Lower-bound	12,128	67,000	0,181		

In this case, once the $\text{sig}=0.162 > \alpha=0.050$ does not reject the H_0 . Does that mean that there are no significant differences in the averages for the satisfaction of InterRailers regarding the variable catering between the three destinations.

Tourist Entertainment

The descriptive level, it appears that the average rating on the satisfaction of InterRailers and 3.9075 for Italian tourist entertainment in Italy, from 3.7910 for Greek tourist entertainment in Greece and 3.4410 for the Croatian tourist entertainment in Croatia (Table 1.11). The highest average value is related to tourist entertainment in Italy.

Table 1.11: Descriptive Statistics (tourist Attractions).

Descriptive Statistics			
	Mean	Std. Deviation	N
Italian Tourist Entertainment	3,9075	0,52838	3,9075
Greek Tourist Entertainment	3,7910	0,42870	3,7910
Croatian Tourist Entertainment	3,4410	0,41000	3,4410

In this case, it is not necessary to check the assumption of normality before performing parametric test of ANOVA because when samples are larger than 30, this procedure is pointless (Maroco, 2003).

The output presented below (Table 1.12), refers to the sphericity test Mauchly (Mauchly's Test of Sphericity), plus an assumption that it needs to be verified to be able to use parametric test for more than two matched samples (ANOVA for repeated measurements). The Mauchly sphericity test measures the equality of variances of differences between treatment levels.

In this case, since the $\text{sig} = 0.269 > \alpha = 0.050$ for test of sphericity, the H_0 was not rejected. It is said that there is sphericity and then we can apply the test for paired samples (ANOVA for repeated measurements) (Table 1.13).

Table 5.12: Mauchly's Test of Sphericity (Tourist Attractions).

Mauchly's Test of Sphericity ^b							
Measure: MEASURE_1							
Within Subject s Effect	Mauchly' s W	Approx Chi- Square	d f	Sig.	Epsilon ^a		
					Greenhouse -Geisser	Huynh -Feldt	Lower -bound
Factor1	0,960	2,628	2	0,26 9	0,962	0,990	0,500

Tests the null hypothesis that the error covariance matrix of the orthonormalized transformed dependent variables is proportional to an identity matrix.

a. May be used to adjust the degrees of freedom for the averaged tests of significance. Corrected tests are displayed in the Tests of Within-Subjects Effects table.

b. Design: Intercept

Within Subjects Design: factor1

Table 1.13: Test of Within-Subjects Effects (Tourist Attractions).

Test of Within-Subjects Effects						
Measure: MEASURE_1						
Source		Type III Sum of Squares	df	Mean Square	F	Sig.
Factor1	Sphericity Assumed	7,897	7,897	3,949	25,619	0,000
	Greenhouse-Geisser	7,897	7,897	4,105	25,619	0,000
	Huynh-Feldt	7,897	7,897	3,988	25,619	0,000
	Lower-bound	7,897	7,897	7,897	25,619	0,000
Error (factor1)	Sphericity Assumed	20,345	20,345	0,154		
	Greenhouse-Geisser	20,345	20,345	0,160		
	Huynh-Feldt	20,345	20,345	0,156		
	Lower-bound	20,345	20,345	0,308		

In this case, since the sig = 0.000 < α = 0.050 the H₀ was rejected. This means that there are significant differences in the means for the satisfaction of InterRailers and variable transport between the three destinations.

With significant differences, it is still necessary to apply a multiple comparison test of means (Table 1.14) to verify that averages between these differences occur.

Table 1.14: Pairwise Comparisons (Tourist Attractions).

Pairwise Comparisons						
Measure: MEASURE_1						
(I) Factor1	(J) Factor1	Mean Difference (I-J)	Std. Error	Sig ^a	95% Confidence Interval for Difference ^a	
					Lower Bound	Upper Bound
1	2	0,116	0,069	0,292	-0,054	0,286
	3	0,466*	0,073	0,000	0,288	0,645
2	1	-0,116	0,069	0,292	-0,286	0,054
	3	0,350*	0,061	0,000	0,200	0,500
3	1	-0,466*	0,073	0,000	-0,645	-0,288
	2	-0,350*	0,061	0,000	-0,500	-0,200

Based on estimated marginal means

*. The mean difference is significant at the 0,05 level.

a. Adjustment for multiple comparisons: Bonferroni.

In this case, we can see significant differences in the satisfaction of InterRailers between the quality of tourist attractions offered by Croatia and Italy (sig = 0.000 < 0.050) and quality of attractions offered by Croatia and Greece (sig = 0.000 < 0.050).

Conclusions

The world is trying to understand all the changes that have occurred in recent decades. There is unanimity in asserting that these changes were of crucial importance for today's society that lives in a globalized world where all the communication barriers have been filled by information systems technology. Tourism was one of the sectors that most felt these changes. In this research, it is possible to verify that:

In relation to transportation

The average value of satisfaction of InterRailers on the quality of the services provided in rail transportation was 3.4142 for the Italian transportation, 3.0880 for Greek transportation and 3.1149 for Croat transportation.

Taking into account the scale used to determine the satisfaction of InterRailers (Likert scale composed of 5 points) it was assumed that all the results that show average values equal to or greater than 3 - "Sufficient" attributed to the InterRailers quality of satisfied.

Assuming the average values presented above, it is possible to verify that they are all above 3 then verifying that InterRailers are sufficiently satisfied with the quality of services in rail use in Italy, Greece and Croatia.

Although satisfied, it is to emphasize that there are significant differences in satisfaction InterRailers about the quality of services in rail transport used for all three destinations, InterRailers are more satisfied with the quality of services in rail Italians than with the quality of services in rail Greeks and Croats. Although positive, the lowest mean value is related to the quality of services in rail Greeks.

The indicators that were used to evaluate the satisfaction of InterRailers about the quality of services in rail use in Italy, one can conclude that the indicators that show a greater satisfaction from InterRailers are the existing environment at stations and rail transportation and security at stations and on rail. In turn, indicators showed less satisfaction from InterRailers in hygiene and cleanliness of rail transport, the personalized service and information and explanations given in railway stations.

The indicators that were used to evaluate the satisfaction of InterRailers about the quality of services in rail used in Greece, one can conclude that the indicators that show a greater satisfaction from InterRailers are punctuality of the trains and in stations and existing environment rail transport. In turn, indicators showing less satisfaction from InterRailers are the frequency of schedules, the capacity of rail transport and cleaning and hygiene in railway transport.

Finally, with respect to indicators that were used to evaluate the satisfaction of InterRailers about the quality of services in rail used in Croatia, one can conclude that the indicators that show a greater satisfaction from InterRailers are punctuality of trains, the environment in

existing stations and rail transportation and security at stations and on rail. In turn, the indicators that show lower satisfaction from InterRailers are the location of railway stations, the timing and frequency of cleaning and hygiene in railway transport.

In relation to Accommodation

In this investigation we can see that the average value on the satisfaction of InterRailers about the quality of services rendered in 3.6684 accommodations is Italian for housing, housing for the 3.7707 and 3.5874 for the Greek Croatian accommodation. Given the scale used to determine the satisfaction of InterRailers (Likert scale consisting of 5 points) it was assumed that all the results we present average values equal to or above 3 - "Sufficient" attribute to the quality of InterRailers satisfied.

Assuming the average values presented above, it is possible to verify that they are all above 3 then verifying that InterRailers are satisfied with the quality of services in accommodation used in Italy, Greece and Croatia.

No differences were significant and positive although it is possible to verify that the average value is higher on the quality of Greek housing and the average value is lower on the quality of Croatian accommodation.

For the indicators used to evaluate the satisfaction of InterRailers regarding the quality of services provided within the Italian housing, one can conclude that the indicators that showed a greater satisfaction from InterRailers in accessibility to housing, hospitality and times of entry and exit from housing. In turn, indicators showed less satisfaction from InterRailers in the time taken to respond to anomalies, quality and comfort of the bedrooms and en-suite.

For the indicators used to evaluate the satisfaction of InterRailers regarding the quality of services provided within Greek housing, it was possible to conclude that the indicators showed a greater satisfaction from InterRailers regarding hospitality, accessibility to housing, the schedules of entry and exit into housing and receptivity on the part of officials. In turn, indicators showed less satisfaction from InterRailers on issues of general hygiene and cleanliness of bathrooms, and bathing quarters.

Finally, with respect to indicators that were used to evaluate the satisfaction of InterRailers in the quality of services provided within the Croatian housing, the conclusion was that the indicators that showed a greater satisfaction from InterRailers regarding hospitality, the times of entry and exit the accommodation and value for money. In turn, indicators showed less satisfaction from InterRailers regarding the location of housing, accessibility to housing, the response time anomalies and bathrooms, shower facilities.

In relation to Catering

The average value of satisfaction of InterRailers on the quality of the services provided in catering was 3.9689 for the Italian catering, 4.0484 for Greek catering and 4.0597 for Croat

catering. Taking into account the scale used to determine the satisfaction of InterRailers (Likert scale composed of 5 points) it was assumed that all the results that show average values equal to or greater than 3 - "Sufficient" attributed to the InterRailers quality of satisfied.

Assuming the average values presented above, it is possible to verify that they are all above 3 then verifying that InterRailers are satisfied with the quality of services in catering used in Italy, Greece and Croatia.

No differences were significant and positive although it is possible to verify that the average value is higher on the quality of Croat catering and the average value is lower on the quality of Italian catering.

The indicators that were used to evaluate the satisfaction of InterRailers regarding the quality of services provided under the Italian catering, one can conclude that the indicators that showed a greater satisfaction from InterRailers in regards location, hours of operation and quality of food (taste, aroma, texture, presentation). In turn, indicators showed less satisfaction from InterRailers in matters of reliability of service, menu variety and value for money.

The indicators that were used to evaluate the satisfaction of InterRailers in the quality of services provided under the Greek catering, one can conclude that the indicators showed a greater satisfaction for the environment of InterRailers accommodation, dining experience and the relationship between cost and value. In turn, indicators showed less satisfaction from InterRailers regarding waiting times, hygiene and cleanliness and quality of equipment.

The indicators that were used to evaluate the satisfaction of InterRailers in the quality of services provided in Croatian catering, one can conclude that the indicators showed a greater satisfaction from InterRailers in matters pertaining to the number of hours of operation, the environment and the relationship between housing and money value. In turn, indicators showed less satisfaction from InterRailers regarding waiting times, hygiene and cleanliness and quality of equipment.

With Regard to Tourist Entertainment

The average value of satisfaction of InterRailers on the quality of the services provided in Tourist Entertainment was 3.9075 for tourist entertainment in Italy, 3.7910 in Greece and 3.4410 in Croatia. Given the scale used to determine the satisfaction of InterRailers (Likert scale consisting of 5 points) it was assumed that all the results we present average values equal to or above 3 - "Sufficient" attribute to the quality of InterRailers satisfied.

Assuming the average values presented above, it is possible to verify that they are all above 3 then verifying that InterRailers are satisfied with the quality of Tourist Entertainment in Italy, Greece and Croatia.

Although satisfied, is to emphasize that there are significant differences in satisfaction InterRailers about the quality of tourist entertainment for all three destinations, InterRailers are more satisfied with tourist entertainment in Italy than with the tourist entertainment in Greece and Croatia. Although positive, the lowest mean value is related to the quality of Croat tourism entertainment.

The indicators used to assess satisfaction with the quality of InterRailers tourist entertainment in Italy, concluded that there was greater satisfaction from InterRailers regarding the existence of cultural, historical and cultural heritage and diversity of museums. In turn, indicators showed less satisfaction from InterRailers regarding the shortage of equipment for sports activities, retail shopping centers and theme parks.

The indicators that were used to assess satisfaction with the quality of InterRailers of Greek tourist entertainment, it is possible to conclude that the indicators that showed greater satisfaction from InterRailers regarding historical and cultural heritage and nightlife. In turn, indicators showed less satisfaction from InterRailers on music festivals, retail shopping centers and theme parks.

The indicators that were used to assess satisfaction with the quality of InterRailers of Croatian tourist entertainment, it is possible to conclude that indicators showed greater satisfaction from InterRailers on the quality of beaches (river beach), swimming pools, parks and nightlife and gardens. In turn, indicators showed less satisfaction from InterRailers regarding the lack of art galleries and exhibitions, variety of museums, cinema, theater and entertainment and commercial areas.

Tourism is not just another sector, but rather a constellation of activities different in nature, not always unique to tourism, which converge in the same end: to transport, accommodate, feed and provide services that contribute to a pleasant stay to all those that travel, nationals or foreigners, moving to a different destination from the usual, with intention of stay for a limited period of time. It is a global view.

**COMPANIES' COMMITMENT AND ATTITUDE TOWARDS ENVIRONMENTAL
MANAGEMENT – FINDINGS OF A STUDY OF THE
AUSTRIAN TRANSPORT SECTOR**

Fürst, Elmar Wilhelm M.¹; Oberhofer, Peter²

Abstract

Environmental management has become an important business topic throughout the last decade. Concepts like corporate social responsibility and sustainable development are frequently discussed. Nevertheless, the issue still remains very complex with disparities in different business branches. Road transport is in this respect still regarded to be one of the main sources of greenhouse gas emission. Thus it should be an objective of every renowned company to implement a state-of-the-art environmental management scheme that is adjusted to the business focus and continuously enhanced. However measures might often be taken only if they have a positive impact on results or the companies' viability. The intrinsic involvement of the management and its commitment is therefore indispensable. In this paper we discuss the status of the implementation of environmental management based on a survey of Austrian transport for hire or reward companies or businesses in other fields regularly performing own account transport. We show significant differences between companies declaring themselves to practice environmental management actively and others which do not focusing also on managers' attitudes and commitment towards environmental management measures in the respective companies and give indications for political as well as corporate action.

Keywords: environmental management, sustainable transport, attitudes, commitment, transport for hire or reward, own-account transport

Background

The latest UN Climate Conference in Cancun 2010 once more underlined global efforts towards environmental protection (United Nations, 2011). Although consensus could not be reached in every topic and some questions still remained unacknowledged a trend is clearly visible. Many industries even regard this development as a chance for new markets and growth. As a consequence product innovations and research in the field of environmental protection and sustainability are commonly supported. Furthermore companies in many sectors stop considering sustainable management as a burden but rather appreciate it as a helpful tool in the long-term perspective, namely as one way to improve customer relation and image in order to be better distinguished from their competitors.

Outshined by industrial production though, transport is still a serious pollution factor. On the one hand CO₂-emissions of the different transport modes intensify the greenhouse effect (OECD 2010), on the other hand negative external costs are boosted (Verhof 1994, pp. 3-5). Therefore politicians and researchers are striving for solutions and innovations in the transport sector that help to improve the situation of all stakeholders involved. Two basic aspects seem to be essential in this respect. Firstly, the current degree of the implementation of environmental management in companies conducting transport; secondly, corporate decision-makers' awareness and attitudes. Both factors could be seen as preconditions for further progresses at the corporate level leading to a better performance of national economies in environmental matters (e.g. emission targets).

However in order to reach global or national objectives it will be necessary that according actions are also taken on the individual company level. Hence the implementation of corporate environmental management is of crucial importance and therefore stands in the focus of this paper. Following Ajzen's "theory of planned behaviour" (Ajzen, 1991) attitudes and commitment towards environmental managements can be seen as most important prerequisites for further steps (Kaiser et al., 1999).

The term "environmental management" (EM) refers to an environment-orientated management of a company (Müller-Christ 2001, p. 4). It involves all activities and decisions that are necessary to minimise the environmental pollution caused by the company (Baumann, Kössler & Promberger 2005, p. 17). EM is closely linked sustainable management where again a more holistic approach is taken: The triple bottom line approach subdivides sustainability into social, ecological and economical development (Elkington 1999, pp.72-73). Accordingly, corporate EM measures have to be assessed in the framework of ecological, social and economical objectives. Although a positive effect on ecology remains the main goal of EM the implementation of a measure is highly dependent on the economical impact. If the trade-off between cost savings and environment protection can be resolved, a measure is likely to be realised and to persist as managers in the first instance need to be oriented at their company and its objectives:

Since Adam Smith's "invisible hand" (Smith, 1776) established economic theory regards companies as rational entities heading for maximum profit or maximum profitability. Some economists even believe that profit maximisation is a company's only (social) responsibility (Friedmann, 1970). However over time but still already starting back in the first half of the 20th century opinions seem to have changed and so have the attitudes of managers (Hay&Grey, 1974). Modern management theory accepts the interests of different stakeholder groups but considers the customer as focal point in order to ensure the viability (Beer, 1984) of the company and thus corporate sustainability (Woodruff, 1997). In models it could even be shown that profit-maximisation need not be the best way to survive (Schaffer, 1989).

Based on these thoughts one might argue that any measure – and thus also measures related to EM – taken by a reasonable manager will be taken only if it has a positive impact on profit and/or corporate (in the sense of “economical”) sustainability. Reasons for taking a particular action can therefore be (Alberti et al., 2000)

- the legal framework or social pressure and norm (enforcing a certain action),
- a foreseen improvement of the company’s image (linking the action indirectly to profit/economic sustainability)
- or – best of all – a direct positive effect on results/economic sustainability.

If EM is thus perceived as an opportunity for profit increase and/or economic sustainability, managers shall wish to take advantage of it and commit themselves to its implementation. Therefore it is necessary that the management regards EM as a chance for new opportunities in this respect.

To be well prepared for future business and environmental challenges, a management system that continuously deals with environmental issues in order to perform successfully in the long run might be advantageous (Klassen & McLaughlin, 1996, Melnyk et.al, 2003, Dahlström et al., 2003). Most research focussed on EM in manufacturing business, (Kassisis and Soteriou, 2003) showed its relevance for the services industries. It remains unclear, however, whether managers would also take actions that are environmental friendly though but not useful from the economic perspective, be it merely profit increase or sustainability in a broader sense. If they did, commitment could be regarded as ‘excessive’ as – regardless of the school a managers feels to belong to – there would be no economical justification for it but rather a value based or ethical one. Only little research has treated this important topic (Bansal & Roth, 2000).

The Project

The project presented in this paper was focusing at Austrian companies operating either in transport for hire or reward (including haulers, transport companies and freight forwarders with own trucks) or businesses belonging to other industries but regularly performing transport on own account. The latter group was subdivided into the sectors “industry”, “trade” and “craft”, respectively.

To depict the degree of EM implementation vis-à-vis the managers’ commitment and attitudes towards EM a basic distinction was made between those companies declaring themselves to be active in EM and those which did not. Differences with respect to budget, costs, the use of eco-friendly vehicles, employee trainings etc. were considered.

Thus, the following research questions are discussed:

- How do companies describing themselves as EM-active differ from others regarding their strategic and operational management? Which differences occur between small and large enterprises?
- How do decision makers of the respective companies evaluate the importance of EM and sustainability in general for their company?
- What is their attitude towards sustainability and environmental management measures and possible trade-offs?

Empirical Approach

In the course of the entire project several stages were followed in order to develop a broad knowledge basis and to take into account the state-of-the-art in EM in the field of corporate transport in practice. At first websites of different companies belonging to the respective sectors were reviewed and analyzed. In a next step specific research topics were identified and discussed with practitioners of the field. Therefore, several experts of the carrying trade as well as from companies with regular own account transports were consulted in structured face-to-face interviews. On this basis a questionnaire was developed, pretested and eventually launched. In a final step the data was processed and analyzed.

The project started in early 2010. The quantitative survey was conducted by means of an online questionnaire between July and November 2010 and addressed to environmental managers or CEO's of companies in the respective fields. It contained mostly closed questions and appraisals of different statements to assess the attitude towards EM and its implementation. Companies were randomly selected from a publicly accessible member database run by the Austrian Chamber of Commerce (membership is mandatory for all companies based in Austria). Then, companies within the sample were contacted by telephone and a competent target person was identified, approached and encouraged to participate. If this person agreed to do so, a web link to the online questionnaire was sent by direct email. The preceding telephone contact was necessary as in published registers no information on persons in charge of EM is available. It also helped to increase the response rate. Computer Assisted Web Interview (CAWI) was chosen as it is convenient to complete for most respondents. Furthermore it allows complex issues to be illustrated clearly and it is budget friendly (Diekmann, 2007). The most severe problem of many online questionnaires, namely the lack of a specific population (Bosnjak, 2002), is solved by the fact that the target group could be specifically defined and contacted beforehand. It could further be presumed that internet access is generally available for persons within the sample. Divergence loss was minimised by contacting the appropriate respondents in person by telephone in advance.

Results

A total number of 259 questionnaires were registered of which 70% fully completed the online survey. 43% were appending to the group of transport for hire or reward companies

(including haulers, transport companies and forwarders with own-name operations meaning that they operate own trucks) while 47% belonged to the group of businesses in other fields regularly performing own account transport. 10% did not respond to that question.

Figure 1: Sector Affiliation

Figure 2: Distribution of company size groups

Company size

The size of the companies was classified according to the number of employees. A total of 175 companies stated their number of employees. Following the European Commission's definition of small, middle and medium-sized enterprises (European Commission, 2003) they were subdivided into five groups, illustrated in figure 3.

- Group 1: 0 to 1 person
- Group 2: 2 to 9 persons
- Group 3: 10 to 49 persons
- Group 4: 50 to 249 persons
- Group 5: 250 and more persons.

Group 3 (10-49 persons) and group 5 (250 and more persons) were most frequently represented with 52 companies each. While in middle-sized companies (group 3) transport companies prevailed, other businesses with regular own account transport held the vast majority in very large companies (group 5). These groups were closely followed by group 4 (50 to 249) with 50 companies in total. Here, the ratio between transport companies and businesses with own account transport was balanced. 20 participating companies had 2 to 9 employees (group 2) and only one company fell into group 1 (0 to 1 person) – (Fig. 3).

Vehicle fleet

A total of 174 companies stated the number of their officially registered vehicles. Again five groups were formed as follows:

- Group 1: 1 to 9 vehicles
- Group 2: 10 to 19 vehicles
- Group 3: 20 to 49 vehicles
- Group 4: 50 to 99 vehicles
- Group 5: 100 and more vehicles

Fig. 3. Distribution of vehicle fleet groups

The largest group (46) contained companies that licensed between 20 and 49 vehicles, closely followed by the group of companies holding only a few vehicles (42). The smallest group (24) included companies with 50 to 99 vehicles, companies with medium and large fleets ranked in between.

Correlation of company size and fleet size

One will expect that – regarding the sectors on trial – companies that employ more personnel hold more vehicles. A scatter plot and a correlation test should support this assumption. For a clearer visual illustration extreme values above 900 employees or vehicles were filtered out.

Figure 4: Correlation between company size and vehicle fleet

The result of the scatter plot demonstrates a clear positive correlation which is underlined by the embedded positive sloped straight line. Furthermore a Pearson's correlation test showed a rather strong and significant correlation (0,573). Therefore it can generally be stated that the more vehicles a company holds the higher the number of employees and vice versa.

This matter of fact also reduces the need for further statistical tests as it can be assumed that results related to both variables measuring company size are similar.

Practice of active EM

To examine the companies' implementation of EM the respondents who were either decision makers or environmental officers were asked: "Does your company actively practice EM?" 43% of them approved while 57% negated as figure 6 illustrates.

Figure 5: Practice of active environmental management

In a next step the self declared "environmentally-active" companies (n = 111) were asked to agree or disagree to given reasons for the implementation. Multiple answer selection was accepted. The most frequently stated reason for the implementation was the awareness of the increasing importance of EM in the future (74 approvals). 65 companies named legal necessities for a reason to perform environmentally friendly, closely followed by "image improvement" (64). Furthermore the distinction from competition (61), the reduction of costs by environmental protection methods (52), customer demand (42) and a competitive advantage (39) made companies introduce EM. In contrast, "social force" (7) was barely a reason for the implementation of EM. On the other hand companies which admitted not to practice active EM (n = 148) primarily reasoned that they do not see any necessity yet.

Comparison of different groups concerning practice of active EM

Comparing transport for hire and reward companies and others regularly performing own account transport concerning the practice of active EM showed the distributions in figure 7.

Figure 6: Practice of active EM within specific sectors

Figure 7: Relation between company size and practise of active EM

The figures demonstrate that a slight majority of businesses regularly performing own account transport actively practiced EM while 60% of the transport for hire and reward companies negated this question.

Putting the different company size groups into contrast concerning the practice of EM a distinctive trend could be observed. Namely, the bigger the company the stronger was the approval to the practice of EM (Fig. 8).

Coherences between the affiliation to selected groups and the practice of EM

In a first step, the coherence between the affiliation to one of the two distinct groups and the practice of EM was examined. Therefore, transport for hire or reward companies and businesses in other fields regularly performing own account transport were contrasted concerning this matter. A Chi-Square-Test yielded the following results.

		Does your company practice active EM		Total	
		yes	no		
affiliation to sector	Transport companies	Count	44	66	110
		Expected Count	52,6	57,4	110,0
	own account transport	Count	67	55	122
		Expected Count	58,4	63,6	122,0
Total		Count	111	121	232
		Expected Count	111,0	121,0	232,0
<i>Chi-Square Test</i>					
	Value	df	Asymp. Sig. (2-sided)		
Pearson Chi-Square	5,159	1	,023		
N of Valid Cases	259				

Tab. 1. Cross tabulation: practice active EM & sector affiliation

The results show the existence of a significant coherence – even though it was a rather weak one (p-value of Pearson Chi-Square = 0,023). Nevertheless, it could be proven that – taking the numbers of expected and actual counts into account – transport companies are more likely not to practice EM actively. On the other hand businesses with regular own account transport rather perform environmentally-active.

Again a Chi-Square-Test clearly showed a significant coherence (p = 0,000 between the size group and the active practice of EM. Companies with fewer employees admit rather not having implemented EM yet while especially very large companies (250 and more persons) declared to act eco-friendly.

Environmental aspects in the companies' decision making process

In a next step, the decision making process of the participating companies was examined. Therefore, the respondents were asked to indicate on a scroll bar to what extent environmental aspects were considered in the companies' decision making processes (with 0 = not at all considered; 100 = totally considered).

A mean value of 65 indicates that the companies well considered environmental aspects in their decision making processes. In addition, it could be shown that the companies that declared themselves EM-active differed from the group of non-active companies.

Fig. 8. Environmental aspects in decision making process

	<i>active environmental m.</i>	<i>N</i>	<i>Mean</i>	<i>Std. Deviation</i>	<i>Std. Error Mean</i>
<i>extent of environmental aspects decision making pr.</i>	yes	93	73,66	17,336	1,798
	no	62	51,37	29,678	3,769

Tab. 2. Group statistics: active vs. non-active: aspects in decision making process

The comparison of the groups' box plots show that EM-active companies considered environmental aspects to a higher extent. They had a mean value of 74 while non-EM-active companies reach a value of 51 on average. A t-test for equality of the means proved that the difference between the groups was highly significant. Still, it can be noticed that a mean of 51 for the group of companies that admitted not to practice EM shows that environmental

aspects are considered at least to some extent in the decision making processes. A rather high standard deviation (29.7) implicates, however, that within this group there are companies that consider them thoroughly while others disregard them completely.

	<i>t-test for Equality of Means</i>				
	<i>F</i>	<i>Sig.</i>	<i>t</i>	<i>df</i>	<i>Sig. (2-tailed)</i>
<i>extent of environmental aspects in decision making pr.</i>	25,584	,000	5,894	153	,000

Tab. 3. T-Test: active vs. non-active: aspects in decision making process

Attitude towards sustainability

A company's performance is very often decisively dependent on the attitude of its management (Melnyk, Sroufe, Calatone 2003). As a first step, the attitude of the companies' decision makers or environmental officers towards sustainability was measured. They were asked to evaluate the degree of importance of sustainability in their company using a scroll bar (with 0=no importance at all; 100=highest importance) and to specify to what extent sustainability was considered in terms of employee treatment and investments.

Fig 9: importance of sustainability

A mean of 73 indicates that, in general, sustainability was regarded as rather important (N=213). It was also rated as rather important regarding employee treatment (mean=72) and investments (mean=73). Taken into account the commitment to practice EM actively, it can be observed that EM-active companies significantly evaluated sustainability as more important than "inactive" companies (t-test: p=0,008). Though, in terms of employee treatment, the two groups only differed very weakly (t-Test: p= 0,048) and regarding investments no difference

at all could be observed (t-Test: $p=0,096$). A one-way anova shows that all company size groups consider sustainability as equally important (anova: $p=0,325$).

In a final statement concerning the impact of sustainability the decision makers were asked to forecast the importance of sustainability in the forthcoming years (on a scale with -100=importance will decrease significantly; +100=importance will increase significantly). The respondents (N=201) predicted an increasing importance of sustainability in the future (mean=+49). This result is equally shared by both the companies that practiced active EM and those who did not (t-test: $p=0,45$). Furthermore, no significant differences between the company size groups were observed (one-way anova: $p=0,182$).

Attitude towards different environmental actions

To expose the companies' attitude towards the environment and for a better understanding of taken actions the respondents were asked to evaluate given measures concerning EM in their company. 162 companies on average classified given environmental actions whether they are unimportant, neutral or very important for their company. The following measures were most frequently rated as unimportant:

- Use of biomass
- Environmental auditing/reporting
- Use of passive houses
- Energy self supply.

Chi-square-Tests show that there was no coherence between the company size and the evaluation of these measures. They were considered as unimportant regardless of company size.

The environmental measure rated most important was waste reduction. Almost 90% classified it as "very important". Also recycling, process optimisation and the efficient use of resources were rated as very important (>70%).

Further important actions are:

- Efficient lighting
- Heat insulation
- Further training for employees
- Investments in latest technology.

Again Chi-square-tests gave evidence on coherences between the company size and the evaluations. Bigger companies considered process optimisation, efficient use of resources and

further training of employees significantly more important than smaller companies. For the other measures that were rated as important no relation to the company size was observed.

Attitude towards transport-related actions concerning EM

Respondents were asked then to evaluate given transport-related measures as very important, neutral or unimportant. Figure 10 shows the measures most frequently rated as important and unimportant.

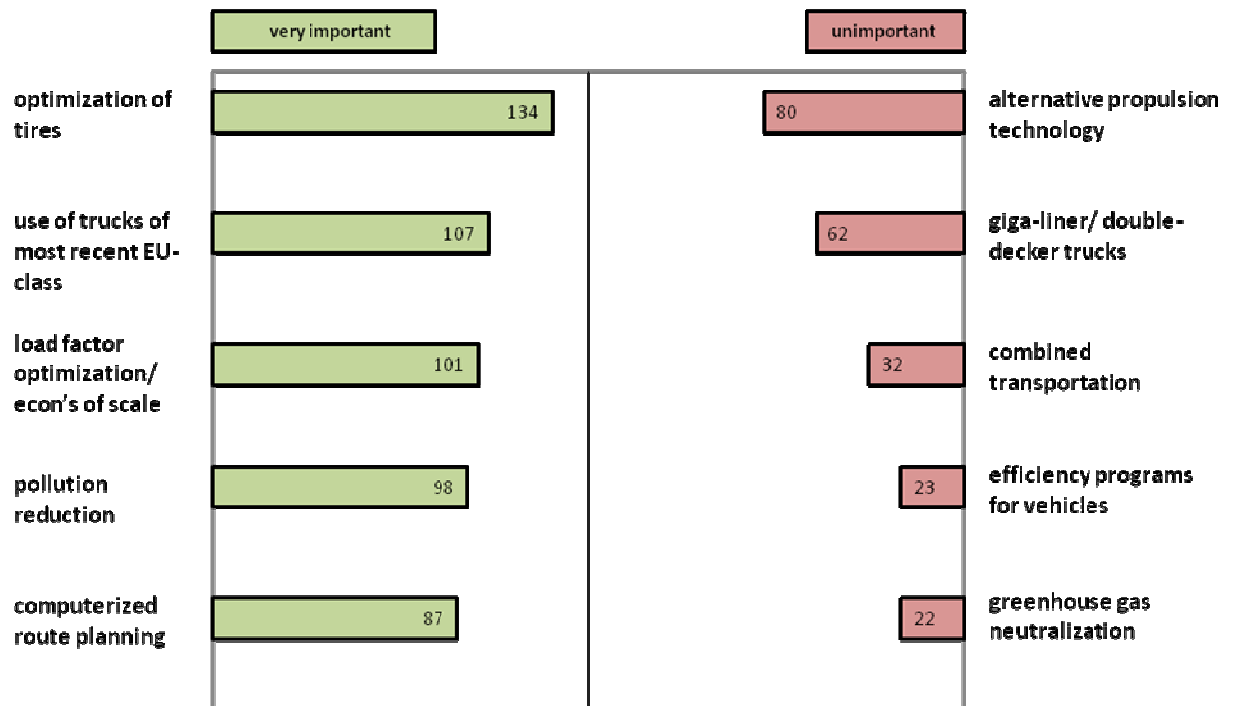

Fig 10: Importance of transport-related measures

162 companies responded on average. Optimisation of the tires was thereby by far considered as most important, followed by the use of the trucks belonging to the most recent EU-class and the optimisation of load factors and economies of scale. Furthermore, pollution reduction and computerised route planning is rated important. On the contrary, alternative propulsion technology is seen as most unimportant followed by giga-liners (heavy weight vehicles) and double-decker trucks. In addition, combined transport, efficiency programs for vehicles and greenhouse gas neutralisation were rather unimportant measures for the respondents. For almost all measures no coherence between the company size and the attitude was observed. Only “combined transport” was rated significantly more often as unimportant by smaller companies.

Certificates

There are only few methods to identify sustainable or environmentally-active companies on an overall basis. An indicator in this respect might be EM certificates –a standardised mean to show commitment to the protection of the environment. The two best known institutions in

Europe that issue specific certificates to companies which observe given standards and comply with regulations concerning environmental performance, are the ISO and the EMAS. By showing an environmental-friendly attitude companies expect to improve both their business performance and their image. Thus, in the next section the representatives of the companies were asked about their attitude towards certification and the possession of certain certificates. In a first, step they could evaluate the importance of certificates (0 = not at all important, 100 = very important). A total of 162 companies see certification neither as very important nor as important but are rather neutral (mean: 57). Though, the comparison of environmentally-active and non-active companies (t-test) showed differences in their attitudes. The respondents of environmentally-active companies (mean: 67) evaluated certificates significantly more important than those of non-active companies (mean: 43). Nevertheless, the bottom line is that in general certification is not yet respected as much as some institutions would probably like them to be.

Fig. 11. Importance of certificates

A total of 92 companies stated to be certified. A Qui-Square-test gave evidence about a highly significant coherence between the practise of active EM and the possession of certificates. Environmentally-active companies rather held certificates in comparison to the “non-active”. The two most common certificates were the ISO 9001-certificate (frequency: 60) concerning quality management and the ISO 14001 (33) focusing on environmental management. The strongest reason for certification was customer request. A total of 63 companies explicitly stated that they were not certified. The majority of them did not see any necessity yet. Furthermore, high expenses were affiliated with the possession and an unfavourable cost-benefit-relation prevented them from applying. A lack of qualified staff apparently was no reason.

Vehicles with alternative propulsion technology

Road freight vehicles and busses with hybrid or electronic propulsion are already offered by almost all major automobile manufacturers (IAA, 2010). However, the respondents evaluated alternative propulsion technology as unimportant and the vast majority did not own such vehicles. Only 28 of the participating companies had vehicles powered by alternative propulsion technology. Out of those 23 belonged to the group that considered themselves as EM-active. The most frequently named reason for the purchase was the positive effect on the environment and the economical energy consumption. A majority of the companies did not hold such vehicles because they considered the technology as not sufficiently developed yet and the acquisition and maintenance costs as too high. A lack of interest in new technologies or failed field tests is no reason.

Decisions in trade-off settings

Eventually respondents were asked to evaluate their accordance (again on a scale from 0 to 100) to three statements addressing possible trade-offs related to:

- As a consequence of an effective environmental measure one employee of your company would become redundant. Would you carry out this measure? Surprisingly managers would give up social objectives for the sake of an environmental one (mean = 65,3). However the loss of an employee might be associated with cost savings and thus cause the acceptance. .
- As a consequence of a effective environmental measure yield would decrease in 0.5%. Would you carry out this measure?
- Does your company practice environmental management to achieve a good image?

		<i>As a consequence of an effective environmental measure one employee of your company would become redundant. Would you carry out this measure?</i>	<i>As a consequence of an effective environmental measure yield would decrease in 0.5%. Would you carry out this measure?</i>	<i>Does your company practice environmental management to achieve a good image?</i>
N	<i>Gültig</i>	143	125	128
	<i>Fehlend</i>	116	134	131
<i>Mittelwert</i>		65,27	52,47	53,47
<i>Median</i>		75,00	51,00	60,00

Tab. 4. Statement results

Statements 2 and 3 are evaluated equally at average (means of 52,5 and 53,5, respectively) indicating that there is a certain chance that such decisions are taken but no clear decision to

either side. For statements 1 and 3 a t-test showed significant differences between EM-active and non-active companies at $p < 0,05$ with a higher acceptance of EM-active firms; for statement 2 no difference could be proven. Controlling for company size only for statement 3 a significant impact could be shown with higher acceptance for larger companies.

Conclusion

Only 43% of a total of 259 participating companies described themselves as being active in environmental management. Especially larger companies carried out EM due to the awareness of its growing importance in the future, image improvement and the distinction from the competitors.

Sustainability in general was considered important throughout the whole sample regardless of company size and the approval of active EM. According to the respondents this importance would increase in the future.

Although the automotive industry puts more and more emphasis on vehicles with alternative propulsion technology, the majority of the interviewed companies did not hold such vehicles. They considered the technology as not sufficiently developed and related costs as too high. Therefore, it is necessary to support further research and development and to provide financial aid in order to encourage transport service providers to invest in an environmental-friendly fleet. As alternative propulsion technology is clearly rated as unimportant, further campaigns to improve the attitude towards these new technologies are necessary. Also the development of respective standards (e.g. for recharging batteries and related power stations) as well as the promotion of systems practicability seems indispensable.

A majority of 57% of the participating companies clearly stated not to practice EM actively. This might be interpreted as surprising and to some extent unexpected as politicians keep launching several programs, campaigns and aids in this respect. According to the relation between company size and active practice of EM, the non-active companies mainly belong to the group of smaller companies, which – as a consequence of a lack of market power – are usually exposed to higher economical and market pressures. Furthermore, they rather operate in the domain of transport for hire or reward, a market with a high rate of competition, which supports the latter presumption. This could be seen as an indication for further, more specific corrective political action, particularly targeting at smaller transport companies. This could either be done by an according legal framework (barring the risk of a competitive disadvantage for the domestic transport industry and leading to an increased rate of flagging-out of national trucks) or by incentives (like financial aid or tax allowances). Nevertheless, even the self-declared non-active group did consider environmental aspects at least to some extent in their decision making processes. They also rated sustainability in

general as important and predicted an increasing importance during the coming years. In addition, the attitude towards environmental measures did not significantly differ between small and large companies. All this raises several questions regarding the disproportionately high amount of small companies within the non-EM-active group:

- Are smaller companies of the transport sector economically able to perform environmentally friendly?
- Which other barriers exist preventing companies from implementing EM?
- Do companies have sufficient information about opportunities to improve their environmental performance? Are they well aware that performing ecologically can yield economical improvements and thus raise profitability?

These challenges might lead to new programs in order to strengthen the awareness as well as public funding and to encourage companies to improve their environmental performance. Moreover, these issues should also be addressed in further research projects focusing on the efficiency and effectiveness of political measures as well as on the state-of-the-art, specific needs and barriers of small enterprises and ways to a successful implementations of EM systems in an overall sustainable framework.

MOBILITY OF THE SIGHT AND HEARING IMPAIRED – BARRIERS AND SOLUTIONS IDENTIFIED

Fürst, Elmar¹; Vogelauer, Christian²

¹WU Vienna, Institute for Transport and Logistics Management. Email: elmar.fuerst@wu.ac.at

Abstract

Persons with sight or hearing impairment are a significant part of the population. When using public transport numerous specific problems have to be overcome. However those two groups are often not recognized as having special needs and demands, rather they are mistaken as blind or deaf. Taking the completely different mobility barriers for these groups into account, the current situation is not satisfying.

In order to reveal the most common and most hindering specific problems to passengers with reduced eye sight or hearing a qualitative short-study as well as a large scale research project were initiated sequentially. The results are based on interviews with persons directly concerned, their representatives, authorities and transport companies as well as on discussions in related internet-fora. Problems and Solutions were gathered and segmented into four categories, namely problems at stops and stations, in vehicles, general mobility problems and public perception.

It is shown, that most measures proposed could be implemented with little to no cost as many problems are merely resulting from a lack of awareness, empathy or insufficient training. Furthermore the implementation of several measures would not only improve access to public transport for the two specific groups but for almost all passengers.

Keywords: Sight impaired, Hearing impaired, definition, barriers, solutions

Introduction

Every day hundreds of millions of people use public transport to reach their workplace, do their shopping, get to their leisure activities, visit friends and family and go on holidays. Be it by bus, tram, subway, train, ship or plane, most of them take the services provided to them for granted and do not spend time considering these conveniences.

Two special interest groups who are often hindered to use these basic services are in the focus of this article. The sight and the hearing impaired constitute two significantly sized passenger segments with special needs and barriers that are widely ignored by public transport service providers. However the public transport systems represent quite often the only possibility for these people to be mobile, i.e. to get to destinations they want to reach as they are unable to use individual transport means like cars, motorbikes or bicycles.

People with visual or hearing impairments represent a significant part of the population. Using public transport services they have to overcome numerous specific problems and obstacles. Quite often they are not even recognized as a group for themselves with special needs and demands but rather mistaken for blind and deaf people. Taking into account that mobility barriers for these groups are completely different, this situation, of course, is not acceptable.

In order to reveal the most common and most hindering specific problems people with sight and hearing impairments are confronted with and to collect proposals to solve them, a qualitative short-study based on interviews with persons directly concerned, their representatives, authorities and transport companies as well as on discussions in related internet-fora respectively was conducted. Problems at stops and stations, in vehicles, general mobility problems and public perception were taken into account. To further the understanding of the specific needs, barriers and possible solutions a large scale project was proposed. The well elaborated and accurate research plan was deemed beneficial and was accepted for funding. Thus, starting with a thorough literature review in online databases as well as libraries of several universities, the results gained in the pre-study were evaluated and partly confirmed partly rejected.

BaCkground

The two groups of the sight and the hearing impaired represent large segments of the population who often are not recognised as having to overcome specific barriers and needs concerning the use of public transport services.

There are no exact figures for the size of the two respective groups, neither in Europe nor in Austria, but a dedicated module of the micro census survey by Statistics Austria showed that roughly 3.8% of the population (or 318.000 people) suffer from persistent sight impairments and about 2.5% (202.000 people) are hard of hearing. Both groups tend to include older persons with females representing a majority of the persons concerned. In contrast only around 8.000 persons in Austria are blind and another 8.000 are deaf. (Leitner, 2007) Although the sizes of the groups are not exactly estimated, other research projects dealing with persons with reduced mobility (PRM) and public transport often estimate quite the same amounts of passengers as are presented here.

Therefore measures taken for the first two groups reach a by far wider number of persons. Taking into account the utility those solutions provide to “normal” sighted or hearing people every measure helps basically all passengers and is not merely restricted to the target groups in focus – following the principle “Design4all” – and thus could show an opportunity for transport companies to improve their profit situation.

In addition to the economic benefits a company may generate through a clear focus on the needs and barriers of sight or hearing impaired passengers there is a strict legal requirement on several levels of legislation stating the minimum requirements for impaired persons. The most general and the only “law” with global reach is the UN Convention on the Rights of persons with disabilities, which clearly states that it

is to “promote, protect and ensure the full and equal enjoyment of all human rights and fundamental freedoms by all persons with disabilities” (United Nations, 2006). The EU as well as the United States have issued several other legal guidelines and regulations such as the Americans with Disabilities Act (ADA) (Department of Justice, 2008), the EU disability strategy (COM, 2010) or the EU disability action plan. (COM, 2007) On the Austrian national level the constitution as well as regular legislation prohibit the discrimination of disabled persons and state that free and equal access to all field of daily living has to be granted.

It is not the authors’ intention to play any groups off against each other, but to increase the sensitivity for the needs of the sight and hearing impaired. Eventually it is necessary to identify problems, show ways to easily solve them and keep pushing towards a continuously improving dialog between the persons affected, their representatives and the transport service as well as technology providers in order to support the mobility of sight and hearing impaired passengers. This was also emphasised in several previous studies (Fürst and Kuhar, 2009; Fürst, 2010; Fürst and Vogelauer, 2011)

Definitions

As a first step it is necessary to clearly identify the two target groups of sight or hearing impaired passengers. This is of particular importance, as there are several parameters determining the actual level of hearing and seeing with some restrictions not necessarily decreasing the ability to be mobile in public transport. Therefore it was one of the main tasks to clearly differentiate between mobility-restricting factors and others.

Sight impairment

Based on interviews with experts, including ophthalmologists, orthoptists and optometrists, six main parameters for the quality of seeing could be identified.

1. **Visual acuity** (*visus cum correctione*, v.c.c; 1.0 is the average normal eyesight) determines the distance in which an opening of 1° in a standard Landolt-circle can be assessed. As the visual acuity uses a logarithmic scale the most often found translation of decimal values into percentage quotations is not applicable. Persons with low visual acuity show severe problems when using public transport services, as the ability to read information texts and electronic displays is decreased. Therefore navigation and resolution of information is restricted to close proximity objects. This parameter is also the commonly used one by official regulations like the ICD10 (which also includes field of vision) shown in the table below.

Category of visual impairment	Visual acuity with best possible correction	
	Maximum less than:	Minimum equal to or better than
1	6/18	6/60
	3/10 (0,3)	1/10 (0,1)

	20/70	20/200
2	6/60	3/60
	1/10 (0,1)	1/20 (0,05)
	20/200	20/400
3	3/60	1/60 (finger counting at 1 metre)
	1/20 (0,05)	1/50 (0,02)
	20/400	5/300 (20/1200)
4	1/60 (finger counting at 1 metre)	Light perception
	1/50 (0,02)	
	5/300	
5	No light perception	
9	Undetermined or unspecified	

Table 1: Classification of severity of visual impairment recommended by a WHO Study Group on the Prevention of Blindness, Geneva, 6-10 November 1972. (WHO Technical Report Series No. 518, 1973)

The term "low vision" in category H54 comprises categories 1 and 2 of the table, the term "blindness" categories 3, 4 and 5, and the term "unqualified visual loss" category 9.

If the extent of the visual field is taken into account, patients with a field no greater than 10 o but greater than 5 o around central fixation should be placed in category 3 and patients with a field no greater than 5 o around central fixation should be placed in category 4, even if the central acuity is not impaired.

Source: World Health Organization: <http://apps.who.int/classifications/apps/icd/icd10online/>

The three values in the respective lines in the ICD-10 table refer to the different notations that are used in different countries worldwide. According to ICD-10 chapter 7 block H54 categories 1 and 2 can be classified as "low vision", 3, 4 and 5 as blindness. (WHO, 2011)

2. **Contrast vision** is a measure of the contrast a person is able to perceive. The lower the contrast of electrical displays or signs is, the harder it can be read. The best contrasts can be reached by using white and black whereas light blue on white or dark gray on black surfaces is mostly irresolvable. To measure the contrast level between an object and its background there are several commonly used scales like Michelson (1972) (ratio of the difference in light density to the sum of light density of both objects), Sanders & McCormick (ratio between the difference in maximal and minimal light density to the maximal light density) (Ziefle, 2002) and Bjoerset & Brekke (1980) (ratio between the light density of the foreground to the light density of the background). The higher the needed contrast of a person, the harder it is to use public transport services as badly contrasted objects i.e. door-opening buttons and levers, guidance systems and

displayed information might not be distinguishable for the respective person. The figure below illustrates several colour combinations and their respective contrast values.

Figure 1: Colours and their respective contrasts (Bundesministerium für Gesundheit, 1996)

The “K”-values in figure 1 relate to Michelson-contrasts and the colour codes are based on a CMYK-scale (Cyan, Magenta, Yellow and Black).

3. The **field of vision** defines the angle that can be conceived by the respective person, the average for normal sighted persons is a 180° horizontal and 130° vertical angle. Several deceases, such as retinitis pigmentosa, can negatively influence the visual field and therefore reduce the angle in which a person is

alerted to movement. This results in increased need for head movement when using public transport services, but does not directly influence the ability to utilise those.

4. **Colour vision** is the general ability to see and differentiate colours from one another. Persons with a red-green weakness or blue-yellow weakness cannot distinguish between the respective colours, but can differentiate the intensity/contrast levels of the colours. Due to this persons with a slight colour weakness are still able to determine between colours such as red and green as long as the saturation is high enough (intense red or green). However, as most guidance systems do not solely rely on colour coding the restrictions to using public transports are very limited.

5. **Movement vision.** With decreased movement vision persons are unable to focus faster moving objects, such as cars, busses or trains or the stimulus of a moving object is slower detected. This leads to critical situations when crossing streets and miscalculating the speed of traffic or simply ignoring moving objects. However there is little public transport providers can do to compensate for this impairment and the general ability to use public transports is not limited.

6. **Stereoscopic vision.** Persons who lost their stereoscopic vision cannot exactly estimate the distance to objects. This constraint is however not excluding those persons from using public transport as most information can be obtained regularly. With persons not born with a stereoscopic vision disorder the brain is even able to slightly accommodate for this loss. What has to be taken into account is that strongly contrasted environments help the respective passengers navigate more easily as through the relation of object sizes and markings, the position in space can be anticipated to a certain extend.

Hearing impairment

While there is a large variety of factors influencing sight impairments, hearing impairment can be measured with one value only, namely the level of sound that can be heard or the auditory threshold of a person. While there are two main forms of hearing impairment, conductive and sensor neural hearing loss, both result in an increase of the hearing threshold level.

The measurement can be performed through several different tests, with the "hearing distance"-test being one of the most common. According to the guidelines the hearing distance is defined as the distance in which at least half of the words spoken by an examiner can be repeated correctly by the test person. Another test was designed by Boenninghaus and Röser (1973) where two tables are used, one for the distance in which whispered and normally spoken words are repeated correctly and one for an audiometric test. Those two values are then combined to determine the level of acoustic impairment.

Method

This chapter is going to present methods used in the two projects constituting the results in this article. It has to be stated, that the results from the pre-study clearly influenced the work in the research project as they were taken as the starting point for further and more thorough research.

Pre-Study Method

In a qualitative short study mobility barriers for the sight and hearing impaired have been addressed. On the basis of a literature research a survey guideline with several open questions to be used in structured expert interviews was developed. The interviews were restricted to Austria, but the results might still be transferable to other countries.

To get a comprehensive picture not only persons directly affected by a sight or hearing impairment were interviewed but also their representatives in associations or support groups as well as public authorities and responsible persons from transport companies (Table 2).

<i>Interview Partners</i>	<i>Count</i>
<i>Visually impaired Persons</i>	11
<i>Acoustically impaired Persons</i>	5
<i>Associations</i>	3
<i>Transport companies</i>	4
<i>Authorities</i>	2

Table 2: Persons interviewed

Furthermore dedicated threads were opened in internet-based discussion fora in order to reach also those affected persons who are not mobile (Table 3).

<i>List of discussion boards</i>	<i>URL</i>

Table 3: List of internet-fora

Table 4 shows the basic structure of the interviews which were slightly adapted according to the respective interview partner.

<i>Subjects</i>
<i>Estimation of the size of seeing and hearing impaired persons in the population</i>
<i>Mobility problems of the affected groups</i>
<i>How are problems detected?</i>
<i>Development of possible solutions</i>
<i>Ways of taking specific measures</i>

Table 4: Contents of the interviews

The interviews were transcribed and detailed lists of the detected problems of hearing and seeing impaired people with regard to their mobility were compiled. The possible solutions raised by interview partners were also included. During several project meetings categories were defined and the problems and solutions were classified accordingly.

Research Project Method

The research project started with a profound literature search and review on the topics "Sight impaired" and "Hearing impaired" in several databases shown in the table below.

Sight/visually impaired

<i>Database</i>	<i>Results Sight</i>	<i>Results Visually</i>
<i>ProQuest</i>	<i>377</i>	<i>4679</i>
<i>EBSCOHost</i>	<i>28</i>	<i>553</i>
<i>GoogleScholar</i>	<i>3020</i>	<i>46.600+</i>
<i>PubMed</i>	<i>9</i>	<i>1767</i>

Table 5: Results for Sight / visually impaired

Hearing/acoustically impaired

<i>Database</i>	<i>Results Hearing</i>	<i>Results acoustically</i>
<i>ProQuest</i>	<i>3772</i>	<i>0</i>
<i>WISO</i>	<i>13</i>	<i>0</i>
<i>GoogleScholar</i>	<i>70.200+</i>	<i>72</i>
<i>EBSCOHost</i>	<i>552</i>	<i>0</i>
<i>PubMed</i>	<i>5228</i>	<i>67</i>

Table 6: Results for Hearing / acoustically impaired

The results were then reduced to the articles with a relation to mobility of the respective user groups. Additionally the project partners were asked to contribute with their knowledge and resources to increase the size of the available data pool. This led to an extension of the search with additional topics such as “Hard of hearing” or “Persons with reduces mobility”.

The resulting convolute of articles, books and other papers was then classified according to their main topic. It was eventually possible to identify 4 main categories in which most of the material could be fitted into. These are shown in the table below.

<i>Article categories</i>
<i>Definitions</i>
<i>Policy making</i>
<i>Needs and Barriers</i>
<i>Solutions and Aides</i>

Table 7: Categories for literature review segmentation

Based on these four categories the existing barriers, needs and solutions were updated and a more elaborate listing of results was developed. In addition the main target group for the specific solutions were identified and added to the tables.

Results

The following tables show the results combined short study as well as the first results of the research project. To allow for easier understanding a segmentation into four areas was assigned. These are “stops and stations”, “vehicles”, “other/general mobility problems”, and “public awareness”.

Stops and stations

The following table depicts commonly occurring problems at stations and the surrounding area.

<i>Identified problem</i>	<i>Possible solution</i>	<i>Mainly for</i>
<i>Complex use of ticket machines</i>	<i>Possibility to increase the size of text.</i>	<i>Sight impaired</i>
	<i>Voice output on demand</i>	<i>Sight impaired</i>
<i>Readability of timetables</i>	<i>Timetables placed not too high – legibility has to be guaranteed (e.g. using reading aids, loupes, etc.)</i>	<i>Sight impaired</i>
	<i>Pre-printed timetables in large print</i>	<i>Sight impaired</i>
	<i>Decrease of distance between glass and timetable to allow reading with low vision aids</i>	<i>Sight impaired</i>

	<i>Use of antireflection glass for showcases</i>	<i>Sight impaired</i>
<i>Displays</i>	<i>Extended information on displays</i>	<i>Both groups</i>
	<i>Use of contrasting colours</i>	<i>Sight impaired</i>
	<i>Increase of font size</i>	<i>Sight impaired</i>
	<i>Decreased height of mounted displays to eye-level and increased accessibility</i>	<i>Sight impaired</i>
<i>Incomprehensible announcements at stations</i>	<i>Show announcement on displays and info-screens ("two-senses-principle")</i>	<i>Both groups</i>
	<i>Use of induction technology, especially at larger stations</i>	<i>Hearing impaired</i>
	<i>Information per SMS upon requests</i>	<i>Both groups</i>
	<i>Announcements available through MMS</i>	<i>Both groups</i>
	<i>Free hotline with tape-service for important information</i>	<i>Both groups</i>
	<i>Clear, slow and understandable tape-records and announcements</i>	<i>Both groups</i>
<i>Inadequate guiding systems</i>	<i>Installing additional guiding systems</i>	<i>Sight impaired</i>
	<i>Purpose-check of existing guiding systems by affected persons</i>	<i>Sight impaired</i>
	<i>Including affected in planning process</i>	<i>Both groups</i>
	<i>IT-based guiding systems (web-based, cellular)</i>	<i>Both groups</i>
<i>Multi vehicle stations</i>	<i>Clear splitting of station areas for different lines</i>	<i>Sight impaired</i>
	<i>Clearly visible display of the line arriving next</i>	<i>Both groups</i>
	<i>Announcements of approaching vehicle</i>	<i>Sight impaired</i>
<i>Station signposting</i>	<i>Bigger font sizes</i>	<i>Sight impaired</i>
	<i>Use of clearly visible markings, paying attention to contrasts, height and place</i>	<i>Sight impaired</i>
<i>Stations in rural areas</i>	<i>Safe footpaths</i>	<i>Both groups</i>
	<i>Speed-limitations for other traffic in the station area</i>	<i>Both groups</i>
	<i>Relocation of stations aside from main roads</i>	<i>Both groups</i>
<i>Specially trained staff</i>	<i>Especially at central stations more support personnel</i>	<i>Both groups</i>
<i>Entering and leaving vehicles</i>	<i>No traffic on lanes between vehicle and station while dis-/embarkation</i>	<i>Both groups</i>
<i>Information at stations</i>	<i>Continuous information through Bluetooth or IR</i>	<i>Both groups</i>
	<i>Downloadable web-based route-planning and on-trip use</i>	<i>Both groups</i>
<i>Elevators at stations</i>	<i>Emergency-button for hearing impaired persons</i>	<i>Hearing impaired</i>
	<i>Acoustic information</i>	<i>Both groups</i>

Table 8: Problem identification and possible solutions for the stops and station area

As one of the main problematic factors the missing or misleading guidance systems could be identified. Especially sight impaired often exhibit problems with missing contrast levels of floor bound systems. Hearing impaired on the other hand often reported problems when using elevators or service hotlines with

missing or no visual output, so that they were not able to identify the problem in a case of emergencies. Further areas with regular problems were (overhead) signposts that were illegible or acoustic announcements at stations which were identified merely as background noise.

Vehicles

The means of transport as the second most important factor in public transport pose the following problems to sight and hearing impaired.

<i>Identified problem</i>	<i>Possible solution</i>	<i>Mainly for ...</i>
<i>Use of ticket machines on vehicles</i>	<i>Voice output on demand</i>	<i>Sight impaired</i>
	<i>Bigger font size</i>	<i>Sight impaired</i>
<i>Legibility of network plans</i>	<i>Plans at eye-level, focus on legibility</i>	<i>Sight impaired</i>
	<i>Driver has plans in large print</i>	<i>Sight impaired</i>
	<i>Network plans in large print available</i>	<i>Sight impaired</i>
<i>Displays on vehicles</i>	<i>Show announcements on displays ("two-senses-principle")</i>	<i>Both groups</i>
	<i>Check used colours with the affected</i>	<i>Sight impaired</i>
	<i>Font size easily readable</i>	<i>Sight impaired</i>
<i>Quality of announcements</i>	<i>Optical display of announcements</i>	<i>Both groups</i>
	<i>Use of induction-technology</i>	<i>Hearing impaired</i>
	<i>On-demand information about next station (Bluetooth)</i>	<i>Both groups</i>
	<i>SMS- or MMS-queries</i>	<i>Both groups</i>
	<i>Free hotline with tape-service for important information</i>	<i>Both groups</i>
	<i>Take employees for test drives to let them perceive the comprehensibility and quality of announcements</i>	<i>Both groups</i>
	<i>Pronunciation, clarity and speed of announcements and tape-records</i>	<i>Both groups</i>
<i>Automating</i>	<i>Mobility training for affected supported by transport companies</i>	<i>Both groups</i>
<i>Distance vehicle – pavement</i>	<i>Drivers to stop close to pavement</i>	<i>Sight impaired</i>
	<i>Use of low-floor-vehicles</i>	<i>Both groups</i>
<i>Information in the vehicle</i>	<i>Device to be informed about the route, the next stop etc. Upon request</i>	<i>Both groups</i>
	<i>On-demand general information via bluetooth</i>	<i>Both groups</i>
	<i>Downloadable web-based route-planning and on-trip use</i>	<i>Both groups</i>
<i>Doors</i>	<i>Large tactile door opening buttons</i>	<i>Sight impaired</i>

Table 9: Problem identification and possible solutions for vehicles

For sight impaired passengers the size of the network plans as well as the positioning within the vehicle was reported as a main problem. As with the rocking of the vehicle it gets increasingly hard to keep track of

the correct column or line small font sizes and the inability to approach the plans and displays prevents sight impaired from using most of them.

The quality of spoken announcements as well as the missing of the former was commonly criticised by hearing impaired persons. In addition the incomprehensibility in combination with fast speech and missing signal tones to increase the awareness of the passengers was pointed out. Badly comprehensible announcements were also a topic for the sight impaired, as they often have to rely on the announced station name as they are unable to read the displayed textual information.

General mobility problems

Table 10 shows the more general mobility problems sight or hearing impaired are facing while travelling from or to home or their destination.

<i>Identified problem</i>	<i>Possible solution</i>	<i>Mainly for ...</i>
<i>Information about transport on the internet</i>	<i>Possibility to increase the size of fonts and inverted colours</i>	<i>Sight impaired</i>
	<i>On-demand voice output of site</i>	<i>Sight impaired</i>
<i>Road signs as barriers</i>	<i>Place on gantries</i>	<i>Sight impaired</i>
	<i>Use of max. permiss. height (2.2 m)</i>	<i>Sight impaired</i>
	<i>Use of protective coatings</i>	<i>Sight impaired</i>
<i>Bollards, hydrants, advertising pillars, green spaces, cordons</i>	<i>Use signal colours</i>	<i>Sight impaired</i>
	<i>Double cordons with connecting elements</i>	<i>Sight impaired</i>
	<i>Replace by fixed railing</i>	<i>Sight impaired</i>
<i>Construction site security</i>	<i>At least to crossbars</i>	<i>Sight impaired</i>
	<i>Signal colours for scaffoldings</i>	<i>Sight impaired</i>
	<i>Solid barriers at building pits</i>	<i>Sight impaired</i>
	<i>Barriers with construction fences</i>	<i>Sight impaired</i>
<i>Weather conditions</i>	<i>Stricter regulations for snow removal and gritting</i>	<i>Both groups</i>
	<i>Fixed cordons when danger of roof avalanches</i>	<i>Both groups</i>
	<i>Tree and bush cutting</i>	<i>Both groups</i>
<i>Railroad crossings without gates</i>	<i>Installation of gates</i>	<i>Both groups</i>
	<i>Tactile floor markings</i>	<i>Sight impaired</i>
	<i>Flashlights in the floor before train arrives</i>	<i>Both groups</i>
	<i>Tow away parked vehicles</i>	<i>Sight impaired</i>
	<i>Restaurant menu tables on the wall, restaurant tables not on the pavement</i>	<i>Sight impaired</i>
<i>Other obstacles on pavement</i>	<i>No placards/advertisements covering signs</i>	<i>Sight impaired</i>
	<i>Removal of different levels, gaps</i>	<i>Both groups</i>
	<i>Tactile and optically contrasted markings</i>	<i>Sight impaired</i>
<i>Cycle tracks</i>	<i>Involvement of seeing and hearing impaired people</i>	<i>Both groups</i>

<i>Identified problem</i>	<i>Possible solution</i>	<i>Mainly for ...</i>
	<i>Distinct separation by advertisements or similar</i>	<i>Sight impaired</i>
<i>Architecture</i>	<i>Easily visible handrails</i>	<i>Sight impaired</i>
<i>Glass walls</i>	<i>Use of non-transparent glass</i>	<i>Sight impaired</i>
	<i>Use of safety glass</i>	<i>Sight impaired</i>

Table 10: Identification and possible solutions for general mobility problems

As the most hindering factor for the mobility of sight impaired when going to or from the station badly placed security measures for construction sites as well as street side based obstacles such as bollards, hydrants or advertising pillars with low contrasts to the surrounding floor were reported. Furthermore signs at head height pose a severe injury risk.

With the increasing implementation of cycling lanes alongside sidewalks an additional safety risk for sight impaired is created if the respective lane is not separated with clear signs and the cyclists do not show the adequate behaviour.

Especially in rural areas railroad crossings without gates and no optical signalling systems were identified as potential risks. Further many stations in these areas show badly placed signposts, missing plans or no support for impaired passengers at all.

Public awareness

For sight or hearing impaired potential passengers the general lack of awareness as well as the insufficient training of staff is one of the most fundamental sources of mobility restrictions. In addition planners and architects without specific knowledge are often unaware of the impacts their, often highly praised, designs have on the mobility of the two groups.

<i>Identified problem</i>	<i>Possible solution</i>	<i>Mainly for ...</i>
<i>Inadequate training of staff and planners</i>	<i>Special courses focusing on different disabilities and impairments for architects, planners, drivers and other staff of transport companies</i>	<i>Both groups</i>
	<i>Lobbying by associations</i>	<i>Both groups</i>
	<i>Brochures, information material</i>	<i>Both groups</i>
<i>Unawareness of specific problems</i>	<i>Improve publicity of related information platforms</i>	<i>Both groups</i>
<i>Research & Development</i>	<i>Include affected people in research & development</i>	<i>Both groups</i>
<i>Lack of awareness and empathy</i>	<i>Information campaigns</i>	<i>Both groups</i>
	<i>Special events like "Dialog im Dunkeln"</i>	<i>Both groups</i>

Table 11: Problem identification and possible solutions within the field of public awareness

As most current planners have never had the possibility to learn about the specific needs of sight or hearing impaired persons it would be highly indicated to include the respective persons and their representatives in projects currently being developed to allow for a direct exchange between the groups.

Furthermore specific courses at universities and other high-level educational institutions should be developed and offered to all stakeholders in the public transport sector to allow for a boarder dissemination of the existing knowledge.

Conclusions and implications for further research

As can be seen in the above tables, there is a large amount of barriers to sight or hearing impaired passengers in public transport services. These barriers range from the stations and vehicles of public transport service providers to the doorsteps of the impaired to the minds of staff and planers. While the physical barriers are the most visible, the mental ones are the most persistent and hardest to combat. However most of these can be solved or at least reduced with little to no effort and are therefore easy to eliminate for service providers.

Further a reduction or even elimination of these barriers would not only benefit the sight or hearing impaired but also most other passengers of public transport services as the general navigation is eased and the quality of the system overall is increased.

It has to be clearly stated, that without the cooperation of persons concerned, transport service providers, technology as well as infrastructure and transport means providers there will be no real possibility to find cost efficient and easy-to-implement solutions for both sides. Therefore it is highly indicated, that further research in the field of solution development for sight of hearing impaired passengers in public transport is conducted.

What was also made obvious during the current research project was the missing information on the general needs of sight and hearing impaired as well as the sizes those two groups. Most current data is based on self-assessment or self-rating and can therefore hardly be judged as reliable. There is hardly any scientific evidence available that would quantify the groups based on reliable definitions.

**COMMITMENT AND IDENTITY: AN EXPLORATION INTO THE INTEGRATIVE, INTERACTIVE
AND EMERGENT NATURE OF COMMUNITY
POLICY MAKING AND IMPLEMENTATION**

Gadman, Leslie¹; Salajczyk, Agnieszka¹; Williams, Roger¹

¹Faculty of Business, London South Bank University

Abstract

Social networking is changing the world of international government, finance and business. Amongst other things members of social networks are demanding greater transparency in corporate and government institutions. Research shows that there is a change in the balance of power in decision making and this in turn is leading to more innovative and sustainable solutions. Community led (bottom – up) innovation projects using social networking technology are emerging as a leading source of creative power engaging the wisdom of crowds as opposed to the single - mindedness of policy makers. Research shows that transparency, shared commitment, empathy and trust play an essential role in their success. Consequently, for community led networks to be effective, their members must be competent in building and maintaining excellent inter; intra; and extra - personal relationships. Analysing data from multiple sources participating in the European Commission's "Digital Agenda 2020" programme, the paper concludes that the success of this and programmes like it will depend on the desire of members to acquire history - making identities by maintaining identity defining commitments across the network. Implications for theory and research are discussed.

Key words: Knowledge economy; innovation diffusion; trust and commitment.

Introduction

Community led social networks are driving changes in policymaking that are invalidating existing practices. With over 1 billion people online worldwide, community led social networks are a force of unprecedented power and for the first time in human history, mass cooperation across space and time is happening. Whether engaged in business, government, finance or philanthropy, community led social networks are gaining increasing popularity yet their success requires specific competences related to the ability to satisfy deep concerns with commitments that matter (Gadman and Cooper, 2009). Research has shown that individuals participating in community led social networks have distinct ideas about personal and collective identity (Callon, 1980; Van de Ven 1986) and this can lead to disagreement which can impede the transformation process (Dougherty, 1992). While it has been shown that some amount of disagreement is useful for producing more innovative solutions (Amabile, 1996), the evidence suggests that insurmountable disagreements result in delays, suboptimal compromises and most often, failure to ever build a sustainable community. According to Gadman (1996) an effective balance between positive and negative disruption is established when actors gain trustworthy identities by maintaining identity defining commitments across

the community network. Advances in neuroscience have linked commitment and identity to oxytocin, a single neuropeptide which, amongst other things helps generate empathy, generosity and trust. However, oxytocin has a very short shelf life and as a consequence the quality of social interactions cannot be taken for granted and require constant attention. Evidence suggests (Gadman and Cooper, 2009) that high quality community networks produce synergistic results when concerns are addressed through committed action. For example, in business “crowdsourcing” (Howe, 2006) has been shown to inject fresh ideas into traditional manufacturing processes, speed up production cycles and cut costs by gathering ideas from sources outside of their immediate employee community. This cannot happen without a clear understanding of the drivers of concerns at various levels in the business and the committed action of individuals to address those concerns.

Commitment and Trust in Social Networks

Recent studies suggest that social networks engender trust and the more they are used, the greater the levels of trust they generate. According to Zak (2011), trust goes to the heart of our economic and social systems and is essential for successful economic transactions and that nations with higher levels of trust enjoy stronger economies than those on the other end of the spectrum. This link between trust and prosperity explains the difficulties encountered by New Member States and Accession Countries as they seek to adjust to privatisation in the European Union? Research shows that the systematic corruption which led to the fast acquired personal wealth following privatisation in Russia still exists in these New Member States and Accession Countries. For these fledgling communities, notions of transparency and freedom of information are anathema to the self – interests of business oligarchs whose powerbases are made up of relatives or close associates of government officials, even government officials themselves, not to mention criminal bosses.

Even in such corrupt communities, Gadman (1996) argues that trust and commitment remain essential to their sustained success because they form a tightly controlled community even if motivated by fear and greed. So whether for good or evil, commitment to alleviate concerns plays an essential role in determining the outcomes of purposeful relationships (Abrahamsson and Livari, 2002). Gadman and Cooper (2009) suggest that it takes a special type of leader to build and maintain commitment based communities. (Savage 1996, Gadman 1996, Adams 2004). Long before social networking technology existed, Heidegger (1962[1927]) reminded us that: “We are naturally world disclosers and by means of tools, technology and coordination we awaken coherent spaces or worlds which make possible a distinct and pervasive way in which things, people and selves appear and in which certain ways of acting make sense” (p.17). Much emphasis today is placed on social networking technology but much less is known about the community based networks they enable, especially why some succeed where others fail. Gadman and Cooper (2009) believe this is because ICT is only one component in a complex web of human and technological dynamics which have at their centre the need for trust (Ridderstrale and Nordstrom 2004, Flores, 1998). Like other social networks, community based networks are webs of relationships that generate material or social value

through complex dynamic exchanges of both tangible and intangible goods, services and benefits. They challenge existing theories of transaction cost economics, which regard organisations as efficient contractual instruments (Coase, 1937; Williamson, 1985) by demonstrating that efficient contracting depends upon effective cooperation, without which successful competition would not be impossible. While dinosaurs like Alan Sugar still operate within the “your fired” paradigm, it is clear that the values underpinning that paradigm are inconsistent with those required to run new internet based models of collaboration and cooperation seen in successful social networks. At their core, community led social networks are characterised by values of transparency, shared commitment, empathy and trust. Research show that when these values are skilfully enacted, they lead to the free flow of information and the generation of knowledge across an ever widening and inclusive landscape of participants. The purposes and principles behind community networks are more consistent with theories of knowledge transformation (Nonaka and Takauchi, 1995) in that they comprise of individuals capable of self - organising to a point where there is no breakdown in the cost and quality of the contract. They do this through orchestrating the “speech acts” (Austin, 1962; Searle, 1975) which make up network of commitments (Winograd and Flores, 1987). These commitments drive and coordinate action among the members of the network. These examples suggest a more synergistic relationship between transaction cost (Coase 1937) reasons to organise and those based on commitment and knowledge (Conner and Prahalad 1996) in that both offer some economic advantage to members. Conner and Prahalad (1996:478) go so far as to say that the primary contribution of the knowledge – based view is to round out transaction cost theory by recognising knowledge based transaction costs. Unfortunately, because the organisational models supporting this approach tend to be highly nuanced and pluralistic (Hock 1999, von Hippel 2002) many community led initiatives fail because their members fear loss of identity and control and consequently fail to take advantage of the power which comes from well coordinated and committed networks of people.

In considering the challenges associated with knowledge disclosure, diffusion and utilisation (Spinosa, Flores and Dreyfus 2001) across community led networks, the paper shows that while their popularity continues to grow, the diffusion and manifestation of innovation becomes more challenging when increasing levels of personal and financial commitment are required (Mauer, Rai and Sali, 2004). This paper concludes that the success of community based social networks depends on the desire of participants and the organisations they represent, to be authentic (Heidegger, 1962) by maintaining identity defining commitments across the network (Gauntlett 2002, Spinosa et al., 1997). This holds significant implications for theory and future research.

Commitment and Identity

The paper explains why and under what circumstances people in community based social networks become committed and how this leads to identity creation. One view is that people identify with the organisation of which they and the recipients are a part (Kogut and Zander 1996). Such identity when linked to shared values, beliefs and assumptions might be considered a cultural identity (Schein 1992, Laine –

Sveiby 1991) or disclosive space (Spinosa, Flores and Dreyfus, 2001) and might also be reflected in such things as shared coding schemes (Hansen; Nohria; Tierney 1999), language and cognitive schema (Winograd and Flores 1997), the convention and rules by which people coordinate their behaviour and decision making (McKinney and Gerloff 2004) shared moral values and convergent expectations (Flores 1993). In other words it reflects committed participation in a shared cultural identity (Weeks and Galunic 2003).

According to Spinosa, Flores and Dreyfus (*ibid*), core assumptions behind community based networks is that stakeholders participate by converting what they know, both individually and collectively, into tangible and intangible value that they offer to the network to satisfy deep collective concerns. Stakeholders accrue value by engaging their natural potential as they realise new worlds of possibility in the new disclosive space. A natural consequence of this awakened reality is the establishment of an identity as someone who makes life worth living for themselves and those around them. Successful community based social networks are made up of people with this motivation.

March and Cyert (1963) recognised that firms are not monolithic profit – maximising entities but rather complex and structured systems whose overall behavior is affected by decisions made sequentially and independently by their members (Cyert and March 1963; Cohen, March and Olsen 1972; March and Olsen 1972). Consequently, it is possible to conclude that organisations are comprised of autonomous individuals who utilise possibly different methodologies to achieve some level of performance (Malone and Smith 1988). Differences create pressures for isomorphic adaptation and emphasise the need for legitimacy (DiMaggio & Powell 1983). At the organisational level, institutional theory posits that legitimacy is a key success factor for organisations, defining legitimacy as acceptance of the organisation by its environment (Meyer & Rowan, 1977). Consequently, legitimacy is gained by adopting positioning strategies which indicate conformance to the essential characteristics of the institutional environment. It is also the means by which organisations and their constituents define their identities and in so doing favourably shape their environment for their own ends (Gauntlett, 2002). In order to explore the ways individuals maintain legitimacy while forming their identity in community based networks, it is necessary to understand what kind of practices they perform such that they produce personal and network identities that matter. According to Flores and Spinosa (1998), people are considered history making or entrepreneurial (Spinosa, *et al.*, 1997), when they involve two interrelated activities: interpreting which actions are appropriate given their intense concerns and positioning their actions so that they are accepted by those who matter. Developing such an identity engages listening which ultimately influences others to adopt a point of view more closely aligned with that of the influencer and to take on new practices which change the way the world appears to people. This history making capability requires a keen awareness of intense personal commitment and the skilful expression of that commitment in action in some domain of interaction. Heidegger's (1962 [1937], pp. 352-8; 434-44) emphasis on shared public spaces offers such a domain and an opportunity to explore community based networks like ERISA, to examine the positioning strategies of their members and the public and personal identities they create.

Identity Building, the Internet and Architectures of Participation

According to Adams (2004) the internet is revolutionary not because of the great search engines and enormous library of interconnected information but because it's two - way communications technology allows large numbers of people to interact with each other. While some interactions such as those on Facebook and Twitter might be considered trivial, many more are purposefully designed to satisfy the concerns of large communities. The quality of these interactions is measured by the strength of the commitments generated as one person or group promises to deliver results to another person or group in such a way that ultimately there can be agreement that the promise was met and the need satisfied (Winograd and Flores 1987; Flores and Spinoza 1998)). In other words, commitment structures deliver value because they are held together by the strength of the collective promises and actions of their members and identity built on the extent to which a person's word is their bond. For example, they commit to be reliable and they adopt positioning strategies like letting others know what's going on. Alerting them if problems arise and offering counter - proposals designed to resolve the problem to another's satisfaction. They use the internet to build legitimacy through core commitment structures based on trust (Winograd and Flores 1987). Table 1 describes six aspects common to all commitments.

Depending on the focus of commitment and the circumstances, an actor may be committed to a community network in different ways. According to Von Hippel (2001), they may feel its benefits (affective component). They may have an emotional and rational investment in the project which drives their continued participation (durability component). Finally, the community may be bonded by the strength of the collective promises of its members (normative component). Most researchers agree that it is the affective component which is the most desirable (Meyer and Allen 1997; Gadman and Cooper, 2009) because it is that aspect which enables bonding at each level of commitment.

Table 1. Six Aspects of Commitment

<i>Aspect of Commitment</i>	<i>Description</i>
<i>Focus</i>	<i>Defines the target of one's commitment. This target can be an organisation, project, community, etc.</i>
<i>Strength</i>	<i>Defines how deeply an actor or group is attached to an entity. An actor is more or less committed than simply being committed or not.</i>
<i>Conditions</i>	<i>Define what has to be done in order to fulfil the requirements of the commitment. E.g. explicit requests outlining conditions of satisfaction.</i>
<i>Durability</i>	<i>Depending on the commitment target, the durability of the personal contract varies. E.g. commitment to career may last a lifetime while commitment to a project is shorter term.</i>
<i>Essential Forms</i>	<i>At least three forms of commitment exist: Affective, normative and compliant. These form a composite which changes over time. Because they engender attachment they are regarded as the essence of commitment.</i>
<i>Levels</i>	<i>The unit of analysis in commitment studies. 1) Individual commitment 2) group or team 3) organisation. Each can have a commitment towards an entity</i>

This paper shows that successful community based networks are made up of conversation generated commitment structures that bond members to each another. This rich network of commitments delivers value by addressing the deep concerns of community members and ultimately the beneficiaries of their work. The essential purpose of community based networks is integrative interaction producing results greater than the sum of individual actions (Richardson 2004). Because people make up community based networks the currency of commitment is the making of requests which are met with promises that are kept. This suggests that richly synergistic communities are like magnets attracting people who enjoy this affective component of commitment. Especially when it enables them to “show up in the world” and in so doing, make a difference “in the world” that makes a difference such that the world is not the same as a result of their actions. Ironically, in the ERISA programme this quality appears present at every level in the community except the executive level. Even with these exceptions, a small dedicated group work diligently to address the concerns of the community and are beginning to established an identity for both themselves and ERISA as a potential history making event (Richardson 2004, Olson 1965). According to this community - collective model (von Hippel and von Krogh 2003) newcomers share with existing members and derive benefits from revealing their ideas (Callhoun 1986; Taylor & Singleton 1993). This is possible because their ideas can be reviewed and commented upon by others and in terms of learning benefits, the group's feedback can be direct and specific to the newcomer. Such architectures of participation (Raymond, 1999) include low barriers to entry by newcomers and some mechanism for balancing the need for control with the need for improvisational innovation. This architecture of participation allows for a free market of ideas in which anyone can put forward proposed solutions to problems; it becomes adopted, if at all, by acclamation and the organic spread of its usefulness. Ultimately, the reward for such rich networking is the ability to progress toward levels of knowledge and discovery beyond those achieved by conventional means

especially awareness of one's own identity through core commitment revelation. Research on the core commitment structures of community based networks has not been well established, let alone compared to those of traditional communities and the overall lack of a theory of suggests a qualitative grounded approach to develop analytical categories and propositions (Glaser & Strauss 1967; Meyer, 1997; Strauss & Corbin 1990).

The theory development in this paper is based on the European Region Information Society (ERISA) an association of European regions seeking to accelerate the impact of ICT on the quality of life of citizens, business profitability and government processes. The paper is organised as follows; firstly it provides a review the research method employed in the study. It then provides a history of ERISA related development data. It then proceeds to theory induction by an analysis of contributing behaviour exhibited by members of the ERISA community. The paper concludes by discussing implications of the study for theory and research.

Research Method

This section describes the research method employed in the study. It proceeded in three phases: Sampling of the case, data gathering, and data analysis. One case was selected in order to increase the depth of the analysis, acquire and report experience with the gathering of new and unfamiliar data (Numagami 1998). ERISA was sampled because it was hoped that it would reveal areas as yet undiscovered in current research into identity creation in community based networks. ERISA also offered an ideal sample because it was in the initial stages of enabling each member region to move from policy to practice in the key areas of government, infrastructure, health, inclusion, education and business. As is common with such grand schemes, these noble intentions are rarely followed by committed action and as such offer a rich source of data into the challenges of moving from policy into practice. The data in this paper covers the second phase of the European Broadband Portal (EBP11), a key ERISA programme which commenced in January 2011 and is due to run until December 2012. The research studies events occurring during its critical launch phase, especially the challenges of transforming policy into practice. Data were gathered from a number of different sources and occurred between April and October, 2011. The analysis was inspired by the writings of Winograd, Flores and Spinosa (Winograd and Flores 1987) on commitment based networking and its relationship to the Gadman and Cooper (2009) concept of Open Source Leadership. Leadership and membership of these networks requires a description and explanation of commitment characteristics and their relationships, which together describe the process of developing commitment in a community based network. The characteristics, relationships and actors performing them are identified and described in this section on the basis of the analysis. Flores draws on the works by Heidegger (1962 (1937)), Kierkegaard (1985) and Hegel (1979) but rather than giving any detailed description of the philosophical underpinnings of their writings, the intent here is to further elaborate the interpretation of Flores (1993) and Gadman and Cooper (2009) as it relates to understanding the dynamics of leadership, commitment and its operation in community based networks. Winograd and Flores (1987) have opened the discipline of tracking, mapping, and combining commitments based on the constituting power of human speech. In their writings on

computers and cognition, they have stated that there is a general structure for forming commitments for actions to satisfy concerns. Concern, to them, is an ongoing generalisation of need. Through the focus on concerns and commitments, new views of the world emerge. One of these views is “the identification of the new institutions arising alongside old ones”. This is explained as follows: “Mapping social institutions in terms of their concern and commitment structure tells us what is genuinely new and what is a new way to accomplish old goals” (Flores & Spinoso 1998, p. 357). In this paper the social institution to be mapped is the ERISA European Broadband Portal (EBP11) community as it takes on a radically new approach to Broadband infrastructure development across Europe. If this is accepted, EBP11 can be seen as a new institution arising alongside more traditional ones and possibly a genuinely new way to achieve sustained results. “If we are to evaluate whether a change has occurred, we have to look at the changes in concerns and commitments, *i.e.*, the changes taking place in the respective actors’ commitment networks. Once we become familiar with the way commitments drive action, we no longer believe that we have to understand in advance all component parts of whatever social action we seek. Rather, we see that we must identify concerns and begin forming commitments to address them. Open Source Leadership (Gadman and Cooper, 209) is the basic organising skill that forms and manages commitments to deal with concerns. On the basis of one commitment, many others can be grown” (Flores & Spinoso 1998, p. 357). Data were gathered from seminars, workshops, round tables and a series of interactive conferences (I – Conferences) with secondary sources coming from documents on the European Broadband Portal (e.g. original concept papers, WIKIs, magazine articles, news features and links to other projects attempting similar challenges.

ERISA History and Development Characteristics.

This section provides a brief history of The European Regional Information Society Association (ERISA), its wider context, objectives and an overall characterisation of the development process. ERISA was awarded the service contract for the creation, animation and maintenance of the second phase of The European Broadband Portal (EBP11) by the European Commission. The development of the European Broadband Portal was initiated by the European Commission (DG Information Society & Media) following an open Call for Tender for the supply of a “Web Portal for Exchange of Good Practice for Broadband Deployment”. The project commenced in January 2008 and lasted for a period of 30 months. Following a review and approval this second phase commenced in January 2011 and runs until December 2012.

The EBP11 programme seeks to put in place a coherent on - line community of relevant stakeholders, providing them with the tools for effective sharing of experiences and good practices and a participatory environment for seeking common and shared solutions. Their aims are as follows:

- Stimulate the exchange of best practices and the sharing of experiences;
- Utilise the broadband blueprints to deliver the practical solutions that change people’s lives
- Facilitate demand aggregation and joint procurement;

- Act as a central information platform, publishing calls for tender, expressions of interest, awards and other notices;
- Become in this way a virtual meeting point between community broadband champions, suppliers and rural, urban, municipality, regional and national governments;
- Permit sparsely populated areas to coordinate their demands for broadband, establishing a critical mass for technological solutions, next generation access and such as satellite, that provide large coverage.

The EBPII blueprints are designed to “bridge the gap” from policy to practice, to bring solutions to life, to make a vision a reality and to contribute directly to the “Digital Agenda”(Europe 2020: A strategy for smart, sustainable and inclusive growth).

Theory Induction

In this section, propositions are developed towards a theory of core commitment structures in community based social networks engaged in the process of innovation. Through the application of commitment based community networking, the propositions are grounded in documented strategies of people diffusing innovative ideas through synergistic community action. According to Abrahamsson (2002) the key concepts constituting the basis of such networks are actors, drivers, concerns, actions and outcomes. In this paper, three levels of actors were considered: individual, group and organisation (Hage, 1980; Curtis *et al.* 1988). With the exception of the executive level, changes at ERISA (EBPII) happened at each of these levels in a way that appeared to increase performance across the whole network. The leadership action primarily took place at the organising level where maintaining uniqueness and direction was critical in effecting a balance between ethical / moral, relational, inspirational and institutional capital. Here questions such as “do we have the right people to support the innovative process?” and “can we clearly define the economic, environmental and social benefit?” were asked and answered. Each operating level was defined and mapped against phases such as developing the commercial model and financial plans and their supporting technical architecture and engaging stakeholders to work in joint collaboration with ERISA. These operational stakeholders represented a range of concerns e.g. local and regional authorities were concerned about access to broadband in their territory. While national authorities were concerned about implementing national broadband strategies. Community and other groups were concerned about lack of access to affordable broadband. Industry players and associations were concerned about their engagement in successful public private partnerships. National and European policy makers were concerned about access to ICT and its impacts at local and regional levels. So with these concerns, it was possible to understand the drivers of commitment.

Commitment Drivers

Research in other disciplines (e.g., Sabherwal & Elam 1995, Meyer & Allen 1997) has shown that the development of commitment is influenced by various drivers. The drivers identified in organisational behavioral literature were mapped to the proposed four categories. Project drivers reflect the objective features of the EBP11 project, such as costs and benefits. They indicate reasons for EBP11 to exist. Psychological drivers involve key individuals in the project, reflecting properties such as the need for identity as an achiever, past historical success, *etc.* Social drivers originate from a group rather than an individual. These drivers are, e.g. power and politics, or public identification with the EBP11 project. Finally, structural drivers represent the contextual conditions surrounding the project: the environment for EBP11 activities. A potential driver is anything affecting the commitment of the actors and can occur in the macro and micro environment as well as within the organisation, group or team.

Concern and action

The research sought out evidence of the strength of a person's commitment by observing patterns and frequency of activity directed at addressing concerns. For example, in ERISA high levels of commitment were evidenced by a small number of people at the concept and design stages while those at executive level appeared more interested in posturing and rhetoric than actually causing anything of any significance to happen. The concepts of concern and action together constitute commitment however, action by itself does not bring about commitment but might be interpreted as a sign. This is consistent with the views expressed by the behavioral school of commitment research which emphasises the role of action as commitment target. "[...] commitment targets should be actions rather than objects, as it is virtually impossible to describe commitment in any terms other than one's inclination to act in a given way towards a particular commitment target" (Oliver 1990, p. 30). Consequently, the research sought out evidence of the strength of a person's commitment by observing patterns and frequency of activity directed at addressing concerns. For example, in the EBP11 project much of the early conversation took place among highly committed team leaders who, unlike the senior executives who played a major part (at the improving and integrating levels) in setting up the initial communications infrastructure. One shortcoming of the research was an inability to say for sure exactly what the deep psychological drivers were and how they were directed toward meeting the overarching concerns of the project. Consequently, while it was not possible to accurately gauge the level of commitment held by the Senior Executives of ERISA, their patterns of actions make levels of commitment to EBP11 difficult to assess.

Outcomes

Only actions produce outcomes and outcomes bear relevance in this research since it has been shown that it is on the basis of outcomes that future actions are planned (Newman & Sabherwal 1996). In EBP11 unintended outcomes took the form of dissatisfaction with across national and regional boundaries, which subsequently lead to difficulties in co - operation between different groups. Unintended outcomes were also

positive. For example, accidental discoveries cleared the way for new EBP11 activities (that were initially not intended). Intended outcomes reflected the fact that the EBP11 project looks highly likely to have achieved the goals set for it despite poor executive leadership.

Conclusions and Implications

The purpose of this paper was to apply a commitment based analytical model (Abrahamsson, 2002) to the ERISA EBP11 programme to understand the motivations and strategies supporting the desire of its actors to engage in the development of a Broadband Infrastructure across Europe. The research suggests that commitment based community networks are primarily concerned with the effective diffusion of innovative ideas. The study shows that in order to shift the concerns of a culture, community network leaders must clearly articulate and gain buy in to the challenge to be addressed. They must create and maintain clear focus and develop a shared sense of commitment among participants. The research reveals a complex interaction between the commitment drivers and the successful outcomes of the project especially the unfolding and alteration of commitments in time and through time at the improving, operating and integrating levels as circumstances change. In particular, it shows how over time the objective features of ERISA EBP11 in terms of cost and benefits diminish as obstacles are encountered and psychological and social drivers play a greater part. Indeed it is possible to say that ERISA EBP11 could potentially fail over time if attention is not paid to such changes in the concerns of its network of commitments.

The study has implications for research into the impact of community based networking strategies on strategic management. Firstly, it is important to recall that much strategic planning in business is preoccupied by public reputation, i.e. what the public recognises as important about the institution and its tradition. Did Steve Jobs create an entire organisation that shared his balance of concerns - for the back - end yes, but for usability first and foremost? The new focus on strategy in both business review articles and in boardrooms reveals the confusions and difficulties corporations are having over determining their self - image (Porter 1980, Prahalad and Hamel 1990). In taking the position that personal and corporate identity is neither wholly the result of total commitment (Gergen 1991) nor wholly the result of recognition - based identity (Hegel (1979), the implications require a deeper consideration of the challenges surrounding collaborative community models especially those based on the Web (Wilde and Hax 2001).

Secondly, by suggesting that personal and community identity are outcomes of the well positioned enactment of a compelling concern to make something better than it was before, how do business leaders develop successful positioning strategies such that their committed actions result in the emergence of a new world alongside the old? Thirdly, empowerment of individuals is a key part of what makes community networks successful, since in the end innovations tend to come from small groups, not from large, structured efforts. The study shows that community based networks don't rely on containment or tight control of the environment to maintain their position, but rather, an exquisite balance and ability to respond to rapidly changing conditions. This kind of responsiveness is hard for a large network to achieve, but not impossible,

especially in the presence of the kind of competition that virtual networking brings. Finally, the Internet is a community based network's greatest asset, making massive decentralised projects possible. On the other hand, intellectual property is its nemesis and has the potential to stifle and restrict the creative capacity of free - thinking scholars, programmers, scientists, designers and engineers. There is increasing evidence to suggest that a philosophy, a strategy and a technology have aligned to unleash great innovation. The internet is simple, yet its power is profound. The power to bring people together in committed conversations that produce outcomes far greater than the sum of the individual parts. The distribution of knowledge is the key contemporary task and if knowledge empowers people, are contemporary systems ready for the disruptive influence of 'openness'?

Abstract

The specific objective of this work is to analyze how public agricultural resources are allocated to the young Tuscan vigneron (between 18 and 40 years old) and if their distribution creates “leverage” effect on the principal financial values. Taking into account the economic face of sustainability, we must concentrate our attention on the long-term economics of the young farmers on the basis of their recent financial performance. The results are obtained by the sum of total expenditure (I and II pillar of CAP and CMO wine sector) from 2005 to 2009, crossed with the financial values: principal items of revenues and the costs. Then was calculated the profitability and its impact on revenues, without the weight of public support and the support. This research was triggered by a combination of factors: Public Support, Financial Value and Public Choice theory (PEST and PERT policies). From the first results seems that the public support has balanced only in part (5.8%) the lack of profitability of young winemaker. Thus income as not changed the lose in the gross profit margin GPM, but it only covers some of the cost sustained. If there was no support the effects would have been more dramatic, especially for the future of vigneron.

The research can be a helpful instrument to evaluate if the political objectives of the policy makers are coherent with the actual agricultural public support between the research data or if exists a conflict efficiency and effectiveness of agricultural spending.

Keywords: young winemakers, wine support, CMO, Italy

Introduction

The impact of the effect of public support especially in the crisis period, can be relevant for agriculture development and farm competitiveness. The theme of public intervention on market failure can be discussed under different aspects. Taking into account the economic and policy face, the attention of these studies are concentrates on the long-term economics of the vigneron on the basis of their recent financial performance (Gomez et al., 2009). The aim is to contribute to the analysis of agricultural policies, in particular of the Common Agriculture policy CAP, trough expenditure. It is an exercise that is central to economic policy analysis since the majority of policies are implemented through the expenditure. And the analysis of the

expenditure, actually, provides a great opportunity for researchers and policy evaluators at all stages of the evaluation process. The research has chosen to study young farmers because without doubt their future will effect the primary sector and analyze how public resources are allocated among them. The scenario of Italian agriculture is characterised by great changes and challenges, however only 6% of Italian agriculture enterprises are managed by young farmers³³. It is a relevant argument because agriculture is amongst the sectors driven by the socio economic system and the Common Agricultural Policies (CAP) is the second highest expense for the EU. Farm subsidies and their widespread implications have played an important role in the structure of the CAP. The Common Policies regulation has undergone many changes over the last 50 years. The policy makers and agriculture lobbies have been discussed and argued against (Becker, 1983). The CAP still retains its position as the largest component of European Union expenditure, accounting for approximately 42% of the total European Union planned budget for the period 2007-2013 (Gorton et al., 2009; Swinnen, 2010). The concept of policy sustainability, can be described how the ability of the existing array of policy interventions to continue. Even within this context there are shades of meaning. One usage is where the policy initiates a response that continues after the instrument is withdrawn, such as may happen when an investment grant stimulus farm productivity in a way that raises income and leads to higher levels of saving and investment without the need for further assistance. Another usage, more relevant in the present context, is where the cost of the instrument changes, an unsustainable policy being one where the costs escalate to the extent that they present budgetary difficulty or are no longer considered commensurate with the benefits created or are in other ways no longer acceptable. Looking at the Appropriations for Commitments for the year 2009³⁴, the incidence of the CAP on the EU budget was a total of 40.7 percent (split into 30.5 and 10.2 percent respectively between Pillar I and II). A similar figure, 41.3 percent (31.1 and 10.2 percent between I and II Pillar) was recorded in 2008. The effects and efficiency of farm income support has been widely discussed over recent decades. The CAP of the EU has been the subject of much criticism both for the budget resource it uses and for the distortions it creates inside the EU and on world markets (Swinnen et al., 2010). It is important to note, that the CAP, in the course of its evolution has been accompanied, by a number of structural measures that directly or indirectly have had environmental objectives regarding protection and control (Coleman, 1998; Kay, 1998).

The wine sector with its Common Market Organisation (CMO) system has been partially treated in a different way, due to lobby pressures and market structural characteristics (Gaeta, 2009). The CMO for wine has gradually evolved since 1962, with the most important regulations being adopted in 1987 (Reg. 822/87) and 1999 (Reg. 1493/99). The latest CMO regulations entered into force on 1st August 2009 (Reg. 479/2008). This Regulation concerns a voluntary grubbing-up scheme where uncompetitive producers and surplus wine is being removed from the market; gradual withdrawal of distillation subsidies until 2012 (phasing out

33 *Istat-Eurostat analysis of 2007 showed there is a ratio of one young farmer "under 35", in Italy there are 13 agriculture from more than 65 years.*

34 *Source: CAP post-2013: Key graphs and figures, November 2010, http://ec.europa.eu/agriculture/cap-post-2013/graphs/graph1_en.pdf*

measure) for crisis distillation, potable alcohol distillation and the use of concentrated grape must measures. This aid can be allocated for development of incentive envelopments such as wine promotion, restructuring vineyards etc.³⁵

In short, in the current debate on the present and future of the CAP, an assumption generally accepted on the weight of this policy on the overall budget is that its incidence lies just above 40 per cent, and that the ratio between Pillar 1 and 2 is more or less 3:1. Is this a legitimate assumption? Does the evidence of the amount of money received by its recipients endorse this postulate?

Literature Review and Objectives

The majority of studies on the political economy of the CAP use different empirical models, relating indicators of policy distortions to a set of political indicator variables, or more descriptive methods to analyse the historical development of the CAP and its context, as well as motives behind certain decisions and ideology (Harvey, 1982; Pearce, 1983; Tracy, 1984; Moyer et.al,1990; Josling et.al,1991; Olper, 1998; Ackrill, 2000). Most economic analysis of public policies are focused on the allocation of public support such as market failure. In the food agricultural systems around the world, instances of market failures are easily identified. As Arrow has shown (Arrow, 1964), a complete set of risk markets represents a sufficient condition under which a market equilibrium is a Pareto optima. Moreover, general equilibrium formulations with incomplete markets have demonstrated clearly that market failure is a fact of life. In the most general sense, a government wishing to intervene to correct market failures must design a set of rules to reduce transaction costs of the private economic system. This essay will argue that agricultural policy in the UE has led to both the enhancement of efficiency through "productive policies" and the transfer of wealth and income to special interests through redistributive or "predatory policies." These two activities can be labelled as PESTs and PERTs. PEST policies, or political-economic-seeking transfers, are meant to redistribute wealth from one social group to another and are not explicitly concerned with efficiency. In contrast, PERTs, or political-economic resource transactions, are intended to correct market failures or to provide public goods; these policies have neutral distributional effects, at least in design (Rausser, 1982). The net effect of PERT policies is to increase the size of the pie. A review of the history of public policy in agriculture reveals not only tension between the PERT and PEST roles of the public sector, but also some coordination between these two types of activities. As different interest groups pressure the political process, the government trades off PESTs and PERTs in its attempts to acquire, balance, and secure political power. At times this has led to combinations of programs that appear incoherent. For example, conservation programs require the retirement of vulnerable acreage, while crop price supports penalize premature land retirement and create incentives for overutilization of vulnerable acreage. These apparent incoherencies, however, result from institutional arrangements that generate a government portfolio of productive and predatory policies. In

³⁵ The Reg. 479/2008 has maintained that policies with objective to regulate winegrowing potential (Gaeta, 2009) and Reg. 555/2009 laying down detailed rules for implementing Reg. 479/2008. The reform CMO wine has been included in the CAP unique: Reg.1234/2007.

such a world, the challenge for economists is to design and advocate policies that are both economically productive and politically sustainable (Rausser, 1982). The “farm problem” has been described in one context or another by different types of market failure, instability, excessive market power of the middlemen, inadequate returns for invested capital, unacceptable uncertainty, private risk aversion which exceeds society’s risk aversion, and so on. Governmental intervention is introduced to provide a remedy to such problems through collective action (Becker, 1981). Much of this literature is based on the presumption that governmental intervention in some broad sense improves efficiency. This positive sum game view of governmental intervention also presumes a political economy which improves the allocation of resources. In one fashion or another, the policies introduced by the government reduce the transaction cost that would exist if the “invisible hand” were to operate (Rausser, et.al.,1982). However, in modern literature there are important gaps and several facets about the study of distributive agricultural policy, efficient support, and their impact of gross margin and the incidence on farmers revenues.

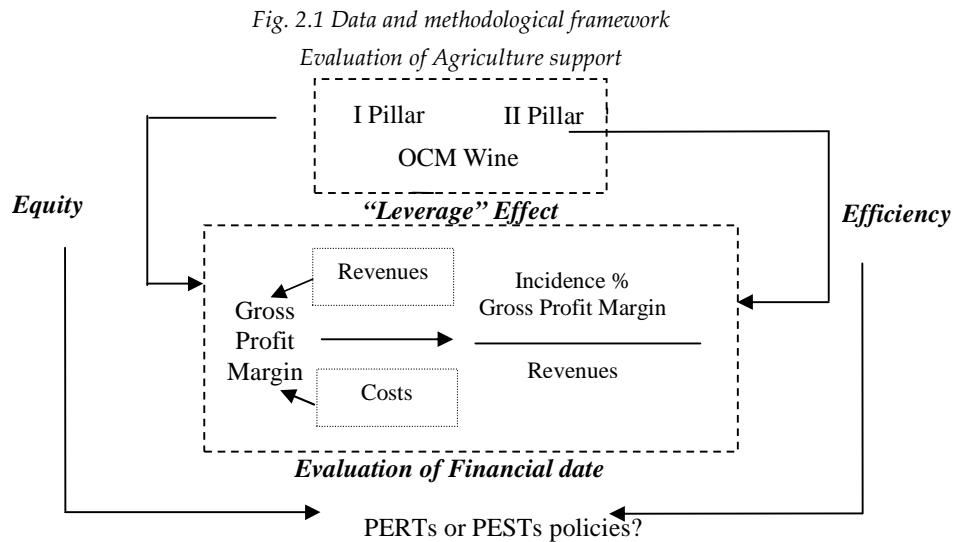

The innovative and specific objective of this work is to analyze how public resources are allocated among the young wine farmers (between 18 and 40 years old) and if their distribution creates leverage for major financial values. Indeed, this paper analyzed the leverage of public support on the gross profit margin, than the farmers profitability for discussing about the efficiency of regional agricultural and wine policies (Begalli et. al., 2009). The paper aims to verify if the political objectives of the policy makers are coherent with the actual agricultural public support between the research data or if exists a conflict efficiency and effectiveness of agricultural spending, such as Public Choice and PERts and PESTs theory discussion (Buchanan, 1962; Rausser, 1982)

Methodology

The focus of the paper is analysed one small group of 27 wine and grape producers pinpointed in the provinces of Florence and Siena in Tuscany where the wine produced is mainly Chianti and Chianti Classico³⁶. As seen in figure 2.1, the research considers two types of data. The first data set is represented by the distribution of agricultural public support on the young wine farmers from 2005 to 2009³⁷. This data was obtained from the Tuscany Agency for Agricultural Payments (ARTEA) database. In this paper are considered nine agriculture policies: single farm payments (PUA) as the I Pillar policy; agro-environmental, setting up of young farmers, Farm investments and modernisation, diversification in activities not linked to agriculture, woodland reforestation, private land improvement, Rural Development Services and Consulting Services as the II Pillar policy and the vineyard reconversion and restructuring indicator corresponds to the specific CMO policy and represents a subset of both the Total Farm support and sustainability support indicators.

36 *In this work, research survey groups were made of 131 young wine makers but only 27 farmers were presented.*

37 *Payments are considered in two the different support policies: RDP in 2000-2006 and RDP in 2007-2013 (Reg. 1872/2003; Reg. 1257/1999); CMO wine sector Reg. 1493/99, Reg.479/2008; Reg. 555/2008).*

The second data set is represented by the financial values (Revenues and Costs) of young vignerons members of the Confagricoltura of Florence³⁸. The results are obtained by the sum of total public support from 2005 to 2009, crossed with the financial values: principal items of revenues and the costs³⁹. Then was calculated the profitability and its impact on revenues, without the weight of public support and the support (sum of the revenues and farm support) to verify if there is leverage on the gross profit marginal values and to what measures.

Then, the paper tries to verify the combination of PERTs and PESTs policies: if the political objectives of the policy makers are coherent with the actual agricultural public income between the research data (I, II pillar and CMO wine) or if exists a conflict efficiency and effectiveness of agricultural spending.

Results

Analyses of public support

The effective real amount of total farm support, for the young farmers' group considered, are distribution by years and policies (I, II pillar and CMO wine) shown in table 4.1.1. The total annual farm support indicator, as seen, was obtained by the analyses of 1st and 2nd pillar of CAP⁴⁰ an CMO wine (only the

38 Confagricoltura is one of three unions in the agricultural sector. It is the most important Italian trade union. agriculture lobbyist.

39 These costs concern only those of production (Labor and financial expenses costs were not considered).

40 The first pillar refers to the single farm payments. Mainly for olive oil sector and cover crops (cereals).

vineyards reconversion and restructuring policy). It is the sum of single nine policies for each of the years considered. Looking at the table we see that on the total farm support, the Rural Development (II Pillar) weighs 61.4%, compared to 30.2% of I pillar and 8.3% CMO wine policies. But, the distribution of public support from 2005 to 2009 follows a different path⁴¹: the first pillar, as direct support to farmers (without the obligatory investment) is increasing. The second, linked to rural development and competitiveness is declining but represents only 0.3% of the total paid from Tuscany at 15th October 2010. The CMO wine policies keep track of the oscillations, probably due to vineyard reconversion policy that has been put into operation during the years 2004-2009 in compliance with CMO in wine.

Tab.4.1.1 Amount and distribution percentage of the support by policies, years 2005-2009

	CAP (I pillar)		CAP (II pillar)		CMO wine		Total Farm Support
	€	%	€	%	€	%	€
2005	31.303	14.3	153.787	70.2	33.938	15.5	219.030
2006	49.398	19.0	204.225	78.6	6.291	2.4	259.914
2007	44.966	62.9	13.387	18.7	13.190	18.4	71.542
2008	65.636	40.7	81.233	50.4	14.266	8.9	161.136
2009	123.775	37.6	186.965	56.7	18.724	5.7	329.464
TOTAL	315.079		639.598		86.409		1.041.087

The different sources of public support are highlighted in table 4.1.2. It shows that the amount of the total farm support (from 2005-2009) for polices and their percentage on the total contribution.

41 The Tuscany region has received for the period from Rural Development 876,140,965 million Euros (from the program 2007-2013), equal to 4.97% of the Italian Rural Development budget. From 15th October 2010 (Italian Ministerial data), Tuscany has been Granted only on the 21.30% of the total support. Regarding the distribution its mainly improving the competitiveness of agriculture and forestry.

Tab.4.1.2 Amount and distribution percentage of the support by single policies, from 2005 to 2009

Policies		Total Farm Support 2005-2009	
		€	%
Single farm payments	I Pillar	315.079	30.3
Agro-environment	II Pillar	392.772	37.7
Setting up of young farmers	II Pillar	80.000	7.7
Farm investments/modernisation	II Pillar	83.977	8.1
Divers. in activit. not link.to agriculture	II Pillar	34.933	3.4
Vineyards reconver./ restructur.	(CMO wine)	86.409	8.3
Woodland reforestation	II Pillar	35.913	3.4
Rural Development services	II Pillar	9.000	0.9
Technical assistanced	II Pillar	3.000	0.3
TOTAL		1.041.087	100

The first information about analysis of the different sources of public support is the role of the first pillar subsidies (single farm payments) and the agro-environmental measures. They are indicators of direct support to farmers' income. A significant amount of funding comes from the I pillar subsidy percentage (single farm payments, a direct public farm support) cover 30.3% of the total support: a value that is still very high. Agro-environmental policy (37.7%) and farm investments (8.1%), represents the most important sources of funding given that these rural development measures transfer the total support. The policies linked to sustainability, Vineyard reconversion policy represents 8.3% of the total support. Taking into account other policies: setting up of young farmers (7.7%), diversification in activities not linked to agriculture (3.3%), woodland reforestation, private land improvement policies (3.4%), rural development services and technical assistance are the remaining quota and the lowest support rates. Among the problems that involves the business public support system, a great impact issue on the effectiveness of the contribution is represented by the time discontinuity of financial transfers. The lowest level of total farm support (II Pillar) was obtained in 2007 like in Fig. 3.1. This is partly due to the budgetary problems of paying entities that are, in turn, subject to financial derivatives in comparison with the EU or the Ministry of Agriculture.

Fig. 3.1 Percentage variation compared to 05-09 period by policies, years 2005-2009

Effects on revenues and costs

The paper analyses the principal revenue items: grape sales, wine sales, olive oil sales, lees agritourism (farm holidays) and other revenues and the principle costs items analyses. In terms of marginality the work shows the distribution of total revenues (R) and costs (C) for the period 2005-2009, the difference between revenues and costs the gross profit margin (GPM), and the percentage incidence of revenues whit Public Support (GPM/Rt).

Table 4.2.1 shows the distribution from 2005 to 2009 and the average for farm of total revenues (R), total farm support (FS) and the sum of revenues and farm support (Rt); costs (C) and the percentage of gross profit margin, without FS (GPM) and with FS (GPM/Rt). As has been discussed, the level of public funding is a part of company revenues. For this reason public support acts as a cushioning variable for the effect of negative gross profit margin. Looking at the table while the and therefore the GPM is reduced by 11% in five years form 57.1% in 2005 to 46.1% in 2009. The last two columns where is show the percentage of the gross profit margin on revenues without a farm income (GPM/R) and with public support (GPM/Rt) during the period 2005-2009. There is an incidence of public support which has a leverage effect of 5.8%. That is not covering nor the lack of GPM nor the increase of costs.

Tab.4.2.1 Distribution of revenues and costs and a proportion of gross profit margin on revenues with public support. The leverage of public support

	Revenues (R)	Total Farm Support (FS)	Costs (C)	Total Revenues Rt (R + FS)	GPM (R-C)	GPM (Rt-C)	Incidence GPM/R	Incidence GPM/Rt
	€	€	€	€	€	€	%	%
2005	1.162.889	219.030	499.480	1.381.919	663.409	882.439	57.1	63.8
2006	1.166.643	259.914	495.451	1.426.558	671.191	931.106	57.5	65.2
2007	1.669.879	71.542	678.325	1.741.421	991.553	1.063.096	59.3	61.0
2008	1.874.818	161.136	968.051	2.035.954	906.766	1.067.902	48.3	52.4
2009	1.771.925	329.464	968.964	2.101.390	802.961	1.132.425	46.0	53.9

Conclusions

The analysed case study, even if it refers to a particular area and group, highlights some considerations that can be extended globally to public support efficiency and the real effectiveness of the sustainable economic policies. As already discussed, public support is concentrated in two policy interventions. A significant quota of funding comes from 1st pillar subsidies (30.3%), the second Agro-environmental measures, as indicators of direct support to farmers' income are 37.7% of the total. They represent the most important source of funding given that this rural development measure transfers the total support. Among the Rural Development (RDP II pillar) policies linked to competitiveness, vineyard reconversion policy covers 8.3% of the total support and farm investments the 8.0%. The most significant results of the survey about principal revenues and costs items analyses, show the reduction of the gross margin as the difference between revenues and costs. This is caused by the increase in farm costs, they have increased by 50% between 2005-2009 and the revenues remain constant. The paper confirms that the public support has leverage on the gross profit margin. However the reduction of gross profit margin quota from 2005-2009 shows that costs have increased much more than leverage support. The incidence of GPM/R respected GPM/Rt represented only the 5.8%. Thus public support as not changed the loss in the GPM, but it only covers some of the cost sustained. If there was no support the effects would have been more dramatic, especially for the future of vignerons. The reduction of profit has effected of rural development measures because: it is difficult to find the co-financing quota for these measures and in relationship to the reduction in bank guarantees above all for young farmers. Paradoxically where investments are necessary to improve competitiveness, the resources and incentives are lacking. Agricultural policy is a complex web of interventions covering output markets, input markets, trade, public good investments, renewable and exhaustible natural resources, regulation of externalities, education, and the marketing and distribution of food products. Do these massive governmental interventions correct for market imperfections, lower transaction costs, effectively regulate externalities, and enhance productivity? Or are these programs the result of manipulation by powerful commodity or agricultural interest groups actively engaged in rent-seeking or

directly unproductive activities? (Buchanan and Tullock 1962; Krueger 1974; Bhagwati 1982). On the basis of economic theory cited in the introduction it is possible to note the “distance” between the correct efficient decision, the equal redistribution of public funding and its correct application. The application and redistribution is inspired by the criteria of Public Choice more than Pareto’s efficiency. The results of public allocation and measures, seem to be identified in Rausser definitions about the PERTs and PESTs policy (Rausser, 1983). The policies that are generated to correct market inefficiencies and failure that have the aims to improve a hypothetical collective welfare system, PERTs policy (it is the aim of II pillar of the CAP), finish in configuration as PESTs intervention made for private interest of the decision makers. (In the Tuscany Rural development program, for the vigneroni there are only seven main financial measures where by farmers can obtain funding. But the other measures how efficient are they? Economic policy is the result of debates and political pressure what role should the pressure groups play against the institutions and policy-makers. With reference to the theory of Downs in the context of Public Choice, political parties in a democracy formulate policy strictly as a means of gaining votes (Downs 1957). But, what will the future for young vigneroni be after 2013, when the future of the CAP and market are still uncertain?

Introduction

An option is a contract between two parties whereby one party acquires the right, but not the obligation, to buy or sell a particular commodity or instrument or asset, at a specified price, on or before a specified date.

NSE started trading in index futures, based on popular S&P CNX Index, on June 12, 2000 as its first derivatives product. Trading on index options was introduced on June 4, 2001. Futures on individual securities started on November 9, 2001. Trading in options on individual securities commenced from July 2, 2001. While BSE started future trading, based on Sensex, on June 9, 2000. It was followed by trading in index options on June 1, 2001; in stock options and single stock futures (31 stocks) on July 9, 2001 and November 9, 2002, respectively. Index options recorded turnover of US \$ 1,778,459 million during 2009-10, an increase of 115.14 % over the turnover of US \$ 732,385 million during 2008-09. Index option accounted for 50.26 % of the total turnover during the 2009-10, followed by the trading in stock futures at 21.43 %.

Volatility is defined as relative rate at which the price of securities moves up and down. Volatility is found by calculating annualized standard deviation of daily change in price. If the price of stock moves and down rapidly over short period of time, it has high volatility. If the price almost never changes, it has low volatility. There are two opposite school of thought on the impact of derivative trading on the volatility of stock market. One school of thought argues that introduction of derivative trading lead to reduction in volatility. They are proponents of '**Market completion**' or '**stabilizing forces**' Hypothesis. Other school of thought argues that introduction of derivative trading led to increase in volatility. They are proponents of '**Destabilizing forces**'.

In the literature, researchers have found that the average daily return of the market is not same for all days of the week. This is generally referred as "day-of-the-week-effect". The day-of-the-week-effect has attracted the attention of the many researchers because it is believed to be one of the factors contributing to the volatility. The study of day-of-the-week effect continuous to be very important because the existence of significant day-of-the-week effect would be very useful for developing profitable trading strategies. Investor could buy stocks on days with abnormally low returns and sell stocks on days with abnormally high returns. According to French (1980) stock prices should rise higher on Monday than on other days because the time between the close of trading on Friday and the close of trading day on Monday is three days, rather than the

normal one day between other trading days. But empirical studies have documented that average return on Friday is abnormally high, and the average return on Monday is abnormally low for most of developed countries like U.S.A., U.K. and Canada. While in developing markets, the abnormally low returns appears on Tuesday.

This paper intends to achieve the following objectives:

1. To examine the impact of option trading on volatility of Indian stock market.
2. To investigate the impact of option trading on day-of-the-week effect of Indian stock market.
3. To compare the impact of option trading on NSE and BSE.

Literature Review

Volatility of stock market:

Singh and Mehta (2010) investigated the relationship between trading volume and stock return volatility in selected Asian stock Indices. The author had used the GARCH (1, 1) model to analyze the volatility and to forecast in the return series for these individual stocks indices in Asia. He found that coefficient estimates for the volatility equation are highly significant for all series. He observed that the time series of stock returns for all the stock indices are not temporally independent processes and tend to have volatility clustering and temporal dependence.

Debashish (2008) studied the impact of future trading on the jump volatility of NSE Nifty stock index by using FPE/ multivariate Granger causality technique. He also considered other macro economic variables like term structure of interest rates, volatility of the NSE Junior index, risk premium, inflation rate and industrial production index and found that future trading activity is not force behind the jump volatility. Moreover, volatility of other macroeconomic variables are not responsible for volatility in stock prices of NSE Nifty.

Mallikarjunappa and Afsal (2008) studied impact of future trading on spot market volatility on CNX Bank Nifty, a sector based index by using GARCH model and Chow test for parameter stability. The results showed that derivatives doesn't have any stabilizing (or destabilizing) effect by decreasing (or increasing) the volatility.

Samanta and Samanta (2007) analyzed the impact of introducing index futures and stock future on the volatility of underlying spot market in India. He considered S&P CNX Nifty, Nifty Junior and S&P 500 and used GARCH model for the study. He found that there is no significant change in the volatility of spot market, but the structural changes in the volatility to some extent. He also found mixed result in spot market volatility in case of 10 individual stocks.

Vipul (2006) used S&P CNX Nifty Index and individual stocks (both derivative and non derivative) to study the impact of derivative trading on the stock market volatility. He applied extreme value measure of

volatility and GARCH model and found strong evidence of reduction in Extreme Value and GARCH volatility on the introduction of derivatives for all the underlying (except Nifty).

Mohan et al (2004) analyzed the data of S&P CNX Nifty to measure the impact of future trading on the volatility of NSE of India and concluded that change in volatility of the underlying stock market could not be completely attributed to the introduction of future trading.

Nagaraj and Kiran (2004) studied the impact of introduction of the NSE Nifty index futures on Nifty Index volatility using ARMA-GARCH model. They also examined the effect of September 11 terrorist attacks on the Nifty spot-futures relation and found that the relation between futures trading activity and spot volatility has strengthened, implying that the market has become more efficient and assimilating the information into its prices

Hetamsaria and Deb (2004) explored the impact of index futures on the Indian stock market volatility using GARCH model and have shown that the introduction of futures results in a reduction in the spot market volatility. It also showed that domestic market factors represented by the NSE 500 had a significant effect, in determining the volatility of the Nifty index but the other international factors are found to have insignificant effect.

Shenbagaraman (2003) explored the impact of introduction of derivative trading on cash market volatility by using data on stock index futures and options contract traded on S&P CNX Nifty for the period of Oct 1995 to Dec 2002. He used GARCH model and found that no change in the volatility, but the nature of volatility seems to have changed post futures.

Nath (2003) used the IGARCH model to study the behavior of stock market volatility after the introduction of futures and concluded that the volatility of Nifty index had fallen in the post future period.

Thenmozhi (2002) used the variance ratio test and Ordinary Least Square Multiple Regression Technique to study the impact of the introduction of Nifty index futures on underlying Nifty index volatility in the Indian markets and concluded that futures trading have reduced the volatility in the spot market.

Day-of-the-week effect:

Padhi (2010) tested the presence of day-of-the-week effect in Sensex, Nifty, BSE100, BSE500 and S&P CNX Nifty by using GARCH (1, 1), GARCH-M (1, 1), EGARCH and GJR model and found the presence of day-of-the-week effect in Nifty only.

Chia and Liew (2010) examined the day-of-the-week effect and asymmetrical behavior of BSE Sensex for pre-9/11 and post-9/11 sub periods by using EGARCH and EGARCH M models and found asymmetric market reaction to positive and negative news and significant presence of day-of-the-week effect regardless of sub periods.

Chander et al. (2008) examined day-of-the-week effect in Indian stock market by using BSE Sensex, BSE 100, S&P CNX Nifty and S&P CNX 500 for two sub periods:1) pre rolling settlement period, April, 1997-December, 2001; and 2) post rolling settlement period, January, 2002- March, 2007. The results report lowest Friday return in pre settlement period. However, Friday returns were highest and Monday returns were the lowest in post settlement period.

Raj and Kumari (2006) investigated the presence of seasonal effects in the Indian stock market by applying regression models. The negative Monday effect and the positive Tuesday effects are not found in India. Instead the Monday returns are positive while the Tuesday Returns are negative.

Sarma (2004) investigated day-of-the-week effect for BSE30, BSE100 and BSE 200 stock index and found some seasonality in daily return.

Bahttacharya et al. (2003) examined the presence of day-of-the-week effect in Indian Capital Market By using OLS and found significant positive returns on non- reporting Monday. However, they found significant positive return on non-reporting Thursday and Friday by using GARCH model.

Chaudhury (1991) was the first to report day-of-the-week effect. Broca (1992) found lowest mean return on Wednesday, instead of Monday as exhibited by developed countries.

Research gap:

This study is different from the existing literature on the basis of three grounds. Firstly, only one study has been conducted on impact of option which has not considered indices of BSE. Secondly, no study has been conducted on impact of option trading on day-of-the-week effect. Thirdly, it tries to compare volatility of NSE with volatility of BSE.

Research Methodology

Data collection:

To study the impact of option trading on Indian stock market, closing prices of two indices are considered: S&P CNX Nifty and BSE Sensex. The closing price of S&P 500 is used to isolate the effect of world stock market from the impact of option trading. The data on these indices is collected from the website of NSE and BSE. The data is collected for 16 years and whole period is divided into two parts:

For S&P CNX Nifty: Pre-option period (01-04-1995 to 03-06- 2001) and post-option period (04-06-2001 to 31-03-2011)

For BSE Sensex: Pre-option period (01-04-1995 to 31-05-2001) and post-option period (01-06-2001 to 31-03-2011)

Methodology:

All the results were computed on the basis of R_t which is rate of return r in period t , computed as logarithmic first difference of closing price. Descriptive statistic is used to check the behaviour of the series. ADF is applied on returns to check the stationarity of the time series. The null hypothesis of the tests is:

H_0 : There is unit root in time series.

H_1 : There is no unit root in time series.

Following is the equation of ADF test:

$$\Delta Y_t = \beta_1 + \beta_2 t + \delta Y_{t-1} + \sum \alpha_i \Delta Y_{t-i} + \varepsilon_t$$

Another method is:

$$\Delta Y_t = \beta_1 + \delta Y_{t-1} + \sum \alpha_i \Delta Y_{t-i} + \varepsilon_t \text{ without trend}$$

Where β_1 is constant, β_2 is coefficient on time trend and where $\Delta Y_{t-1} = (Y_{t-1} - Y_{t-2})$,

$\Delta Y_{t-2} = (\Delta Y_{t-2} - \Delta Y_{t-3})$, etc.

The main assumption of ordinary regression model is that the errors have the same variance throughout the sample. This is also called homoscedasticity model. If the error variance is not constant, the data are said to be heteroscedastic. Therefore, heteroscedasticity will cause the OLS estimates to be inefficient. In case of heteroscedasticity, GARCH family models are used. To check the heteroscedasticity, ARCH LM test is used. Engle (1982) introduced a new approach for modeling heteroscedasticity in a time series. He called it the ARCH (Autoregressive conditional heteroscedasticity) model. The process by which the variances are generated is assumed to be as follows:

$$\sigma_t^2 = \alpha_0 + \alpha_1 \mu_{t-1}^2 + \dots + \alpha_p \mu_{t-p}^2$$

This equation is known as p^{th} order ARCH process.

The null hypothesis is:

H_0 = There is no arch effect.

H_1 = There is arch effect.

GARCH M model with additional regressor is used to study volatility and day-of-the-week effect because it considers day-of-the-week effect in the variance equation. This model includes variance which is appropriate measure of risk in conditional mean equation. ARCH-in-mean or GARCH-M model was originally proposed by Engle, Lilien and Robins (1987). This model is based on the assumption that return and risk go together; higher the risk, higher the return. If the volatility of the asset returns, which signifies risk, is time varying, the logical extension of 'risk-return tradeoff theory' suggests that during the period of high volatility, the asset return will be high as compared to period of low volatility.

Following is the equation used for GARCH M model:

Conditional mean equation:

$$R_t = \alpha_0 + \sum_{i=1}^n \alpha_i R_{t-1} + \alpha_2 R_{S\&P500-1} + \alpha_3 M + \alpha_4 T + \alpha_5 Th + \alpha_6 F + \lambda h_t^2 + \varepsilon_t$$

Conditional variance equation:

$$h_t^2 = \delta_0 + \delta_1 M + \delta_2 T + \delta_3 Th + \delta_4 F + \beta \varepsilon_{t-1}^2 + \gamma h_{t-1}^2$$

Where λ is a measure of the risk premium, as it is possible that the conditional variance, as proxy for the risk, can affect stock market returns. If λ is a positive, then the risk averse agents must be compensated to accept the higher risk. M, T, TH and F are the dummies of Monday, Tuesday, Thursday and Friday, respectively. β measure the effect of recent news on volatility. The sum of β and γ measures the persistence of volatility in the stock market.

Findings and Discussion

As a step toward investigating whether introduction of option trading has changed the behaviour of stock market, descriptive statistic is computed for both pre-option and post-option period. Table 1 presents the result of descriptive statistic for both periods. Visual inspections of the results of descriptive statistic indicates that mean return has increased in post option period. The figures obtained for the standard deviation estimates, provide an initial view of volatility, where, by comparing the two periods (pre-option and post-option), it seems that volatility has decreased over time. Both the series exhibit skewness and excess kurtosis (>3). The results of Jarque-Bera test reject the null hypothesis of normality.

Table 1
Descriptive Statistic

Indices	Mean		Standard Deviation		Skewness		Kurtosis		Jarque Bera Test	
	Pre	Post	Pre	Post	Pre	Post	Pre	Post	Pre	Post
S&P CNX	9.81X10 ⁻⁵	0.00067	0.01738	0.01675	0.03383	-0.28831	5.93971	11.681	550.1319	7670.513
Nifty									(0.0000)	(0.0000)
BSE Sensex	6.07 X10 ⁻⁵	0.00069	0.01782	0.01665	-0.01704	-0.1116	5.00864	10.546	251.5663	5792.828
									(0.0000)	(0.0000)

p values are reported in parentheses

ADF test is applied at first log difference with intercept, trend and intercept and none. Table 2 presents the result of unit root test. The ADF test rejects the null hypothesis of unit root in both pre and post option period which implies that returns of both S&P CNX Nifty and BSE Sensex are stationary. Therefore, it can be inferred that both the series are integrated of order one, i.e., I (1).

Table 2
ADF Test

Indices	Intercept		Intercept & Trend		None	
	Pre	Post	Pre	Post	Pre	Post
S&P CNX Nifty	-24.1039	-22.4035	-24.0959	-22.3989	-24.1119	-22.408
	(0.0000)	(0.0000)	(0.0000)	(0.0000)	(0.0000)	(0.0000)
BSE Sensex	-23.61043	-22.35011	-23.6024	-22.3453	-23.6184	-22.3546
	(0.0000)	(0.0000)	(0.0000)	(0.0000)	(0.0000)	(0.0000)

p values are reported in parentheses

We need to check the heteroscedasticity of the series as least square method tends to be inefficient because of its assumption of homoscedasticity. In case of heteroscedasticity, GARCH family models are used. In order to check the heteroscedasticity, ARCH LM model is applied. The results of ARCH LM test are reported in table 3. ARCH LM test reject the null hypothesis of no arch effect for both the indices in pre and post option period. In summary, the return series of S&P CNX Nifty and BSE Sensex seem best described by an unconditional leptokurtic distribution and possesses significant conditional heteroscedasticity.

Table 3
ARCH LM Test

Indices	F-statistic		Obs*R-squared	
	Pre	Post	Pre	Post
S&P CNX Nifty	8.627249	28.61933	74.33073	233.6868
	(0.0000)	(0.0000)	(0.0000)	(0.0000)
BSE Sensex	8.763809	30.87202	75.38049	250.2526
	(0.0000)	(0.0000)	(0.0000)	(0.0000)

p values are reported in parentheses

For a closer examination of pre-option and post-option conditional volatility, the GARCH M model is fitted to the data. Panel A of table 4 reports the results of mean equation. The coefficient of α_1 shows that relation of returns of S&P CNX Nifty and BSE Sensex with their lagged returns decreased significantly in post-option period. The value of α_2 indicates that the relation of lagged S&P 500 with the return of S&PCNX Nifty and BSE Sensex is insignificant in both pre and post-option period which implies that prices of S&P 500 can not be used for predicting stock prices of Indian stock market. The value of α_3 , α_4 and α_5 shows that return of S&P CNX Nifty are significantly negative on Monday, Tuesday and Friday during pre option period. While the coefficient of α_6 shows significantly negative return on Friday for BSE Sensex during pre option period. During post-option period, there was no significant presence of day-of-the-week effect in returns of both the indices. The value of λ in mean equation is not statistically significant for any of the indices implying that the stock market doesn't provide higher returns during the high volatility period (both pre and post-option period).

γ	0.833772	0.825706	0.827488	0.834298
	(0.0000)	(0.0000)	(0.0000)	(0.0000)

p values are reported in parentheses

Panel B reports results of conditional variance equation. As per the results of panel B, there are no evidences of presence of day-of-the-week effect in variance equation of S&P CNX Nifty and BSE Sensex for both the period. β measures the effect of recent news on stock market volatility which has increased for both the indices in post-option period. The sum of β and γ measures the persistence of volatility in stock market which has increased for both the indices during post-option period. The option trading has higher impact on volatility of BSE as compared to NSE.

ARCH LM test is applied again to see whether there is any leftover arch effect in the series. Table 5 reports the result of ARCH LM test. ARCH LM test can not reject the null hypothesis of no hetroskedasticity for both the period. Result shows that series don't have any leftover arch effect.

Table 5
ARCH LM Test

BSE Sensex	0.414272	0.828171	3.744248	7.46136
	(0.9281)	(0.5901)	(0.9274)	(0.5892)

p values are reported in parentheses

Conclusions

This article examines the impact of trading in the S&P CNX Nifty index option and BSE Sensex index option on the behaviour of Indian stock market. The distributional properties of the daily return series are first examined to determine whether the GARCH M model can characterize the return series. The GARCH M model appears to be an appropriate model for intraday return series. Parameters of conditional volatility of pre-option and post-option periods are estimated with the GARCH M model and compared to determine if the estimated parameters have, in aggregate, changed significantly after the introduction of option. The empirical results of GARCH M showed some evidences of day-of-the-week effect in S&P CNX Nifty (NSE) and BSE Sensex (BSE) during pre-option period. But these evidences of day-of-the-week effect disappeared after introduction of option trading. The result also indicates the increase in persistence of volatility during post-option period. The insignificant coefficient of variance in mean equation implies that investors will not get higher return during high volatility period.

Abstract

This paper reports on an explorative investigation into the differences between Morocco and Spain in the types of communication media that organizations use for personnel recruitment and that employment seekers use to find a job. Based on the Information Richness Theory of Daft and Lengel (1984), the Context Theory of Hall (1976), and the value, uncertainty avoidance, of Hofstede (2001), it is expected that the Moroccans use media with higher information richness than the Spanish.

To gain insight into the communication media that Moroccan and Spanish organizations use for personnel recruitment, interviews with comparable organizations in Morocco and Spain were held. Moroccan organizations do indeed more frequently use media high in richness such as professional societies, and Spanish organizations more often use media with a lower level of information richness such as newspapers.

To gain insight into the communication media employment seekers use to find employment, experiments were performed among 100 Moroccan and 95 Spanish respondents. The results did not corroborate the expectations. Although there were many differences between the countries in media job seekers use to find a job, these differences were not related to context and uncertainty avoidance.

Organizations should recognize that employment seekers from cultures other than their own might tend to use different types of communication media to find a job than employment seekers from their own culture do. Employment seekers, in turn, should realize that organizations from other cultures might use a number of other types of communication media to advertise their vacancies.

Keywords: International personnel recruitment, media choice in personnel recruitment, culture, job seekers, Morocco, Spain

Introduction

Since the last half of the nineteenth century, the variety of communication media has increased enormously. Herlé and Rustema (2005, p.23) show that between 1800 and 1992 twelve new media were introduced; these include the telegraph, telephone, personal computers, and the Internet (www). After 1992, even more new media were introduced such as text messaging, videophone, Skype, Twitter.

In spite of the increasing number of possible ways to communicate, business cultures around the globe have not yet become standardised. From the literature, such as in Beamer and Varner (2008); Lane, Distefano, and Maznevski (2006); Sae (2005); Samovar and Porter (2004); and Victor (1992), it appears that there are significant differences between cultures in the areas of business ethics, organization management, preferred leadership style, the aspects that motivate employees, business letters, annual reports, argumentation, and presentation and negotiation styles

An aspect that has not yet been formally studied is whether cultures also differ in their use of and preference for the different types of communication media such as face-to-face communication, telephone, e-mail, and letters that they regard as appropriate for different types of business communication. There is, although, anecdotal evidence that cultures actually differ in the communication media they prefer and use. The Swiss architects Herzog and de Meuron who built the Olympic stadium of Beijing, the Bird's Nest, said in an interview in August 2008 that they were extremely amazed that the commission to build this stadium, an order worth millions of dollars, had never been drawn up in writing. This nicely illustrates that cultures may differ in the communication media they regard as being appropriate for a particular usage; for instance, in Switzerland, a multi-million dollar order requires a written contract, but in China, an oral agreement is sufficient.

Anecdotal evidence is not the only basis for expecting that cultures might differ in the communication media they regard as appropriate for a certain message; it can also be expected on the basis of a combination of three theories: the Information Richness Theory of Daft and Lengel (1984), the Context Theory of Edward T. Hall (1976), and the value Uncertainty Avoidance of Geert Hofstede (2001). We will first discuss these theories and formulate on the basis of these theories expectations regarding differences between Morocco and Spain in the communication media that organizations use for personnel recruitment (senders' perspective) and that employment seekers use to find a job (receivers' perspective) (2).

In Section 3, we will deal with our study of the types of communication media that organizations use for personnel recruitment. Subsequently, we go into the method of research (3.1), the results (3.2), and our conclusion in light of the expectations.

In Section 4, we deal with the study of the communication media that employment seekers use to find a job. In sequence, we go into the method of our study (4.1), the results (4.2), and the conclusion in light of the expectations (4.3).

Section 5 tries to connect the results of both studies and discusses the striking observation that in neither Morocco nor Spain do organizations seeking personnel use the same communication media as the employment seekers do.

Media Choice and Cultural Values

Information Richness Theory

The Information Richness Theory makes a distinction between media that are high in richness, such as face-to-face-communication, and media that are low in richness, such as memos, reports, and tables. The extent of information richness is determined by the type of cues a medium passes on – verbal, non-verbal, vocal cues (intonation and loudness) for example), how easy it is to give feedback, and the extent to which the message can be tuned to the receiver. The more cues that can be passed on, the easier it is to give feedback, and the more the message can be tuned to the receiver, the higher the information richness of a communication medium (Daft and Lengel, 1984).

Daft and Lengel (1984) analysed managerial information behaviour in the United States with the help of the Information Richness Theory. Media high in richness are used to give information about complex organizational topics and to reduce ambiguity; whereas, media low in richness are used to communicate relatively simple, easy to understand messages. Webster and Trevino (1995) have tested the Information Richness Theory among managers in the United States, and the results of their study confirm those of Daft and Lengel (1984).

The information richness theory was developed in the United States and also tested among US managers. The question arises as to whether this theory also holds true for other cultures. On the basis of two other theories, we can expect that this is not the case: the context theory of Edward T. Hall and the value uncertainty avoidance of Geert Hofstede.

Context Theory

According to the Context Theory (Hall, 1976), cultures differ in the extent to which they use context and situation for the interpretation of a message. In high-context cultures, most of the meaning of a message is deduced from the context in which the words occur; i.e. in non-verbal communication, and the setting of the communication. In low-context cultures, the meaning of a message is primarily deduced from the words. Low-context cultures communicate explicitly, high-context cultures implicitly. In Figure 1, a number of cultures are arranged in a decreasing order of context. Since the context of cultures has not yet been studied as systematically as, for example, the cultural values of Geert Hofstede (Cardon, 2008), the arrangement is mainly based on incidental observations. Although there is an urgent need to develop instruments to measure context and investigate the context of more cultures (Cardon 2008), there is also a collective feeling among culture specialists that the classification as presented in Figure 1 is true (Beamer and Varner, 2008; Victor, 1992).

High context	Asian cultures
	Arabic cultures
	African cultures
	Latin-American cultures
	Italian and Spanish cultures
	British cultures
	French cultures
	North-American cultures
	The Netherlands
	Scandinavian cultures
	Germany
Low context	Swiss-German

Figure 1 Rough classification of high- and low-context cultures (From Victor 1992, p.160).

Since high-context cultures rely on context and non-verbal communication for the interpretation of a message, we can expect that persons in high-context cultures prefer communication media such as face-to-face communication that allow them to use these aspects in order to interpret an utterance to media such as the newspaper that does not allow them to use these aspects. In contrast, persons from low-context cultures will have less preference for communication media that allow them to interpret non-verbal information.

If we combine the information richness theory with the context theory, we can expect that information media high in richness will be used more frequently in high context cultures, and that information media low in richness will be used more frequently in low context cultures.

Uncertainty Avoidance

Uncertainty avoidance is one of the five cultural values that Geert Hofstede (2001, p.145-208) uses in order to categorize the cultures of the world. He defines uncertainty avoidance as follows: "Uncertainty Avoidance Index (UAI) deals with a society's tolerance for uncertainty and ambiguity. It indicates to what extent a culture programs its members to feel either uncomfortable or comfortable in unstructured situations. Unstructured situations are novel, unknown, surprising, and different from usual. Cultures that avoid uncertainty try to minimize the possibility of encountering such situations through imposing strict laws and rules, and safety and security measures. The opposite type, uncertainty accepting cultures, are more tolerant

of opinions that are different from what they are used to; they try to have as few rules as possible ...” (Hofstede’s home page at <http://www.geert-hofstede.com/>)

Cultures with high uncertainty avoidance have a much greater need for clarity, preclusion of ambiguity and uncertainty, and legislation. Cultures with low uncertainty avoidance have less need of these (Hofstede, 2001, p.146, 161, 174, & 180). One of the things that might help to meet the needs of persons with high uncertainty avoidance is communication. It is likely, though, that not all communication media will equally reassure them; media that communicates in such a way that nothing of the interpretation of the message can be left to chance will be preferred. If we combine the information richness theory with uncertainty avoidance, we can expect that information media high in richness will be used more effectively in cultures with low uncertainty avoidance than in cultures with high uncertainty avoidance, and that information media low in richness will be used more effectively in high uncertainty avoidance cultures.

Expectations

On the basis of a combination of the Information Richness Theory of Daft and Lengel (1984), the Context Theory of Hall (1976), and the uncertainty avoidance value of Hofstede (2001), we can expect that cultures that differ in context and in uncertainty avoidance will also differ in the communication media they use and prefer. We will investigate whether this holds true in a study of the communication media that organizations use for personnel recruitment (senders’ perspective) and the communication media that employment seekers use (receivers’ perspective) in Morocco and Spain. In figure 1, we have seen that Spanish cultures have a lower context than African and Arabic cultures. Since the Moroccan culture is a mix of African and Arabic cultures, the Moroccan culture has a higher context than the Spanish culture. Morocco and Spain also differ in uncertainty avoidance: the uncertainty avoidance is higher in Spain than in Morocco. On a scale from zero to 100 where zero stands for very low uncertainty avoidance and 100 for very high uncertainty avoidance, Spain has a score of 86 (Hofstede 2001, p. 500); the score of Morocco is 68 (Estimate see <http://www.urbanministry.org/wiki/geert-hofstede-cultural-dimensions>) (Hofstede 2001, p. 500). These differences between Morocco and Spain in context and uncertainty avoidance lead to Expectation 1 from the senders’ perspective and to Expectation 2 from the receivers’ perspective.

Expectation 1: Due to the fact that Spain has a lower context and higher uncertainty avoidance than Morocco,

a. Spanish organizations more often use communication media with low information richness than Moroccan organizations do.

b. Moroccan organizations more often use communication media with high information richness than Spanish organizations do.

Expectation 2: Due to the fact that Spain has lower context and higher uncertainty avoidance than Morocco,

a. Spanish employment seekers more often use communication media with low information richness than Moroccan employment seekers do.

b. Moroccan employment seekers more often use communication media with high information richness than Spanish employment seekers do.

We will deal with Expectation 1 in Section 3 and with Expectation 2 in Section 4.3.

Communication Media Used for Personnel Recruitment in Morocco and Spain

Method

In order to gain insight into the communication media that organizations use for personnel recruitment, an explorative qualitative study was performed. We interviewed five organizations in Morocco and five comparable organizations in Spain (see Table 1, first column) regarding the communication media they used for the recruitment of university-educated HRM managers. We restricted our study to this type of function for two reasons: first, because it is plausible that type of function has an impact on the communication media used for recruitment; and second, we knew we were going to use university students studying to be HRM managers in the experiment that was used to answer Expectation 2 (see 4.1), and we wanted the study of the senders' perspective to be as similar as possible to the study of the receivers' perspective.

Results

Table 1 shows the three communication media that each of the five organizations are said to use most often for the recruitment of university-educated HRM managers.

Table 1 The three communication media that Moroccan and Spanish organizations are said to use most often for the recruitment of university educated HRM managers

Type of organization	Morocco	Spain
Bank	Intranet, assessments, through family, friends, acquaintances	Website organization, job vacancy website, newspapers
Hospital	Unsolicited application, professional society/network, assessments	Website organization, job vacancy website, professional society
Telecommunication-organization	Intranet, employment agency, unsolicited application	Website organization, job vacancy website, newspapers
University	Intranet, newspapers, assessments	Boletín Oficial del Estado, the bulletin of acts of Spain (no other media!)
Call centre	Unsolicited application, through family, friends, acquaintances, job vacancy website	Website organization, job vacancy website, unsolicited application
Total	Through family, friends, acquaintances 2x Assessments 2x Unsolicited application 3x Professional society 1x Employment agency 1x Intranet 3x Website organization 1x Job vacancy websites 1x - Newspapers 1x	- - Unsolicited application 1x Professional society 1x - - Website organization 4x Job vacancy websites 4x Bulletin of acts 3x Newspapers 2x

In order to determine the information richness of the communication media mentioned, we followed Daft and Lengel (1984) and determined for each communication medium the type of cues a medium could pass on (verbal cues, non-verbal cues, vocal cues), whether or not it is easy to give feedback, and whether or not the message can be tuned to the receiver. The results of this analysis are presented in Table 2.

Table 2 Analysis of the information richness of the communication media mentioned by the organizations

Communication medium	Verbal cues	Non-verbal cues	Vocal cues	Feed-back	Tuned to receiver	Information richness
Through family, friends, acquaintances	+	+	+	+	+	5
Assessments	+	+	+	+	+	5
Professional society	+	+	+	+	+	5
Employment agency	+	+	+	+	+	5
Unsolicited application	+	+	+	+	+	5
Intranet	+	-	-	+	+	3
Website organization	+	-	-	+	+	3
Job vacancy website	+	-	-	-	+	2
Bulletin of acts	+	-	-	-	-	1
Newspaper	+	-	-	-	-	1

It is a matter of fact that this classification is anything but univocal. We stated, for example, that there are no *non-verbal cues* in the intranet, website organisation, job vacancy websites; however, aspects such as a logo, a picture, colour, lay-out, and emoticons that could, in principle, occur in these media are non-verbal cues. We did not differentiate the media on these non-verbal cues since we did not know whether the organizations used these cues in their job advertisements. Our analysis of the aspect *tuned to receiver* is neither unambiguous. The website of an organization can be considered to be tuned to the receiver since it may only attract the people who want to work for that organization. Job vacancy websites can also be regarded as tuned to the receiver since they are organized according to the jobs a person seeks. The question is whether a website of an organization is more tuned to the receiver than a job vacancy website is. As can be seen in Table 2, we did not differentiate the media for this aspect.

The last column of Table 2 gives an indication of the media richness of the communication media the organizations said they use most often for recruitment of university-educated HRM managers. If we calculate the richness of all the media used in Morocco (through family, friends, acquaintances (2x5=10), assessments (2x5=10), unsolicited application (3x5=15), professional society (1x5=5), employment agency (1x5=5), intranet (3x3=9), website organization (1x3=3), job vacancy websites (1x3=3), newspapers (1x1=1)), we get an information richness score of 61; whereas, we get a score of 39 for Spain (unsolicited application (1x5=5), professional society (1x5=5), website organization (4x3=12), job vacancy website (4x3=12)), newspapers (2x1=2), bulletin of acts (3x1=3)).

Conclusion and discussion

Our explorative qualitative study into media differences between Spanish and Moroccan organizations in the media they use for the recruitment of university-educated HRM managers suggests that Expectation 1 indeed holds true. Spanish organizations seem to use communication media with lower information richness

than Moroccan organizations do, and Moroccan organizations seem to use communication media with higher information richness than Spanish organizations do. It should be underlined, though, that this result is only based on a small survey. Besides, the method used to determine the information richness of the communication media is not univocal. More research is definitely needed.

Communication Media Moroccan and Spanish Employment Seekers Use to Find a Job

In order to test which communication media Moroccan and Spanish employment seekers use to find a job as university-educated manager, experiments were performed. In 4.1, we deal with the methodology used; in 4.2, we report the results; and in 4.3, we discuss the results in light of the expectation 2.

Method

Respondents

Respondents for Morocco were 100 students of Management, Law or Economy studying at the Université Mohammed 5 in Rabat, the capital of Morocco. Respondents for Spain were 95 students studying Management or Economy at the Universitat de Barcelona; Barcelona is a large town in Spain. The mean age of the respondents was 22 (SD=3.3) for Morocco and 20 (SD=2,4) for Spain; all were about to finish their Bachelor's Degree studies. In Morocco, questionnaires were administered in French as French was the official language of the university where the experiment was held, and in Spain, in Spanish, the official language of Spain.

In order to measure whether the Spanish respondents indeed had a higher uncertainty avoidance than the Moroccan respondents (cf. 2.4), their uncertainty avoidance was measured with the validated measuring instrument of Hofstede (1994), the questions 13, 16, 18, and 19 of the VSM-survey. The data showed that the uncertainty avoidance level of the Spanish respondents was indeed higher than the uncertainty avoidance level of the Moroccan respondents. The difference is even more than expected on the basis of the surveys of Hofstede: 55. Context levels of the respondents were measured by means of the questionnaire of Gudykunst, Matsumoto, Ting-Toomey, Nishida, Kim and Heyman (1996). The difference in context between Morocco (M=2.24, SD=.56) and Spain (M= 2.35, SD=.48), where 5 stands for low context and 1 for high context, was not statistically significant. Our expectation based on the higher uncertainty avoidance levels of the Spanish respondents compared to the lower uncertainty avoidance levels of the Moroccan respondents was similar to the expectation based on the lower context levels of the Spanish respondents compared to the higher context levels of the Moroccan respondents. Because of this, we can still expect that due to the fact that our Spanish respondents have a higher uncertainty avoidance level than our Moroccan respondents a) Spanish employment seekers will more often use communication media with a low information richness than Moroccan employment seekers do, and b) Moroccan employment seekers will more often use communication media with a high information richness than Spanish employment seekers do.

Materials and measuring instruments

Respondents were presented with the following case: Imagine you have finished your studies and you are now looking for a job that fits in with your studies. In order to find such a job you will use different communication media such as newspapers, Internet, and so on. In the table below you will find a list of communication media that you could use in order to find this job. Please indicate for each of the communication media whether or not you will use it to find a suitable job?

The list contained the communication media mentioned in Table 3. The choice of media in the list was mainly based on the communication media mentioned by the organizations in the first part of the study (see Table 1) and communication media were added that could be used in our view. Table 3 shows the information richness of all the media, based on the same principles as in 3.2 ... and with the same weaknesses.

Table 3 Communication media presented to the respondents and their information richness

<i>Communication medium</i>	<i>Verbal cues</i>	<i>Nonverbal cues</i>	<i>Vocal cues</i>	<i>Feed back</i>	<i>Tuned to receiver</i>	<i>Information richness</i>
<i>Through family, friends, acquaintances</i>	+	+	+	+	+	5
<i>Professional society</i>	+	+	+	+	+	5
<i>Employment agency</i>	+	+	+	+	+	5
<i>Social network</i>	+	-	-	+	+	3
<i>Intranet</i>	+	-	-	+	+	3
<i>Website organization</i>	+	-	-	+	+	3
<i>Job vacancy website</i>	+	-	-	-	+	2
<i>Professional journal</i>	+	-	-	-	+	2
<i>Regional newspaper</i>	+	-	-	-	-	1
<i>National newspaper</i>	+	-	-	-	-	1

After the respondents indicated which communication media they thought to use, they had to indicate which three media they preferred.

Procedure and statistical tests

The questionnaire was handed out in classrooms or at workspaces in corridors of universities. The respondents completed the questionnaires individually in the presence of one of the researchers. The data for Morocco was gathered by Islah Boukhira and for Spain by Lola Nouwens and Malouke Reiniers.

Chi-square tests were used to determine whether there were statistically significant differences between the countries regarding their use of a communication medium, and regarding their preference for a communication medium. The criterion used for statistical significance was .05 for all tests.

Results

Table 4 shows for each of the communication media presented to the respondents (see Table 3) how many Moroccan and how many Spanish respondents said to use that medium in order to find a job as a university-educated manager. Besides the summarized data for communication media with the same information richness is presented.

Table 4 Communication media used to find a job as a university-educated manager

Communication medium	Information richness	Morocco N=100	Spain N=95	Significant difference Morocco versus Spain according to χ^2
Through family, friends, acquaintances	5	71 72%	94 99%	$\chi^2(1) = 27.31, p = .000$
Professional society	5	48 49%	20 24%	$\chi^2(1) = 16.03, p = .000$
Employment agency	5	39 39%	76 80%	$\chi^2(1) = 33.85, p = .000$
Total Information richness 5	5	158 53%	190 63%	NS
Social network	3	48 48%	20 21%	$\chi^2(1) = 16.03, p = .000$
Website organization	3	77 77%	86 90%	$\chi^2(1) = 6.50, p = .011$
Total Information richness 3	3	125 62%	106 55%	NS
Job vacancy website	2	86 86%	87 92%	NS
Professional journal	2	62 63%	53 57%	NS
Total Information richness 2	2	148 74%	140 74%	NS
Regional newspaper	1	46 46%	59 62%	$\chi^2(1) = 5.08, p = .024$
National newspaper	1	67 68%	58 61%	NS
Total Information richness 1	1	113 57%	117 61%	NS

First of all we see that there are not any significant differences between Morocco and Spain for the summarized data for media with the same information richness: media with information richness 5, 3, 2 and 1 are said to be used to the same extent by the Moroccan and Spanish respondents. There are, however, significant differences between the countries in use of the communication media separately. Regarding the

three media with an information richness of 5 - a very high information richness - the professional society is used more often by the Moroccan respondents than by the Spanish respondents. The other two media with a richness of 5 are used more often by the Spanish respondents. One of the two media with a medium information richness (3), the social network is used more often by the Moroccan respondents than by the Spanish respondents, but the other medium with a medium information richness, website organisation, is used more often by the Spanish respondents than by the Moroccan respondents. One of the media with a very low richness (1), regional newspaper, is used more often by the Spanish respondents than by the Moroccan respondents.

Table 5 shows how often the Moroccan and the Spanish respondents mentioned a communication medium in response to the question, "Which three communication media do you have a preference for."

Table 5 Communication media preferred in seeking a job as a university-educated manager

Communication medium	Information richness	Morocco N=100	Spain N=95	Significant difference Morocco versus Spain, according to χ^2
Through family, friends, acquaintances	5	46 20%	49 18%	NS
Professional society	5	23 10%	9 3%	$\chi^2 (1) = 7.70, p = .000$
Employment agency	5	7 3%	52 19%	$\chi^2 (1) = 34.94, p = .000$
Total Information richness 5	5	76 34%	110 40%	$\chi^2 (1) = 6.04, p = .014$
Social network	3	6 3%	1 0,4%	χ^2 could not be performed due to cell < 5
Website organization	3	22 10%	23 8%	NS
Total Information richness 3	3	28 12%	24 9%	NS
Job vacancy website	2	43 19%	27 10%	$\chi^2 (1) = 5.17, p = .002$
Professional journal	2	15 6%	17 6%	NS
Total Information richness 2	2	58 26%	44 16%	$\chi^2 (1) = 3.86, p = .049$
Regional newspaper	1	12 5%	18 6%	NS
National newspaper	1	41 18%	27 10%	$\chi^2 (1) = 4.63, p = .031$
Internet (for example Google)	1	41 18%	53 19%	NS
Total Information richness 1	1	94 42%	98 35%	NS
Total number of media mentioned		226	276	

Table 5 shows a number of statistical significant differences between Morocco and Spain in media preference. Regarding the media with a high information richness (5), the Moroccan respondents prefer the professional society significantly more than the Spanish respondents do, but the Spanish respondents prefer the employment agency more than the Moroccan respondents and overall the Spanish respondents have a higher preference for media with a high information richness (5) than the Moroccan respondents. There are no significant differences between the countries in preference for media with information richness 3, but there are for media with information richness 2. The Moroccan respondents do not only prefer job vacancy websites more than Spanish respondents do, but they also have a higher preference for all media with

information richness 2 than the Spanish respondents have. With regard to media with a very low information richness (1), the Moroccan respondents do prefer the national newspaper more than the Spanish respondents do.

Conclusion and discussion

Our experiment with 100 Moroccan respondents and 95 Spanish respondents has shown that there are differences between these cultures indeed in use of and preference for communication media in order to find a job as a university-educated manager. Table 6 gives an overview of all the significant differences found.

Table 6 Summary of significant differences in use of and preference for a communication medium in seeking a job as university-educated manager (results in line with expectation are underlined)

Communication medium	Information richness	Use of medium	Preference for medium
Through family, friends, acquaintances	5	Spain > Morocco	NS
Professional society	5	<u>Morocco > Spain</u>	<u>Morocco > Spain</u>
Employment agency	5	Spain > Morocco	Spain > Morocco
Total Information richness 5	5	NS	Spain > Morocco
Social network	3	<u>Morocco > Spain</u>	-
Website organization	3	Spain > Morocco	NS
Total Information richness 3	3	NS	NS
Job vacancy website	2	NS	Morocco > Spain
Professional journal	2	NS	NS
Total Information richness 2	2	NS	Morocco > Spain
Regional newspaper	1	<u>Spain > Morocco</u>	NS
National newspaper	1	NS	Morocco > Spain
Internet (f.ex. Google)	1	-	NS
Total Information richness 1	1	NS	NS

Results that corroborate expectation 2 are underlined. It is clear that only 4 out of 12 significant results are in line with our expectations. Expectation 2a (Spanish employment seekers more often use communication media with low information richness than Moroccan employment seekers do), is only corroborated for the use of regional newspapers (information richness 1), this medium is used more often by the Spanish respondents than by the Moroccan respondents (see Table 4). Expectation 2b (Moroccan employment seekers more often use communication media with high information richness than Spanish employment seekers do), is corroborated for three media: the professional society (information richness 5) and the social network (information richness 3) are used more often by the Moroccan respondents than by the Spanish respondents (see Table 4) and the Moroccan respondents show a higher preference for the use of a professional society (information richness 5) in order to find a job than the Spanish respondents do (Table 5).

Two thirds of the significant results are not at all inline with our expectations on the basis of the differences in context and uncertainty avoidance between Morocco and Spain. Contrary to expectation 2a Spanish respondents more often than Moroccan respondents used family, friends, acquaintances (information richness 5), employment agencies (information richness 5) and website of organizations (information richness 3) in order to find a job (see Table 4) and the Spanish respondents preferred the employment agency (information richness 5) more than the Moroccans and they also had an overall preference for media with information richness 5 than the Moroccans (Table 5). Contrary to expectation 2b Moroccan respondents had a higher preference than Spanish respondents for job vacancy websites (information richness 2), all media with information richness 2 and newspapers (information richness 1) (see Table 5).

The results of our experiment show that culture has impact on the media that job seekers use to find a job, but it is still unclear which aspects play a role in this choice. Cultural factors such as context and uncertainty avoidance definitely do not have the impact that we expected, since our expectations are anything but corroborated. Further research is needed to gain insight into the factors that determine why Moroccan and Spanish job seekers differ in the media they use in order to find a job.

The Impact of Culture on Media Choice and Practical Implications

The two studies reported on in this article reveal similarities and differences between Morocco and Spain in media choice for both personnel recruitment (section 3) and seeking employment (section 4). Moroccan and Spanish organizations use a number of similar media for personnel recruitment: website of the organization, job vacancy websites and newspapers are for example used in both countries, although not to the same extent (Table 1). The differences between the countries in media choice for personnel recruitment suggest that context and uncertainty avoidance indeed have impact on this choice. The Spanish organizations more often used communication media with low information richness than the Moroccan organizations did and the Moroccan organizations more often used communication media with high information richness than the Spanish organizations did.

Regarding the media job seekers use to find a job Moroccan and Spanish job seekers use a number of similar media: in both countries family, friends, acquaintances, websites of organizations, job vacancy websites and newspapers are very frequently used, although not to the same extent. The many differences between Morocco and Spain in media job seekers use to find a job are –surprisingly- not in line with what we expected on the basis of context and uncertainty avoidance (Table 4 and 5). Apparently other factors play a role in the media choice of job seekers. Which factors that are calls for further research.

The results of our study have some practical implications. A first interesting result is that there is no complete fit between the media organizations use for recruitment and the media job seekers use. The employment agency and professional journal is for example often used by the Spanish respondents (Table 4), but never mentioned by the Spanish organizations (Table 1). The Moroccan respondents say to use often the website of an organization, a job vacancy website, newspapers (Table 4), but these media are hardly

mentioned by the Moroccan organizations. Organizations could improve their personnel recruitment by fine-tuning the media they use for recruitment to the media job seekers employ.

Organizations that want to recruit employees from other cultures should realize that employment seekers from other cultures might use different communication media to find a job than employment seekers from their own culture do. Ideally they should adapt their communication media to their target group.

Finally, employment seekers should realize that organizations in another culture may use different communication media to advertise a vacancy than organizations in their own culture do.

* This article is partly based on the Bachelor's theses International Business Communication, of Islah Boukhira, Malouke Reiniers and Lola Nouwens which were written under the supervision of the author.

PREDICTING GREEK INTERNET USERS' INTENTIONS TO USE ONLINE SHOPPING: EMPIRICAL EVIDENCE USING AN EXTENDED TECHNOLOGY ACCEPTANCE MODEL

Giovanis, Apostolos N.¹

¹Dept. of Business Administration, Technological Educational Institute of Athens. E-mail: giovanis@teiath.gr

Abstract

This study develops and validates an extended model to predict internet users' intentions to buy online using a Business-to-Consumer (B2C) e-commerce platform, based on the Technology Acceptance Model (TAM). TAM has been introduced and applied as a reliable and robust model for predicting users' adoption determinants of different technologies. However, researchers usually integrate additional constructs to the original model in order to improve its predictive power. Hence, in the proposed model, in addition to ease of use and usefulness, compatibility with the technology, an element of Innovation Diffusion Theory (IDT), and perceived risk are also proposed to be considered as determinants of customers' attitudes and intentions toward on-line shopping acceptance. The model was validated using data collected from 931 internet users and analyzed using Partial Least Squares Path Modeling technique (PLS-PM). The results provided substantial support for all the proposed hypotheses and showed the significance of the extended constructs. The implications of the results to both researchers and practitioners are discussed at the end of the paper.

Keywords: E-commerce in Greece, Adoption intentions, Technology acceptance model, Innovation diffusion, Perceived risk

Introduction

Following the advancements of information and communication technologies (ICTs), new modes of shopping have been emerged in recent years. A new channel for Business-to-Consumer (B2C) transactions is e-commerce which helps organizations to reduce costs, expand their businesses to national and international markets, achieve high rates in sales growth, and introduce effective pull-type supply chain management to reduce inventories and overheads. For consumers the advantages of e-commerce include saving of time, better prices, more product choices, faster order processing, availability of goods 24 hours a day, 365 days / year, from almost any location, quicker delivery of digital products, experience by receiving a wealth of product information etc. (Vijayasarathy, 2004; Turban and King, 2003).

Despite the rapid growth of the B2C e-commerce over the past few years, the rate of e-commerce adoption varies from country to country, because of differences in personal characteristics of the consumers, different cultures, different legal framework and different technical infrastructure (Barbonis and Laspita, 2005). In Greece, online shopping has emerged recently. A recent national survey carried-out by Focus BARI (2008),

reported that internet penetration in Greece is 42%. 23% of internet users have purchased products from online stores and their population size was estimated to be around 700.000 people. Despite the fact that 37% of internet users in Greece are heavy users (more than 30 hours per week), however, around three out of four internet users have denied using online shopping so far. Based on these figures, Greece is among the European countries with the lowest levels of e-commerce penetration. While e-commerce has become an important issue powered by the growth of the internet, there are limited empirical studies in Greece exploring consumer behavior in the online shopping channel (Kardaras and Papathanasiou, 2000; Karayanni 2003; Maditinos et al., 2010; Saprikis et al., 2010). Most of these research efforts are exploratory in nature or their results cannot represent the e-commerce situation in Greece due to sampling limitations, so as they are not able to provide a clear strategy for the development of e-commerce in Greece. Thus, in order to obtain a more accurate picture of Greek online shopping development in the years to come, it is of great importance to understand the reasons of internet users' denial to buy online, and what is required from them to start thinking about e-commerce alternative.

There are a lot of studies providing insights into the reasons leading to e-commerce adoption. Among the most widely accepted approaches are Technology Acceptance Model (TAM) (Davies, 1989) and Innovation Diffusion Theory (IDT) (Rogers, 1995). TAM is particularly attractive for its parsimony and its good predictive performance in a variety of IT adoption contexts, particularly in a work-setting. However, for the adoption and use of online shopping, other relevant factors besides perceived usefulness and perceived ease of use should be considered in order to come up with a more powerful model toward explaining customer's intentions to buy online. A very promising approach is the combination of TAM with IDT and customers' perception about risks incurred by e-commerce systems' usage, in order to explain customers' decision mechanism toward acceptance or rejection of the new technology. Similar approaches have already been used in the contexts of e-commerce, mobile commerce/payment, and broadband acceptance (Agarwal and Karahana, 1998; Vijayarathy, 2004; Chen et al., 2002; Tan and Teo, 2000; Wu and Wang, 2005; Chen, 2008; Oh et al., 2003).

Drawing on the above perspectives, this study is based on the Theory of Perceived Risk (TPR), the Innovation Diffusion Theory and the Technology Acceptance Model (TAM) to discuss the relationships between consumers' beliefs about e-commerce, including its usefulness, ease of use, compatibility and risk, their attitudes toward online shopping, and finally their intentions to buy online.

The rest of the paper is set out as follows. The next section presents the previous literature and sets out the hypotheses of this study. These are followed by the methodology of this study. Then, the paper presents the results of the empirical study in achieving the goals set above. Discussion and conclusions are provided in the last section.

Literature Review and Research Hypotheses

The combination of TAM with IDT is explained in the subsequent sections, and the most important relevant research efforts conducted in the field of e-commerce are analyzed. Then the nature of perceived risk and its influence on on-line shopping adoption are examined. Finally, based on the literature review, the respective research hypotheses are presented.

Technology acceptance model (TAM)

The Theory of Reasoned Action (TRA), proposed by Ajzen and Fishbein (1980), is a well-established model that has been proven successful in predicting behavior across different contexts. Davis (1986) has used TRA to develop TAM for predicting IT usage. According to Davis et al. (1989), while TRA can be used to explain virtually any human behavior, TAM is mainly used to provide an explanation of the relationships between the computer acceptance determinants across a broad range of end-user computing technologies. According to TAM, a person's belief determines his/her Attitude toward things. An Attitude is a kind of perceived behavioral control, and its enhancement will influence positively Behavioral Intentions and result in actual behavior. The original TAM suggests that two beliefs – Perceived Usefulness (PU) and Perceived Ease of Use (PEOU) – are instrumental in explaining the variance of customer's Attitude (ATT), then PU along with customer's ATT determine customer's Behavioral Intentions (BI). PU is defined as the degree to which a person believes that using a particular system would enhance his/her performance, while PEOU is defined as the degree to which a person believes that using a particular system would be free of effort. Furthermore, PEOU is also hypothesized to be a predictor of PU (Venkatesh and Davis, 2000). These two factors can be easily understood by system developers and can be taken into account during system's requirement analysis and other system's development stages.

TAM is one of the most accepted theories aiming to predict and explain new information technologies acceptance and use (Lee, Kozar, and Larsen, 2003). With regards to e-commerce adoption, TAM was used to predict on-line shopping acceptance either from a general perspective (Teo et al. 1999, Salisbury et al. 2001, Park et al. 2004, Shih 2004) or from a specific perspective by analyzing the usage of a specific virtual store (Gefen and Straub 2000, Chen et al. 2002, Gefen 2003). Therefore, using TAM as the basis for studying consumer intention to buy online is a highly valid approach.

Innovation Diffusion Theory (IDT)

IDT has been extensively used in IT and IS research framework (Karahanna *et al.*, 1999). IDT was proposed by Rogers in 1962 to explain how an innovation is accepted and diffused within a social system (Rogers, 1995). According to IDT, innovation adoption or rejection begins with consumer awareness of the innovation, and diffusion is a process through which an innovation is communicated via certain channels over time among members of a social system. IDT has been widely applied in predicting IT adoption behavior. It suggests a set of five innovation attributes to explain the rates of adoption by users. More specifically, Rogers (1995) postulated that an innovation is more likely to succeed and be more readily

adopted if its relative advantage, as a consequence of its introduction, is evident; if it is compatible with the potential customers' past experiences, beliefs and the way they are accustomed to work; if it is easy to understand and use; and if it is trialable and observable prior to adoption.

However, previous studies including the meta-analysis of 75 diffusion papers conducted by Tornatzky and Klein (1982), found that only relative advantage, compatibility and complexity were consistently related to innovation adoption. For this reason, only these three attributes can be used in predicting and explaining customers' behavioral intentions to buy online.

Relationship between TAM and IDT

Although originated from different disciplines, there is a complementary relationship between TAM and IDT. Moore and Benbasat (1991) found that the relative advantage construct is similar to PU, and the complexity construct is similar to PEOU. This suggests that TAM and IDT reconfirm each other's findings, which enhance the confidence in the validity and reliability of these approaches (Chen *et al.*, 2002). Thus, the only important innovation characteristic that is not included in TAM reasoning is Compatibility. Compatibility is evaluated by assessing the innovation's compatibility with existing values and beliefs, previously introduced ideas and potential adopters' needs (Rogers, 1995). Chen *et al.*, (2002) and Vijayasarathy (2004) combined the original TAM with the Compatibility construct of IDT to explain customer's Attitude about online shopping systems. Moreover, Chen *et al.*, (2002) found a relation between Compatibility and PU, a result which was also determined by Moore and Benbasat (1991).

Perceived risk and its influence on online shopping decision

From their very beginning, consumer behavior studies have considered and analyzed the role of risk in customer's buying decision process (Bauer, 1960; Cunningham, 1967). As risk cannot be measured objectively, the majority of these efforts have considered perceived risk (PR) which is defined as "*the consumer's subjective belief of suffering a loss in pursuit of a desired outcome*" (Pavlou, 2003). Gatignon and Robertson (1985) identify that uncertainty in an innovation is a direct determinant of acceptance. On the other side, consumer behavior theory argues that uncertainty and perceived risk are equivalent concepts and can be used indistinctly (Peter and Ryan, 1976; Stone and Gronhaug, 1993; Crespo *et al.*, 2009). In the context of e-commerce, perceived risk influence has been analyzed from very different theoretical approaches. Several authors have noticed that perceived risk in e-commerce context has a negative effect on online shopping behavior (Park, Lee and Ahn, 2004), intention to adopt e-commerce (Salisbury *et al.* 2001; Featherman and Pavlou, 2003; Pavlou 2003; Crespo and del Bosque, 2008), attitude toward usage behavior (Shih 2004; Vijayasarathy; 2004) and perceived usefulness of the system (Shih, 2004). The current study is using the above framework in order to determine consumer's perceived risk beliefs about e-commerce and its impact on adoption decision process.

Proposed model and research hypotheses

The proposed research model illustrated in Fig. 1 adopts TAM belief-attitude-intention behavior relationships.

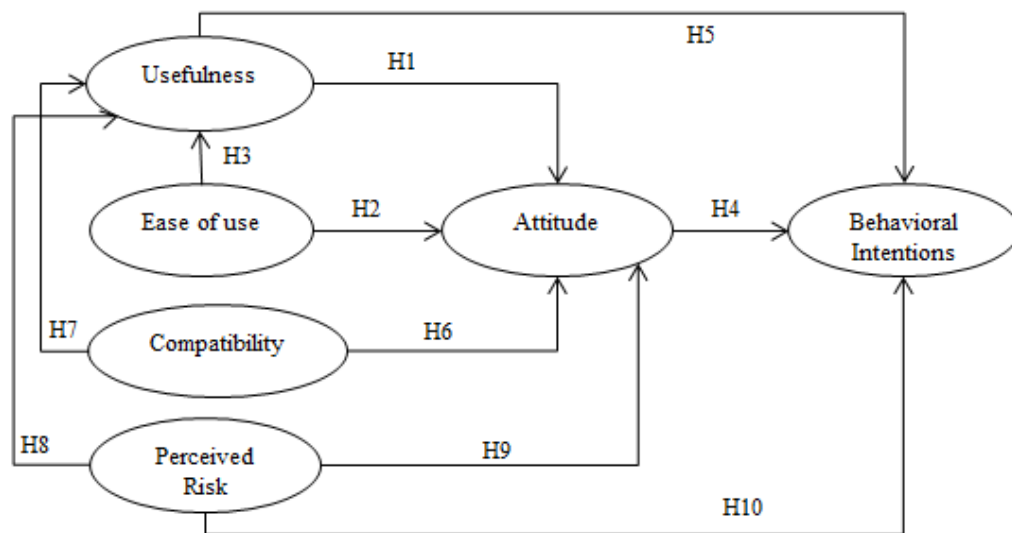

Fig. 1: E-commerce Adoption Model

These relationships can be stated in the following hypotheses.

H1. There is a positive relation between consumers' attitude toward online shopping and their beliefs about its usefulness

H2. There is a positive relation between consumers' attitude toward online shopping and their beliefs about its ease of use

H3. There is a positive relation between customers' beliefs about online shopping usefulness and their beliefs about its ease of use

H4. There is a positive relation between consumers' intention to use online shopping and their attitude toward it

H5. There is a positive relation between consumers' intention to use online shopping and their beliefs about its usefulness

H6. There is a positive relation between consumers' attitude toward online shopping and their beliefs about its compatibility

H7. There is a positive relation between consumers' beliefs about online shopping usefulness and its

compatibility

H8. There is a negative relation between consumers' attitude toward online shopping and their beliefs about its risk

H9. There is a negative relation between consumers' intention to use online shopping and their beliefs about its risk

H10. There is a negative relation between consumers' beliefs about online shopping usefulness and their beliefs about its risk

Research Methodology

In order to empirically validate the proposed e-commerce adoption model and the hypotheses previously stated, a cross sectional survey aimed at internet users in Greece, aged 18+, without previous online transactions was used.

Questionnaire structure and measurement scales

A questionnaire was employed to collect data from Greek internet users without previous experience in online shopping. Likert scales (1–7), with anchors ranging from “strongly disagree” to “strongly agree” were used for all belief items to ensure statistical variability among survey responses for all items measured. The items of the questionnaire were adapted from existing and well tested scales offered by the extant literature. In particular, the scales for measuring perceived ease of use, perceived usefulness, attitude and behavioral intentions were adapted from the original TAM instrument (Davis, 1989; Davis *et al.*, 1989; Taylor and Todd, 1995) and subsequent applications of TAM to e-commerce and other technology acceptance studies (Taylor and Todd, 1995; del Bosque and Crespo, 2010; Vijayasarathy, 2004). The measurement items for perceived risk were adapted from the studies of Featherman and Pavlou (2003) and Crespo and del Bosque (2008). The measurement items for compatibility were adapted from the studies of Moore and Benbasat (1991) and Taylor and Todd (1995). In order to maintain the technical and conceptual equivalence of these instruments, a translation and back-translation strategy was applied during the development of the Greek version of the questionnaire. Two bilinguals translated the measures, originally written in English, into Greek, and then another two bilinguals translated the Greek-written measures back in English again. A third person was used to compare both the original and the back-translated versions of the survey instruments and highlight any discrepancies in meanings. After the review process, these five persons had a meeting to discuss and resolve the problems found during the review process. These problems were resolved along with the correction of some syntax errors. The former version of the questionnaire was given to three experts from the e-commerce industry to evaluate the preliminary design of the survey instruments. Based on their comments and suggestions, some of the wording and format of the questionnaire were modified to enhance its readability. Finally, a factor analysis was performed on the data collected from the pilot study. The results were satisfactory, given that the five expected factors corresponding to the five intended constructs clearly

emerged and all factors' Cronbach's alpha values were well above the commonly accepted threshold value of 0.70.

Data collection and sample profile

As Tan and Teo (2000) state, web-based surveys are appropriate when the target is internet users and a short time frame for responses is required. Thus, this study was carried out through an online survey aimed at internet users of age 18+ in Greece without online shopping experience. An online questionnaire was posted on the Internet using Google docs facilities. To reach participants a "snowball" data collection technique was used. In order to guarantee the representativeness of the sample, quota stratification was employed taking as a basis the Greek internet users' profile resulted from the annual research conducted by Focus BARI during 2008. The sample was defined in accordance with two demographic criteria: gender and age. 100 appropriately trained university students were used to approach 10 individuals each, satisfying the quota strata determined above, and asked them to participate in the online survey. The data were collected during June and July 2010.

The research work obtained 955 responses of which 24 were eliminated because they were incomplete. Table 1 provides the socio-demographic profile of internet users in Greece (Focus BARI, 2008) and those of the obtained final sample. As for gender and age, which are the items used for quota stratifications, the sample obtained in the present study and the population of internet users is very similar. However, certain differences are observed in the other two characteristics. More specifically, the percentage of university graduates in the sample is bigger than those in the population of internet users, while the percentage of employed participants in the sample is lower than those in the population of internet users.

<i>Variable</i>	<i>Population (%)</i>	<i>Sample (%)</i>
<i>Gender</i>		
<i>Male</i>	58.5	57.4
<i>Female</i>	41.5	42.6
<i>Age</i>		
18-24	27.4	26.5
25-34	32.6	31.4
35-44	21.7	22.3
45-54	12.7	13.9
55+	5.4	5.9
<i>Education Level</i>		
<i>Primary</i>	19.3	21.6
<i>Secondary</i>	22.2	28.2
<i>College/University</i>	58.5	50.0
<i>Occupation</i>		
<i>Employed</i>	60.6	68.4
<i>Unemployed</i>	39.4	31.6

Table 1: Sample and population profile

Data Analysis and Results

The method of Partial Least Squares (PLS) analysis (Gefen *et al.*, 2000), an implementation of Structural Equation Modeling (SEM), was applied to test the measurement model, to determine the internal consistency, reliability and construct validity of the multiple-item scales used to operationalize the study variables. PLS is a multivariate technique that helps in constructs' testing of the psychometric properties of the scales used to estimate the parameters of the structural model (Fornell, 1987).

The sample size of 931 respondents considered to be adequate for PLS implementation. In general, the most complex regression in PLS implementation will involve either the indicators of the most complex formative construct or the largest number of antecedent constructs leading to an endogenous construct. Based on Barclay *et al.* (1995), sample size requirements should be at least ten times the number of predictors from either of the above rules, whichever is greater. In our case, since there are no formative constructs, the larger number of antecedent constructs leading to an endogenous construct is five and the minimum sample size based on the above rule is forty cases.

The data analysis employed a two-phase approach suggested by Anderson and Gerbing (1988) in order to assess the reliability and validity of the measures before using them in the research model. The first phase includes the analysis of the measurement model, while the second phase examines the structural relationships among latent constructs.

Validation of the measurement scale

The test of the measurement model involves the estimation of internal consistency, reliability, as well as the convergent and discriminant validity of the study constructs, which indicates the strength measures used to test the proposed model (Fornell, 1987). As shown in Table 2, all reliability measures are well above the recommended level of 0.70 as an indicator for adequate internal consistency (Gefen *et al.*, 2000).

The latent constructs also show adequate convergent and discriminate validity. Based on Fornell and Larcker (1981), convergent validity is adequate when constructs present an average variance extracted (AVE) which is greater or equal to 0.5. Convergent validity can also be verified when items loading on their associated factors are well above 0.5, which is true in our case (Gefen *et al.*, 2000).

Factors	Items	Mean	Std. dev.	Loading	CR	Reliability	Cronbach's Alpha	AVE

	BI4	5.485	1.725	0.942	164.603			
	BI5	5.535	1.672	0.945	171.735			

Table 2: Psychometric Properties of the Constructs

In order to test for discriminate validity, a matrix of loadings and cross-loadings was constructed (see Table 3). By using this matrix, the loadings of an item with its associated factor (or construct) to its cross-loadings were compared. All items had higher loadings with their corresponding factors in comparison to their cross-loadings. Therefore, it was concluded that there is enough confidence in the discriminate validity of the measures and their corresponding constructs (Chin, 1998).

Table 4 illustrates the discriminant validity of the constructs, with correlation among constructs and the square root of AVE on the diagonal. All values on the diagonal were greater than those in corresponding rows meaning that all measurement variables load more highly on their own constructs than on the other constructs (Fornell and Larcker, 1981).

Thus, it was concluded that online shopping adoption is explained sufficiently by the revealed latent variables' structure (convergent validity), and this structure includes all unique manifest variables (discriminant validity).

Table 4: Discriminant Validity Assessment

Results of hypotheses testing

The PLS method was also used to confirm the hypothesized relations between constructs in the proposed model. The significance of the paths included into the proposed model was tested using a bootstrap resample procedure (MacKinnon *et al.*, 2004). Smart-PLS software was used to conduct the PLS-PM analysis (Ringle *et al.*, 2005). Table 5 shows the model's standardized path coefficients and their statistical significance which is used for the hypothesized relations' validation.

<i>Effects</i>	<i>Std. Coefficient</i>	<i>Standard Error</i>	<i>t-value</i>	<i>Hypotheses Validation</i>

Table 5: Assessment of the Structural Equation Model

The results presented in Table 5 show support for hypotheses H1, H2, H6 and H8 as compatibility (COMP), perceived usefulness (PU), perceived risk (RISK), and perceived ease of use (PEOU), emerged as significant predictors of attitude (ATT). Further, attitude (ATT), perceived risk (RISK), and perceived usefulness (PU) proved to significantly affect customers' intentions to buy online (BI) supporting hypotheses H4, H5, and H9. Finally, perceived usefulness (PU) is affected by compatibility (COMP), perceived risk (RISK), and perceived ease of use (PEOU) supporting hypotheses H3, H7, and H10.

The proposed model accounted for 40.2% of the variance in perceived usefulness, 51.1% of the variance in attitude, and 53.6% of the variance in intentions. The relatively high values of coefficients of determination (R^2) indicate that sizeable portions of the variances in the dependent variables were explained by the chosen independent variables. By combining TAM with IDT and perceived risk, our study has shown the relevance of two other salient beliefs with customers' attitude and intentions formulation.

Discussion and Conclusions

The aim of this study is to advance our understanding in what is need to be done in order to increase penetration of online shopping in Greece. The major contribution of this study is that empirically investigates the applicability of Technology Acceptance Model's extension with Innovation Diffusion Theory

and the Theory of Perceived Risk in the online shopping context. A comprehensive research framework was developed and PLS-PM analysis was conducted to empirically validate the proposed model. The results show that there are significant relationships between research variables. Consumers' intentions to use online shopping are positively affected by attitude toward that behavior and are negatively affected by perceived risk associated with the system. The proposed framework also provides insights on the determinants of consumers' attitude formation about e-commerce. More specifically, compatibility was found to play the central role in the proposed model, since it directly affects customers' attitude, while at the same time raises customers' perceptions about the benefits of the new technology. Other significant determinants of attitude formation are the two salient beliefs of TAM, perceived usefulness and perceived ease of use, and the beliefs about risk as well.

Online shopping is considered as one of the emerging shopping channels. According to findings of this study, the priorities for online providers of product or services for better acceptance of e-commerce in Greece are to improve consumers' attitude toward online shopping by influencing consumer's beliefs formulation about the new transaction channel, and, at the same time, to reduce their perception about the risks of such behavior. As noted in previous research, compatibility, perceived usefulness and perceived ease of use lead to favorable attitude toward e-commerce (Gefen and Straub, 2004; Vijayasarathy, 2004). Virtual stores need to adjust their website contexts to match the preference of their major customer groups. For example, online vendors can provide a simple and easy-to-use interface or a rich and useful interface to enhance the shopping intention of consumers. Although attitude is an important issue in online shopping, the results of this study showed that perceived risk plays an important role as inhibitor of online shopping acceptance. This finding implies that online vendors should rely not only on the operational characteristics of websites, their perceived usefulness and perceived ease of use, but also on perceived risk of consumers toward these websites and online product and services they deliver. Practitioners need to take perceived risk into account in their website planning efforts. To diminish perceived risk, online vendors can improve the content of their websites. They also need to make special efforts to improve defects and problems that could influence consumers' perception of online shopping (Li and Huang, 2009). Other measures include: a. a money back warranty; b. a clear policy about the security and privacy of the transactions and the establishment of international standards concerning these two critical issues; c. information availability by the vendor about the online company d. a clear legal framework (Grabner-Kraeuter, 2002; Corbitt *et al.*, 2003). Online vendors need to be devoted to understand the factors that influence the formation of consumer's behavioral intention toward online shopping and develop appropriate strategies in order to influence their formation.

There are some limitations in this study. First, a non-probabilistic sampling strategy was followed for data collection, which does not allow for the full generalization of the results. The proposed model can be used for further research in close cooperation with the online vendors operating in Greece, using a random sampling approach and resulting to a more representative sample which will allow the extraction of results that represent the Greek population in total. Secondly, this study has not included some characteristics of

products/services marketed online, which may influence the choice of online shopping. Future research may identify some additional applicable factors such as product/service characteristics or individual differences so as to better understand the online shopping behavioral intentions. Finally, the findings and the implications of this research were obtained using a cross-sectional study. This reduces the ability of the study to reflect the temporal changes in the research constructs. A longitudinal study on the subject is necessary in order to determine and clarify the effects of temporal changes.

ENVIRONMENTAL CONCERN AND CONSUMER RECYCLING BEHAVIOR IN CYPRUS**Hadjimanolis, Athanasios¹**¹Professor, Business School, European University Cyprus**Abstract**

The paper refers to the empirical exploration of factors influencing the recycling behavior of consumers in Cyprus.

Environmental concern is considered as a major determinant of recycling, together with knowledge on environmental issues, socio-demographic variables, and especially policy controllable institutional factors. The theoretical model that is used as framework for the research draws on both environmental psychological approaches, as well as, sociological and economic theories. A random sample of 300 consumers has been surveyed with questions on the above determinants of recycling and the actual recycling behavior of consumers. The collected data have been analyzed by SPSS software with multiple regression and other multivariate methods.

Recycling rates among Cypriot consumers were found to be higher for women and older people. Education, environmental knowledge, and environmental concern have all a positive impact on recycling, while a high level of perceived barriers has a negative association with the recycling effort. Recycling rates were not found to vary significantly among employment or income groups.

The empirical exploration of recycling factors is a very important issue for both policy makers and product designers and an under-researched area in Cyprus, a country at a relatively early recycling stage.

Policy makers can improve recycling policies with research results based on the actual behavior of Cypriot citizens.

Keywords: consumers, planned behavior, barriers, recycling behavior.

Introduction

Conservation of the scarce natural resources and protection of the environment are increasingly being seen as major societal issues. Recycling can be considered as a significant part of conservation behavior (Castro et al, 2009). It requires consumers to choose between alternatives for disposal of a product (or its packaging), i.e. discarded as garbage or sorted and saved separately for eventual recovery of its material through special processing (Ebreo et al, 1999). Positive recycling behavior affects indirectly the purchasing of products with preference given to the selection of recyclable versus non-recyclable products and packaging (Davis et al, 2002).

Public policy has a significant role to play in the stimulation of recycling behavior through a number of intervention strategies (Steg and Vlek, 2009). These intervention strategies are briefly discussed in the next section. For the successful operation of recycling schemes consumers have to be persuaded about the importance of source separation of the different materials (Ying et al, 2007).

While most studies concentrate on advanced countries with proper infrastructure for recycling, there is a relative deficiency of studies in peripheral countries at early stages of recycling. Some recent exceptions, i.e. studies focusing on developing countries at early stages of recycling, include Schoot Uiterkamp et al, 2011 and Scheinberg et al, 2011. Cyprus is a country at an early stage of recycling and as an EU member has to deal with the problem of solid waste disposal, which is particularly acute in a small island country with limited space and inadequate sanitary landfills. Proper attention to recycling alleviates the problem of waste disposal, reduces pollution, and contributes to the protection of valuable non-renewable resources. The infrastructure for recycling has been developed in the last three to four years and is still severely limited and not well organized. Despite these infrastructural shortcomings the diffusion of recycling behavior, as a desirable social practice, is acknowledged as of paramount importance within a broad government environmental policy.

The special conditions of recycling behavior in Cyprus can be briefly summarized into the following:

- Special efforts are required for recycling on behalf of consumers due to the inadequate infrastructure. Recycling is mainly of the drop-off type rather than the curbside recycling. People seem relatively reluctant to sort waste. Only 64% of Cypriots (third lowest percentage in European Union – EU 25) agree “to sort waste so that it can be recycled” against 72% of EU 25 (Special Eurobarometer 217, 2005).
- Knowledge about recycling is relatively scarce.
- Awareness of environmental consequences of the recycling behavior is not yet high. Cypriots are less concerned about “growing waste” than other EU citizens (15% one of the lowest percentages in EU 25) (Special Eurobarometer 217, 2005).
- There is a relatively low influence of pressure groups (environmentalists).
- There is limited landfill space in an island country.

The purpose of the study is to examine the recycling behavior of Cypriots and their participation in recycling schemes. The sociological theory of context related (situational and institutional factors) is combined with the theory of planned behavior as a framework for the study. The paper tests the relationship of factors considered by these theories with recycling behavior. More specifically it investigates the impact of personal (socio-demographic and psychological characteristics) of consumers and country-specific institutional factors on the recycling behavior and explores the implications of the findings for public environmental policy and the actions of producers and marketers of consumer goods. The unique

contribution of the paper is the combination of personal and contextual factors as recycling determinants in the context of a country at an early recycling stage. There is relatively little research on drop-off recycling programs in comparison to research on curbside recycling in the literature (Sidique et al, 2010). Studies on contextual factors are also relatively scarce in the recycling literature (Steg and Vlek, 2009). Furthermore contextual factors, as extrinsic and potentially controllable variables, are more open to government policy intervention (Do Valle et al, 2005).

Section 2 below presents a literature review of the recycling behavior and its determinants, while section 3 provides an overview of the methodology followed. Section 4 gives a summary of the main research results and section 5 a discussion of the results. Finally the last section 6 presents the conclusions and a number of recommendations for public policy makers.

Recycling Behavior: A Literature Review

Many research studies have investigated the recycling behavior and have tried to determine its antecedents (Hornic et al, 1995). The two main research traditions are those of environmental psychology with emphasis on personal factors and that of environmental sociology and economics with emphasis on contextual (situational and institutional) factors viewed as barriers and facilitators for the recycling behavior (Davis et al, 2002).

Due to the early stage of recycling in Cyprus the main emphasis in this paper is on contextual factors and social norms. The main theories of recycling factors are briefly considered and the literature on contextual factors is analyzed in more detail. The theories of recycling are broadly classified as psychological (or socio-psychological to be more precise) and sociological. Psychological theories include the theory of planned behavior and the theory of altruistic behavior. The sociological theories include the theory of social pressure and the related balance theory of adapting own attitudes to those held by others, the theory of self-identity (social representation), and the social dilemma approach.

The theory of planned behavior (TPB) is one of the major framework theories in research on environmental behavior in general and recycling in particular (Ajzen and Fishbein, 1980, Tonglet et al, 2004, Knussen and Yule, 2008). In TPB models behavior is predicted by intention, while intention itself is predicted by attitudes towards behavior, subjective norms, and perceived behavioral control (Ajzen, 1991). The latter refers to the extent that a person believes that his/her actions can have an impact on a particular situation, in this case whether individual recycling activities affect the environment (Do Valle et al, 2005).

The main criticism against TPB is that it assumes that the target behavior is based on the individual's volitional control, i.e. individual will. Therefore emotions, past behavior, and habits have been measured to extend the TPB model in some studies (Carrus et al, 2008).

The theory of altruistic behavior of Schwarz has been used to explain environmental behavior (Schwarz, 1977, Bratt, 1999). It describes how people develop personal and social norms regarding moral behavior.

Participation in recycling and through it in conservation of resources and reduction of environmental pollution is considered as an activity involving both personal morality and social responsibility (Tonglet et al, 2004). The theory considers the concepts of awareness of consequences and responsibility denial in order to explain why sometimes personal norms of altruistic behavior do not lead to corresponding behavior, e.g. recycling (Bratt, 1999). The theory of Schwarz has been extended by Stern and colleagues to the value–belief–norm theory, which maintains that pro-environmental behaviors are based on personal values and beliefs that issues relevant to these values are under threat, while the individual can take action to restore the values (Stern, 1999, Oreg and Katz-Gerro, 2006).

Theories considering variables related to individual decision making are certainly important in recycling activities, a more complete, however, approach would take into account the social structure within which the individual acts and which impacts its values, attitudes, and behavior (Oreg and Katz-Gerro, 2006).

The theory of social pressure and expectations of others suggests that humans have frequently the desire to integrate into a local community therefore the social pressure by valued others like family members, neighbours, and friends has a significant impact on a durable recycling behavior (Shackelford, 2006). Research suggests a positive relationship between an individual's beliefs about the recycling efforts of others and own recycling efforts (Hage et al, 2009).

The theory of self-identity refers to the person's conception of self and its effect on behavior (Sparks and Guthrie, 1998). The individual's self-concept includes both personal and social identities. The latter derive from membership of social groups. People tend to align with the norms and behavior of such groups. For environmental group members recycling may then be part of environmental activism. For those who are not involved in environmental groups individual concerns (like favorable attitudes or perceived behavioral control) may be more relevant as decision making guides (Terry et al, 1999). Similarity between personal identity and identity of the 'typical recycler' would lead people to involvement in recycling activities (Manneti et al, 2004).

The social dilemma approach to recycling considers the costs and benefits of this activity for a particular individual (Shinoki and Kimura, 2007). Recycling activities lead to the production of a public good, i.e. improved environmental quality and preservation of resources. This causes a "social dilemma" situation where the payoff or benefit to the recycling participant is lower than that obtained by the non-participant, who obtains the benefit without suffering any inconvenience or cost (Hage et al, 2009).

Human behavior, including recycling, depends on many other factors besides the personal and motivational ones considered in the above psychological and social theories. Contextual or situational factors like the availability of recycling facilities, conditions of the logistic system of waste collection (physical proximity of containers or kerbside collection) and generally the technical infrastructure may promote or constrain recycling at the household level (Boldero, 1995, Steg and Vlek, 2009). People involved in recycling frequently face internal or individual and external or institutional barriers (Smallbone, 2005).

Hornic et al (1995) in their meta-analysis of 67 empirical recycling studies have identified two major types of variables involved, i.e. incentives and barriers or facilitators. Space, cost, and the effort needed to recycle, are some of the relevant factors since they determine the opportunity cost of recycling (Hage et al, 2009). People are more likely to recycle if they have the appropriate opportunities, facilities, and knowledge to recycle, while they are not obstructed by physical barriers like inconvenience, lack of time, and space (Tonglet et al, 2004). The model of needs, opportunities, and abilities takes the objective situational constraints directly into account in contrast to the theories and models mentioned above (Olander and Thorgensen, 1995). The low-cost hypothesis suggests that high behavioral costs due to high barriers lead to a lower impact of environmental concern on environmental behavior (Diekmann and Preisendoerfer, 2003).

The above set of barriers and facilitators are directly influenced by the government recycling policy. Governments can influence consumer recycling behavior, for example through legislation and economic incentives (Smallbone, 2005). Trust in the recycling authorities and the perceived effectiveness of government recycling policy may also have an impact on people's decision to recycle (Hansman et al, 2006, Omran et al, 2009). Local authorities play a significant role through the supply of infrastructure (recycling bins, etc.) thus increasing the convenience of recycling. The design of an appropriate recycling policy has to take into account the attitudes of people toward recycling and their perception of barriers to recycling (Tonglet et al, 2004). Such a policy could include persuasive instruments like exhortation and public information campaigns, but also specific incentives like price incentives.

Based on the above described theories and especially the TPB theory many empirical studies have considered various sets of variables as antecedents of recycling participation. They are briefly summarized under four categories socio-demographic, environmental attitudes and concern, environmental knowledge, and situational variables.

Some socio-demographic variables, like income, have been found as good predictors of recycling (Schultz, et al, 1995). Other researchers consider the effect of income as ambiguous pointing out that opportunity cost of time increases with income (Hage et al, 2009). Employment status is expected to affect recycling due to its correlation with income and especially time availability. Gender may have an influence on recycling effort and females are expected to be more active in recycling (Meneses and Palacio, 2005). Recycling efforts increase with age (Hage et al, 2009). Education has been found to be positively correlated with recycling (Schultz et al, 1995, Vicente and Reis, 2008). Others have, however, found a negative correlation relationship (Hage and Soederholm, 2008). Based on socio-demographic variables the following hypotheses have been formulated:

- H1.** Recycling rate is higher for women
- H2.** Recycling rate is higher for higher income groups
- H3.** Recycling rate is higher among older people

H4. Recycling rate is higher for more educated people

H5. Recycling rate is lower among full time employees

High awareness of and positive attitudes to ecological issues (i.e. high environmental concern), and knowledge of related issues (biodegradability, recyclability, reusable versus one-way packaging, etc.), indicate that consumers are conscious of the importance and benefits of recycling for reduction of pollution and preservation of non-renewable resources. There have been many studies supporting a positive relationship between high environmental concern and ecologically responsible behavior such as recycling (Hornic et al, 1995, Diekman, and Preisendoerfer, 2003). There is also empirical support for the relationship between environmental knowledge and environmental behavior in general and recycling in particular (Hansman et al, 2006). Other studies, however, have shown that awareness and knowledge do not necessarily lead to positive recycling behavior (Bratt, 1999, Ebreo et al, 1999, DoValle et al, 2005).

H6. Recycling rate is higher for those having higher environmental concern

H7. Recycling rate is higher for those having higher environmental knowledge

Social and institutional factors are important because they have a direct impact on recycling behavior as barriers or facilitators, while at the same time they may shape attitudes and values (Guagnano et al, 1995). Some other factors that have been considered in the literature, but are not further examined in the current study include past and habitual behavior as a powerful predictor of recycling behavior (Knussen and Yule, 2008).

H8. Recycling rate is higher for those perceiving lower barriers to recycle

The above short review of the literature indicates the importance of several categories of factors affecting recycling behavior. A parsimonious model based on a combination of the most important variables will be used. The proposed research model uses actual recycling behavior as the dependent variable of interest and four categories of independent variables as briefly described below.

1. Socio-demographic variables (gender, age, education, income, etc.)
2. Attitude related variables (Degree of environmental concern)
3. Level of knowledge about environmental recycling issues
4. Institutional and situational factors (Barriers and other variables affecting the opportunity cost).

Methodology

A telephone survey of the general public was used with computer assisted telephone interviewing. A random sample of 300 consumers from the Nicosia district has been used mainly from the urban areas, which have recycling facilities. The survey took place in October 2009. The questionnaire was designed for telephone interviews, which lasted around 5-6 minutes in order to secure the desired consumer

participation. It has been pre-tested with 10-20 consumers to spot any problems or weaknesses. Information collected refers to demographic data (age group, gender, education level, income etc.) and attitudes, perceptions, and recycling behavior as detailed in the literature section. Table 1 below describes the main characteristics of the sample.

Items from standard scales are used whenever possible in order to make the comparison with published results in other countries easier, adapted if necessary for Cyprus conditions. Apart from frequency analysis and cross-tabulation, sophisticated bivariate and multivariate statistical techniques have been used in the analysis of data with the SPSS software package. Independent t-tests, analysis of variance (ANOVA) and multiple regression represent examples of such techniques.

The dependent variable is a measure of the actual recycling behavior. It measures the recycling rate for three categories of material/packaging through three five point scales (1= never to 5 = always). It measures how frequently respondents recycled paper products, PMD (plastics, metals and composites) and glass. The summated scale of the three items: "Sumrecyclate" has a good reliability, Cronbach's $\alpha = 0.83$.

The main independent variables were socio-demographic: gender, age, education, annual family income, and work status. Regarding attitudinal variables "Environmental concern" was measured with five statements of five points each (1= completely disagree to 5= completely agree) each related to recycling. Examples of such statements are: "Recycling is a serious issue" and "Recycling deserves time and effort". The summation scale of the five items has a good reliability $\alpha = 0.84$. A summation indicator was constructed for environmental knowledge (sumenvknowl) based on three statements (1= Right 2= Wrong 3= Don't know - reconverted to 0 for further analysis). Similarly a summation scale was constructed for barriers to recycling (sumbarriers) based on four statements as reasons for not recycling (1= Not important, 5= Very important). Examples of the latter include 'lack of time' and 'distance of recycling bins'.

Table 1 Sample characteristics

Gender	Men	Women				
	49.2 %	50.8%				
Age	18-30	31-50	51+			
	20.6%	41.2%	38.2%			
Education	Primary School	Gymnasium	Lyceum	College	University	Univ.
	9.6%	10.6%	26.9%	12.3%	Undergrad	Grad.
Employment status	Unemployed	Full-time employed	Part-time employed	Pensioner		
	10.3%	63.1%	2.7%	23.6%		
Income	Less-than euro 20.000	20.0000-39.999	40000-59999	+ 60000		
	33.9%	38.9%	10.6%	4.3%		

Results

Descriptive results

The recycling rate is average (3.31 on a scale of 1-5) for paper, slightly higher than average for metal/plastics and relatively low for glass as indicated in Table 2 below. People in Cyprus recycle therefore most often metal/plastics and paper products and to a smaller extent glass. The distance of recycling bins from their homes, followed by lack of storage space, appear to be the main barriers to recycling in Cyprus as indicated in Table 3 below. The acknowledgement of the personal obligation to recycle, the belief that recycling is a serious and urgent issue and the opinion that recycling deserves time and effort are the three attitudes that have the highest level of agreement of the respondents as indicated in Table 4 below. Recycling knowledge was found to be at relatively high levels. A very high percentage (96%) of the respondents know that recycling reduces environmental pollution, while 85% know that plastics are not biodegradable, while a lower percentage (55%) know that paper is biodegradable as indicated in Table 5.

Table 2 Recycling rate

Recycling rate	Mean	STD
Paper	3.31	1.556
Metal/Plastics	3.47	1.662
Glass	2.69	1.695

Note: STD = standard deviation

Table 3 Recycling Barriers

Recycling Barriers	Mean	STD
Lack of time	1.89	1.13
Lack of storage space	2.23	1.16
Distance of recycling bins	2.56	1.26
Knowledge of sorting materials	1.71	1.00

Note: STD = standard deviation

Table 4 Recycling attitudes

Recycling attitudes	Mean	STD
Waste as threat to environment	4.27	0.58
Recycling as serious and urgent issue	4.37	0.57
Personal obligation to recycle	4.41	0.53
Recycling deserves time and effort	4.30	0.58
People not recycling harm the environment	4.26	0.66

Note: STD = standard deviation

Table 5 Recycling knowledge

<i>Recycling knowledge</i>	<i>Frequency of right answer</i>
<i>Biodegradability of paper packaging</i>	55.1%
<i>(Non)Biodegradability of plastic packaging</i>	84.7%
<i>Recycling reduces environmental pollution</i>	96.3%

Data analysis

Gender is a statistically significant independent variable in the multiple regression model of recycling rate presented below in Table 8. (In order to indicate which gender shows higher recycling rate an independent t-test was conducted confirming that the recycling rate “sumrecyclrate” is significantly higher for women (Table 6). Hypothesis 1 is confirmed the recycling rate is higher for women.

Table 6 T-test of equality of recycling rate means for gender

	<i>Mean</i>	<i>STD</i>	<i>STD Error</i>
<i>Men</i>	8.76	4.234	0.348
<i>Women</i>	10.16	4.048	0.327
<i>Sumrecyclrate</i>	<i>Sig (two-tailed)</i>	<i>Mean difference</i>	<i>STD error difference</i>
<i>Equal variances assumed</i>	0.004	-1.3999	0.4776
<i>Equal variances(not assumed)</i>	0.004	-1.3999	0.4779

Note: STD = standard deviation, STD Error = standard error

One-way analysis of variance (ANOVA) has shown that differences of the recycling rate across the four income groups are not significant. Hypothesis 2 is therefore rejected. Recycling rate is similar across income groups.

One-way analysis of variance (ANOVA) has shown significant differences across age groups (Table 7). Therefore Hypothesis 3 is confirmed. Recycling rate is higher among older people. (Scheffe test: Mean difference of the group: 18-30 and the group: (51+) is 1.95428 significant at 0.05 level).

TABLE 7 Recycling rate by age group /One -way ANOVA

Group	Age Group	N	Mean	Standard deviation	S. Error
1.00	18-30	62	8.19	4.20	0.53
2.00	31-50	124	9.49	4.05	0.36
3.00	51+	115	10.15	4.22	0.39
Total		301	9.47	4.19	0.24
<i>Test of homogeneity of variance</i>					
<i>Levene statistic</i>					
0.422	DF1		DF2		Sig.
	2		298		0.656
ANOVA	Sum of squares	df	Mean Square	F	Sig.
Between groups	153.907	2	76.953	4.476	0.012
Within groups	5123.156	298	17.192		
Total	5277.063	300			

Note: S. Error = Standard Error

Source: Data analysis

Recycling rate and education level are positively correlated, although the correlation coefficient is rather low. Spearman's correlation coefficient $\rho = 0.115$ Sig. (two-tailed) = 0.05. Hypothesis 4 is therefore confirmed. Recycling rate is higher among people with higher education.

One-way analysis of variance (ANOVA) has shown that differences of the recycling rate across the employment groups are not significant. Hypothesis 5 is therefore rejected. Recycling rate is similar across employment groups.

Recycling rate is positively correlated with environmental concern: Pearson's correlation coefficient $r = 0.275$, Sig. (two-tailed) = 0.000. Hypothesis 6 is therefore confirmed. Recycling rate is higher among people with higher environmental concern.

Recycling rate is also positively correlated with environmental knowledge. Pearson's correlation coefficient $r = 0.122$, Sig. (two-tailed) = 0.034. Hypothesis 7 is therefore confirmed. Recycling rate is higher among people with higher environmental knowledge.

Recycling rate is negatively correlated with barriers to recycling. Pearson's correlation coefficient $r = -0.426$ sig. (two-tailed) = 0.000. Hypothesis 8 is therefore confirmed. Recycling rate is higher among people with lower levels of perceived barriers.

Multiple regression results are summarized here and indicated in Table 8 below:

Dependent variable: Recycling rate (Sumrecyclrate)

Independent variables: gender, education, age, recycling knowledge (sumrecknowl), recycling barriers (sumbarriers), and environmental concern (sumenvconc). The percentage of variance explained is around 28%.

Model 2: R = 0.526 R square = 0.277 Adjusted R square = 0.262

Sumrecyclrate = 0.688 (constant) + 1.521 gender + 0.454 education + 0.660 age -0.501 sumbarriers + 0.294 sumenvconc.

The best statistically significant predictors of recycling rate are the independent variables: gender, age, and the indicator of the level of barriers (sumbarriers) as indicated in the equation above and Table 8. The assumptions of multiple regression are met as confirmed by the collinearity diagnostics and the plots of the regression standardized residual.

Table 8 Multiple Regression - Recycling Rate

Independent Variable	Unstandardized Standard		Standardized		
	coefficients	Error	coefficients		
	B		Beta	t	Sig. t
Constant	0.688	2.570		0.268	0.789
Gender	1.521	0.419	0.182	3.632	0.000
Education	0.454	0.154	0.161	2.954	0.003
Age	0.660	0.318	0.118	2.075	0.039
Sumrecknowl	0.326	0.314	0.053	1.038	0.300
Sumbarriers	-0.501	0.071	-0.371	-7.024	0.000
Sumenvconc	0.294	0.095	0.160	3.101	0.002

Note 1: (Dependent Variable: Recycling rate: Sumrecyclrate)

Note 2: (Sumrecknowl: Recycling knowledge, Sumbarriers: Recycling Barriers, Sumenvconc: Environmental Concern).

Discussion

It was found that recycling rate is higher for women and older people. This could be due to the higher environmental concern of women versus men and older versus younger people. An independent t-test has not found statistically significant differences between males and females regarding environmental concern. A one-way ANOVA test has, however, shown a statistically significant difference of environmental concern at the 0.05 significance level between age groups, especially the group 18-30 and the group 51+. An alternative explanation is that these groups (women and older people) have more time at their disposal in order to separate materials and put them in the recycling bins. The finding that the recycling rate does not differ significantly among employment groups, which include unemployed and pensioners, indicates that the alternative explanation is rather weak. In contrast to this finding Ebreo et al, (1999) have found a statistically significant relationship between employment status and recycling behavior. Hage et al, 2009, have found a clear impact of increasing age on recycling in contrast to the poor explanatory effect of other socio-economic variables in their study.

Higher levels of education have a positive impact on recycling rates. Similarly higher levels of environmental concern are associated with higher recycling. Recycling is also higher among people with higher levels of environmental knowledge. Our findings agree with those of Diekman, and Preisendoerfer (2003). Similarly Omran et al, 2009 have found that the level of awareness and understanding of recycling increases participation in recycling schemes. Other studies, however, have shown that awareness and knowledge do not necessarily lead to positive recycling behavior (Ebreo et al, 1999, DoValle et al, 2005).

Attitudes (environmental concern) were found positively associated with the recycling behaviour. Tonglet et al, 2004 report similar findings. High levels of perceived barriers to recycling have a negative impact on recycling rates. Our findings agree with those of the literature. Hage et al, 2009, for example, have found that convenience regarding collection of materials, indicating no or low barriers, has an important positive impact on recycling behavior. Access to recycling and good recycling facilities are also cited by Bratt, 1999, as essential for recycling behavior.

Conclusions and Recommendations

Recycling rates among Cypriot consumers were found to be higher for women and older people. Education, environmental knowledge, and environmental concern have all a positive impact on recycling, while a high level of perceived barriers has a negative association with the recycling effort. Recycling rates were not found to vary significantly among employment or income groups. The most important predictors of recycling were found to be gender, education, environmental knowledge, barriers, and environmental concern.

The results show that certain groups of consumers are more likely to recycle than others, while environmental concern and knowledge, including awareness of recycling facilities, as well as recycling convenience are important factors in recycling behavior.

Limitations of the reported research include the fact that self-reported behavior for a socially desirable activity introduces bias because people tend to claim higher participation rates than their actual ones.

The design of an appropriate recycling policy with realistic recycling objectives and specific target groups has to take into account the attitudes of people toward recycling and their perceptions of barriers to recycling (Tonglet et al, 2004). Our recommendations are based on two major types of strategies, i.e. structural and informational strategies (Steg and Vlek, 2009). Structural strategies should aim to improve the existing recycling facilities and eliminate barriers to recycling, especially that of distance of recycling containers. Other related active recycling policies could use taxation and regulation. Policy instruments should be tailored to local needs.

Informational strategies aim toward better marketing of recycling by identifying target segments and using for example demographic variables for segmentation of people, e.g. age, gender or education. The basic issue

in information strategies is how to translate the awareness of recycling importance among people into an intention to act and eventually try recycling and establish a long term recycling behavior. The information campaign should also try to dispel misconceptions of inconvenience and address reservations about storage in households of containers for separate materials, the physical handling of them, and the time and effort required.

A PROPOSED INTEGRATIVE FRAMEWORK OF CORPORATE BRAND IDENTITY

Halliburton, Chris¹; Bach, Stephanie²

¹ESCP Europe, London, NW3 7BG. Email: challiburton@escpeurope.eu

²Bomdardier AB, Sweden.

Abstract

The purpose of the paper is to provide an integrated conceptual framework showing how corporate brand equity is generated. It builds upon a number of previous studies which have focused upon specific aspects of brand equity and integrates these within a more comprehensive model. It is based upon a review of the corporate branding, consumer psychology and strategy literature. The result is the construction of a number of sub-models and an overall proposed framework which integrates internal and external determinants of consumer-based corporate brand equity and combines these within a comprehensive framework. The model encompasses internal, company-determined, variables, a Stimulus-Organism-Response model, the stakeholder cognitive perception process, a number of mediating variables such as corporate performance, industry sector and internationality, and the resulting impact upon corporate reputation and brand equity. As a conceptual paper, further work will be required for empirical validation, although it does have management implications by means of its integrative nature. The originality of the work is that it is both comprehensive and it puts forward an integrative model which goes beyond previous work which has focused upon specific aspects of corporate brand value. It also analyses the links between the different constructs and the directions of causality and influence.

Keywords: Corporate brand equity; corporate brand models; corporate branding; brand conceptual framework; brand management

Introduction

Brands are increasingly recognised as a key asset accounting for over 60% of corporate value. Increasing attention has been focused upon the corporate brand and a number of studies have considered different aspects of how corporate brand equity is created. Some research has treated the internal, company-driven elements, others have focused upon the consumer perception process and others have considered external mediating factors. In this article we propose an integrated model to analyse how corporate brand equity is generated. The major contribution is to provide a conceptual framework which is both comprehensive and which integrates existing work within a coherent model.

Brand and Corporate Brand Definitions

The American Marketing Association defines a brand as “a name, term, sign, symbol, or design, or a combination of them, intended to identify the goods or services of one seller or group of sellers and to differentiate them from those of competitors” and there are countless other such definitions. Unfortunately, there is no accepted definition of ‘brand value’ – for some this is equated with financial value, for others consumer metrics, and for others a combination of the two. Other terms are used such as brand equity (again for some a consumer measure for others financial), brand knowledge, brand association, brand contribution, etc. For the purposes of this paper we will use the term ‘brand value’ in its widest sense to accommodate all such possible measures, and the term “brand equity” to refer to consumer perceived equity.

Although the bulk of the branding literature focuses upon product branding, more recently there has been greater attention given to corporate branding, (Balmer, 2001a&b, Balmer and Greyser, 2003, Kapferer, 2009, de Chernatony and McDonald, 2003, Aaker, 2004). A corporate brand should give a clear picture and should personify the values of the company (de Chernatony and McDonald, 2003). Organisational characteristics such as values, culture, people and skills form a source of competitive advantage, which is difficult to copy, (Aaker, 2004, de Chernatony and McDonald, 2003). Kapferer (2009) argues that companies use the corporate brand as a tool to create and defend their reputation, to advocate a socially responsible position, and to target the labour market, especially in financial markets or business-to-business markets. The corporate brand can be used to build recognition and credibility, which in turn, can encourage relationship building (de Chernatony and McDonald, 2003), and is an important factor for international brands (de Chernatony, Halliburton & Bernath, 1995). Corporate brands focus upon multiple stakeholders, which makes their management more complex (Stuart and Jones, 2004, Baker and Balmer, 1997, Melewar and Jenkins, 2002, Kapferer, 2009, Esch et al, 2006). Corporate branding is now increasingly manifested through digital channels (Halliburton and Ziegfeld, 2009). Thus, a number of authors have concluded that corporate branding is of higher strategic importance relative to product branding, (Ind and Riondino, 2001). Various models or frameworks have been proposed for corporate brand identity, (Melewar and Jenkins, 2002, Melewar and Saunders, 1998, Gregory and Wiechmann, 2001, Staudte and Schmidt, 2004).

Methodology

We first of all conducted a review of the corporate branding, consumer psychology and the strategy literatures. We then constructed frameworks to analyse the internal and external determinants of consumer-based corporate brand equity and combined these within a proposed integrative comprehensive framework.

A Proposed Framework of Corporate and Brand Equity

We propose a framework which incorporates internal (company) factors, external (consumer) factors and mediating factors. This distinction allows us to incorporate the company’s desired positioning and brand architecture with the consumer and stakeholder perception process as well as with mediating variables.

Internal determinants

The core element here is the corporate values that play an important role in formulating the corporate mission, vision and hence corporate strategy. Corporate values also influence the corporate culture and the corporate brand personality and manifest themselves in corporate behaviour, which in turn impacts upon the corporate identity. See Figure 1. Figure 1 – Internal Determinants of Corporate Brand equity

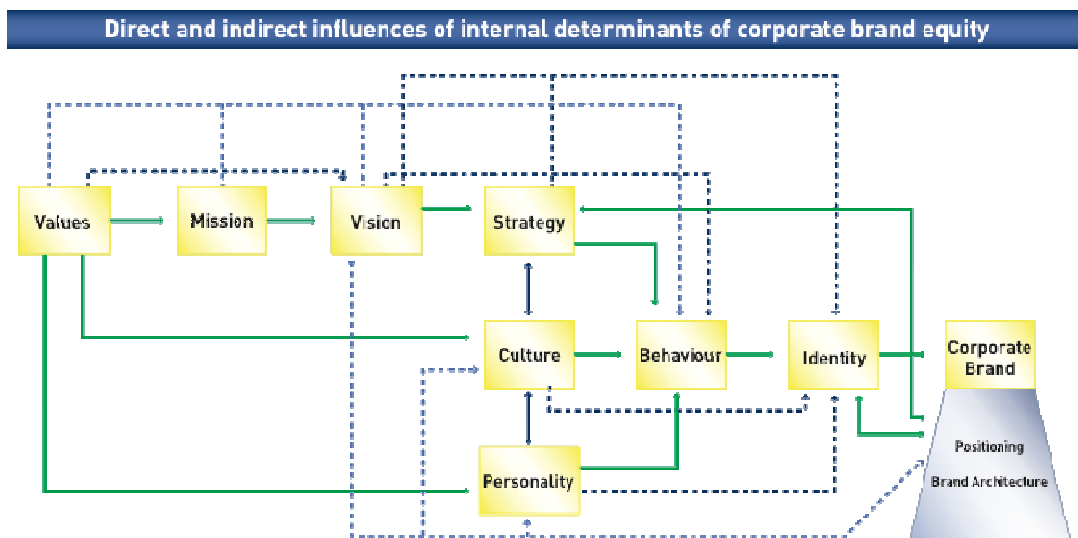

Figure 1 – Internal Determinants of Corporate Brand equity

Firstly, corporate values contribute intrinsically to brand equity, they help to harmonise actions, (de Chernatony, 2002), and they play an important role in formulating the corporate mission, which demonstrates the purpose and focus of a company's objectives and provides the basis for establishing the corporate vision. Corporate vision is the future-oriented guideline by which the organisation sets the goals and objectives it wants to achieve in the future (Grant, 2005). The corporate strategy is then selected in order to deliver the corporate vision within the particular market and competitive environment in order to achieve a sustained competitive advantage (Lechner and Muller-Stewens, 2005). The interaction between the corporate strategy and the prior elements of values, mission and vision determines the unique philosophy of the business. These determinants can either be formulated by the top hierarchy within the company or on a more collective or consensus basis across the organisation, depending upon the corporate or national culture (Simoes et al, 2005).

Secondly both corporate values and corporate mission influence the corporate culture to a significant degree (de Chernatony, 1999). Corporate culture can be seen as shared values, norms, attitudes, beliefs, ideals and organisational work habits, which not only characterise the behaviour and self-conception of the staff but also the company as a whole. The corporate culture can thus be understood as a social control mechanism that plays an important role for communication and motivation and hence influences the staff's behaviour. In order to avoid inconsistent behaviour that might be negatively perceived by stakeholders, corporate values and corporate culture should be strongly aligned (de Chernatony, 2001; Dowling, 1994).

Thirdly, corporate values affect the corporate brand personality. This is a key element that relates to the beliefs and attitudes within the organisation (Balmer, 2001). Consequently corporate identity can be seen as a subset of specific value-constellations that shows what a company represents and describes the human characteristics that are related to the firm (Davies et al, 2003). In more explicit cases the corporate personality can be characterised by the company founder's personality, (e.g. Richard Branson and Virgin or Steve Jobs and Apple), (Balmer and Greyser, 2002).

As already indicated, corporate strategy, culture and personality are the key drivers of corporate behaviour, (Herrmann, 2005). This can be especially significant when dealing with problems as well as with the perceived consistency of service. In order to maintain such consistency again it is essential that corporate behaviour is aligned with the values, mission and vision (Diller, 2001; Bruhn and Homburg, 2004).

Lastly, corporate behaviour has a direct impact upon the corporate identity, which can cover a broad and complex area across disciplines. The marketing discipline (corporate identity) and the organisational discipline (organisational identity) share a related interest. While corporate identity essentially responds to the question "what the company represents" and therefore deals with the internal and external communication of the company's unique character, organisational identity addresses the issue of "who is the company" and thus pays greater attention to internal perception and values (Balmer, 2001; Brockdorff, 2003). A company is therefore characterised by its corporate identity, by bundling specific attributes and embodying them within the staff's minds (Aaker and Joachimsthaler, 2009). However external representations such as the name, logo and visuals also contribute to the corporate identity (Dowling, 1994). Thus there is a balance to be achieved between internal and external stakeholders. For internal stakeholders, corporate identity supports identification and commitment to the company and for external stakeholders' identification of the company's uniqueness (Bruhn and Homburg, 2004). Corporate identity also plays an important role in the choice of brand architecture determining whether a product brand or a corporate brand architecture is selected (Herrmann, 2005). Brand architecture refers to the brand portfolio, either a 'House of Brand' strategy (such as P&G), a 'Branded House' (such as Unilever), or a fully corporate brand (such as Virgin or Sony). Branding decisions may be made at different levels of the hierarchy – with product brands typically assigned to middle management, whereas the corporate brand strategy is determined by top management. Hence leadership is critical in establishing a strong corporate identity, which should be

embodied in staff attitudes and behaviour, especially in the case of service brands (Balmer, 2001a and 2004). Accordingly, the corporate brand strategy should be in the line with the overall corporate strategy.

External determinants – SOR model

Corporate communications, employees as stimulus carriers and third party communication are the three major ‘**stimulus**’ components within the proposed framework. Balmer and Gray (2000) refer to this as “total corporate communications”, comprising primary, secondary and tertiary communication from the communications function itself, from the organisation and its employees, and from third parties via word of mouth. The perceptual process has received extensive attention from marketers and psychologists. This includes activation and involvement and the cognitive information processing dimensions and the affective processes of association and attitude formation. These processes are summarised within the framework under the ‘**organism**’ element of the SOR model. The responses to these processes are strong corporate brand awareness and positive brand associations across the stakeholder group. Strong corporate brands enjoy high top-of-mind awareness, important for brand choice (Keller, 2007). They also embody positive brand associations or image. In contrast to the corporate identity (company determined within the framework), the corporate image is the short-term stakeholder-specific perceptions (Fombrun, 2001, Brockdorff, 2003). The long-term corporate reputation therefore comprises the sum of the short-term stakeholder-specific corporate images. These all comprise the ‘**response**’ element within the SOR model. See Figure 2.

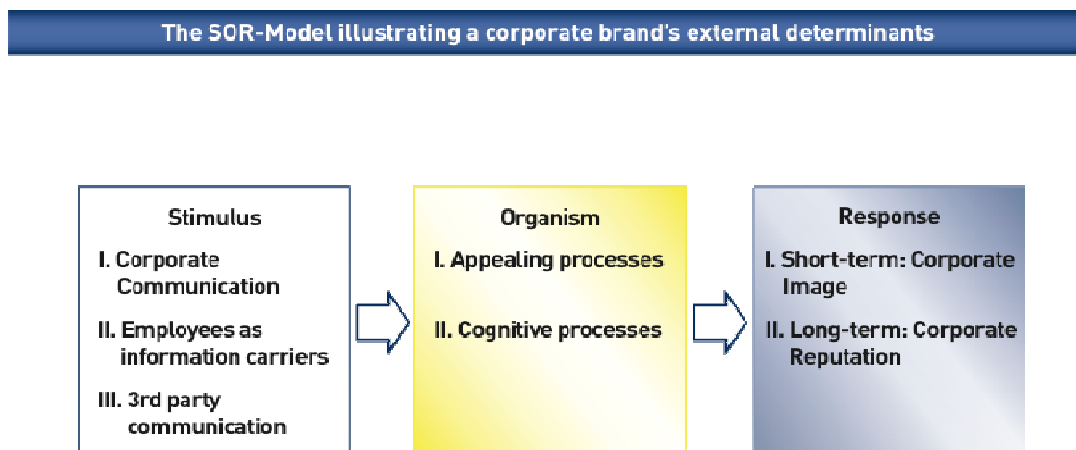

Figure 2 – External Determinants - S-O-R Model

External determinants – SOR model – ‘Stimulus’

The stimulus component of the SOR model comprises corporate communications, employees as stimulus carriers and third party communications. As a word of caution, some authors have highlighted a potential area of conflict for corporate brand management if these three are not in alignment and well managed (De Chernatony, 2001; Stuart and Kerr, 1999). However, if well aligned this can result in a positive perception of corporate identity such as quality, competence, trustworthiness, attractiveness, reliability, credibility and responsibility (Blackston, 2000).

Corporate communications

Corporate communications plays a key role in the many different areas of contact with multiple stakeholders, a role of coordination and integration. The objective is to create an integrated approach and a coherent brand architecture for the corporate brand and to ensure a consistent presentation of the organisation (Stuart and Kerr, 1999; Bruhn and Homburg, 2004).

The corporate identity is transmitted by corporate communications, corporate design and corporate behaviour. As a consequence, the relationship between the corporate identity, brand architecture and corporate brand positioning are communicated to both internal and external stakeholders via traditional communication tools such as advertising, PR and sponsorship and by newer digital methods. As regards external stakeholders, the key concerns include reliability for customers, credibility for suppliers and investors and responsibility for the general public, whereas internal stakeholders pay particular attention to trustworthiness (Fombrun, 1996).

Management and staff as information carriers or advocates

Although their importance can be underestimated, employees are valuable representatives of the corporate identity and thus information carriers and even advocates of the brand, especially for those with direct contact with external stakeholders, (Simoes et al, 2005). In order to communicate the corporate brand to the external environment in a consistent way, internal communication plays an important role (Tomczak and Kernstock, 2004). Burmann and Zeplin (2006) point to “organisational citizenship behaviour” which can be transferred to the corporate brand. The driving factor is the appreciation of and commitment to the corporate identity and, by implication, an employee’s psychological engagement to the corporate brand. This can involve active participation and internalisation of corporate identity but may also have a positive effect on employee motivation, attitudes and behaviour (Burmann and Zeplin, 2006). Hence corporate brand communication is embodied by the staff. This may be achieved by internal communication, by in-house role models, or by carefully selecting staff who share corporate values and culture (Burmann and Zeplin, 2006; Aaker, 2004; Kitchen and Laurence, 2003).

In addition, managers, especially senior managers or founders, are important communicators as they transmit the corporate values, culture, and corporate identity to internal and external stakeholders such as investors, media, analysts and the general public (Aaker, 2004; Kitchen and Laurence, 2003). Managers can

therefore embody the corporate identity leading to a relevant, long-term, differentiated and consistent positioning (Aaker and Joachimstaler, 2009) - famous examples are Bill Gates, Microsoft or Jack Welch, General Electric.

Third party communications

In addition to the company's own staff, a wide range of third parties can also contribute to brand communications. Customers are perhaps the most obvious group, where referrals, or indeed advocacy can be amongst the most persuasive communications, as evidenced in the 'net promoter' concept. A recent study by Forrester Research found that 'email from people you know' showed the highest level of trust followed by consumer product ratings or reviews (Forrester Research, 2008). Clearly the increase in social networking and consumer communities or tribes has encouraged this. Other third parties may also contribute to the total communications effort – these include suppliers, independent reviewers, influencers, trade associations, journalists, and indeed many others, Public Relations can be seen as the effort to influence some of this third party communications.

External determinants – SOR model – 'Organism'

Corporate brand perception process

Having described the stimulus, we now outline the cognitive perception process. In this context, the corporate brand embodies compacted information 'chunks' which can help to reduce the overall information-overload (Meffert et al, 2005; Baumgarth, 2004). See Figure 3.

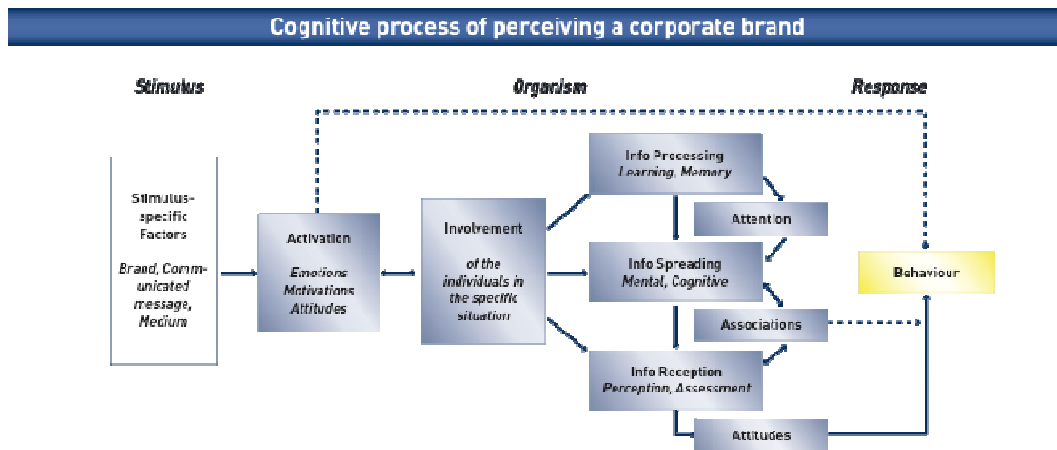

Figure 3 – Cognitive Perception Process

This framework requires that perception of external stimuli are activated via human drive forces such as emotions, motivations and attitudes that result in awareness raising and attention by the different stakeholders and which then trigger specific behaviours (Baumgarth, 2004; Meffert et al, 2005). Corporate communication can play an important role as a perception-screener or filter to influence stakeholder behaviour (Keller, and Lehmann, 2003). As emotions and hence motivations and attitudes strongly depend upon a specific culture, cultural conditions have to be taken into account when defining and transmitting stakeholder-specific stimuli, especially by globally operating companies (Meffert et al, 2005; Krober-Riel and Weinberg, 2003).

This also depends upon the level of stakeholder involvement in the product category and is determined by influencing factors specific to the person, the context and the stimulus (Trommsdorff, 2004). This activation and involvement have a significant effect on the cognitive processes, the mental, rational process of absorbing (selective perception and evaluation), handling (thinking and knowledge) and saving (learning and memory) information. Cognition therefore can be understood as the processes by which an individual conceives his/her environment and controls behaviour accordingly (Trommsdorff, 2004; Krober-Riel and Weinberg, 2003).

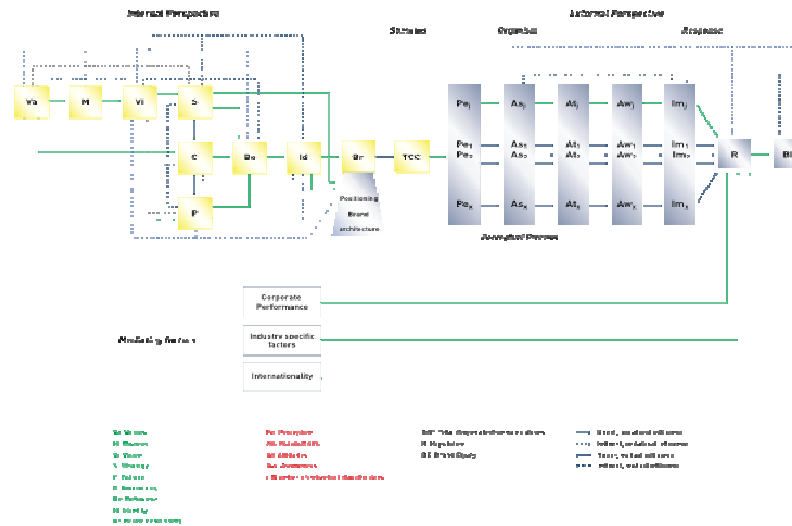

When absorbing information, specific stimuli will be selected, organised and interpreted and result in selective perception of the information. As information is digested the perceived stimuli reach the sensory memory for a split second, to be transmitted to the short-time memory subsequently. Making use of different stimuli patterns, brand management is able to trigger higher attention levels, to overcome the sensory memory and reach the short-term memory. This represents the stakeholder's active memory which decrypts, enhances, interprets and translates the stimuli into organised information leading to specific knowledge of the situation. By this means, the different stakeholders relate the transmitted information to their existing knowledge which evokes a stakeholder-specific association (Brockdorff, 2003; Krober-Riel and Weinberg, 2003). For this reason it is crucial for the perception of a corporate brand to communicate clear, stakeholder-specific messages. The previously organised information finally reaches the long-term memory. As a consequence the levels of knowledge and preferences will change, which can then cause a change in behaviour (Foscht and Swoboda, 2005; Krober-Riel and Weinberg, 2003).

So the objective of brand management is the long-term retention of positive knowledge and associations towards the corporate brand in the minds of stakeholders, given their perception process. Moreover, relevant and differentiated corporate brand associations have to be evoked in order to satisfy the stakeholder's needs. This can be supported by effective corporate communication and stakeholder contact points. In addition corporate brand associations can have a distinctive value for different stakeholders (Aaker, 1992; Dacin and Brown, 2002). Therefore, associations have an impact upon stakeholder attitudes as well as on the corporate image, reputation and corporate brand equity as outlined below. Figure 10

External determinants – SOR model – 'Response'

Corporate reputation and corporate brand equity

The outcome of the perception process is stakeholder response in terms of awareness and image and their consequent effect upon corporate reputation and hence brand equity. See Figure 4.

Va Values	Pe Perception	TCC Total Corporate Communications
M Mission	As Associations	R Reputation
Vi Vision	At Attitudes	BE Corporate Brand Equity
S Strategy	Aw Awareness	
C Culture	Im Image	
P Personality	I Stakeholders	
Be Behaviour		
Id Identity		
Br Brand Positioning		

Figure 4 – Integrative Model of Corporate Brand equity

Awareness of the corporate brand can be defined as the stakeholder’s ability to identify the corporate brand, to bring it to mind and to allocate it to a specific business category (Brockdorff, 2003). Awareness may either be passive (aided) or active (unaided) awareness, (Homburg and Krohmer, 2006). The highest level of awareness is reached if a corporate brand is selected first within its category. Such corporate brands enjoy so-called top-of-mind awareness which is especially relevant for brand choice (Keller, 1997). Corporate brand management therefore has to establish strong brand awareness as a marketing objective as well as the choice of brand architecture since this is a necessary condition for the development of a strong image and reputation, the foundation of a corporate brand value. Corporate communication therefore enables the

stakeholder to perceive the corporate identity, which is the basis of both corporate image and reputation (Aaker, 1992; Balmer and Gray, 2000).

As already indicated the image of a corporate brand is influenced by the stakeholder's specific associations and depends on tangible characteristics such as the brand name, logo, visuals, etc., (Tomczak and Kernstock, 2004). Corporate image is based upon the communication of the corporate identity as determined by the company - it is a mental picture that a stakeholder holds individually at a certain point of time. In contrast to the corporate identity (company self-perception), the corporate image describes the short-term stakeholder-specific perceptions (Fombrun, 1996; Brockdorff, 2003). Ideally these two images should be the same however this may often not be the case and so one goal of strategic brand management is to minimise this gap.

The overall long-term corporate reputation is the accumulation of the short-term stakeholder-specific images. This reputation can be seen as the collective (emotional and rational) perceptions and evaluations by all the stakeholders (Fombrun, 1996). A positive corporate reputation may be evidenced for example by the corporate brand being appreciated as responsible, reliable, credible or trustworthy; by the staff's commitment to the company; by positive tertiary communication; as well as by the satisfaction and loyalty of the staff and consumers (Aaker, 2004). The reputation is the result of a process where stakeholders evaluate all services of a company and it determines the long-term corporate brand equity generated by the organisation, (Brockdorff, 2003).

Mediating factors

In addition to these endogenous factors, three mediating variables are postulated – corporate performance; industry specific factors and internationality (Fombrun, 1996).

Influence of corporate performance

Previous studies suggest a number of qualitative and quantitative performance factors which affect corporate reputation positively or negatively. Positive qualitative factors include leadership, talent management, investment strengths, marketing intensity and CSR initiatives. Negative, or uncertain, qualitative factors include unrelated diversification (which may be perceived as unfocused or risky, (Grant, 2005)) and media presence (which may indicate operations in turbulent markets, for example the BP Mexican Gulf issue). Positive quantitative factors include market capitalisation, market share, rising share prices, equity use, return on assets and sustainability. Negative quantitative factors include volatility, risk assumptions and shareholder concentration (possibility of interference). In summary, reputation supports sustainable competitive advantage and is correlated to corporate performance mostly in a positive direction, (Carmeli and Tishler, 2005; Davies et al, 2003).

Influence of industry sector

Prior work suggests that industry sector can have an impact on corporate reputation, hence corporate brand equity (Schwalbach, 2001). To operate in a specific industry can positively influence the company's reputation due to the fact that some industrial sectors are held in higher esteem (e.g. automotive industry in Germany), whereas others have a lower reputation (e.g. energy supply companies in Germany). The industry classification can have a consequent impact for companies clearly associated with specific industries (Schwalbach, 2001).

Influence of internationality

Internationality can also have an effect if a specific industry has a high rating in a specific country. This might reflect national competitive advantages but could also relate to cognitive processes, attitudes to internationality or to specific national perceptions and country of origin effects, including explicit references such as "made in..." or "made by...", e.g. 'made in Germany' for automotive or engineering sectors, French luxury products or Italian design, (Schwalbach, 2001). Some financial brand valuations explicitly include internationality, including Interbrand for example. There is some counter evidence that in certain sectors, local brands may be preferred over global, (for example the European food sector – (Schuiling & Kapferer, 2004).

Figure 4 therefore proposes an integrative framework for the creation of corporate brand value. It integrates the internal (company) and external (consumer) variables, the perceptual process, the S-O-R-model and the mediating factors. It also attempts to show the nature of the interactions between the different variables. The previous sections outlined the different determinants of corporate brand equity and their impact on the corporate brand value. By integrating work from a number of existing sources we have tried to systematise the different heterogeneous conceptions and relate them to each other within a structured framework.

Conclusions

Our review of the branding and other literature has enabled us to propose an integrative corporate brand value creation framework. We argue for the inclusion of internal (company) as well as external (consumer) variables as well as mediating factors.

The management implications are that there is still a need therefore to reconcile academic and practitioner models and to seek greater universality. This does imply the use of a comprehensive framework which incorporates company-determined constructs as well as consumer, and other stakeholder, measures.

Limitations and Future Research

The principal contribution of this paper is to provide a comprehensive theoretical framework for the generation of consumer brand equity. The next steps will require validation of the model and empirical testing with practitioners.

EFFECT OF EXTENSION CONTACT ON RICE PRODUCTIVITY IN GAZIPUR DISTRICT OF BANGLADESH

Haq, Abu Zafar Mahmudul¹

¹Assistant Professor, School of Business, City University, Banani, Dhaka 1213

Abstract

The impact of extension contact is examined with a view to evaluate the agriculture extension in Bangladesh. It is found that the impact of extension contact is stronger for the comparatively nearer villages to upazila headquarters. This effect is weaker for those villages which are comparatively away from upazila headquarters. Evident shows that the influence of extension contact is strongly positive and significant in the upazila where peoples are mostly involved in agricultural works. The results show that the impact of extension contact which is one of the basic tenet of agricultural extension, as found in the yield of rice in the whole survey area, is strongly positive and significant. Some determinants of extension contact are also examined. Findings revealed that education of farmers, size of farm families, number of earners of farm families, irrigation and villages which are nearer to the upazila headquarters are key determinants for a household participation in extension contact.

Keywords: Extension contact, farmer, rice yield

Introduction

In order to raise farmers' income and production in developing countries, governments and international organizations have been aggressively promoting agricultural extension services in those countries. According to a review of tens of researches by Birkhaeuser and Evenson (1991), on the whole the extension services have contributed to some extent to raising the amount of information and thus the productivity levels of farmers. In the late 70s, an extension system involving 12000 workers was initiated under the denomination of "Training and Visit System" hereinafter referred to as T&V system in Bangladesh (Illah *et al.* 1996; Reynar *et al.*1996). Yet, whether or not that program actually contributed among the farmers' productivity in terms of income or physical production and if yes, whether the benefits of the system are homogeneously distributed among the farmers have not been clarified enough. The Gazipur district is one among many average rice productivity areas of Bangladesh. It is necessary to increase the rice productivity of the Gazipur district. It will support to reach the self sufficiency of the rice productivity in Bangladesh. Haq *et al.* (2003) found that the extension contact has positive impact on the income of farmers of the Gazipur district. It is also depicted that large farmers, higher income of farmers, young farmers are some key factors to adopt extension contact. The study is recognized but unclear due to smaller samples and fewer study sites respectively. To remedy this situation serious studies on the extension services and its determinants are necessary. Thus the current paper, based on farmers in the central area of Bangladesh, has two major

objectives: 1) to assess the benefits of agricultural extension services on the productivity of rice and 2) to determine the type of farmers who benefited from the extension services.

Methodology

Sampling Design

The research area was Gazipur district which is an average agricultural productivity area. The selection of the study sites and sample respondents were done purposively. There were some salient features in the selection procedure. First one, the selected district includes some important infrastructures such as BARI, BIRRI and BSMRAU etc. Second one, total numbers of selected villages were ten by taking two villages from five upazilas (subdistricts). Of the two villages in each upazila, one village is selected comparatively nearer to the upazila headquarters and the other one is selected comparatively away from the upazila headquarters. The selected comparatively nearer villages were namely, Samantapur (Sadar), Bagnahati (Sreepur), Dushya Narayanpur (Kapasias), Katalia (Kaliakoir) and Poinlanpur (Kaliganj). The selected villages which were comparatively away from the upazila headquarters, namely, Bara Bhabanipur (Sadar), Saitalia (Sreepur), Noyanagar (Kapasias), Poshim Chandpur (Kaliakoir) and Bhatgati (Kaliganj). Third one, the total households were more than one hundred in the selected villages (BBS, 1993). It was then decided to collect² one hundred samples from each village. The total numbers of investigated farmers were one thousand (2 villages x 5 upazilas x 100 farmers) and multistage random sampling technique was followed. Primary data was collected using survey method and personal interviews were conducted through pre-tested questionnaires with a view to collect data. The survey was administered with the help of staffs of the BARI in 2002. Fourth one, each upazila has some characteristics: Sadar upazila is completely urban type; Sreepur, Kapasias and Kaliganj upazilas are rural type and headquarters of these upazilas are the only urban areas while Kaliakoir upazila headquarter is the only urban area and Safipur is the other urban area of this upazila (BBS, 1993). This study can be comprehensive compared to many research works due to the above salient features which will explore the actual situation of agriculture extension either in Bangladesh or else where from the grassroots levels.

Conceptual Framework

Many of the previous researches used the productivity index representing the amount of production per unit of farm land, that is, the value added of production, which is found by deducting production costs from gross income. By using that index, it is possible to convert the specific quantities of products into given amounts of money to be added up; therefore it represents a considerable

²Data was collected from the author's Ph.D program.

analytical benefit. The method of settling the type of variables from which the index is determined, expected to be discussed.

As is commonly used in analyzing production function, chemical fertilizer, farm buildings, irrigation facilities, family and hired labours should be considered as important investment functions (Evenson *et al.*, 2001; Owens *et al.*, 2003). Haq *et al.* (2003) considered crop income per unit of land as dependent variable and chemical fertilizer cost per unit of land, irrigation cost per unit of land, experience of farmers, farm area, number of times extension contact as independent variables. Therefore, it summarized the model, $\ln \text{crop income} = f(\ln \text{ chemical fertilizer, } \ln \text{ irrigation, } \ln \text{ experience, } \ln \text{ farm area, } \ln \text{ labour, extension contact dummy}_1, \text{ extension contact dummy}_2)$. Haq *et al.* (2004) interpreted total income as dependent variable, while age of farmers, years of schooling of farmers, family size, number of educated family members, number of earners of a farm family, rural institutions dummy, number of times extension contact, proportionate effect of flood to crop land, distance between crop land to market, homestead area, size of farm, irrigation cost, village dummy were taken as independent variables. The income function was solved by applying ordinary least squares. The above concepts provide to run an empirical model which is found in the ensuing section.

Empirical Model

The model applied here is the input-output model. The heart of the input-output model is the concept of the production function $[Y=f(\text{Capital, Labour})]$ which helps us in understanding the role of important variables like capital and labour in determining the crop productivity. But only two factors have no reflection on the productivity of a major crop like rice. Therefore, based on related past studies and logical analysis some important explanatory variables which are considered in this study namely age of the farm household head (Ag), number of family earners in the household (Fea), number of times extension contact received by the farmer for the sample crop season (Et), proportionate effect (%) of flood to crop land (Fec), distance from farm land to market in miles (Mr), actual size of cultivated land in acre (Fs), per acre total cost of chemical fertilizer (Chem), per acre total labour cost (Lab), per acre total money spent for irrigation (Irr), village dummy (Vdummy) = 1 if near village; otherwise = 0 and upazila dummy (Udummy) i.e. Sadar upazila = 1, otherwise = 0.

The yield of rice (maund/acre; 1 maund=37.3 kg) is the dependent variable in the present paper as it is the major food crop in the country. It includes boro rice because it is hardly affected by the natural disaster compared to other rice crops and it was cultivated by all sample farms.

In the objective of this research, the most important variable is that of the activities of the agricultural extension services. In Bangladesh T&V system, farmlands are divided into blocks and the T&V workers target the representative farmers of the different blocks, who are referred to as "contact farmers" (Haq *et al.*, 2003). Although the T&V workers can directly get in touch with ordinary farmers, they mainly train the contact farmers, who afterwards transmit the training results to the other farmers, in a progressive system (*ibid.*). Considering this situation in Bangladesh, the current paper used the frequency of contacts on the basis of actual number of times contacted between ordinary farmers and T&V workers or contact farmers. Note that the combination of T&V workers and contact farmers is hereinafter referred to as "extension agents"

(ibid). Most of the farmers of Bangladesh are either illiterate or unskilled. Thus with the knowledge derived from extension services through extension contact, farm operators may increase their production (Haq *et al*, 2003; Owens *et al*, 2003). Relevant importance of other selected variables can be found in related literatures (Haq *et al*, 2004; Evenson *et al*, 2001; Begum *et al*, 1998). Except for the variables of contact frequency, proportional effect of flood to crop land, village dummy and upazila dummy, all the variables have been evaluated with a logarithmic converter to avoid disparities of the figures (Haq *et al*, 2003; Owens *et al*, 2003). Data have been analyzed by correlation and regression analyses. The productivity expressed in terms of physical quantity is as follows for village level analysis: $\text{Ln Rice yield} = f(\text{LnAg, Ln Fea, LnFs, Et, Fec, LnMr, Ln Lab, LnIrr, LnChem, Vdummy})$. For the upazila level analysis the above function is, $\text{Ln Rice yield} = f(\text{LnAg, Ln Fea, LnFs, Et, Fec, LnMr, Ln Lab, LnIrr, LnChem, Vdummy, Udummy})$.

Results and Discussion

Correlation Analysis

It is argued by some researchers that a correlation analysis is necessary to identify the degree of association between the dependent and selected independent variables in order to determine their expected signs prior to multivariate analysis (Evenson *et al*, 2001). A bivariate analysis is done and Table -1 demonstrates the possible signs of selected numerous factors which can affect on the yield of rice.

Regression Results

The estimated values of coefficients and related statistics of the multiple regression coefficients of villages and upazilas are presented in Table-2 and Table-3. The adjusted R² values agree with similar studies which are understandable because of the numerous factors affecting the yield of rice. The F-values are significant at 1% level of significance which implies that the specifications of the models were reasonably accurate (Begum *et al*, 1998). The results of the functional analysis suggest that except for few variables, all the variables had a positive effect on rice yield in the sample farms.

The coefficient for contact comparatively nearer villages is particularly great (0.116), compared to the villages away from the upazila headquarters (0.064). The contact coefficient is stronger in Kapasia upazila (0.112) which is followed by Kaliganj upazila (0.076) and other upazilas. According to Owens *et al*, (2003) a frequency of one and two operations per year between extension agents and farmers generates a high contribution to yield. However, a frequency of three or more than three times per year showed no clear effects in his study. Compared with the results of Owens *et al*, (2003) the results of Haq *et al*, (2003) suggests that in Bangladesh, the higher number of contacts (3 contacts or more per year) between extension agents and farmers seem more effective. Haq *et al*, (2003) found that the coefficient for 3 contacts or more per year was 0.353, while the coefficient for 1-2 contacts per year was 0.234. The present analysis suggests that in Bangladesh, the higher number of contacts between extension agents and farmers seem more effective the in the case of comparatively nearer villages with minor exception. Conversely, no such clear effects are found in the comparatively far villages since their coefficients are not significant. Jan *et al*. (2008) also observed that the coefficient for contact is stronger in the well situated villages. Analysis by upazila levels imply that higher number of contacts is more effective in the case of rural type upazila where more than eighty percent peoples are also engaged in agricultural works. Kapasia is a rural type upazila where the involvement of peoples in agricultural works is 80.15 percent (BBS, 1993) and the effect of contact is stronger in Kapasia upazila. Despite some similarities of other upazilas with Kapasia upazila, no clear effects of extension contacts in other upazilas are found as their coefficients are either significant or insignificant. The more higher number of contacts are plausible because the farmers who have more than three contacts could get case – by - case suitable guidance encouraging the application of fertilizers or prevention of insects and diseases etc.(Haq *et al*, 2003). Accordingly, it is possible to ascertain in the context of all villages as well upazilas that the contacts with extension agents contributed to improve agricultural production per unit of farmland.

Relationship of the Selected Characteristics of the Farmers with their Extension Contact

Since the average number of times extension contact in the investigated areas was not higher, it is necessary to examine what type of farmers is provided extension contact.

Table – 4 shows that extension contact is associated with the young age farmers, small size of farms, higher number of earners of a family, higher number of family members, little distance between farm land and nearest market, irrigation expenditures and comparatively nearer villages from upazila headquarters. The Vdummy is not important for extension contact. The relationship of Chem is insignificantly negative and hence, it keeps importance for extension contact. The insignificantly positive Ed implies that extension has importance for literate and illiterate farmers. According to Huffman (1974) extension activities help farmers who did not acquire enough school education to improve their ability to adjust. Similarly, the literate farmers may not

be excluded from extension contact unless the quality of education is life oriented and this situation prevails in Bangladesh and other developing countries. The difference in the educational background of the farmers keeps influence the effectiveness of extension services and thus magnify the economic gap between farmers in a vicious cycle (Haq *et al*, 2003). Therefore, extension contact is necessary to provide among all farmers regarding out their educational background since extension is a type of education for all.

Table- 4 Relationship of the selected characteristics of the farmers with their extension contact

Dependent variable	Characteristics of farmers	Correlation coefficient	Calculated values	Tabulated values*	Significance level
Et	Ag	-0.012	0.704	0.254	0.01

	Udummy	-0.088	0.006	0.254	0.01

* Bio Statistics: B K Mahajan, 6th ed. Jaypee Brothers, India.

Note: ³Ed- Schooling years of the farm household head (Mean value is 5.77 years);

⁴Fm- Number of family members of a household (Mean value is 5.34);

Explanations of Et, Ag, Fs, Fea, Mr, Chem, Irr, Vdummy and Udummy variables are same as previous sections.

Conclusion

This paper was aimed at clarifying the effects of agricultural extension on improving the productivity of farmers with the example of one district of Bangladesh, emphasizing the relevance of number of times extension contacts between farmers and extension agents. The results of the study can be summarized as follows:

First, from the estimated production function, it is clarified that the more the extension contacts between extension agents and farmers, the higher the productivity is. This clarifies that the extension contact has positive and significant effects in improving farm productivity. The effect of extension contact is stronger in those villages which are comparatively nearer to upazila headquarters. The effect of extension contact is weaker in those villages which are comparatively away from upazila headquarters. The effect of extension contact is stronger in those upazilas where the involvement of peoples in agricultural works is about eighty percent.

Second, by examining the factors determining the contacts between extension agents and farmers, a positive correlation was found with the level of education, size of farm families, number of earners of farm families, irrigation and villages which are comparatively nearer to the upazila headquarters. On the other hand, the size of farm, age of the farm household head, chemical fertilizer, distance between farm land to nearest market and upazila dummy variables have no direct relationship with the extension agents.

Considering the overall estimation, it has been possible to ascertain that agricultural extension positively contribute to increasing the rice productivity of farmers to some extent but there is a necessity to develop the system toward more efficiency for all farmers in Gazipur district of Bangladesh. It is anticipated that the findings of the study will help the planners and policymakers of Bangladesh to offer a better agriculture extension in future.

**MEASURING CUSTOMER SATISFACTION OF ELECTRONIC DEVICE BY USING
SERVQUAL APPROACH -A CASE STUDY OF UDDIPON DIGITAL SYSTEM IN
DHAKA, BANGLADESH-**

Haq, Abu Zafar Mahmudul¹

¹Assistant Professor, School of Business, City University Banani, Dhaka 1213, Bangladesh

Astract

Servqual factor is necessary in order to gain a high level of customer satisfaction. In a competitive marketplace where businesses compete for customers, customer satisfaction is seen as a key differentiator and increasingly has become a key element of businesses strategy. This study explores overall customer satisfaction as well. The major objectives of the study were as follows: customer perception towards different service quality factors and determining the customer satisfaction of overall service quality in Uddipon Digital System which is working in the IT Product Market of Bangladesh since 2003 and served more than 250 companies. Both primary and secondary data have been used. Primary data was collected through questionnaire. Analysis technique was descriptive. Many weaknesses of service quality were found. The study also thinks that many clients are possible to manage in order to accelerate the business activities of Uddipon Digital System in Bangladesh.

Keywords: Customer satisfaction, Servqual, Bangladesh

Introduction

Background of the study

In the recent world business has become more competitave where customer satisfaction plays an important role to servive in the market. To gain a higher level of customer satisfaction servqual factor is must. Customer satisfaction, a business term, is a measure of how products and services supplied by a company meet or surpass customer expectation. It is seen as a key performance indicator within business and is part of the four of a Balanced Scorecard. In a competitive marketplace where businesses compete for customers, customer satisfaction is seen as a key differentiator and increasingly has become a key element of business strategy. This study explores overall customer satisfaction as well by considering the major objectives which are as follows:

- Consumer perception towards different service quality factor.
- Determining the customer satisfaction of overall service quality in Uddipon Digital System.

Significance of the study

There is almost no study found on customer satisfaction of IT products of Bangladesh and in this respect this study will be able to find out the satisfaction level that would help IT product firms like Uddipon Digital System for their service development through service quality where needed on the basis of the findings of the study.

If any company wants to go or introduce in the market they can study this report. This report might help them to aware the current customer demand and such other factors. After studying this they can easily maintain firm their shrines easily & solve or ignore the major problem to serve the best to the clients.

The use of information and communication technology has been playing a vital role in the 21st century due to globalization and the government is encouraged to adapt with the coming future. The government of Bangladesh has target to establish a resourceful and modern country by 2021 through effective use of information and communication technology- a "Digital Bangladesh".

"Digital Bangladesh" does not only mean the broad use of computers, perhaps it means the modern philosophy of effective and useful use of technology in terms of implementing the promises in education, health, job placement, poverty reduction etc. Therefore, the government underscores a changing attitude, positive thinking and innovative ideas for the success of "Digital Bangladesh"(www.digitalbangladesh.gov.bd).

The philosophy of "Digital Bangladesh" comprises ensuring people's democracy and rights, transparency, accountability, establishing justice and ensuring delivery of government services in each door through maximum use of technology-with the ultimate goal to improve the daily lifestyle of general people. Government's "Digital Bangladesh" includes all classes of people and does not discriminate people in terms of technology. Hence, government has emphasized on the four elements of "Digital Bangladesh Vision" which are human resource development, people involvement, civil services and use of information technology in business. This paper will also aid to learn the factors regarding the titled issue by doing this, which factor may affect the company what they do for the performance.

Literature Review

Customer Satisfaction Research

Both public and private sectors have given much attention to the concept of customer satisfaction in the past couple of decades. Naturally, administrators have requested their staff to do customer satisfaction studies for their own organizations. In this section, the researcher elaborates on the importance of the customer that is the access control user and its perception

towards the service provided by the access control service provider and their satisfaction on the service received. Consumer satisfaction provides the basis for the marketing concept and has been shown to be a good predictor of future purchase behavior. As a reflection of its importance, consumer satisfaction is a popular topic in the marketing literature. Most models of consumer satisfaction—and service quality—maintain that discrepancies between ex ante expectations of a good or service and the product's ex post performance are the best predictors of the satisfaction or quality perceived by the customer (e.g., Oliver 1977, 1980; Parasuraman, Zeithaml, and Berry 1985, 1988).

Customer Satisfaction

The concept of customer satisfaction has drawn the interest of academics and practitioners for more than three decades in the light of fact that customers are the primary source of firm's revenue without the emergence of the consensual definition of concept. Churchill and Suprenant (1992) define customer satisfaction as an outcome of purchase and use resulting from buyers' comparison of the rewards and costs of the purchase in relation to the anticipated consequences. It also has been viewed as an emotional state that occurs in response to the evaluation of a service (Westbrook, 1981). The former conceptualization recognizes that satisfaction is determined by a cognitive process of comparing what customers receive (rewards) against what they give up to acquire the service (costs), whereas the latter view satisfaction as an emotional feeling resulting from evaluation process. Consistent with this view, customer satisfaction is defined as an emotional response, which results from a cognitive process of evaluating the service received against the cost obtaining the service (Woodruff et al., 1991; Rust et al., 1994). Satisfaction is an emotional or feeling reaction. Moormann (2000) defines satisfaction as a positive feeling about a particular entity. Rust et al (1996) define satisfaction as how customer perceives service and how they feel about it. This is because customer decisions take place in the customers' mind. Oliver (1991) defines consumer satisfaction as the overall attitude towards goods or services after they have acquired and used it. It is post choice evaluative judgment resulting from a specific purchase selection and the experience of using/consuming it.

Customer satisfaction measure is useful for assessing the effectiveness of efforts to redesign elements of the service delivery system (Chase et al., 1991)

Service Quality Research

Delivering high quality services has been recognized as the most effective means by which a service company's can create a competitive edge from the competitors (Parasuraman et al, 1991). Studies have also demonstrated the strategic advantage of delivering superior quality to market share as well as profits (Gronross, 1988). Research on services has grown correspondingly. In particular, academics and practitioners alike have exhibited considerable interest in the issues

that surround the measurement of service quality. Service quality is one of the major issues facing operations managers (Gupta et al., 1995) but it is an area characterized by debate concerning the need for assessing customer expectations and service quality assessment (Parasuraman et al., 1994). Service marketing literature in general and service quality in particular is still evolving and not achieves the maturity stage yet, thus this study is aimed at exploring the service quality in the UDS management services which is still lacking behind and need further explored.

Relationship between Satisfaction and Service Quality

Satisfaction is defined as a customer's perception of a single service experience, whereas quality is the accumulation of the satisfaction for many customers over many service experiences. Such post-evaluation experiences perhaps lead over time to a more general attitude. Moreover, service is equal to the perception of a single service as received and measured against the expected service received. The difference in the degree, direction and discrepancy between perceptions and expectations of a customer result in a level of satisfaction or dissatisfaction (Hill, 1992).

The relationship between customer satisfaction and quality can be explored by using Gronroos (1984) quality dimensions. In his work, Gronroos determines the technical quality of the service process that the customer is left with when the service production process and its buyer-seller interactions are over. Customers can often measure this dimension relatively objectively because of its technical nature. The service dimension is another quality dimension, which has been used in literature as a functional or process quality of the process. The customer is also influenced by how he receives the service and how he experiences the simultaneous production and consumption process.

However, in the literature three theoretical conclusions can be found regarding the relation between satisfaction and (service) quality. First, (service) quality is understood as an antecedent of customer satisfaction (Peyrot et al, 1993; Woodside et al, 1989). According to this interpretation, (service) quality is equated with the customer's appraisal of a concrete product or service experience (Gotlieb et al., 1994). Consequently, it does not include expectation aspects, whereas satisfaction is based on the (dis-) confirmation of expectations associated with the service or product experience.

Second, both constructs are treated as one and the same. According to this approach no significant theoretical difference between satisfaction and (service) quality exists (Gummesson, 1987; Spreng and Singh, 1993). As with the first interpretation, the aforementioned divergences concerning the higher stability of quality perception and the emotional dominance of satisfaction are ignored by this approach.

The third approach is where customer satisfaction is modeled as an antecedent of quality. Following this interpretation, the product and/or service related quality perception is as seen as

the higher order and more stable variable, which is built mainly on previous experiences of (dis-) satisfaction related to discrete transactional episodes (Bitner, 1990; Bitner and Hubber, 1994; Bolton and Drew, 1991, 1994). Thus, satisfaction is regarded as a short term emotional state that results from an intrapersonal comparison of the customer's expectations with the evaluation of a single product or service encounter. This emotional state of satisfaction leads to an overall, global attitude about (service) quality (Dabholkar, 1993) which is only implicitly based on some kind of internal expectation standard. Because quality is a dynamic construct, additional consumption experiences influence and modify the existing quality perception and cause changes in this perception (Thompson and Getty, 1994). In other words, multiple satisfaction evaluations contribute to an overall quality evaluation.

In this research, it follows what Rust et al (1996) has clearly illustrated in the relationship between perceived quality and satisfaction. It has pointed out in two different situations. As illustrated in Figure 2.1, the perceived quality is higher than expected. This situation will usually result in satisfaction. Oppositely perceived quality is not as good as expected. In this situation will result in dissatisfaction. This disconfirmation (gaps) forms the conceptual basis for the SERVQUAL model for the service quality and satisfaction.

Conceptual Framework

The framework will provide the researcher with a guide on how to develop the service quality instrument to be implemented in this study. The development of framework has to start from an initial idea and concept. In this case of implementing service quality, one can start by trying to analyze the range of options available such as development of service quality dimensions as well as the existing models of service quality. The researcher will discussed at the service quality dimensions from various studies. Service quality is multidimensional (Parasuraman et al, 1985) and a very complex phenomenon (Gronroos, 1998). Thus this section is to identify the most suitable construct and dimensions for highway management services. The framework is illustrated as Figure 2.1 below.

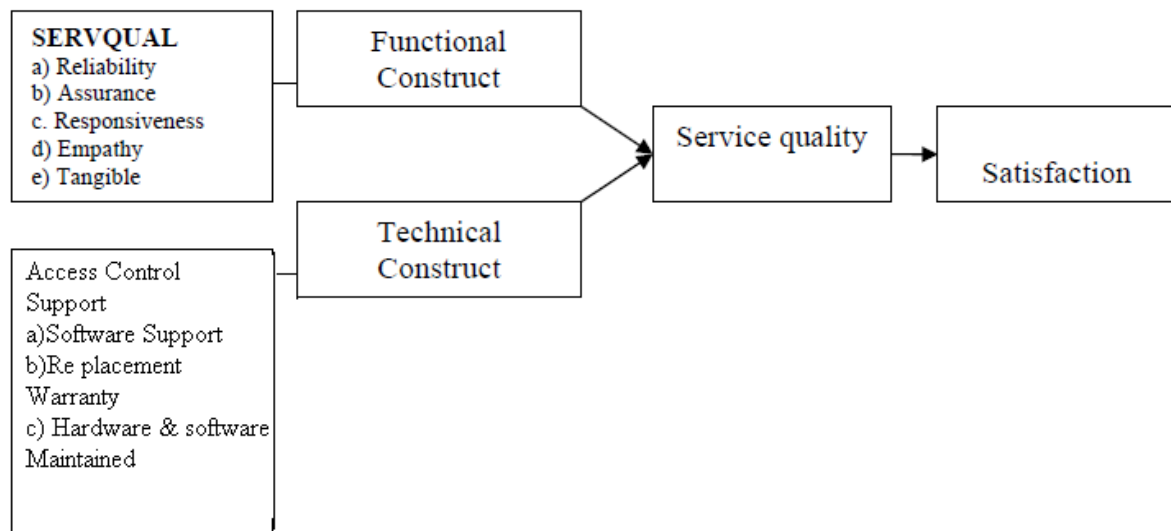

Figure 2.1: Proposed Conceptual Framework

The model proposes that the service quality consist of technical and functional dimensions. The model also proposes that there are direct relationships between service quality perception and the technical construct and the quality dimensions, in addition to the indirect effects of technical and functional quality on service quality perception. The model also suggests that the service quality leads to customer satisfactions. There is theoretical support for a multi dimensional, multi level model of service quality (Dabholkar et al, 1996), but little effort has been taken to conceptualized and empirically tests such structure.

SERVQUAL was modified in the present study to reflect the nature of UDS management services. Parasuraman et al (1988), indicated that such modifications were appropriate and do not represent difficulties related to the reliability and validity of the instruments.

The SERVQUAL Model

Given the growth of services in the last decades, many researchers have recognized the need to develop measures of service quality. One of the most often used measures is the SERVQUAL based on extensive research in generic determinants of perceived service quality (Parasuraman, Berry et al. 1985; Parasuraman, Berry et al. 1988; Zeithaml, Parasuraman et al. 1990; Parasuraman, Berry et al. 1991; Parasuraman, Berry et al. 1993; Parasuraman, Berry et al. 1994). The model measures the difference between customers' expectations about general quality of a certain group of service providers and their perceptions about the actual performance of a service provider from that group. It uses a set of service quality determinants measured by a 22- item scale. The model defines customer satisfaction as perceived service quality, which is the gap between expected service and perception of service actually received. Many studies in different service

industries use the model as a basis for developing surveys to evaluate customer satisfaction, which was the ambition of the authors.

Dimension in SERVQUAL Model

Boulding et al. (1993) perceived the dimensions of service quality as a function of a customer's prior expectations of what should transpired during a service encounters, as well as the customer's most recent contact with the service quality delivery system. These perceptions of quality dimensions form the basis for a person's intended behavior. Their findings suggest that the two different types of expectations have opposing effects on perceptions of service quality and that the service quality perceptions positively affect the intended behavior.

Starting with the ten dimensions, Parasuraman et al (1988) conducted studies in several sectors to developed and refined SERVQUAL, and using factor analysis reduced the ten dimensions to five. These five new dimensions were defined as below and summarized in Table 2.3.

Tangibles

According to Kotler (1999), Bitner and Zeithaml, (2003), the appearance of physical facilities, equipment, personnel and communication materials of an organization is the tangibles. Churchill and Peter (1999) added that customer look for quantity in the equipment, facilities and communication used to provide the service.

Reliability

According to Kotler (1999), Bitner and Zeithaml (2003) the ability to perform the promised service dependably and accurately is the reliability. Churchill and Peter (1999) added that customers want performance to be consistent and dependable.

Responsiveness

According to Kotler (1999), Bitner and Zeithaml (2003) responsiveness is the willingness to help customers and provide prompt service. Churchill and Peter (1999) added that customer must see service provider as ready and willing to perform.

Assurance

According to Kotler (1999), Bitner and Zeithaml (2003) assurance means the knowledge and courtesy of employees and their ability to convey trust and confidence.

Empathy

According to Kotler (1999), Bitner and Zeithaml (2003), empathy means the provision of caring, individualised attention to the customer. Key dimensions used in this study can be summarised as Table 2.3 below:

Tangible	Appearance of physical facilities, equipments, personnel, and communication materials
Reliability	Ability to perform the promised service dependably and accurately
Responsiveness	Willingness to help customers and prompt service.
Assurance	Knowledge and courtesy of employees.
Empathy	The firm provides care and individualised attention to its customers.

Table 2.3: Dimensions in SERVQUAL Model

While being widely applied, the SERVQUAL model has also received criticism for not including prices in the assessment or for the inclusion of expectations as a variable in measuring service quality (Boulding, Kalra et al. 1993). Perhaps the most often heard criticism pertains to the lack of a clear link between satisfaction and perceived service quality identified by some research (Duffy and Ketchard 1998). An alternative model (SERVPERF) was later developed for these reasons, based on the findings that service quality does not depend on expectations and can be directly measured by simple performance based measures of service quality (Cronin and Taylor 1994).

Service Quality Model

According to Grönroos (1982), the quality of a service perceived by customers will differ depends on what strategy the company chooses to deliver and promote that service. The service quality model by Grönroos holds that the quality of a service, as it is perceived by the customer, can be divided into technical quality and functional quality dimensions. The former denotes what the customer receives as the output of a service production process and the latter how the technical quality is produced and transferred to the customer during buyer-seller interactions

Grönroos (1988) posits that the technical quality is the “basic condition for a positively perceived total quality, but the functional quality is the one that adds competitive edge” (Gummesson and Grönroos, 1987). Furthermore, in the relationship marketing, the growth of the importance of functional quality in comparison to technical quality becomes a strategic one

(Grönroos, 1993). The distinction is also made in the model between perceived and expected service quality and it is suggested that the quality is perceived subjectively. Grönroos, (1988) further develops the model by positing that in the case of a company, which extends product offer with services, it is more appropriate to talk about total perceived quality. According to him, a high perceived quality is obtained when the experienced quality meets customer expectations, i.e. the expected quality. However, if the expectations are unrealistic, the total perceived quality will be low, even if high quality was experienced (Grönroos, 1988). Grönroos urged that the total perceived quality is not only defined by the level of technical and functional dimensions, but also by the gap between the expected and the experienced quality.

Discussion on the Proposed Researched Model

Based on the Parasuraman et al (1988) gaps model, this research will focus on the gaps 5, where it measures the perceived service against the expected service provided by the highway service provider to measure their service quality. According to Parasuraman et al (1988) the smaller the gap between adequate service and perceive service, the higher the perceived adequacy of the service. The gap 5 is simplifies as Figure 2.2 below.

Figure 2.2: Service Quality FRAME WORK 1

According to Gronroos (1988), in order to make a list of determinant or factors of good quality useful for managerial purposes, it has to be short enough, but still provide a comprehensive list of aspects of good quality. Therefore, for the purpose of this study the researcher has chosen Parasuraman et al (1988), ie the five service quality dimensions as the most relevant study because it fit with the suggestion made by Gronroos (1988) the quality dimensions has been developed specifically for services, and the dimensions are derived from empirical studies and statistical analysis. Zarita (2006) demonstrates that these five dimensions will be one aspect of service quality construct that is the *functional/process construct*. Thus the suggestion of the conceptual model based on the above discussion is illustrated as figure 2.3 below

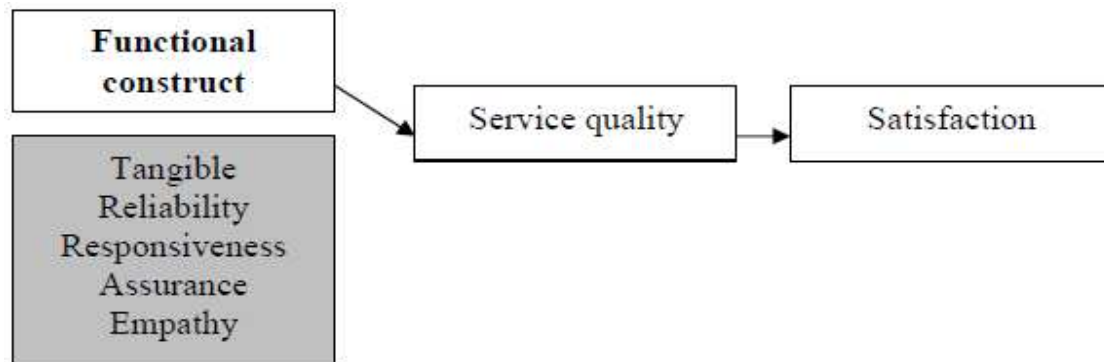

Figure 2.3: Service Quality FRAMEWORK 2

As Parasuraman et al. (1988), suggest that the five (5) dimensions above are generic dimensions which are appropriate to apply in measuring Service Quality for all service sector. However, Taylor and Baker (1994), urged that the relationship of service quality is different from industry to another industry of services as mentioned by Carmen (1990). New factors should be added and taken into account based on generic and appropriateness of the services sectors.

Gronroos (1988) urged that the quality of a service, as it is perceived by the customer, can be divided into technical quality and functional quality dimensions. The technical quality is the basic condition for a positively perceived total quality. In the UDS management and services, the UDS and the facilities used by the access control users represent the *technical/outcome quality* dimensions. On the other hand the highway service provider/concessionaires who provide the management and maintenance of the services and facilities represent the functional or process dimensions. Operational highway management and services consist of two main task (1) the management and (2) maintenance. The management involves all the coordination of work, toll collections, supervision and other management task, whereas maintenance involves the outcome of the physical aspect which is the road and its facilities. Figure 2.3 below illustrate the framework and conceptual model based on the conclusion made.

Figure 2.3: Service quality FRAMEWORK 3

The technical or Outcome quality of the physical aspects is the second part of the framework which is the maintenance of the access control and facilities. However, in the marketing terms, it is known as the physical evidence. Zeithaml and Bitner (2003), customers often rely on tangible cues, or physical evidence, to evaluate the service before its purchase and to assess their satisfaction with the service during and after consumption.

Service Quality Foundations

There are many factors regarding a products or services which have a direct impact on customer satisfaction, service quality is one of them. If the quality of service is not good, the customer will not be satisfied. So as a consequence it will be very difficult for that product or services to survive in the market any longer. So it has been chosen service quality as an important factor to assess customer satisfaction on access control of uddipon digital system.

Besides, access control is also a services oriented product. So to know the customers satisfaction level on access control service quality is must. Otherwise the study would not satisfy the objective taken in this report.

Methodology

Overview of Uddipon Digital System:

The organization is a group of young and experienced energetic professionals working as the driving force behind this Company Uddipon Digital system since its inception in the year 2003 in Bangladesh. In this short span of time it has already earned a good reputation by its' own sincere effort and hard work.

The organization initially started with Sales and Service of Computer Hardware and Supply of Networking Products and Accessories in the Bangladesh market.

The organization gradually developed the Company in the line of business of Import, Wholesale Distribution and Retail Sales of IT products like Computer Hardware, Networking products and various kinds of Electrical and Electronic equipments and Accessories including Electronic Security systems, among others.

Uddipon digital system has our Registered Office to take care of our Corporate Affairs and a Showroom-cum-Shop for marketing and sales purposes.

Uddipon Digital system gradually developed the Company in the line of business of office automation products Time Attendance Solution, Access Control & High Security ID card Printing, Automated Security (including access control and CCTV) and Biometric related technology. Product line of it includes the latest Barcode & Biometric Printing, Scanning and Reading technologies and all the solutions for POS. We offer a variety of portable stationary

devices including Portable Data Collection Terminals (PDTs) and state-of-the-art forward compatible spread spectrum Radio Frequency (RF) technology for real time data collection with wireless networks.

During the past few years of successful consolidation and dominance as one of the automated company in Bangladesh which concentrates in local market through the business partners.

The corporate policy of Uddipon Digital system is to take prompt business decisions; regular and careful work supervision and monitoring, professional skill development through appropriate training and human resource development. A panel of highly skilled Technical & Management Consultants is always at hand to tackle critical issues to help facilitate smooth business transactions both at home and abroad.

Data collection

For organization of the paper, it has been used the knowledge and experience from various department of Uddipon Digital system. An effort has been tried to focuses the service quality system in Uddipon Digital system. To complete the paper it is used some official documents provided by the authorized person of the company. To add more valuable information, researcher has searched the company profile and website. Some other books writing on service quality also helped to finish the paper successfully. Primary data has been collected through personal interview with the investment officer to make the concept clear.

- Target population: Corporate clients are considered to collect relevant data of the study.
- Sample size and sampling technique: 15 corporate clients have been selected through convenience sampling techniques due to the time and cost constraints. Self-administered questionnaire is the research instrument. The questionnaire was close-ended where 5 points liker scale is used from I= strongly disagree to V = strongly agree. Face to face or personal interview was the data collection techniques since the rate of refusal is usually low under these methods (Sherlaker, 1990).

Analytical Technique

Analytical Technique: Descriptive analysis has been conducted. Mean analysis has been applied in order to fine respondents perception towards Tangible, Reliability, responsiveness, assurance, empathy and service quality.

Findings

Here it has been tried to find out the satisfaction level by calculating mean value of customer response on SERVQUAL Factors.

I - Strongly Disagree

II - Disagree

III – Neutral

IV - Agree

V - Strongly Agree

Part - 1

Section	Question	Mean
Tangibility	1. The physical facilities at Uddipon digital system are visually appealing.	3.3
	2. Materials associated with the service are visually likable at Uddipon digital system.	3.6
Reliability	3. The products/services provided were represented accurately by the company.	3.5
	4. The product is delivered on the promised time by the company.	4.3
Responsiveness	5. Employees of Uddipon Digital system give prompt service to customers.	3.1
	6. The company shows a sincere interest in solving the problem.	3.1
	7. Employees of Uddipon Digital system always willing to help customers.	3.1
Assurance	8. Service time provided by the company is enough for the product.	3.5
	9. Replacement service that assured is given properly in warranty time.	4.5
Empathy	10. The employees of Uddipon Digital system Understand the specific needs of their customers.	3.0
Service Quality	11. Access to overall services is satisfactory.	3.5
	12. Communication style and information provision is at satisfactory level.	2.9
	13. Security of your care is satisfied with Access control solution.	3.4
	14. Competence in overall service delivery is satisfactory level.	3.3
	15. Customers are satisfied with the up-to-date range of physical facilities of access control.	3.4

In part 1, the analyzed data on perception has been described on the basis of organization's Tangibility, reliability, responsiveness, assurance, empathy; service quality. Here is the explanation of the collected data one by one.

Tangibility

We had asked our valued clients about the organization physical facility. But it is seen that most of the clients were less than agree in the case of organization Physical facility. Out of 15 sample sizes, 2 were strongly agree, 5 were agree, 5 were Neutral, 2 were disagree and rest 1 were strongly disagree about the Physical Facility. The mean is 3.3 that stand in natural position.

On the other hand, we also asked about the material associated. Our question was " Materials associated with the service are visually likable at Uddipon digital system " In this case Out of 15 sample sizes, 1 were strongly agree, 9 were agree, 3 were Neutral and 2 were disagree. But nobody claimed strongly disagree about this option. So it can conclude that

Fig.-4.1

most of the clients are agree on the respective factors.

Reliability

We asked to the clients that the company represent all the products / services accurately or not. In this case Out of 15 sample sizes, 2 was strongly agree, 6 were agree, 5 were Neutral, 2 were disagree and 0 were strongly disagree that the products/services that came were represented accurately by the company. It is seen that on average the clients are between neutral and agree position.

When we asked about the delivery process which the customer ordered, the clients agree that they got the products what they ordered. In this case Out of 15 sample sizes, 6 were strongly agree, 3 were agree, 3 were Neutral, 3 was disagree. But nobody claimed strongly disagree about this option. So it is seen that on average the clients are in agree position about they got the product what they ordered.

Fig.- 4.2

Responsibility

We have tried to find out the employee prompt service to customer. Out of 15 sample sizes, 2 were strongly agreed, 4 were agreed, 4 were Neutral, 3 were disagree and 2 were strongly disagreed about employee prompt service to customer. In the conclusion it is seen that the ratio is neutral position.

One of our questions was about the sincere interest in solving the problem.

Out of 15 sample sizes, 3 were strongly agreed, 3 were agreed and 1 was Neutral, 8 disagree. Nobody strongly disagree it. In the conclusion it is seen that the ratio is neutral position.

Fig.- 4.3

When we asked the clients about the willingness to help customer Out of 15 sample sizes, 2 were strongly agreed, 2 were agreed, 7 were Neutral, 3 were disagreed and 1 strongly disagree it. In the conclusion it is seen that the ratio is neutral position.

Assurance

When we asked the clients about the time period give by the company for the product. After completing the analysis that it is seen that Out of 15 sample sizes, 2 were strongly agreed, 6 were agreed, 4 were Neutral and 5 were disagreed and 1 was strongly disagreed. Nobody strongly disagree it. But In the conclusion it is seen that the ratio is between neutral and agree.

We asked to the clients that "Replacement service that assured is given properly in warranty time". Out of 15 sample sizes, 7 were strongly agreed and 8 were agreed. Nobody Neutral, disagreed, strongly disagree it. In the

conclusion it is seen that the ratio is between agree and strongly agree. So it is seen that most of the clients were satisfaction in this stage. And they had no claim against the question. It is also good point to get more potential clients.

Fig.- 4.4

Empathy

We are trying to find out The employees of Uddipon Digital system Understand the specific needs of their customers. Depending on this issue, out of 15 sample sizes, 2 were strongly agreed, 5 were agreed, 1 were Neutral, 5 were disagreed and 1 was strongly disagreed. In the conclusion it is seen that the ratio is neutral. So it is quite alright and it may play bad impact on looking the potential customer.

Fig.- 4.5

Service Quality

To find out the Service quality level we asked clients against Access control. The question was ". Access to overall services is satisfactory." Out of 15 sample sizes, 3 were strongly agreed, 5 were agreed, 5 were Neutral, 1 was disagreed and 1 were strongly disagreed. In the conclusion it is seen that the ratio is between Neutral and agree. So it is also alright and does not play any bad impact on service quality.

We also asked the customers that are they getting everything from Uddipon digital system what they need. Out of 15 sample sizes, 6.67% was strongly agreed, 26.67% were agreed, 26.67% were Neutral, 33.33% were disagreed and 6.65% was strongly disagreed. In the conclusion it is seen that the ratio is neutral. So this factor may play bad impact on customer service quality.

On the survey it is seen that Out of 15 sample sizes, 20% were strongly agreed, 33% were agreed, 20% were Neutral, 20% was disagreed and 7% was strongly disagreed against the argument "Security of your care is satisfied with Access control solution. So the mean value is 3.4. In the conclusion it is seen that the ratio is between neutral and agree.

When we asked a question on Competence in overall service delivery is satisfactory level, out of 15 sample sizes, 1 was strongly agreed, 7 were agreed, 3 were Neutral and 4 were disagreed .Nobody strongly disagreed with the statement. In the conclusion it is seen that the ratio is neutral position. So this factor may play bad impact on service quality.

And finally when it went to know about the customers are satisfied with the up-to-date range of physical facilities of access control, out of 15 sample sizes, 4 were strongly agreed, 5 were agreed, 0 were Neutral, 5 were disagreed and 1 were strongly disagreed about their quality of services. In the conclusion it is seen that the ratio is between neutral and agree. So this factor does not play any bad impact on service quality.

Fig.- 4.6

Conclusion

After analyzing the data, it has been found that some factors may play bad impact on service quality which may reason to decline clients. Although most of the clients did not make any comment regarding the issues, it may reply that they may leave the company at any time.

From the finding of the report and the discussion of the objectives, I can present some suggestion. Such as-

- From the findings as it has seen that the responsiveness is not enough strong because of the employees are not willing help and they are not sincere solving the problem. So they should increase the responsiveness.
- Most of the clients complained that they are not responded when they get a problem from a client. If they have not enough human resource, they may hire some more engineers.

- In case of the service, most of the clients were not pleased. They should develop their service quality.
- One bigger thing is the promise which the company may breaks as per the clients view. So the company should keep their promise. Otherwise they will fail to satisfy their customers.
- Uddipon digital system communication style is not good. So they should develop the communica

Managerial Implication

Most of the case it is seen that the clients were unhappy because of the product and employee in Uddipon digital system. Not only that but also customers are not well satisfied regarding the after sales services. So the managing director should take special action on behalf of this issue. For ever organization service quality is like a vehicle. Without the best service quality the company may fall down and lost from the competitions market. There are lots of competitors in the market. The managing director should survey to other competitors to find out their service quality or working procedure which will add extra benefits for the organization. The MD always should be dated about the information of the competitors. An organization should be ready to provide the latest customer service.

A customer always wants quick service. So, in this case the organization should keep more service provider because they solve the problem within short period of time. If the company fails to response any query within very short time, the customer will be dissatisfied. Moreover the organization should guarantee to the customer to keep the information confidential.

From the above discussion it has to provide some curative key for the development of the company. After evaluating the objectives, it is seem that most of the clients are dissatisfied with the products, service and finally the customer services. They should sincere about the above three items to increase their sales and brand value.

Uddipon Digital System is one of the most potential Access control product supplies in Bangladesh. The employees of this firm are very much expert and they have the knowledge how to capture the market and provide the necessary support. But the firm needs more employees for its substantial growth. It would rather feel like producing researcher's personal opinion about practices in the head office. It has been found that they have many multinational & leading companies in Bangladesh. So they need to provide necessary support to the clients more strongly rather than now.

**THE CASE OF FINANCING AN INDUSTRIAL ENTREPRENEUR BY BASIC BANK
LTD, GULSHAN BRANCH, DHAKA, BANGLADESH**

Haq, Abu Zafar Mahmudul¹

¹Assistant Professor, School of Business, City University, Banani, Dhaka 1213, Bangladesh

Abstract

This study has been conducted on “The case of Financing an Industrial Entrepreneur by BASIC Bank Ltd.” Gulshan Branch, Dhaka in order to achieve the aspiring objective of:

- To know the genesis and present Status of BASIC Bank Ltd. Gulshan Branch.
- To analyze case history of an entrepreneur financed by the branch.
- To suggest policy implications arising out of the study.

It has been found that in the development of Future Entrepreneur BASIC Bank Ltd. played a good role. Their deposit growth is more than 5.4% where as the providing loans growth is 1.88%. That result shows that the efficiency of loans was provided & deposit collected.

In the other objective by studying the case it was found that the entrepreneur didn't face a lot of problem to have the loan if the documents are provide on the right way & almost the coordination of the employee is very much heartfelt. Basically in the case study the entrepreneur had faces a lot of problem in doing business but the characteristics of the leadership is much in him.

By considering the case it is a successful story where very few recommendations needed to given:

- Diversify the managerial power
- Increasing Investment.

Keywords: Entrepreneur, BASIC Bank

Introduction

Background Of The Study

Industrial Entrepreneur play an important role in the value addition of the economy and there they helps in the economic development of the county. They provides employment of million of men and women, sources of technological innovations and new product make an easy entry as well as exist of industrial enterprises. They also create value addition to local price and can

establishing forward and backward linkages. Besides, they can produce exportable surplus and thereby helps to earn foreign exchange.

Bangladesh is mainly an agro-based country and her economy has undergone rapid structural transformation towards manufacturing and services. Industrial entrepreneurs specially medium and small have considered as the principal driving force of Bangladesh economy. Industrial enterprises in Bangladesh, along with stimulating private ownership and entrepreneurial skills are flexible and can adopt quickly to changing market demand supply, generate employment, helps diversify economic activities and make significant contribution to the exports and trade of the declined from 50% in 1973-99 to around 20% in 2009-10 (ERB, 2010). So now, boosting the industrial sector should be an imperative and along with the growth of this sector which includes large, medium and small, the financial market have played significant roles in both urban and rural areas.

In the industrial sector, Industrial policy has been prepared, taking into consideration the govt's determination to achieve the MDGs by 2015, and have the number of the unemployed and hunger and poverty stricken people by 2017. To alleviate poverty by creating additional employment opportunities, the policy aims to create job for at least one man per family. The policy envisages rapid industrialization through short, medium, and long term measures, aiming to raise the rate of GDP growth to 8% by 2013 and 10% in 2017 and thereafter. The proposed policy puts emphasis a private sector industrialization efforts but at the same time vows to reform the public sector enterprises to make them profitable. The proposed industrial policy envisages an increase in the industry sectors share in GDP to 40% by 2021 from the 28% and this proportion of the employed work force to 25% by that period from 16% more. The main features of Bangladesh's industrial sector with opportunities for establishing import substituting industries alongside expansion & improvements of export oriented ones. These policy issues have a positive role in the development of industrial entrepreneurs in Bangladesh.

In considering the above context, the issue of financing in industrial enterprises as well as entrepreneurs, is getting importance by The Bangladesh Bank, The Central Bank of the country. The Bank of Small Industries & Commerce Bank Ltd. (BASIC) registered under the Company Act 1913 on the 2nd August, 1988, started its operation from 21st January, 1989. The main mandate of BASIC Bank is to provide financial services to the Small enterprises spreaded throughout the country. The proposed study on "Financing an Industrial Entrepreneur by BASIC Bank Ltd.- Gulshan Branch, Dhaka" is a modest attempt by the researcher as a requirement of the entrepreneurship program. It is hoped that the study will help bank management to handle industrial entrepreneurs more efficiently. The future researcher in this line will find a new way of their thinking specially The Financial aspects & add knowledge in the existing researcher. The

entrepreneurs will also be benefitted by having a good knowledge and understanding of the practical business as well as taking right decision in right time.

Objective of the Study

The broad objective of the study was to analyze the financial aspect of an industrial entrepreneur of BASIC Bank Ltd. Gulshan Branch.

The specific objectives of the study are as follows:

- To know the genesis and present Status of BASIC Bank Ltd, Gulshan Branch.
- To analyze case history of an industrial entrepreneur financed by the branch.
- To suggest policy implications arising out of the study.

Scope

The entire study was based on a case study of an Industrial loan holder. As this is an intensive study, the scope was confined to the entrepreneur only.

Methods of investigation

Data sources:

Data were collected basically from two sources:

- Secondary Sources.
- Primary Sources.

Secondary sources:

Data collected from secondary sources were based on the following aspects:

- Operational materials of the Bank;
- Annual Report of BASIC Bank Ltd;
- Periodicals published by Bangladesh Bank;
- Gulshan Branch, BASIC Bank, documents on enterprise financing.
- Website information.

Primary Sources:

The study was based on case study method and the stages of investigation employed in this study are given bellow:

Study area:

BASIC Bank Ltd. Gulshan Branch (112 Gulshan Avenue, Gulshan, Dhaka-1212) was the study area of this research.

Study Sample:

As a case study, a single unit was selected for the study.

Sampling Unit:

Mars Knitting Ltd. was selected as a sampling unit for the case study because the entrepreneur is one of the loan holders provided by BASIC Bank, Gulshan Branch.

Sample Size:

The size of the sample was limited to only one unit. In spite of that much concentration was given to make it as objective as possible. It is hoped that this effort fulfill the requirement or efficiencies, reliability and flexibility.

Methods of Data Collections:

Questionnaire, Personal Interview etc was employed to collect data for the case study.

Limitations of the Study

The study suffers from the following limitations:

- As the case is based on a particular individual unit, the personal experience of other Industrial clients of BASIC Bank Ltd was not considered.
- All the information is not gathered from the main Industrial loan holder Retd. Lt. Col. Monirul Islam Khan. As he was reluctant to give some of the important information, researcher had to rely on his staff.
- It was not possible to do numerical assessment of Retd. Lt. Col. Monirul Islam Khan's business because of his non-co-operation regarding profits and other personal matters. In spite of the limitations, it is hoped that the study would be able to fulfill the objectives.

Genesis of BASIC Bank Ltd. Gulshan Branch

Introduction to BASIC Bank Ltd.

The BASIC Bank Ltd. was established as a banking company under The Companies Act 1913 and licensed its operation in 1989. At the outset the bank started as a joint venture enterprise of the BCC Foundation with 70% share and Government of Bangladesh with the 30% share. The BCC Foundation being nonfunctional following the closure of the BCCI, the Government of Bangladesh took over 100% ownership of the bank on the 4th June, 1992. The bank was

established as the policy makers of the country felt the urgency for a bank in the private sector for financing Small Scale though it is not nationalized.

Adjudged as one of the soundest bank in Bangladesh, The BASIC Bank is unique in its objectives. It is a blend of development and commercial banking functions. Fifty percent of its loan able funds revenue to be invested in Small and Cottage Industries.

Approach of BASIC Bank Ltd.

The bank attaches special emphasis to technical and advisory support to small scale industries in order to enable them to sum their enterprises successfully. Micro credit to the urban poor through linkage with NGO's with a view to facilitating their access to the formal financial market for the mobilization of resources is another diversification of services offered by the bank.

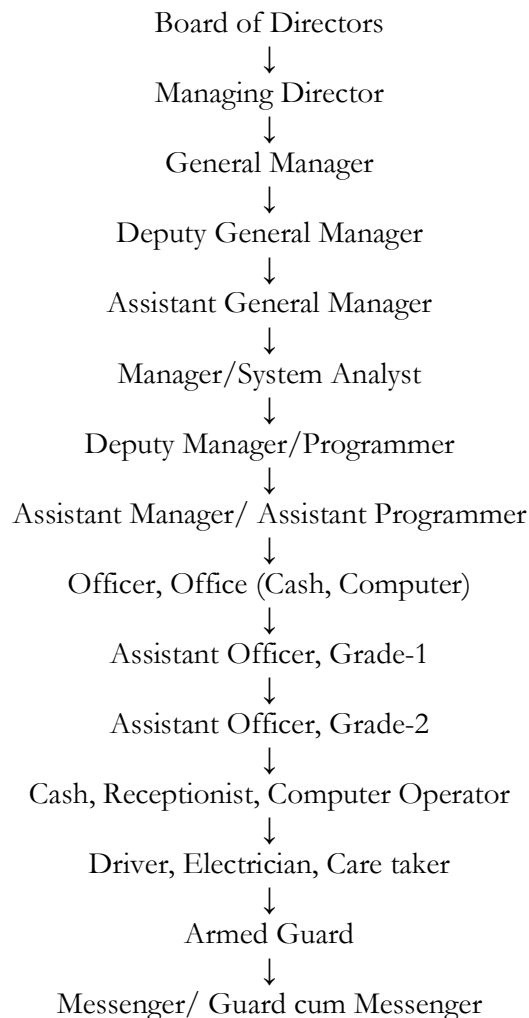

The bank provides an environment in which its staff members feel they can exercise their initiative and judgment within a clearly established frame work. The bank is the leader in offering excellent career opportunity in transparent and participative management culture. Coping with the competitive and rapidly changing financial market, BASIC bank maintains close contraction with its clients. The regulatory authorities, the share holders (GOB), other banks & financial institution.

Organizational Goal of BASIC Bank Ltd.

- To employ funds for profitable purposes in various fields with special emphasis on Small-Scale Industries.
- To undertake project promotion to identify profitable area of investment.
- To search for newer entrepreneurs for investment & development products to such needs.

Organizational Structure, Head Office, Dhaka
