Entrepreneurship development program of the bank

The founders of this Bank envisioned to foster entrepreneurship from among the potential, new and small entrepreneurs and to generate employment through financing SMEs. In harmony with the dream dreamt by our forefathers, BASIC Bank never ran after the so called blue chips (the established and larger corporations) to maximize our profit. Rather, we always remained stick to the triple bottom line: People, Planet & Profit and focus attention to the Small and Medium Scale Enterprises (SMEs). In this way, a lot of entrepreneurs have grown with us through which employment opportunities have been created for a large number people.

The trend of Loans & Advance Of BASIC Bank Ltd. is one most thing by that easily the entrepreneurship development program can b understand.

From 2006 to 2010 the trend is almost upward where as the other financial institute are ran after the client to sell loan.

Monirul Islam Khan also had to fulfill those criteria before getting his loan. The following are a snapshot of his personal and professional profile:

Name	Retd. Lt. Col. Monirul Islam Khan
Father's Name	Late Ahsanul Khan
Present Address	2, Abbas Nir, Mohakhali DOHS, Dhaka
Family Composition	Mother, Wife, 1 Daughter, Son in Law
Name of Term Loan Product	Overdraft
Name of the Bank & Branch	BASIC Bank Ltd. (Gulshan Branch)
Tenor	36 Months (Renewable)
Interest Rate	13.00%
Security Provided	Flat what has owned for him.
Nature of Business	Manufacturing Fabric from Yarn.

Table: Profile of Ret. Lt. Col. Monirul Islam Khan

Source: Mr. Monirul Islam Khan

The Motivational Forces Behind The Success

Mr. Monirul was brought up in a middle class family in the city of Kushtia where he got the chance of good schooling. He was the elder son of his family and had three younger brothers. Like all the other middle class families his parents somehow managed to provide him with secondary and higher secondary level education (SSC and HSC). His dream from childhood was to become a professor of the Dhaka University, but unfortunately his destiny had something which he never dreamt of. He didn't know that the dream which he has dreamt for his future is going to be shattered so viciously.

It was his father (Mr. Mijanul Islam Khan) who used to give him the motivation and inspiration to go ahead in life and fetch the dream. One day all of a sudden his father called him up and said that he should start packing his bags to go to Dhaka for his higher studies. He was totally surprised when he heard the news and was thinking how his father who was just a simple service holder managed such a big amount for his higher studies. On asking, his father replied that he sold one of his four piece of land and took some loan against their house from his neighbors Md. Hasanuzzaman, Mahbubur Rahman who also were very good friends. Mr. Monirul was deeply mesmerized by his father's sacrifice. He didn't know what to say when he heard all these from his dad and was totally speechless. He was both happy and worried about the fact that how his father was going to repay the debt. Finally, he thought that his dream was taking the shape of reality as he started his journey to pursue his higher medical studies in Dhaka. With his outstanding results in both the preliminary education (SSC & HSC) he got admitted in Army.

It seemed like a wind of change has finally blown the dark clouds of sorrow and was bringing a new hope of light into his life. It was a new beginning for him and with that happiness and new enthusiasm he was about to get started with his new life. The way of life becomes changing & he did excellent performance in that sector. He made himself as an intelligent & curious person that increased his thirst for knowledge. This thirstiness about knowledge made him different from others. The other main characteristics are sincere about doing jobs. He is also sincere about time. These three things made him successful in his life. By these reason he got the award of his career & at the time of resigning he was continuing the post of Colonel in the Army. After giving his best performance he got the honor that he dreamt of on his boyhood.

The Struggle Towards Success

After resigning from the armed force he didn't want to waste his time by passing idle work. So for that he thought that he had to do something for him, his family & for the society. So for that he started a Fish Feeding Mill in Khulna because there are vast demands of the feed in the south side of the country. The major people of the Khulna division are attached with fish business. He

judged the demand & for that he goes to the business with a good investment. By this investment he cut a good return from the business.

To start the business he had to face many problems because he was an outsider of the city. He had to find it out the supplier, land, worker support etc. So for that he found Mr. Rajib Rahman who doing business since 1994 in the same sector with a few investments that is not sufficient to survive & gaining more return. Mr. Monirul Islam Khan offered him for joint business with a share of 70:30. Mr. Rajib Rahman accepted this offer & helped him in the business.

After resolving this problem the Fish Feeding Mill was running good & creating a face value towards the farmer. By earning a good face value Mr. Monirul Islam Khan thought that he had to increase the capacity of the mill. But on that time he had a heart attack in 1998 & it was major. So for that he was unable to work for 8 months, on that situation the mill going to be loosing because lack of proper care. In the same time Mr. Rajib Rahman betraying with Mr. Monirul Islam Khan & want to take over the 60% share of the mill. For that he showed that on the time of Mr. Monirul Islam Khan the mill losses 14 Lac taka in 3 months.

By his illness & betraying of Mr, Rajib Rahman, Mr. Monirul Islam Khan took decision that he doesn't run the business any more. After taking this decision he sold his share to Mr. Rajib Rahman & Abdul Bari. By selling his share he got 35 Lac taka as per ratio. Mr. Monirul Islam Khan then came back to Dhaka & took rest 6 months by doing nothing.

The Beginning of His Business

In the time of rest he found that in Bangladesh the RMG (Ready Made Garments) is the most growing business & from this an entrepreneur can get a good profit by using time & tide ness with cheaper price. But he didn't have interest in main business because it needs a lot of money what is not possible to invest by Mr. Monirul Islam Khan at that time. He thought that he came to the supply chain on RMG because it needs not huge money whether by proving the quality Mr. Monirul Islam Khan can earn good profit from it. He find that yarn is the main raw material of RMG. So he made a factory named **Mars Knitting Ltd.** near the Gazipur Road what present capacity about 20 tons a day by the handling of 110 employees.

Mr. Monirul decided to use his previous experience in opening up his mew business. Mr. Monirul faced a lot of trouble running his new business. Though he had the knowledge experience to operate such an industry but he faced problem to get order from the buyers. So to collect the order he came as a leader to the entire employee. First he used his previous position to meet the buyers & then try to convince them where as the merchandiser also tried their best collect order. But Mr. Monirul didnt wait for them so that he also tried from his perspectives. That made him successive to operate his business. In that time the persons who had a good connection with Mr. Monirul by the way of his previous business were very much helpful to

running his business by giving suggestions, policy making, organizing & getting more work order.

By passing a tough time near about 2 years Mr. Monirul made his business running well. In that time he cut a good profit of 15 lac taka per year. The work order goes up & up because of the quality & time ness. But it wasn't possible to serve by Mr. Monirul Islam's industry because of poor investment. So for that he thought that he had to take a loan from the bank for developing his business. He made a plan to take the loan from such type of bank where small & medium investment enterprises are motivated. Then he contact with BASIC Bank- Gulshan Branch with the hope of getting a loan to spread his business as the demand grows up.

Introduction With BASIC Bank

By the suggestion of the business partners & familiars Mr. Monirul goes to the BASIC Bank- Gulshan Branch & meted with the manager to have a loan. Then the branch manager insist him take loan for the development of his business. There he found the same proposal what he heard from the outsiders & almost fair support for him.

Particulars of proposed venture

BASIC Bank explained him the whole procedure of what are the requirements needed to apply for an Industrial loan. They stated that there are two kinds of Industrial loan, and they are:

Cash Credit:

<i>Eligibility</i>	<i>All Industrial businesses where the Key personnel have 5 years experience in the line of business.</i> <i>Satisfactory credit report</i>
<i>Method of Appraisal</i>	<i>The client's business experience, expertise, business volumes and monthly cash flow are used in the assessment process.</i>
<i>Margins (indicative)</i>	<i>The quality of receivables would be of importance in fixing margins up to which working capital is made available.</i>
<i>Tenor</i>	<i>Maximum 36 months (Renewable)</i>
<i>Pricing</i>	<i>Risk based pricing strategy, in line with the market rates.</i>
<i>Security</i>	<i>Primary:</i> <ul style="list-style-type: none"> • <i>Charge on the inventory and receivables.</i> • <i>Charge on other current assets</i> <i>Personal guarantee of proprietor/partners/ directors.</i> <ul style="list-style-type: none"> • <i>Charge on fixed assets.</i> <i>Secondary:</i> <ul style="list-style-type: none"> • <i>Collateral security on a case-to-case basis.</i>
<i>Interest</i>	<i>13% Fixed Rate, typically for 36 months.</i>
<i>Review</i>	<i>Facility terms & pricing are both reviewed at least annually</i>
<i>Processing fee</i>	<i>Processing fee of 1% is generally charged on small loans. Actual fee charged is determined on a case-to-case basis.</i>

Table : Details of SME Overdraft Facility

Source: BASIC Bank Ltd Website, face to face conversation with officials of Gulshan Branch

Mr. Monirul Islam Khan selected the Overdraft Loan as it matched his criteria. The requirements of taking an Overdraft Loan were also fulfilled by the client. Mr. Monirul Islam Khan then had to submit all his legal business documents as stated in requirement of Overdraft Loan. The steps of the whole procedure are given below.

Step - 1: Mr. Monirul filled up the loan application form and the charge documents which were provided by BASIC Bank.

Step - 2: BASIC Bank sent the necessary information to Bangladesh Bank for obtaining the CIB report of Mr. Monirul Islam Khan.

Step - 3: The Bank then sent some of their credit officers to verify the business stocks of Mr. Monirul Islam Khan and also had a brief observation of his family. These verifications are done without informing the Industrial loan holder.

Step - 4: Disbursement was made within 96 hours after receiving the clean CIB report from Bangladesh Bank.

After going through all the terms and conditions and the procedure he finally had his loan. The total procedure took around 15 days and Mr Monirul Islam Khan got the revolving Overdraft Industrial loan of Tk. 60 lac for 36 months on 15th June 2002.

The Industrial loan turned out to be a blessing for Mr. Monirul Islam Khan. It took his life to a happy trail from a murky, gloomy and dismal one. By this he brought some equipment of around 40 lacs for his factory & rest of the money were used for purchasing raw materials and as working capital. Gradually the production capacity goes up & the owner gets the competitive edge at that business.

Present Status

<i>Company Name</i>	<i>Mars Knitting Ltd.</i>
<i>Asset Worth</i>	<i>Tk. 10 Core (approximately. 2010)</i>
<i>Business Place Rent</i>	<i>Tk. 2,00,000 per month</i>
<i>Business Type</i>	<i>Moderate Scale</i>
<i>Target market</i>	<i>Reputed RMG Manufacturing Company</i>
<i>Major Competitors</i>	<i>Various textile companies</i>

Table: Present Business Status

Source: Mr. Monirul Islam Khan

Future Plan

Mr. Monirul Islam Khan has the plan not to expand his business in the textile sector but he want made his business more competitive by providing quality product. He had the plan to make his daughter & son in law efficient in this business on the time of his absence the business will run well. His upcoming target is to make a new factory where he can made large volume products. So for that he wants to buy a place where he would be able to make a factory of his own. For that he wants to submit a proposal to the BASIC Bank Ltd. for a Long Term Industrial Loan near about 15 core tk.

Problem of the entrepreneur in Bank Loan

Although the loan holder didn't face a lot of problem to have the loan amount but for sanctioning the loan the borrower has to submit all the required documents where the employee of BASIC Bank by giving proper suggestions. For the approval of the loan the loan borrower has to mortgage his flat. By submitting all the require documents he got his loan at the earliest time.

Objective Analyze of the entrepreneur's problems

From the study the required objectives are fulfilled:

- From the first objective the researcher found that BASIC Bank Ltd.-Gulshan Branch has doing a good performance on deposit collection & providing loans to the clients.(Page-9- Growth of Deposit & Growth of Advance of BASIC Bank Ltd.)
- The entrepreneurial qualities are also finding out from the study, because on basis of the qualities the success comes to him.
- At the study the researcher tries to give some strong recommendations which are very much needed to imply in the industry of the loan borrower.

Findings From The Case Study

Explanation of Is There Any characteristic of entrepreneur found in Mr. Monirul Islam Khan

Mr. Monirul Islam Khan certainly possesses most of the characteristics of an entrepreneur within himself. The steps he had taken when he was 50 years old & prove that age is not a barrier for becoming an entrepreneur. But sometimes it has a good influence on running a business. He loose his business in Khulna at the age 52 with having poor health but his desire didn't stop to go forward.

Whether Mr. Monirul Islam Khan Comparable to a Successful entrepreneur

Mr. Monirul Islam Khan is definitely comparable to a successful entrepreneur. He has all the qualities (risk taking capacity, new business policy, positive thinking, time consciousness etc) of an entrepreneur and is always optimistic to achieve good things. He is always looking forward to take up new challenges and is a good risk calculator. He assumes the future condition but he hadn't the aspiration to make his business too large.

One of the main reasons behind Mr. Monirul Islam Khan for Becoming a Successful Entrepreneur is not to waste time where as the other reasons are also work as same. He has the motto of using time as much you can.

Evaluation of The Accuracy of Making Decision of Mr. Monirul Islam Khan

It has o be said that Mr. Monirul Islam Khan has always been absolutely clear about his decisions from the very young age. He made the right decision of joining ARMY in the young age & then after retirement the beginning business in Khulna. After loosing this business he also judged the importance of RMG sector. These two decisions proved him accurate decision maker.

The Influencing Lessons from Mr. Monirul Islam Khan To Be An Entrepreneur

The influencing lesson from Mr. Monirul Islam Khan is that age & money is not a barrier to a man to be an entrepreneur. He proved that with utilizing time, hope & right decision a man can

be successful entrepreneur with having a little investment. Determination about the goal & right time right decision for the upcoming situation is the main lessons come from him.

Mr. Monirul Islam Khan - An Opportunity Seeker With Examples.

Mr. Monirul Islam Khan is an opportunity seeker and has always grabbed the opportunity to go ahead in life. He initially grabbed the opportunity to start his business of fisheries because of its huge demand & then comes to the Textile. He can judge the upcoming situation very well.

Summary of findings, recommendations

Diversify the managerial power

Mr. Monirul Islam Khan needs to diversify the managerial power to other. Because at that age he is not willing to take more risk to increase his business. Though the family members are not willing to take over the business but it is very much needed to make them ready to take the challenge. To diversify the managerial power Mr. Monirul Islam Khan can choose his daughter or son in law who are very much reliable. For that he has to motivate to attend the office at least two days within every week or after the lunch of three days in a week. First he has to give them power & share of his business & also give some job that did they make it successful. After some of the short term liability they may be motivate to take more responsibility and from that the Managerial Power can come out.

Increasing Investment

Mr. Monirul Islam Khan has to increase the investment because it will make him more competitive in the price decreasing. Mr. Monirul Islam Khan will be able to produce more products which will be cheaper than now & make him competitive. The price competitiveness has added extra advantage for his business. The present business asset of Mr. Monirul Islam Khan is 10 crore where as the other competitors are invested a huge amount but not based on that, the increasing investment is needed for capturing more order which will make his business in a good shape.

Policy Implication

In the part of policy implication the researcher suggest that the entrepreneur has to give emphasis on the recommendation i.e. diversifying managerial power, increasing investment & some internal change. The overall study is a successful one whether the entrepreneur had faces a lot of problem but with the help of BASIC Bank Ltd. & his internal capacity he came out from all the uncertainty. Here in this part the entrepreneur have to make a good relation with the BASIC Bank Ltd. which played an important role to become a successful entrepreneur. Where as the bank has not such type of marketing capacity to disclose/branding them(entrepreneur) to others.

The leadership capacity & also the help of BASIC Bank Ltd. is the main topic to gathering knowledge from the case which based on a practical one.

**DETERMINING A MULTILEVEL MEDIATING ROLE OF
WORK CHARACTERISTICS IN RELATIONSHIP BETWEEN
MACRO-ORGANIZATIONAL VARIABLES AND
WORK PERFORMANCE OUTCOMES**

Hernaus, Tomislav¹

¹Department of Organization and Management, Faculty of Economics and Business, University of Zagreb. Email: thernaus@efzg.hr

Abstract

The paper presents an in-depth research on the link between 4 macro-organizational and 15 micro-organizational variables from a multilevel perspective, using a HLM methodology. The research was primarily oriented towards understanding the nature of the influence which macro-organizational, organization design concepts have on their micro-organizational, work design counterparts. Multilevel analysis was conducted on a research sample of 51 organizations and 1285 work positions. The results showed that cognitive and social characteristics of organizations have significant influence on work characteristics. While the influence of cognitive characteristics is much stronger and more widespread, the influence of social characteristics also exists, although it was present only partially.

Furthermore, a lower-level mediation analysis was conducted in order to test a mediating role of work characteristics in relationship between macro-organizational variables and work performance outcomes. Research findings revealed a partial existence of mediating effects in almost 50% of all possible relationships. They were more represented in the case of contextual performance than in the case of task performance as an outcome variable, and with a more significant influence regarding cognitive characteristics (cross-functional training in particular) than social characteristics of organizations. Results led to the conclusion that some macro-organizational variables have a more or less direct influence on work performance, as well as to the insight that some work characteristics are more relevant than others, depending on particular organization design practice.

Keywords: organization design, work design, work characteristics, work performance, multilevel analysis, lower-level mediation

Introduction

Current business trends are putting significant requirements on everyday working practice and are causing rapid changes. Due to globalization and information technology development, as well as due to influence of other relevant factors, organizations are forced more than ever before to internally align and optimize their systems, rewards, structures,

employees, jobs, and organizational processes – if they want to survive. Significant changes in the business environment over the past 20 years require a new practice of work and organizing that has outpaced underlying theories and methods (Child, 2005).

Work is not performed in a vacuum but is done in organizations. For that reason it is imperative that we understand how organizations, as social systems, influence the way work is designed and managed (Hackman and Oldham, 1980). Although issues on organization design and nature of organization's work exist for some time, they had been rarely put into the same research focus (e.g., Van de Ven and Ferry, 1980; Moorhead, 1981; Griffin, 1982; Daft and Steers, 1986), especially not as system-wide concepts. Although work design is tightly woven into the structure and function of organizations (Torraco, 2005), the evident link between organization design and work design has been neglected in both theory and practice (Gyan-Baggour, 1999). Furthermore, their relationship has not been related to work performance outcomes neither.

Until recently, this complex organizational issue was addressed only from a single level of analysis. However, existing research findings potentially may lead towards wrong conclusions and may provide an incomplete picture because they oversimplify complex relationships. Roberts *et al.* (1978), as well as Rousseau (1985) and Gersick (1991) were among the first who realized deficiencies of dominantly used single-level research methodology. Even more, they emphasized a need for development of multilevel perspective of organization science. In a short period, multilevel perspective became very popular and applicable because of its potential for integrating macro and micro aspects inside common theoretical framework (Mossholder and Bedeian, 1983). Today, a need for a different, multilevel approach has been acknowledged and broadly accepted (Klein *et al.*, 1994; Dansereau *et al.*, 1999; Klein *et al.*, 1999; Brass, 2000; Luke, 2004; Goldstein *et al.*, 2008).

Applying multilevel lenses leads to a better understanding and more precise insights regarding complex organizational issues (e.g., Behling, 1978; Moorhead, 1981; Rousseau, 1985; Liska, 1990; Cappelli and Sherer, 1991; Tosi, 1992; House *et al.*, 1995; Klein and Kozlowski, 2000), and therefore it is applied in this study as well. The research was conducted in order to address the existing gap in the literature and to apply a multilevel approach in thorough investigation of relationship between organization design practices and broad work design dimensions.

In accordance with mentioned, the main purpose of the paper is to put organization design and work design into the same multilevel context. An in-depth analysis is conducted in order to provide understanding of the multilevel relationship between broad aspects of organization design and work design, with the ultimate impact on work performance. In particular, at the organizational level, the focus is on cognitive and social variables, while at the individual level task, cognitive and social characteristics are investigated, jointly with two outcome variables measuring work performance.

The paper will try to provide the answer on the following research question: What is the nature of relationship between organizational characteristics, work characteristics and work performance outcomes? As such, the research aim represents a unique attempt in the literature. It offers interesting insights on a complex, mediating role of work characteristics in relationship between macro-organizational variables and work performance outcomes, from a multilevel viewpoint.

The paper consists of six parts. After the introduction, the next part reviews relevant literature on organization design and work design in general, and their relationship in particular. In the third part research goals and hypotheses are explained, while in the fourth methodological framework is presented. In the fifth part results of a data analysis and main research findings are provided. Finally, the last part concludes with a summary of the main findings, discusses them from theoretical and practical standpoint, and outlines directions for future research.

Literature Review

Requirement for integrating macro- and micro-levels of analysis regarding several organizational issues has been recognized since 1980s (e.g., Van de Ven and Ferry, 1980; Moorhead, 1981; Griffin, 1982; Rousseau, 1985). It has been realized that designing organizations just to address environmental demands is not enough. We must also match design of the organization to its employees and their jobs.

Competitive trends of the global business environment are causing executives to rethink traditional design configurations and work design (Stebbins and Shani, 1995). Numerous empirical studies conducted during 1970s and 1980s often relied on too narrowly defined concepts of organization design and work design. While organization design has traditionally represented only structural aspects offering rather limited view of organizational reality, work design has dominantly been treated as a phenomenon focusing only on motivational or task characteristics, without considering other dimensions of work.

Many studies have investigated and confirmed the mediating role of task characteristics between organizational structure and outcome variables such as job satisfaction or motivation (Hall *et al.*, 1978; Rousseau, 1978; Pierce, 1979; Brass, 1981; Pierce *et al.*, 1984). Oldham and Hackman (1981) developed the *Job Modification Framework* that shows that significant relationships can be found between organizational structure and task characteristics, as well as between task characteristics and employee reactions.

However, in spite of numerous findings in work design literature, many authors have addressed a lack of systematic attention to context and other contextual factors (e.g., Kelly, 1992; Parker and Wall, 1998; Liden *et al.*, 2000; Parker *et al.*, 2001; Rousseau and Fried, 2001; Wall *et al.*, 2002; Torraco, 2005; Johns, 2006; Fried *et al.*, 2007; Morgeson and Humphrey, 2008; Morgeson *et al.*, 2010).

Their message was directed towards a broader approach and understanding of organization design and work design theory and practice. Nowadays, organization design can be broadly defined as a deliberate process of configuring structures, processes, reward systems, and people practices, to create an effective organization capable of achieving the business strategy (Kates and Galbraith, 2007). On the other side, the area of work design in the last 15 years has also flourished. It includes not only motivational work characteristics, but also many others as well (cognitive, social, contextual, etc.), applying them both at the individual and group level.

New and broader meaning and understanding of organization design and work design concepts puts a significant requirement for testing newly acknowledged and possibly interesting relationships between macro- and micro-organizational variables. It also calls for further investigation of the mediating role of various work characteristics, related to different organizational characteristics, as well as distinguishing work performance outcomes.

At the organizational level, particular interest should be put on cognitive and social dimensions of organizations. At the individual level, various work characteristics should be observed besides traditionally accepted task characteristics. Furthermore, the most appropriate work performance outcomes should be addressed as well.

Recent years have brought a continued increase in the scope and importance of knowledge in general, and knowledge work and knowledge management in particular. Consequently, a cognitive dimension of organizations has been recognized as an important one (e.g., Birkinshaw *et al.*, 2002). It describes people issues and represents the collective human resources (HR) practices that create organizational capability from the many individual abilities resident in the organization (Galbraith *et al.*, 2002). People issues also encompass knowledge management practice, KSAO's of employees, their career development and level of engagement.

Along with stronger focus on people, social dimension of an organization has become more important. It is related to organization's reward system that has a significant influence on employees, as well as their work design practice. Reward system represents means or instruments designed to encourage certain actions or behavior on the part of employees, or groups of employees (Burton *et al.*, 2006). It could provide individual, group or organizational incentives although we can agree with Mohrman *et al.* (2003) and distinguish between two main types: rewarding for individual performance and rewarding for organizational performance. While the former focuses employees on their own performance, the latter focuses them on how to contribute to their team and/or to the overall unit or company performance.

At the individual level, as the world of work is now quite different than it was 20 years ago, perhaps fundamentally so (Oldham and Hackman, 2010), numerous work characteristics have been recognized. Researchers have begun to devote greater attention to extension of the

JCM conceptually, to include a broader range of job characteristics, outcomes, mediators, moderators, and antecedents (e.g., Parker *et al.*, 2001; Morgeson and Humphrey, 2006; Morgeson and Humphrey, 2008; Vough and Parker, 2008).

An interdisciplinary perspective proposed by Campion and Thayer (1985) and Campion (1987) among the first emphasized the multidimensional nature of work design theory and practice. However, a recent effort at categorization by Morgeson and Humphrey (2006) represent currently the most thorough review of existing work characteristics. They identified no less than 21 distinct work characteristics (i.e. patterns) from task, knowledge, social, and contextual sources. For the purpose of this research, three categories of work characteristics will be investigated: (1) task characteristics, (2) social characteristics, (3) cognitive characteristics. The fourth, contextual characteristics were excluded because of potential ambiguity with some of macro-organizational variables.

Task characteristics are most commonly investigated motivational characteristics of work. They are primarily concerned with how work itself and the range and nature of tasks associated with a particular job are accomplished. Cognitive or knowledge characteristics reflect the kinds of knowledge, skill, and ability demands that are placed on an individual as a function of what is done on the job (Morgeson and Humphrey, 2006). Social characteristics have become especially important due to a wider application of teams and teamwork in organizations. It has been realized that people cannot handle tasks that are more complex by themselves and that social support and interaction is inevitable.

Finally, nowadays it is obvious that work performance as an outcome should be also addressed in a different way than traditionally accepted. It has been empirically confirmed that work performance has a multidimensional nature and that it is very important for determining organizational performance (Lawler III, 1996). Currently the mostly used concept of work performance includes task performance and contextual performance (Borman and Motowidlo, 1993; Motowidlo and Van Scotter, 1994; Motowidlo and Schmit, 1999).

Task performance can be defined as the effectiveness with which employees perform activities that contribute to the organization's technical core either directly by implementing a part of its technological process, such as producing products, selling merchandise, acquiring inventory, managing subordinates, or indirectly by providing it with needed materials or services (Borman and Motowidlo, 1993). Such kind of performance refers to activities that are formally part of a worker's job (Conway, 1996).

Contextual performance, on the other hand, represents behavior that does not necessarily support the organization's technical core as much as it supports the organization's climate and culture (Motowidlo and Van Scotter, 1994; Conway, 1996; Borman and Motowidlo, 1997; Motowidlo *et al.*, 1997). Contextual activities are important because they contribute to organizational effectiveness by shaping the organizational, social, and psychological context

and serving as a catalyst for task activities and processes. Such activities include volunteering, to carry out task activities that are not formally part of the job, and helping and cooperating with others in the organization to get tasks accomplished (Borman and Motowidlo, 1997).

Task and contextual performance reflect different aspects of overall work performance that are predicted differently by individual differences variables (Hatrup *et al.*, 1998). Both they were found to be important in determining work quality that is responsible for enhancing individual work performance (e.g., Motowidlo and Van Scotter, 1994). Task and contextual performance represent a strong starting point for determining overall contribution of an individual to a wider, organizational system.

Research Goals and Hypotheses

Numerous models of interaction between macro- and micro-organizational variables exist in the literature. They represent a very useful background for studying the link between organization design and work design although they were traditionally focused only on structural aspects of organization design and narrowly defined job design approach. In the meantime, over the last 20 years, scholars have noted the importance of the work context for understanding organizational behavior (e.g., Cappelli and Sherer, 1991; Mowday and Sutton, 1993; Hatrup and Jackson, 1996; Rousseau and Fried, 2001). However, multilevel interactions have not been addressed appropriately.

Accordingly, it is necessary to develop and to test models that are more comprehensive. Improved models potentially will perceive not only newly updated macro- and micro-organizational variables and their single-level interaction, but they will also apply new or improved methodological approaches and statistical methods. Such practices could lead towards more relevant and more reliable conclusions. Therefore, the aim of the paper is to observe macro-organizational variables, which have not been previously widely studied, and take a broader perspective of work characteristics by applying various types of task, cognitive and social characteristics, from a multilevel perspective. By investigating their interplay and the nature of influence on work performance, useful insights could be provided.

The main goal of the research led to proposing four hypotheses. First two hypotheses were focused on determining the existence of multilevel influence of macro-organizational variables on their micro counterparts. Third and fourth hypothesis strived towards testing indirect, mediating effects of work characteristics between macro-organizational variables and work performance outcomes.

H₁: Cognitive dimension of organizations has a cross-level influence on work characteristics.

The design of work is now inextricably bound up with the structures and processes of organizational systems more generally (Oldham and Hackman, 2010). However, the same

could relate to cognitive dimension of organizations. People are more often seen as a source of competitive advantage and large amount of resources have been invested in managing knowledge in organizations. Therefore, it should be clearly determined in what way the HRM practices are related, directly or indirectly, to work performance. As work design is one of the techniques in the armory of HRM practitioners, potentially it represents a mechanism for translating organizational policies into work practices that are much closer to employees.

H₂: Social dimension of organizations has a cross-level influence on work characteristics.

In global competitive environment, complexity of doing business grows on a daily basis at a higher rate than ever before. The complexity of today's business world translated into complexity of the company's organizational design (Galbraith, 2002). The new world of organizing should logically be reflected in new ways of designing work. Raising complexity strongly addresses a need for social interaction between people and brings significant interdependence at work. Nowadays, not only individuals, but entire organizational units as well should collaborate more often and more intensively to handle complex business issues. Consequently, complexity of organization design could manifest itself through work design characteristics at the individual level.

H₃: Work characteristics mediate the relationship between cognitive variables of organizations and work performance outcomes.

Numerous studies have investigated and confirmed the *Job-Modification Framework* and a mediating role of task characteristics in relationship between organizational structure and employee reactions (e.g., Rousseau, 1978; Pierce, 1979; Brass, 1981; Pierce *et al.*, 1984). Although those findings date from even 30 years ago, Morgeson *et al.* (2010) have recently argued that work designs mediate relationships between context and individual outcomes. As today, we have a much broader understanding of organizational context and work characteristics, their proposition should be tested accordingly but on different set of macro- and micro-organizational variables. In this research, firstly, a mediating role of various work characteristics (task, cognitive, and social) should be tested in relationship between cognitive variables (cross-functional training and employee know-how) and work performance outcomes (task performance and contextual performance), to find out if indirect or direct effects exist between HRM practices and people's knowledge and current work performance outcomes.

H₄: Work characteristics mediate the relationship between social variables of organizations and work performance outcomes.

While many authors had been emphasizing influence of structural variables on work design dimensions, although by using single-level methods of analysis, the influence of social variables of organizations was very rarely addressed. However, Mohrman *et al.* (2003) recognized the existence of two distinguished types of rewards (pay for organizational

contribution and pay for individual contribution) that are by their nature very applicable for two-level analysis. Additionally, as the attitude that reward systems are shaping organizational behavior is widely accepted (e.g., Lawler III, 2000, Galbraith, 2002), it should be interesting to determine whether their influence is direct or indirect in nature.

Research Design and Methodology

In order to test the proposed hypotheses, the research methodology and instrument have been developed. Because of a multilevel nature of a planned research, very rigorous methodological assumptions had to be satisfied, from hierarchically nested data and rigorous subsampling to clearly determining two levels of analysis – individual and organizational.

Although most of the earlier studies on work design were focused on same or very similar occupations, according to Morgeson and Campion (2003) more and more investigations are cross-occupational in nature so we decided for the latter. Such an approach was appropriate because it is the first research of a kind in Croatia, so findings that are more generalizable are more than welcomed.

For the purpose of chosen research design, two separate questionnaires were developed. *Questionnaire for assessing organizational characteristics* was created to collect data on organizations and their macro-organizational characteristics. This questionnaire was filled out by persons who have a holistic view of the organization, mostly by CEOs, HR managers and middle managers in charge of organization design issues. It consisted of 13 items on a 5-point Likert scale (1 - strongly disagree; 5 - strongly agree) measuring 4 macro-organizational variables. *Questionnaire for assessing work characteristics* focused on gathering employees' perceived characteristics of their work. It encountered 75 items on a 5-point Likert scale (1 - strongly disagree; 5 - strongly agree) measuring 15 micro-organizational variables and 2 outcome variables. The questionnaires were pre-tested and their reliability and validity had been checked causing smaller changes in their initial design.

Table 1 Research instrument overview and reliability

	CATEGORY	VARIABLE	# of items	Cronbach Alpha
ORGANIZATIONAL LEVEL	Cognitive variables	Employee know-how (KNOW)	4	.846
		Cross-functional training (TRAIN)	3	.749
	Social variables	Pay for organizational contribution (REWORG)	3	.813
		Pay for individual contribution (REWIND)	3	.735
INDIVIDUAL LEVEL	Task characteristics	Work autonomy (AUTON)	3	.765
		Task variety (VARIETY)	3	.776
		Task significance (SIGNIF)	4	.731
		Task identity (IDENTITY)	4	.847
		Nature of the task (NATURE)	3	.707
	Cognitive characteristics	Job complexity (JCOMPLEX)	3	.771

		Problem solving (PROBSOLV)	4	.712
		Information processing (PROCINF)	4	.868
		Skill utilization (SKILUTIL)	5	.795
	Social characteristics	Initiated task interdependence (INITDEP)	3	.717
		Received task interdependence (RECDEP)	3	.818
		Dependence position (DEPPOS)	5	.712
Interaction with others (INTERACT)		4	.771	
OUTCOMES	Work performance	Task performance (TASKPERF)	6	.851
		Contextual performance (CONPERF)	11	.861

The empirical research was conducted through a field study of the largest Croatian organizations with more than 500 employees because it has been proved that those organizations have more complex organizational solutions with stronger requirements for alignment of various organizational issues. Targeted population consisted of 226 organizations listed by *Croatian Chamber of Economy*. The whole population was included in

the research process due to a very small amount of organizations that satisfied aforementioned size condition.

The questionnaires supplemented with a cover letter and a short brochure were distributed by postal mail to CEOs of targeted organizations. Data collection process began in November 2009 and lasted until February 2010. The research sample was cross-sectional in nature and consisted of 51 organizations with a response rate of 23.2%. The sample was mostly represented by manufacturing organizations (33.3%), along with transport and financial companies (each 11.8%).

Besides organizations, at the individual level, the sample was cross-occupational where 1285 employees were chosen to participate in the research. The snowball sampling strategy was used and respondents were surveyed regarding the nature of their work characteristics. Contact persons in each organization, chosen by their CEOs, had received guidelines for choosing the sample of employees, which represented various parts and levels of the organization.

Very rigorous multilevel sampling requirements were satisfied because more than 65% of organizations had returned 20 and more individual questionnaires for assessing work characteristics. However, 4 organizations were excluded from the sample because they had less than 5 individual answers which led to the final observed sample of 47 organizations. Collected data were analyzed by using software packages *SPSS 18.0* and *HLM 6.08* where, besides multi-level analysis and HLM methodology, several other quantitative methods were also applied (e.g. multiple regression analysis and correlation analysis).

Data Analysis and Research Findings

After data had been collected and questionnaires had been tested for validity and reliability, explorative data analysis was conducted. Missing value analysis showed less than 10% of missing data so pair-wise deletion strategy was chosen. Data were linear and normally distributed (Shapiro-Wilk test showed a value above .88). Descriptive statistics for organizational and individual level is shown in the Table 2.

As a main prerequisite for conducting a multilevel analysis, intraclass correlations (ICC) were calculated for each micro-organizational variable in order to see whether a variance between organizations exists. Although observed coefficients differed in size, for most variables they were above the minimum acceptable value of .05 (Hox, 2002) which allowed further investigation and development of *Means-as-Outcomes* regression models. However,

low values of ICC give an evidence of presence of a bigger diversity of work characteristics within organizations than between organizations.

In order to test the first two hypotheses, partial multilevel analyses were conducted where *Means-As-Outcomes* regression models were created for each pair of dependent work characteristics and independent organizational characteristics. At the significance level of .1 it was determined that 60% of observed relationships between pairs of variables are statistically significant. More precisely, cognitive variables had a stronger influence on work characteristics (in 70% of relationships) than social variables (in 50% of relationships). The most significant relationships, which explained more than 30% of variance, were the following:

- *REWORK* and *AUTON* ($\Delta\sigma^2 = 35.63\%$);
- *TRAIN* and *NATURE* ($\Delta\sigma^2 = 33.89\%$);
- *REWORK* and *NATURE* ($\Delta\sigma^2 = 39.21\%$);
- *KNOW* and *JOBSPEC* ($\Delta\sigma^2 = 34.62\%$);
- *TRAIN* and *PROCINF* ($\Delta\sigma^2 = 30.63\%$);
- *KNOW* and *SKILUTIL* ($\Delta\sigma^2 = 42.58\%$);
- *TRAIN* and *RECDEP* ($\Delta\sigma^2 = 36.70\%$);
- *REWIND* and *RECDEP* ($\Delta\sigma^2 = 30.17\%$);
- *REWIND* and *DEPPOS* ($\Delta\sigma^2 = 60.28\%$).

Detailed list of statistically significant relationships is provided in the Table 3.

Research findings support the first hypothesis where it is clear that cognitive dimension of organizations (employee know-how and cross-functional training) had a significant influence on work characteristics. However, regarding the second hypothesis, it is possible to conclude that the link between social dimension of organizations (pay for organizational contribution and pay for individual contribution) and work characteristics existed, although it was present only partially.

For testing the third and the fourth hypothesis, partial multilevel mediation analyses were conducted for each pair of macro-organizational, micro-organizational and outcome variable. Work characteristics were put as intervening mechanism in relationship between cognitive and/or social characteristics of organizations and work performance as an outcome variable. The analysis was conducted according to the widely accepted procedure defined by Baron and Kenny (1986).

* $p < 0.10$

** $p < 0.05$

*** $p < 0.01$

For testing aforementioned hypotheses, a particular type – a lower-level mediation – had to be applied (model 2-1-1), because only independent variable was at level 2, while mediating and dependent variables were at level 1. In order to conduct a mediation analysis testing of *Intercepts-as-Outcomes* regression models was needed with predictors at both levels (level 1 – individuals; level 2 – organizations).

Figure 1 Lower-level mediation (2-1-1)

Multilevel mediation analysis was conducted through the following four steps by applying reduction in coefficients:

Step 1. The model was developed with independent level-2 variable (X_j) and dependent level-1 variable (Y_{ij}), without mediating variable

$$\text{level 1: } Y_{ij} = \beta_{0j}(a) + r_{ij}(a) \quad (1)$$

$$\text{level 2: } \beta_{0j}(a) = \gamma_{00}(a) + \gamma_{01}(a)X_j + u_{0j}(a) \quad (2)$$

Step 2. The model was developed with independent level-2 variable (X_j) and mediating variable (M_{ij})

$$\text{level 1: } M_{ij} = \beta_{0j}(b) + r_{ij}(b) \quad (3)$$

$$\text{level 2: } \beta_{0j}(b) = \gamma_{00}(b) + \gamma_{01}(b)X_j + u_{0j}(b) \quad (4)$$

Step 3. The relationship between mediating variable (M_{ij}) and outcome variable was determined.

$$\text{level 1: } Y_{ij} = \beta_{0j}(c) + \beta_{1j}(c)M_{ij} + r_{ij}(c) \quad (5)$$

$$\text{level 2: } \beta_{0j}(c) = \gamma_{00}(c) + u_{0j}(c) \quad (6)$$

Step 4. Indirect relationship between independent level-2 variable and outcome variable through mediating level-1 variable was determined.

$$\text{level 1: } Y_{ij} = \beta_{0j}(d) + \beta_{b(d)}M_{ij} + r_{ij}(d) \quad (7)$$

$$\text{level 2: } \beta_{0j}(d) = \gamma_{00}(d) + \gamma_{01}'(d)X_j + u_{0j}(d) \quad (8)$$

Summary of mediation analysis results and aggregated number of statistically significant relationships per each step of the analysis are presented in the Table 4.

Detailed statistically significant mediating effects between particular variables showed that relationship between organizational cross-functional training practice and both outcome variables is mediated almost with each work characteristic (in 80% of cases). Significant mediation effects of numerous work characteristics also existed between pay for individual performance and contextual performance (in 40% of cases).

Table 4 Statistically significant relationships of mediation analysis (step-by-step)

Outcome variables	CONTEXTUAL PERFORMANCE					TASK PERFORMANCE				
	1	2	4	2 & 4	Mediation effect	1	2	4	2 & 4	Mediation effect
Steps in mediation analysis	$X \rightarrow Y$	$X \rightarrow M$ (n.s.)	$X \rightarrow M \rightarrow Y$ (n.s.)	(n.s.)	$\gamma_{01} - \gamma_{01}'$ (s.s.)	$X \rightarrow Y$	$X \rightarrow M$ (n.s.)	$X \rightarrow M \rightarrow Y$ (n.s.)	(n.s.)	$\gamma_{01} - \gamma_{01}'$ (s.s.)

TOTAL (%)	70.00	40.00	8.33	0.00	51.67	50.00	8.33	40.00	31.67	20.00

(n.s.) - statistically non-significant relationship (s.s.) - statistically significant relationship ($p < 0,10$)

Conducted mediation analysis confirmed the third hypothesis only partially because mediation effect between cognitive variables and outcome variables was present in almost 50% of possible relationships for both task and contextual performance.

Regarding the social variables, it seems that they have a more direct influence on task performance than on contextual performance. However, it should also be partially accepted only for contextual performance as an outcome variable, while it should be rejected for task performance.

Discussion and Conclusion

The main goal of the study was to determine a mediating role of work characteristics in relationship between organizational characteristics and individual work performance outcomes. The data from the empirical study were subject to rigorous statistical technique. Analysis of multilevel interactions was conducted by applying HLM technique and it was a basis for determining the proportion of variance between and within organizations.

The multilevel research of pair-wise relationships between 4 macro- and 15 micro-organizational variables revealed that, in general, macro-organizational variables have a multilevel influence on micro-organizational variables although this influence differs. While cognitive variables of organizations had a strong and a direct influence on work characteristics, the influence of social variables was weaker, but still existed. Such findings can be interpreted in a way that organizations could hardly be excellent in all areas of their organization design practice. In other words, they emphasize only some of the organization design aspects by which they influence individuals and their work performance.

Furthermore, the *Job-Modification Framework*, originally conceptualized by Oldham and Hackman (1981), was put in a different context and its main idea was tested by applying the lower-level mediation technique (model 2-1-1). A mediating role of work characteristics in the relationship between organization design and work performance was partially confirmed. Although most work characteristics were mediating variables in at least three relationships (for instance AUTON and NATURE were mediators in five relationships), mediation effect in general was present in 35.83% of cases.

Results also showed that mediating influence was more represented in the case of *contextual performance* than in the case of *task performance* as an outcome variable. Furthermore, its

influence was more significant regarding cognitive variables (cross-functional training in particular) than social variables of organizations. This means that investing in people really pays back to organizations significantly through achieving higher employee work performance. It also supports a notion that people should be understood as a source of competitive advantage.

On the other hand, findings confirmed that rewarding practices had mostly an indirect influence, through contextual performance of their employees, while their impact on task characteristics was more direct. This means that employees will be cooperative and altruistic only if their work characteristics are seminal and encouraging for such a behavior.

Based on the empirical results, a conclusion could be made that some macro-organizational variables have a more or less direct influence on work performance. Additionally, an insight was provided that some work characteristics are more relevant than others, depending on particular organization design practice. In other words, whether a work characteristic will have a mediating role, depends on the nature of the observed organization design concepts, but as well as on the choice of the outcome variable.

However, the research has some limitations. Although various macro- and micro-organizational variables had been observed, due to rigorous research requirements and research scope constraints several interesting ones were not included. Individual sample was based on employees from various parts and levels of organizations, with different occupations. Such a cross-occupational sample offers greater width, but again it potentially results in a greater diversity within organizations, as confirmed by low values of ICC. A number of other possible limitations should also be mentioned, like common-source bias, small values of regression coefficients, subjectivity of respondents, etc.

The contribution of the study is four-fold. Firstly, new insights regarding the relationship between different macro- and micro-organizational variables were provided. By recognizing the existence of cognitive and social dimensions of organizations, a new light was shed on investigating organization design field. In addition, various work characteristics have been jointly tested, allowing for a more generalized view of the work design practice. Secondly, the original *Job Modification Framework* has been tested in a different context by applying different organizational variables, as well as a broader set of work design variables. Large sample at the level of individuals allowed for a joint investigation of numerous variables without questioning statistical power. Thirdly, a multilevel analysis was applied in organizational and work setting, further addressing a need for its wider usage in the area. Very interesting cross-level effects were recognized or addressed. Finally, the research findings offered insights about organization design and work design practice from a new context in a Central and Eastern European country. This can offer new understandings of possible differences in work design practice in different countries and cultures.

Future research studies should focus on further investigation of various relationships between macro- and micro-organizational variables. In doing this, one should apply multilevel lenses because they potentially offer a deeper understanding of complex organizational reality and shed a new light on previously determined single-level effects. In addition, particular and related topics should be investigated in various contexts, which could add a new, cultural perspective of understanding differences between existing organizing practices.

ETHICS, ECONOMIC THEORY AND CORPORATE GOVERNANCE**Huehn, Matthias¹**¹American University of Paris, France. Email: mhuehn@aup.edu**Abstract**

The paper investigates the foundations of corporate governance. It traces the current practical problems of corporate governance to the epistemological and ethical problems of the current mainstream management theory. Management theory has almost completely succumbed to economism, the ideology of mainstream economics. The paper isolates and discusses the three axioms of economism which are deemed to be especially problematic for management/corporate governance theory. The three axioms are: the assumptions that humans always follow the rational principle, that value-free research and application of management tools is possible, and that theory takes primacy over reality. These axioms plus what has been called the “gloomy vision” create a theory of management which is amoral and which in turns leads to immoral and dysfunctional corporate governance. Thus, the paper takes a very high-level look at the debate about ethics in business and argues for the emancipation of business ethics from mainstream economic theory. Management is viewed as a scientific discipline which derives its value from the contributions it makes to managerial practice while Economics has always been – and has recently become more so – a more theoretical field of thought.

Keywords: Management Theory, Corporate Governance, Ethics.

Introduction

In 2005 and 2006 two management gurus published scathing criticisms of *what* management as a scientific discipline teaches (Goshal) and *how* things are taught (Bennis). Both articles caused quite a stir, because they questioned mainstream management thinking and teaching radically. Of the two, Goshal’s notion that mainstream management was indeed evil, creating immoral managers (Bennis accused management professors merely of producing automatons unable to deal with complexity) was by far the more serious accusation. Corporate governance is about putting a structural, legal and ethical framework in place that encourages and enables managers to behave within ethically and legally acceptable parameters and at the same time furthers long-term profitability. Goshal’s ideas are thus very relevant to corporate governance. This paper will argue that Goshal was right and that only a fundamental change in the assumptions underpinning management mainstream theory will lead to a sound theory and practice of corporate governance. I will start by showing what, why and when things went wrong in management theory. Then I will talk about the main epistemological shortcomings – which in my view are massive – of an economised management theory. In a last chapter I will take Goshal’s argument one step further and

explain how immoral management practices which are based on amoral economised management theories undermine Western societies' ethical foundations.

It seems that a large number of leading management scholars share Sumantra Goshal's considerable unease about the mega-trend in management theory towards Hobbesian views on human nature and the mathematisation of what should be a social science. However, Goshal's fundamental criticism is not being incorporated into mainstream theories. Why is that? Mintzberg (1971, 1975, 1979, 1999, 2004, etc.), probably the most important and influential management scholar of the past 30 years has been saying the same things as Goshal for an even longer time, and is also listened to and not acted upon.⁴²

How can management scholars draw on Mintzberg's, Goshal's, Drucker's and also Bennis's ideas and still strongly disagree with their general philosophy, when the four authors' writings are permeated by the idea that management is not a number-crunching exercise done by selfish and totally rational maximisers? We have a hypothesis – and a rather provocative one at that – which answers these questions: people have been brainwashed – they believe in an ideology which allows them to strictly separate between their theories and reality. That ideology is economism.⁴³ We will discuss in this paper how economism acts like a corrosive destroying not only the basis of good (ethical and effective) management practice and theory – and therefore corporate governance – as Goshal claimed, but also how economism is corrupting the social context in which management exists.

Management theory has been replaced by ideology

An ideology and a theory are not easily distinguishable because both contain elements of faith (axioms). If an ideology offers a simple solution to life's recurring complex problems, people often choose the path of least resistance and follow the herd, even if they know the theory/ideology is wrong. There is a large number of definitions of what constitutes an ideology. All of them have in common that an ideology is a collection of theories bound together by a vision or strong beliefs (axioms). Lakatos (1973) called these basic beliefs "hardcore hypotheses".

Popper's falsificationism rests on the postulate that a theory or its hypotheses are testable. If they are not, the whole theory is unscientific (cf. Popper 1934, Lakatos 1973). The demarcation criterion between an unscientific ideology and a scientific research programme, Popper argued, is the falsifiability of a theory in an experiment or through an observation. '[O]ne can

42 Despite Walter Nord's (2005) assurances in Academy of Management Learning & Education, that 'When Henry Mintzberg Speaks, People React'.

43 We use the term economism without its usual Marxist connotations. By economism we mean the ideology of economics; the attempt to declare a sociological discipline as value-free. Any ideology frees its followers from the duty to use their own moral faculties; the result in my view is not an amoral but an immoral society. The term is also not used to denounce Liberalism or Libertarianism as Hans-Hermann Hoppe – whom we will quote later – is the most important living economist in the Libertarian school.

sum up all this by saying that the criterion of the scientific status of a theory is its falsifiability, or refutability, or testability' (Popper 1965: 37).

Scientists are also humans who defend their opinions, even if the facts stand in contrast to them. Being especially smart humans, they even defend the holes in their theories before other people have spotted them, they immunise their theories with what Popper called 'immunising stratagems'. Popper's version of falsification struggled with this. Imre Lakatos developed his Popper's naïve falsificationism into sophisticated falsificationism. He claimed that all research programmes have a limited number of very important hypotheses (the so called hardcore hypotheses). These hardcore hypotheses are surrounded by hypotheses of lesser importance and those act as a protective belt. Repeated falsification of these auxiliary hypotheses in the protective belt would not automatically mean that the whole theory is falsified and has to be abandoned. However, if the hardcore hypotheses are repeatedly falsified (through a clash with reality), the research programme must be given up. In effect Lakatos allowed scientists to employ immunising stratagems up to a certain point, while Popper – somewhat naively – appealed to the scientists' decency.

The argument presented here is that the economic research programme within management in particular and in the social sciences in general is in fact not a scientific research programme but an ideology, whose hardcore hypotheses have been refuted right from the start. It should therefore be given up. An even stronger argument for separating the two research programmes management and economics from each other is that their basic principles (efficiency vs. effectiveness) clash (Hühn 2005). Broekstra is right, when he says, this unhealthy economisation of management is not a new development but a recurring trend:

And here we come to the heart of the matter: the prevailing managerial ideology. Managers are primarily efficiency- rather than effectiveness-oriented. The result is, as Janov (1994) contends, a means-end confusion. (Broekstra 2001: 106)

Fads come and go while the efficiency focus⁴⁴ has become the prevalent ideology in management, much to the detriment of what really should be the focus of analysis in management, i.e. effectiveness. Effectiveness cannot be calculated, however, and is therefore of little relevance in economised management.

Scholars like Lindblom and Herbert Simon (1947) have much earlier criticised the application of economic principles in management. This paper is not simply repeating or enlarging on their critiques. We will take the argument a step further, by claiming that the economic view of social sciences stands in total opposition to some of the most important

⁴⁴ In German and Austrian Economics the economic principle is also called the efficiency and rational principle. Thus, Broekstra is complaining about the economisation of management that has developed into a full-blown ideology. Drucker's postulate, that "effectiveness rather than efficiency is essential in business" (1964: 5) has been discarded by the management economists.

fundamentals of Western philosophy, the basic ideas of the Enlightenment. A theory which like economism stands in stark contrast to the ethical foundations of a culture, must either be accepted as correct beyond reasonable doubt, or be given up immediately. Otherwise it will – if it is mainstream thinking, which is the case with the economic view – undermine and then completely destroy a culture completely. It should be obvious that there is considerable doubt as to the applicability of the economic principle in the social sciences.

The deteriorating situation with regard to corporate governance we can observe around is just the tip of the iceberg. The governance of corporations (regulated by those who govern a country) and the governance of a country are part of the same complex socio-ethical system and a systemic failure in one part of the system will affect the system as a whole. Bennis and Slater (1964) correctly predicted the downfall of the Soviet system in a Harvard Business Review article. A corrupted ideology in one societal subsystem will affect the whole system. This paper argues that the managerial subsystem is destroying the societal system bottom up through the enforcement of an amoral management ideology.

A short critique of economism

Despite its massive shortcomings – the Duhem/Quine thesis alone is able to destroy Popper's hardcore hypothesis⁴⁵ – falsificationism⁴⁶ we accept that the mainstream in all scientific disciplines favours falsificationism – at least officially.

For the sake of brevity we will analyse only the most important axioms of economism, those constituting the hardcore hypotheses of the economic ideology. For that we refer to what Nobel prize laureates Herbert Simon, Friedrich August von Hayek and also Sumantra Goshal have written on the subject. We think that there are at least three closely related hardcore hypotheses. The first maintains, that there are hard facts and only hard, i.e. measurable, phenomena are relevant. The second holds, that there is one rationality which is expressed in a meaningful, i.e. mathematically valid, way in the economic principle, and which allows predictions. Finally, the third axiom, which is maybe the most astounding of the three basic tenets of economism, claims that reality is a function of theory, otherwise prediction would not be possible.

45 Naïve falsification rests on the assumption, that one cannot verify a theory through facts as million of corroborative facts (seeing a million white swans) is proved wrong by finding only one fact (a black swan) that refutes the theory (all swans are white). But, the critics say, what about the theory of seeing which says that the last swan was black instead of white? Who has proved that this is right? The answer obviously must be: no one. A theory can never be tested in isolation. Thus, it is neither impossible to verify nor to falsify theories with facts. For this very reason Imre Lakatos created sophisticated falsificationism which allows social factors (introduced by Thomas Kuhn) into the debate.

46 Popper's falsificationism is still very popular among the scientific community despite its serious shortcomings. Popper's most talented pupil, Imre Lakatos, was even in 1973 quite exasperated, 'I think that the fact Popper's philosophy survived for so long is a sociological mystery. Popper's immortality is secured by this idiotic result.' (1973)

Axiom 1

We shall start with the last point. Hans-Hermann Hoppe, the most important living libertarian economist, calls attention to what is a rather critical argument. He proposes that there are two very different situations: natural events and human activities. For each category there are different rules with regard to the relevance of theory and the possibility of prediction. Hoppe criticizes the two extreme schools in economics, the rational expectation theorists and the radical uncertainty theorists for being wrong logically and empirically. He agrees with Lachmann, whom he sees as the most important exponent of the latter school of thought, about the shortcomings of the rational expectation theorists:

“Lachmann and his followers are correct in emphasizing that the problem of predicting my and others’ future actions is categorically different from that of predicting outcomes of given actions or of natural events. In fact, the destructive part of Lachmann’s argument is largely correct even though it is hardly new.” (1997: 55-56)

Hoppe makes two very important statements in this passage. One with which we agree, and one which we would like to, but cannot agree to. First, Hoppe declares that we can, and indeed should (for insurance reasons for example) predict certain natural events. For example “pattern of earthquakes, tornadoes, cancer, or car accidents...” can be predicted with some degree of accuracy (1997: 56). Human actions, however, are another kettle of fish altogether – and cannot be predicted. Hoppe succinctly explains the world-view of rational expectation theorists,

“Rational expectation theorists only replace the model of man as a never-failing automaton with that of a machine subject to random errors and breakdowns of known types and characteristics.” (56)

The rational expectation theorists are of course the economists that have come to rule the management debate.

Let us come back to Hoppe’s second claim – the one to which we would like to agree, but cannot agree. Hoppe says that Lachmann’s argument, that one cannot make predictions about human actions, is hardly new. This may be true for some enlightened economists. For mainstream management theorists like Günter Wöhe, the doyen of German business administration, it is an outrageous idea worthy of their full contempt. In the 21st edition (since 1960) of his 1300 page introduction into business administration Wöhe, like any sane person, says that the assumption of a “homo oeconomicus” is merely a fiction. In the next sentence, however, he pushes all concerns aside and proclaims that the ever rational maximiser is a valid fiction, which is needed to differentiate business administration from sociology. It makes the analysis and prediction of economic reality possible (2002: 26). This is, of course, a totally unacceptable statement: a valid fiction is a contradiction in terms. Nevertheless, it clearly demonstrates the extent to which the notion, that a business

administration scholar can define a theoretic reality (which in turn defines “physical” reality), has been completely accepted.

This “theoretic turn”, i.e. making reality dependent upon theory is enormously important for business administration as a science, for it gives business administration and economics a special position among the sciences (Wöhe 2001: 24). “Economic Science” (*Wirtschaftswissenschaften*), according to this view, is not a mixture of Arts and Science. Rather, it represents a separate scientific discipline, which renders insights from the Arts and Sciences usable through the application of rigorous mathematical methods. Good old physics envy is alive and kicking. Indeed, this shows that the prevalent mindset of management economists has made it widely acceptable. Human interference coming from the Arts is managed by being expressed in the language of mathematics: the rational/economic principle is the most important axiom of the ideology of economics (economicism); without it, everything breaks down. Thus, the postulate (for that is what the economic principle is: nothing but a wish, not based on reality) – which states that every person maximises/optimises all the time (a point which is of course totally untestable) is the pillar on which the theory of economics, on which reality depends, rests. Maybe the bluff is simply too brash to be called. Maybe economists are too lethargic to think about this problem with their theory.

Axiom 2

The second axiom is the rational/economic principle and it plays such a central role that it has been mentioned in the discussion of the first axiom and will feature in the discussion of the third axiom. In the early 1960s, Herbert Simon did the unthinkable: he looked to and evaluated real life, instead of just issuing advice from the safe confines of science’s ivory tower. In doing so, he discovered that managers do not adhere to the rationality principle when making decisions, and that they do not maximise or optimise – they satisfice. Simon had it easier than economists: he was a social scientist and thus not bound by economic theory.

This new, practical-minded “administrative man” represented the opposite end of the continuum to the theoretical “economic man”, who optimised. Both Lindblom and Simon were very clear on one point: *homo oeconomicus* was not only rare in practice; economic man was a superfluous model, a misleading chimera. Their main criticisms were that it is theoretically impossible that anyone could analyse all the data there is in an objective fashion, and then calculate an optimal solution. Their rather tame criticism of bounded rationality was nevertheless enough to shake the foundations of business administration as a science, because its highest axiom (the economic principle) was declared dysfunctional. It is interesting to note that Simon was given the Nobel prize for economics because he criticized the *validity of the economic principle for the practice of management* while today’s Nobel prizes go to game theorists who base all their models on economic man. The criticism of the economic principle has been acknowledged and then forgotten by economists as if it were a minor point. One look at

Gutenberg's (the founder of business administration after the second world war in Germany) model of the organisation (see Figure 1) shows that without the assumption of a unified rationality (that is, without the economic principle) the whole model becomes a very unstable construction. If the underlying assumption that all decision-making⁴⁷ humans are automatically guided in their decision-making by one rationality is false – that is, if those human agents would be guided instead by either multiple rationalities or, even worse, irrational or intuitive elements – then calculating a solution would be no longer possible. Moreover, the claim to scientific status afforded by being able to offer such an “objective” decision-making principle, is forfeited. Hoppe, himself a radical Libertarian economist⁴⁸, chides his fellow economists of the Positivist type (1997: 56):

“Such a model of man [assuming a rational decision maker] is no less faulty than the one it is supposed to replace. It not only stands in manifest contradiction to the facts, but any proponent of this model is also inevitably caught up in logical contradictions. First off, if our expectations (predictions) concerning our future actions were indeed as rational as rational expectation theorists believe them to be, that it would be possible to give an exhaustive classification of all possible actions (just as one could list all possible outcomes of a game of roulette or all possible locations of a physical body in space).”

Early organisation theorists who hailed the bureaucracy as the best form of organization believed exactly that: one can create a list of all possible situations and human actions, write them down in the organisational handbook and thus create the perfect organization which adapts automatically. The bureaucracy was meant to be the organisational form where the efficiency principle rules. One need not comment on what is today thought of as an extremely naïve belief. As Hoppe shows, giving up the rational principal does not necessarily mean that economics becomes arbitrary, or even a useless pursuit. It just shifts the attention of economists from the study of human action to the study of phenomena within the external world.

Axiom 3

The last axiom, the reliance on hard facts, shows even more clearly than the other two that economism is epistemologically not quite up to modern standards. Economists treat facts as if they were “objective” truths, which of course is an utterly childish assumption. Facts are

47 Today the situation is thought to be much worse, as decision-making is seen as a process which involves non-managers and not an act carried out by few managers.

48 Goshal attacks (Neo-)Liberals of the Friedman fold and sees them as the most important propagators of economism. It would in our view be erroneous to see Libertarians who would subscribe to Friedman's definition of a Liberal, i.e. someone who sees “freedom as the ultimate goal and the individual as the ultimate entity in the society” (Friedman 2002: 6 quoted in Goshal 2005: 83) merely as more radical Liberals. Yet, Libertarians like Hoppe do not assume that humans behave like atoms, i.e. that homo oeconomicus is a fact (although they certainly believe in Hobbes more than Locke and thus support a gloomy vision). It seems that the situation is even more complicated than Sumantra Goshal described it.

merely theories which are given (by a group of people) a special status. Paul Feyerabend (1975), the brilliant anarchist among the philosophers of science, included poltergeists and other paranormal phenomena in his lists of facts and became quite notorious in doing so.⁴⁹ But insisting on the other extreme, i.e. closing one's eyes to the problematic nature of facts, is certainly even more damaging, because science is based on a debate not on silence. The debate about whether value-free economics or management research was possible reached a stalemate when the two camps got bored with the other side's arguments. Basically the aye-sayers argued that objective is needed in science and since it is needed it must be possible, while the other camp held firm to their stance that everything is subjective and therefore objectivity is impossible. Over thirty years and a constructivist debate later, however, there can be no reasonable doubt that value-free (and therefore "objective") research is a practical and theoretical impossibility. Nevertheless adherents to economism, who need objectivity as much as the rational principle in order to be able to cling to their claim to be a proper science, still firmly believe in objectivity. A fact is a fact they say, and thereby affirm that they are Positivists of the most naïve type – about whom Heidegger once quipped that they confuse thinking with calculating. Maybe Heidegger also thought about the fact that economists created a human sub-species. Homo sapiens (the "wise" man) got a younger brother, the homo oeconomicus, the calculating man. This younger brother throws wisdom and common sense out of the window in order to be able to calculate.

A very simple example from a first semester lecture shows the impossibility of value-free economics and the problems caused by economists' failure to accept that subjectivity is inescapable. The author gives Introduction to Business Administration to first semester students. One of the topics dealt with in this lecture is the weighted decision matrix (see Figure 2) – one of the most typical tools of business administration. I briefly explain how a decision matrix roughly works and then let the students explore this tool in a two-hour exercise. They pretend to be top executives of Daimler and their task is to value (!) four potential takeover candidates with the help of four to six criteria (turnover, p/e-ratio, number of employees, image/brand, etc.) and then make a recommendation which company Daimler should buy. The students quickly discover that the most innocuous criteria are the most problematic. Take the number of employees. It looks very much like a sought-after hard fact. The problem is, this "hard fact", like any other fact, does not have any *value* in itself; a *value must be assigned to it*. Porsche has 11,000 employees, while BMW has 110,000 employees. The students are asked assign values ranging from 0 to 10 to all criteria and most student groups give Porsche 10 points and BMW 1 point. Yet, some groups give BMW 10 points and Porsche 1 point. Both have good, plausible arguments for their extremely different valuations of a "hard fact". After encountering an unexpected problem with the "hardest" of all facts, the

⁴⁹ There is an interesting connection between Libertarians and epistemologists in the Feyerabend vein: both are anarchists. Libertarians reject the notion of a state as an authority above the individual and Feyerabend rejects the authority of the scientific high priests (Popper, in his case) defining what is a fact and what isn't.

students become wary. Criteria like image/brand, culture, technology prove are vastly more problematic. An evaluation – the word itself should make that clear – cannot be value-free/objective, because even numbers do not speak for themselves, they must be interpreted and an interpretation is always subjective. When the students discover this, they are relieved and use the tool with greater ease and more creatively. The tool works much better, after it has been cut down to size and the ridiculous assumption that it can be used with mathematical precision.

An argument that is often sold to students is that values only mean ethical/political values and if a scientist uses uncritical value statements, he only has to tell people that he now has left the realm of facts (cf. Wöhe 2001: 55). One may think that this sounds like a practicable rule of thumb; but it isn't. Indeed, it is exactly where economists turn into ideologues. The three foundations of game theory, principal/agent theory and other such mainstream ideologies, includes the rational actor who relies on hard facts, Thomas Hobbes' evaluation of human character, and Milton Friedman's famous statement that "the only social responsibility of business is to make a profit" (1970). All three cornerstones of modern scientific management economics are presented to students as objective and factual foundations, and not as the highly subjective value-statements that they are in reality. Most scholars are not even aware of this, because they themselves have swallowed the fiction that there is value-free research. That means scientists with doctorates in philosophy (PhDs) are like babes in the wood when it comes to rather basic epistemology. A very sad situation. It also means that these people teach economism like (young) priests teach a religion: with a total conviction that they hold the absolute truth. Philip Tetlock puts this very succinctly:

'Placed in the broadest perspective, the current findings remind us that decision theorists are not the only people with strong opinions on the nature of good judgment and rationality. Decision theorists characteristically adopt an explicit prescriptive stance to their subjects of study: there are right answers that can be derived from well-defined axiomatic systems of logic such as Bayes theorem or expected utility theory or game theory. To paraphrase John Milton in "Paradise Lost" their task is to explain the ways of God to man, not the ways of man to God, where God translates for early twenty-first-century audiences as the eternal truths of mathematical models of choice.' (2000: 323)

A whole generation of students has been indoctrinated by the high priests of economism with an ideology that rolls back the achievements of the Enlightenment by feeding them untruths cloaked in the 'pretence of knowledge' (Hayek 1975). The consequences for academia are drastic. Academic work rests on debating different viewpoints in order to get closer to the truth. Should scholars not encourage a critical debate? This should be a rhetorical question as many university mottoes include the word "Truth" (Harvard's motto is of course "Veritas"), but is it? Goshal; Mintzberg, Freeman/Wicks and Parmar (2004) and Bennis/O'Toole (2005) and don't think so and maybe many other academics silently agree but

fear the repercussions of disagreement, and so remain mute. It needs brave deans, editors and reviewers to encourage dissenting views. Goshal, Mintzberg, and Bennis are well-established management gurus, but even they (Mintzberg must be excluded) waited until the end of their careers until they dared to be so critical.

Freeman et al. (2004: 364-5) show the pressures to conform to the prevalent ideology:

‘More subtly, according to McCloskey (1998), the "maximizing shareholder value" view is put forward as a "scientific" theory that is modeled and verified appropriately by ideologists called "economists." Unfortunately, in an attempt to be accepted by their "scientific brethren," several management theorists have adopted the fashion of accepting the economic view of business activity as the most useful one available and have fallen into the trap of the separation thesis. "Maximizing shareholder value" is not a value-neutral theory and contains vast ideological content.’

Dissenting voices are ridiculed and find it very difficult or impossible to publish papers. As academic careers are built on publications, many researchers will undoubtedly shrug their shoulders and succumb to the considerable pressure to conform; thereby helping to destroy what is, according to Mark Blaug the essence of scientific work:

‘Science, for all its shortcomings, is the only self-questioning and self-correcting ideological system that man has yet devised; despite intellectual inertia, despite built-in conservatism, and despite the closing of ranks to keep heretics at bay, the scientific community remains loyal to the ideal intellectual competition...’ (1992: 42)

The struggle between the value-free economists and the more ethically inclined management scholars can be traced back to the first edition of the Harvard Business Review in 1923. Williams expresses his unease about the rational actor (economic man) model and argues that it is a totally unnatural model which causes all sorts of problems in business life:

As an executive of a steel company I commonly heard the shortcomings of the industrial worker explained by reference to the “economic man,” that hypothetical person to whom nothing is supposed to appeal “unless it’s in his pay envelope.” When later I worked and lived among the laborers of both America and Europe, it was an immense surprise to find my companions using exactly this same “pay-envelope theory” to explain the shortcomings of their employers! Manifestly, something must be wrong with any explanation of human behavior which, while so universally accepted as motive for others, is with equal universality refused for one’s self. (Williams 1923: 332).

Economism is spilling over into society in general

After having established the role of economism in management and having discussed the shortcomings of this research programme, we can now proceed to explaining how economism is destroying much more than management theory. Economism has long ago

spilled over into society in general. Corporate governance is only the most visible bridge between management and public life.

Modern Western philosophy and democratic modes of governance are based on the Enlightenment. The most important message of Enlightenment was that an individual not only has the right – but also a moral obligation – to think for himself/herself. One of the Enlightenment's core ideas is that there is no higher moral authority than one's own conscience, and that the individual cannot not delegate moral judgement to either an institution or an ideology. In so doing, it challenged the power of the church, which had insisted for over a thousand years that the authority to enquire and to think was a divine prerogative administered by itself. The quintessence of the Enlightenment philosophy, Kant's categorical imperative, "Act only maxims which you can at the same time will to be universal law" (Paton 1952: 55), does not focus so much on the right to be free, but on the obligation which freedom places on the individual vis-à-vis other individuals. The responsibility for the greater good is not with God or an ideology but in the hand of every individual. The ethical essence distilled from Enlightenment social philosophy, it is still the most important philosophical statement against totalitarianism and ideology.

Economism directly attacks this core of Enlightenment thought because it binds managers to an ideology and its principles and axioms. What is more, it does so disguised as a value-free science. In order to discuss this point deeper I have taken the liberty to re-arrange Sumantra Goshal's arguments (see Figure 3) slightly. This is necessary because, while Goshal raised all the right points, in my view, he stopped his discussion a little bit too early. Perhaps he was bound by too much scholarly restraint, or he was too humble to enlarge the scope from the effect of unethical management theories upon management practice, to that of their wider significance and impact upon society in general. On the other hand, perhaps he simply believed the danger of economism was obvious enough for his readers to make the connection.

The immoral ideology of economism is the result of the confluence of two streams of thought: the pretence of knowledge and gloomy vision. The pretence of knowledge is the result of the unthinking and uncritical application of the three above mentioned axioms. The gloomy vision is based on Thomas Hobbes' view of man; people are egotistical and bad, they always think of themselves first. Goshal attempted to counter this terribly naïve reduction of Hobbesian philosophy – which was created against the backdrop of the horrors of the English civil war – by examples where individuals act not rational in the economic and Hobbesian sense of the word (selfish). Some anthropologists, however, have a more general argument against a Hobbesian view than Goshal: for them the difference between a human being and an animal is the ability to act against one's own interests. Puzzled for a long time by the fact that human babies were extremely slow learners in comparison to young animals,⁵⁰

⁵⁰ Compare a human baby and a fawn. One learns to run around after 10 months, the other in ten minutes.

anthropologists eventually theorised that the relatively slow learning of human babies encouraged the development of compassion in humans, as they had to care so much longer and more intensively for their young than other animals. If this theory is right, a naïve interpretation of Hobbes' gloomy vision is catastrophically wrong about human nature because it questions the demarcation criterion between human and animal. More important and telling maybe is that economism takes a simple rule of thumb ('humans are selfish') and turns it into an absolute truth ('humans are *always* selfish'). Again, common sense tells us that people are indeed very rarely selfish, because all national cultures condemn selfishness and it would be irrational to go against the whole community all the time. Hobbes' argument after all was, that selfishness is the natural state of humans, he did not mince his word and condemned this natural state as evil. The natural state, however, is covered by culture, religion, the state (Hobbes' Leviathan) and other man-made social technologies. Thus, the gloomy vision wants to turn enlightened and civilised humans into fierce animals, governed by Hobbes' *ius naturalis*.

Goshal (2005: 83) uses a standard scenario from Nobel prize winning game theory to illustrate the absurdity which ensues when the pretence of knowledge and gloomy vision are the basis of a scientific theory:

"Consider, for example, the "ultimatum game" in which one player, designated as the proposer, is given the opportunity to propose a division of a certain sum – a gift – between herself and another player, designated as the responder. If the responder accepts the proposal, the sum is divided as proposed. If he rejects the proposal, neither player receives anything. In any variant of the self-interest-based model of human behavior, the proposer ought to offer only a token sum to the responder, keeping the bulk of the amount for herself, and the responder ought to accept the proposal since even a token sum is more than nothing, which is the only alternative available to him."

As the players are not the Hobbesian wolfs economist claim they are, but normal human beings with a sense of justice and normally developed moral faculties, the proposers almost never offer only token amounts and the responder would never think of accepting a token amount. What good is a theory whose axioms are so obviously wrong and which does not even help to explain/predict reality, when the worth of economics – like most social sciences – depends on its ability to predict?

Departing from a utilitarian perspective, which Friedman said is more important than the model itself (predictive power over scientific rigour as a last line of defence), we would like to come back to the ethical dimension. The argument is not really that these theories are not good but that they are inherently evil (Goshal shrunk back from using that word) – because they free managers from their moral obligations. Economism forcefully brainwashes enlightened citizens and turns them into mindless executors of an anti-Enlightenment ideology: "More specifically, I suggest that by propagating ideologically inspired amoral

theories, business schools have actively freed their students from any sense of moral responsibility" (Goshal 2005: 76).

The New Manager does not have to make difficult value judgements, he simply follows a quasi-mathematical model; New Managers are neutral executors of the economic principle. This ideology has created a number-focused manager who cuts costs, but does not create new business opportunities (Mintzberg/Ahlstrand/Lampel 1999); who analyses endlessly instead of synthesising (Porter 1996: 61; "analysis paralysis: Livingston 1971: 83); who multiplies his salary while he destroys the value of his company and lays off employees by the thousands like Detlef Schrempp of DaimlerChrysler and is still hailed as a role model.⁵¹

The organisational model that represents the rule of the economic principle is the rational-legal bureaucracy (cf. Mintzberg 1979). Bureaucrats also have no responsibility other than following the organisation's logic. The excuse for unethical behaviour is the logic of bureaucracy: the rational principle. "I am only doing my job and it is not really important in the great scheme". Relieving New Managers from their duty to think for themselves and make value judgements must lead to inhumane and unethical organisational behaviour.

The economisation of society has accelerated considerably in the past 20 years. The effect of publicly amoral or immoral managers on the rest of society is a very serious complication. The business schools have played an important role in spreading economism by producing armies of cloned New Managers. However, it is not only through the sheer number of disciples that the business schools have been so harmful. Normally students have not studied business, when they enroll in MBA programmes, but law, medicine, engineering etc. Thus economism spreads across the discipline's borders. Probably even more worrying is that MBA students are not educated, they are trained in a very short time. People who have not learnt the basics of management are taught the most important "tools" of management economics without learning about the philosophical basis or the problematic nature of the tools. In other words, people with blank (and therefore open) minds are indoctrinated with an ideology without being shown any alternatives. They believe in economism as only the newly converted are able to believe. Have you ever tried to open someone whose mind and soul are firmly committed to the one Truth? 'Against stupidity the very gods themselves contend in vain', Schiller famously quipped. The author is involved in the training of young strategy consultants for a Top Five consultancy and faces the strongest opposition from people who have no management background, except in-house courses. People armed with limited expertise but strong ideological beliefs will not shift their stance, for neither facts nor reason.

51 Schrempp was made an honorary professor after destroying 50% of his company's stock value because of his exemplary work. The value of his stock options doubled on the day his successor announced that Daimler would divorce Chrysler. Schrempp made most of his money from his biggest mistake. Moral hazard does not begin to describe the situation.

The ideology of economism has reached all parts of society, and it replaces a morality based on the enlightened philosophy of the responsible individual. Thomas Kuhn's (1962) socio-historical view of the advancement of science is able to explain why a scientifically flawed research programme may be highly attractive to a majority of scientists and remain the paradigm despite being falsified. In the case of economism the appeal lies in the simplification of a reality that is too complex to be understood with mathematical models. When Einsteins special relativity theory was delivered what should have been a fatal blow ("quantum entanglement" was faster than the speed of light and therefore clashed with Einstein's most important axiom) the academic community refused to give it up. They were right to do so, as Einstein was later able to incorporate into his model what he at first "explained" as "spooky action at a distance". In management and economics the situation is very different. The gloomy vision and the economic man concept have been wrong from start and have consistently been refuted in experiments afterwards. It is high time to lift the head out of the sand and face reality. Not only for the sake of scientific progress in economics and management but also for the sake of modern humane society.

Quo vadis?

The economisation of management is maybe the most persistent trend. It has been so persistent that it will be very difficult to reverse it. Arguably the most important management scholars (Mintzberg, Hamel, Goshal, Bennis, Schein, Argyris, Drucker to name a few) have always preached the opposite. It does not bode well for change that the most influential scholars have always stood beside the mainstream. It is also very difficult to see change happening when the flaws of economism are so obvious and the vast majority of professors still feel no need to speak up. Corporate governance is a rather young discipline which has been given a lot of publicity lately because the actual governance of corporations has deteriorated visibly. Therefor corporate governance may be an area where change has a chance. This paper has argued that the reason for the deterioration is the wrong de-moralised theoretical basis of management in general and corporate governance in particular. The role of ethics must given a very prominent role in management theory; it should be obvious that ethics has a direct impact on the governance of organisations. Ethics must be an integral part of any management class, certainly of any corporate governance class. Governance cannot happen through administrators; the creators of democratic countries were all entrepreneurs of freedom. Laws are interpreted by wise men, not applied by law programmes. While wisdom cannot be learnt, the structure of morality can be learnt. That should be the least that managers take with them from business schools when it come to leadership.

The writings of Henri Fayol, arguably the first management scholar and great antipode of FW Taylor, are permeated by the notion that managers must be wise and decent judges. If the judges are not wise, if they cannot handle complex decisions, but are simpletons who – because they have never learnt to think for themselves – have to follow Milton Friedman's

mono-rule ethics of maximising the shareholders' returns,⁵² how can employees respect them? How can these *ersatz* managers respect themselves at the end of the working day, at the end of their careers? The concept that the fish always smells from the head is known to most cultures. The governance of any organisation depends to a large degree on the good ethics of a few good and trusted men and women, not on a piece of paper. Paper does not blush, as is obvious in the case of the *German Corporate Governance Kodex*. Many companies signed up and then conveniently forget major codices. The *Kodex* for instance limits the number of directorships a single person is allowed to hold to five. This provision violates Friedmanian logics and it consequently ignored by many directors. Why should you limit your income? The argument you cannot effectively supervise the top managers if you are a member of a large number of supervisory boards, is obviously less convincing than the argument that managers should be egotistical maximisers. Laws and regulations only go so far, personal ethics are ever present and thus act as a much more effective regulator of human behaviour.

With hindsight one can see a straight line from the 1960s to today's managers who are increasingly morally blind. Ethics classes are electives, chosen by softies who are not really interested in a career. In 1971 J Sterling Livingston stated that managers 'mired in the code of rationality' refuse to accept responsibility. John S Tomajan (282) named his 1945 Harvard Business Review contribution 'But Who Is To Lead The Leader?' and concluded that, '[t]he true leader will be entirely selfless.' Selfless, not selfish. The leadership of a company must have a moral compass to be able to lead. The business schools must start to acknowledge the moral vacuum at the top and accept that this in part their responsibility. All people who manage other people (one cannot manage numbers) should also be educated in ethics. Once again, laws and codes do not guide peoples' behaviour as effectively as ethical beliefs. Business schools must stop pumping out soulless maximisers and start to produce educated managers. Otherwise, those who manage will always be tempted to maximise their benefits to the detriment of those they manage and the companies they are supposed to lead to prosperity. A recent research programme, which receives support from many sections of the management community (McFarland 2001, Badaracco 2001, Collins 2001, Mintzberg 2004, Neuschel 2005), stresses that leaders serve and that the best leaders do so silently and humbly.

Conclusion

I proposed that the ideology of economism has displaced traditional management theory almost completely. This was achieved mainly by pushing the economic principle (efficiency) more and more to the forefront until it was the only consideration of managers and

52 Maximisation is a totally unscientific concept anyway, because it assumes that time does not exist. How else do managers know that they are actually maximising profits in the long run, when they maximise them in the current fiscal year? That works only, if managers would be able to see indefinitely into the future.

professors, and at the same time turning effectiveness into a mere constraint. Afterwards I elucidated the massive deficiencies of an ideology that raises theory above reality; focuses on what it assumes to be more easily quantifiable; and assumes that all humans follow the same mathematical formula when they engage in any economic activity. Taken together these axioms of economism create a de-humanised and amoral theory which, when applied, causes managers to behave immorally yet within the moral obligations of their profession as propounded by Friedmanian management scholars. We finally proposed that this immoral (or evil) behaviour by managers cannot be contained within the world of business and slowly but surely is corroding the basis of Western civilisation, Enlightenment. This would close the gap in the feedback loop from management theory to management practices to societies' moral standards, and back to management theory. A vicious circle spinning out of control is gaining momentum. Last but not least we have pointed out that true management scholars like Mintzberg, Bennis, Goshal, Drucker and before them Fayol have always proposed that management is a complex (not simple), highly personal and situational (not following one "law"), and above all moral (not technical) activity. There is no need for a radically new management theory as the basis for corporate governance – it has been there all along.

CUSTOMER RELATIONSHIP MANAGEMENT: WHEN THEORY MEETS PRACTICE

Ioannou, Myrial

¹The Ioannis Gregoriou School of Business Administration, European University –Cyprus. P.O. Box: 22006, 1516 Nicosia, Cyprus. E-mail: M.Ioannou@euc.ac.cy

Abstract

Even though the concept of exchange relationships is not new and has been debated for many decades, application of the concept in practice has not been met with success. Consequently, the paper utilises existing literature in order to guide the effective implementation of CRM in service industries. To this end, it is emphasised that a primary reason of the high failure rates is the myopic adoption of CRM technology as a panacea. CRM is a business philosophy and it is suggested that in view of the complex, multifaceted and distinct nature of exchange relationships, it is imperative to undertake prior qualitative research to better understand if relationships are also desired by customers and if so, the nature of the envisaged relationship. Then, in order to ensure that a valued proposition is designed, emphasis shifts to service employees, process re-engineering with the customer as the focus and facilitating technology.

Keywords: CRM, Failure rates, Implementation, Services

Introduction

Exchange relationships have been extensively researched and debated for nearly 40 years by four different streams of research, namely Business Marketing, Marketing Channels, Services Marketing and Database and Direct Marketing. Similarly, the business community has largely embraced Customer Relationship Management (CRM) since more and more businesses acknowledge the value of customer retention. Nevertheless, in spite of the widespread interest in CRM at both an academic and a practitioners' level, efforts to apply the concept have not been particularly successful. Few academics, however, have paused their on-going search to further refine the concept and actually defend CRM's applicability in practice.

The paper aims to align theory and practice, by focusing the discussion in a specific relational context, that of services whose intangible and inseparable nature is considered as conducive to relationship development (Berry, 1983; Gronroos, 2000). To this end, the paper reviews and discusses the relevant literature on exchange relationships, on the basis of which it recommends how CRM can effectively be implemented in a services setting.

Literature Review

Customer Relationship Management (CRM) has attracted the interest of a plethora of both academics and practitioners and many argue that CRM has become a buzzword in the

business arena. This interest stems from an acknowledgement of the well-documented benefits of relationship building, benefits which are exemplified in highly competitive and fragmented markets (see for example, Sheth and Parvatiyar, 1995; Payne, 1994; Christopher *et al.*, 2002).

Even more so, in service contexts where the offering is intangible and perceived risk much higher, customer relationships are particularly desirable. In fact, academics from the Nordic School, whose research focuses in services marketing, questioned the applicability of the simplistic 4Ps model and called for a refinement in management thinking and a paradigm shift in marketing, to a new paradigm, i.e. relationship marketing (Gronroos, 1994; Gummesson, 1994). In effect, the work of an array of researchers, such as Berry (1983), Gronroos (2000) and Coviello *et al.* (2002) underlines that services performances are inherently relational.

Consequently, many companies have rushed to adopt CRM programs but have ended up with nothing but failed attempts. That is, even though Relationship Management's origins can be traced back in the 1970s, and there is a wealth of literature on exchange relationships, "successful implementation is elusive to many companies" (Chen and Popovich, 2003 p. 672). Specifically, even though CRM failure rates ranged significantly from 2001 to 2009, they have been reported as high as 70% in 2002, while in 2009 they were of the order of 47% (Krigman, 2009)

In light of such a considerable number of failures, a number of practitioners have offered their perspective on what may lead to a successful CRM implementation (see for example, the Tugboat Media Inc, and Chatham Systems Group). Few academics, however, have gone back to the plethora of exchange relationship theories and made a conscious effort of bridging the gap between theory and practice (see for example, Chen and Popovich, 2003; Mendoza *et al.*, 2007; Amiri *et al.*, 2010). Consequently, the **objective** of this paper is to enhance this body of knowledge, with special emphasis given to CRM application in the distinct and allegedly relational nature of service industries.

Implicit in any effort to implement CRM would be a consideration of three important parameters, namely understand:

- (a) that CRM is a business philosophy,
- (b) whether relationships are applicable in the specific context and, if so
- (c) how they can be operationalised in the specific context.

(1) Customer Relationship Management – a business philosophy

An important source of the high failure of CRM implementations is the misapplication of the concept in practice. That is, a considerable percentage of companies fail in their CRM journey as they solely focus on technology – they believe that CRM is simply about software.

A plethora of articles are available online, which suggest how to effectively use CRM technology to prevent failure (see for example, Rodriguez and Boyer, 2010).

But this is simply the tip of the iceberg. The real challenge is to truly understand that CRM is not just a tool; it is a business philosophy which underlines the importance of *value delivery* in establishing and cementing relationships with exchange partners.

In their paper, Chen and Popovich (2003) provide such an explanation, underlying that “CRM is a combination of people, process and technology that seeks to understand a company’s customers” and hence “successful CRM implementation requires an integrated and balanced approach to technology, process and people” (p672). Similarly, through their empirical studies, Mendoza *et al.* (2007) and Amiri *et al.* (2010) also point to the combination of the triple of people, process and technology in effectively implementing CRM.

(2) Applicability of exchange relationships

Nevertheless, the mere transition from the myopic perspective of considering CRM implementation possible from technology alone is not enough to guarantee a successful implementation. That is, there is great controversy in the extant body of knowledge as to whether relationships can in fact be applicable in all contexts: some argue that relationships are evident only in certain contexts and suggest that their applicability may well be a function of the industry sector (Buttle, 1996; Moller and Halinen, 2000). Even broad generalisations, e.g. services settings, however, have been critically debated: for instance, Zolkiewski (2004) questions the applicability of relationships in all services using as examples the relationship between a patient with his/her physician and that of hairdressers and their clients as compared to those interactions between a bank customer and his/her banker. This has led in warnings against the overuse and misuse of the term (Zolkiewski, 2004).

Specifically, a number of factors which pertain to the nature of the product offering (e.g. continuous vs. discreet, level of customer involvement), the structure of the market (e.g. availability of alternatives), and the capabilities of the provider (e.g. professionalism) have been analysed as critical in evaluating whether exchange relationships can flourish (Berry, 1983; Buttle, 1996; Pressey and Mathews, 2000). Further, an integral part of relationship building is mutuality: based on social psychology, Barnes and Howlett (1998) suggest that for a relationship to exist both parties must perceive it, while Gummesson, (1994) and Moller and Halinen (2000) argue that both parties need to be active. Hence, it is also imperative to understand whether the customer wishes to establish and maintain a relationship (Barnes, 1994) in the first place. In effect, however, most research in consumer relationships shows that the customer’s perspective is rarely taken into consideration.

On the whole, it can be seen that prior to any implementation a thorough understanding as to what CRM is and what is not is required. This necessitates an investigation of the underlying exchange conditions to determine whether these are conducive to relationship development.

(3) Nature of potential relationships

Once the underlying exchange conditions have been established, more light can be shed as to what type of relationship may be desired. It is well documented in the literature that under different conditions and situations different relationship types may be appropriate and evident (Wilkinson and Young, 1998; Turnbull *et al.*, 1996; Blois, 1998; Ford *et al.*, 1998; Veloutsou *et al.*, 2002). These may range, for instance, in the degree of dependence, intensity and/or how close or distant they are. Compare for example, how close and personal the potential relationship between a hairdressing salon and its customers is and that of a bank with its retail customers is.

Hence, different relationships will develop in different contexts (Barnes, 1994; Veloutsou *et al.*, 2002) and these relationships will be characterised by different dimensions and will evolve in distinct paths. Such dimensions include satisfaction (Anderson and Narus, 1984; Wilson, 1995), service quality (Christopher *et al.*, 2002), communication (Dwyer *et al.*, 1987; Hakansson, 1982; Moller and Wilson, 1988), adaptations (Hakansson and Gadde, 1992), bonds (Wilson and Mummalaneni, 1986); Dwyer *et al.*, 1987; Liljander and Strandvik, 1995), trust and commitment (Morgan and Hunt, 1994).

Consequently, any effort to effectively implement CRM should not only entail an investigation as to whether relationships can exist and are desirable but also an investigation as to what constitutes such relationships.

Recommendations: How do we implement CRM in services?

The current body of knowledge suggests that in practice the implementation of CRM presents a real challenge to organisations. Hence, in line with current literature, the paper discusses a number of recommendations to aid in the establishment of mutually-beneficial relationships in a services setting.

As a business philosophy, CRM can be successfully implemented only with the appropriate management commitment and a conducive organisational culture. Specifically, a strong management commitment is necessary since CRM implementation requires a considerable investment, but the benefits will not be immediate. That is, even though considerable time, effort and financial investment are necessitated, the potential benefits accrue in the long-term. Hence, organisations which suffer from a short-term orientation and a lack of management commitment will not be able to sustain the appropriate drive and dedication.

Given the right frame of mind, i.e. being customer-oriented (Axson, 1992, Buttle, 1996 and Bennett and Durkin, 2002), organisations will strive to create the *right value proposition*, and to this end they must:

- Understand whether customers are interested in forming a potential relationship with the organisation as well as what different customers perceive as a valuable offering which stands apart from competitors' and can increase customer loyalty (Lovelock and Wirtz, 2004). In light of the complexity and diversity of relationships as well as their context-specific nature (Barnes, 1994; Veloutsou *et al.*, 2002), prior qualitative **research** in each specific context (e.g. both service industry and culture) is needed to understand the type of relationship which is possible and desirable. Qualitative research is especially pertinent in investigating relational phenomena, given the complex and sensitive nature of relationships and is in fact largely employed by the Nordic School which is one of the founding and most prominent research traditions in the area.
- CRM is a process which aims at developing relationships with **selected customers**, thus it is based on segmentation and targeting. Especially in services where choosing the right customers becomes a challenge, service firms need to choose an appropriate customer portfolio (Lovelock and Wirtz, 2004). Specifically, due to the interactive nature of services, the manner in which the customer participates affects not only his/her experience and outcome, but also that of other customers. This, in turn, affects the Lifetime Customer Value (LTV), where LTV is defined as the expected contribution from the customer to the provider's profits over his or her entire relationship. Lifetime Customer Value is estimated using past behaviours to forecast the customer's future purchases, gross margin from these purchases and the costs associated with the customer (Levy and Weitz, 2004). Zeithaml *et al.* (2001) highlight even further the importance of choosing the right customers through their Customer Pyramid, which reveals that there are substantial differences in customers' profitability or LTV.
- The variable nature of service performances does not only pose a challenge to the marketer but it also conducive to relationship development as it enables the **customisation** of the offering. Consequently, service marketers should capitalise on this opportunity so as to enhance their service value. Notwithstanding the above, it is recognised that some services lend themselves to higher degrees of customisation than others, for instance legal services as opposed to banking.
- **Technology** can also help the service marketer's efforts in better understanding and targeting customers as well as in designing valued propositions since customer databases enable the on-going collection and analysis of customer data on such aspects as descriptive information, customer transactions and encounter modes, customer preferences as well as responses to marketing activities. Hence, information technology can be utilised to support the implementation process with relevant and updated information on customer profiles (i.e. demographic

information and LTV) and behaviour. Central infrastructures to CRM applications include data warehouses, Enterprise Resource Planning (ERP) systems and the Internet (Chen and Popovich, 2003).

- Considerable emphasis should also be placed on **service employees** since the delivery of a value proposition and the attainment of customer loyalty is possible only through them. That is, due to the inseparability and variability of service performances, employees become the service, who must ensure, amongst other things, that both the process and the outcome of the service performance meets customer expectations, i.e. what Gronroos (1984) had termed functional and technical quality respectively. As a consequence, Sasser and Arbeit (1976) argued that the first market for the service company should be its employees, who should be carefully selected, trained and empowered to deliver excellent service. A plethora of academics adopted this view arguing that employees are internal customers and jobs are internal products, making Internal Marketing an inseparable element in successful services marketing (Berry and Parasuraman, 1991). Schlesinger and Heskett (1991) provided evidence to this end, when they introduced the Cycles of Failure and Success, while subsequently the Service-Profit Chain highlighted once again the close link between employee satisfaction, loyalty and profitability (Heskett *et al.*, 1994).
- Nevertheless, for service employees to be effective in their positions, the right **organizational structure** must be developed (Copulsky and Wolf, 1990), whereby functional areas, especially marketing, human resources and operations are linked. That is, a concerted effort from both backstage and frontstage employees is essential as well as between employees of different departments, so as to ensure that service delivery is at par. This enables the reduction of a number of non-financial costs incurred by the customer, such as time and physical costs, and essentially increases overall service value. Further, processes and systems must be re-engineered (Axson, 1992), not only to simplify and improve them but also to organise the operations around the customer (Murphy, 1996). Chen and Popovich (2001) also highlight that core business processes should be redesigned and built around the customer: “starting from the customers perspective to involving customer feedback” (p.682). In this way, it can be ensured that the customer is not treated as an object but as an active partner.

Conclusion

Even though exchange relationships have been debated since the 1970s, the concept is still largely misapplied in practice. Hence, the paper aims to bridge the gap between theory and practice by providing a number of recommendations for an effective application of CRM in a services context.

To this effect, it is suggested that it is imperative to redirect the current discussion on CRM implementation, from the myopic perspective which views CRM as a tool (which can be effectively be implemented through technology alone) to understanding that CRM is a business philosophy. This philosophy adopts a holistic attitude to marketing and underlines the importance of value delivery in establishing and cementing relationships with customers. It is therefore, suggested that qualitative research should be employed in each setting to explore whether customers wish to form a relationship with the organisation in the first place and if so, what type of a relationship. Service organisations should then decide which their valuable customers are and which they wish to target. Finally, they would need to invest both in the re-engineering of their processes and in their service employees, since both of these can significantly affect service value. In this effort, technology can lend a helping hand as it provides a consolidated, up-to-date account of the customers' demographics, behaviour and LTV.

Abstract

The purpose of this study is to utilize the framework of resource dependence theory (RDT) context to present the understanding of outsourcing in Turkish Textile Industry which is widely-used in custom manufacturing. This research examines the perspectives of twelve organizations by the data collected through in-dept interviews with the executives of twelve high-ranking textile brands. The results reveal the outsourcing reasons in context of RDT, the current situation of the organizations studied in terms of their strategies on managing, controlling of outsourced manufacturing services. This study provides initial findings of the deliberate decisions of the studied organizations through RDT lens.

Keywords: Resource dependency theory, Outsourcing, Textile Companies

Introduction

Outsourcing implications provide the potential of day-to-day management and strategic decision making. The scope of outsourcing - price reductions, flexibility, quality, technology, core competence, globalization and environmental factors - affects a firm to make an outsourcing decision. These decisions also affect the long-term competitive situation and some risks that the firms had to alter.

Over the time, as the interdependence of world economies increased, the organizations need to maximize productivity and profitability in order to overcome this dependence. Outsourcing therefore emerged as a popular competitive strategy for firms of all sizes in all types of industries (Javalgi et.al., 2009).

Outsourcing presents many opportunities for the firms especially the textile firms. Manufacturing in the low-cost countries such as China, Bangladesh and India offers firms price competitiveness, accesibility to new technologies and quality. On the other hand, there are dependency issues occur while managing the sub-contractors relations in terms of production deadlines, quality control issues, processes and external factors such as political implications of the domestic or outsourcing countries.

The purpose of this paper is based on two main issues. First issue is to explore how firms decide to use outsourcing- under which scope they choose this implication. The second issue

and primary focus of the paper is, by using the framework of resource dependency, to understand the reasons of outsourcing decisions and how much information the firms have on the concepts of RDT to be able to understand outsourcing is an deliberate decision as RDT suggests. RDT context of outsourcing is the focus; because, the components such as uncertainty, dependence and power related dependence issues can be seen as the prospects of outsourcing while the general sight is that many firms consider outsourcing as a cost beneficial factor. RDT postulates that organizations will take deliberate decision to be proactive in their external environments to sustain competitive advantages in potential long-term consequences. RDT provides a rich framework that firms are taking strategic decisions to become active in their environment such as mergers/vertical integration, joint-ventures and other interorganizational relationships, boards of directors, political action and executive succession (Pfeffer and Salancik, 1978). In this paper, outsourcing is taken as a focal strategy through RDT lens for firms to minimize the external uncertainty and environmental dependencies rather than a solid reason as being cost beneficial implication.

The perspectives of twelve high-ranking textile firms were explored through in-dept interviews with their executives who were intimately involved in strategic decision making and on-going outsourcing management in terms of custom manufacturing. RDT themes were explained in detail during the interviews, their perspectives on outsourcing learned and which strategies or implications they are currently using to be actively managing their environments are presented.

Outsourcing Literature Review

A widely used definition of outsourcing is the decision of make or buy. Firms decide what to perform internally versus to buy where and how to in the marketplace (Ellram et al., 2008).

In 1990's, outsourcing has become a focal issue for many industrial manufacturers. Firms implemented many functions such as purchasing, production and manufacturing through outsourcing. Managers concentrated on stock values and forming oppression to increase the firms' profits. During 90's, to descend costs by outsourcing has become the most appropriate way for firms. By having increasing number of outsourcing in many functions, outsourcing definition has diverted from a solid cost-based tactical implication on purchasing /manufacturing to a strategic management function. As the need of outsourcing to emerge as a strategical decisions, firms have defined various dimensions in outsourcing process referring to their value chain and strategic goals to keep the advantage sustainable.

Outsourcing also can be defined as obtaining goods or services externally as provided by the organizations previously (Kakabadse and Kakabadse, 2000). The main stream of outsourcing mostly cited in the literature is the core-competence component of outsourcing reasons that suggests the restructuring of the firms' activities in order to stimulate the development of their main capabilities (Prahalad and Hamel, 1990). By separating essential and non-essential capabilities and tasks helps firms to specialize and focus on the activities

that generate greater added value (Bustanza et.al., 2010). Within the perspective, firms are deciding which activities to perform in-house and which activities to outsource. As a competitive strategy, outsourcing; possesses firms a sustainable advantage through their corporate strategies. To be able to keep the sustainability, firms need to provide better controls and monitoring outsourced relationships (Amaral et.al., 2004).

Outsourcing may offer the firms: "to convert fixed costs into variable costs, to balance the number of employees, to reduce the needs for capital investment, to reduce costs via economies of scale, to accelerate the development of new products, to obtain access to the innovation and latest technologies offered by the supplier of the outsourced service, to focus our resources on those activities with high added value" (Bustanze et.al.,2010). On the other hand, as containing relationships with the suppliers or the resource holders; it may have some disadvantages such as hollowing-out fear, impact on jobs, wrong evaluation of the suppliers, being interdependent, demand changes, political risks, uncertain environment with limited resources, institutional myopia while deciding what and where to outsource.

The literature offers a wide range of different theories having different perspectives on outsourcing arguments (Gottschalk and Solli-Sæther, 2005). In this purpose, resource dependence theory (RDT) perspective will be introduced as a theoretical framework for better understanding the outsourcing decision and its implications.

Resource Dependence Theory

The resource dependence theory (RDT), introduced by Aldrich and Pfeffer (1976) and developed by Pfeffer and Salancik (1978) assumes that; having its roots from the open-system approach based contingency approach; organizations are a sub-system that all activities are affected by the external environment where they take place. According the RDT perspective, there are two main motives: first one is, in terms of demand and constraints from the environment, organizations behave not only by adapting, but also managing their relationship with the external environments towards their advantage. The second motive is, power can occur potentially important role for organizations, for that reason the environment is more a political characteristic during the decision making process.

Referring the two main motives, RDT assumes that, organizations are not solely self-sufficient and they have to obtain their needed resources from the environment which the relationship issue occurs with the other organizations. An environment that has social and physical factors and the relationships based on resources among organizations which are all have different level of power, enabling a situation: the environment is "uncertain" for the organizations (Pfeffer and Salancik, 1978).

In this uncertain environment, RDT states that the organizations need to obtain resources from other organizations as the resources are scarce. Based on this view, the interorganizational relationships occur and eventually this interaction entails mutual

dependence and power issues between the organizations. In literature, there are various definitions of dependence, however in RDT perspective Svensson's (2002) dependence definitions can fit in context to dependency caused by the interorganizational relationships:

- “technical dependence as when two firms use compatible equipment and adapt their business activities to each other in a technical sense,
- dependence based on time, as when two firms need to synchronize their business activities, dependence based on knowledge, as when two firms learn through interaction about each other's strengths, weaknesses and ability to solve problems,
- social dependence, when interaction between two firms are based on personal relationships,
- economic and juridical dependence when two firms are formally dependent upon each other such as through a written assignment”.

In order to take a self-advantage, organizations behave actively to manage dependence factor. Ulrich and Barney (1984) therefore identified that organizational achievement was the maximization of the organizational power. Within the same perspective Pfeffer and Salancik (1978) assert that organizations are the social actors exist dependently to the environmental resources and they try to minimize their resource dependency. This minimization can be managed by adopting some strategies such as: 1-integrations, acquisition and diversifications (as altering strategies), 2- setting a negotiant environment by establishing cooperative structures and 3- setting a regulated environment by legal, political and social activities.

Resource Dependence Perspective into Outsourcing

As RDT focuses on the external environment of the firm and the dependence on the resources (e.g., skills, labor, technology, materials, knowledge) for firms to operate, is dealing with the attention of outsourcing implications as well. RDT emphasises on buyer-supplier relationships (which is a one of the main constructs of outsourcing process), focusing on cooperation and coordination among partners to produce mutual benefits (Dyer and Singh, 1998, Dyer, 2000). Therefore outsourcing is a subject of RDT in terms of organizational relations.

As RDT also extends to supply chain management (it is a must to be well-managed). Inholding many subjects such as; strategic purchasing, long-term relationships, interfirm communications, supplier integration etc. (Paulraj and Chen, 2007), outsourcing implications should also be considered as a strategic decision needed to be researched under RDT lens.

In outsourcing,-on the basis of environmental uncertainty- the resource uncertainty is a topic that refers to the environments with low resource uncertainty have a reduced degree of interdependence and less conflict among the firms. That means the firms would easily access to the required resources (Pfeffer and Salancik, 1978). Low uncertainty (means high resource concentration) will have a cause of fewer suppliers to coordinate so that less dependence to

manage and less motivation to reduce uncertainty proactively (Pfeffer and Salancik, 1978). This component of RDT also refers mutual concepts with outsourcing.

In order to behave proactively in resource acquisition, a firm can become partners in joint ventures or acquiring key suppliers or can form linkages with influential individuals in supplier firms (Provan et.al., 1980). This activity refers to the power concept of RDT and also can be considered in outsourcing decision making process to minimize the uncertainties.

Based on RDT, outsourcing can be entegrated as a strategy into RDT to be examined in multi resource dependency relations as suggested by Hillman et.al. (2009). When outsourcing components are compared with RDT (see Table 1), interesting insights can be seen into understanding of outsourcing field, which is a dynamic, transforming and continuously wide-spreading implication of today's world (Javalgi et.al., 2009).

Methodology

This research has a confirmatory nature. In this context, situation analysis is the design of our research to reach an integrated view within itself. First, the researchers wanted to determine whether outsourcing reasons of the studied firms apply to RDT context (whether the firms have considered any environmental uncertainty, interdependency, power) and whether RDT perspective is relevant in making an outsourcing decision is a deliberately taken as a strategic implication. Second, by revealing the main reasons of outsourcing, the researchers wanted to provide insight of firms' current situations whether they are actively managing their external environment to have the advantage of sustainable outsourcing implications.

To this end, in-dept interviews were conducted to twelve high-ranking textile firms' executives (General Managers and Procurement Directors) who took place in decision making or in charge of outsourcing operations.

The main question of “how textile firms take outsourcing decisions” was asked to allow interviewees to tell all reasons/factors and also the story of their experiences. There were also some points which ensured related to in-dept interview during the structured questions were asked. All of the interviews took place face to face in executives’ present offices. The data were coded by dividing into categories and then assigned to re-categorization regarding to given specific answers. The interviews lasted in a duration of 50 to 70 minutes. All of the studied firms were using outsourcing based on custom manufacturing as they were used to be manufacturers in the past.

Data Analysis

To gain more insights into outsourcing decisions, participants were asked to explain how the decision was made to outsource manufacturing function. The insights are in Table 2. The motivations for outsourcing manufacturing function were mentioned and the benefits sought were categorized and the re-categorized insights will be provided in the following sub-titles.

Table 2. Outsourcing driven factors of the participant firms

<i>Firms</i>	<i>In firms perspective, outsourcing is...</i>	<i>How/why begin outsourcing when you first decided?</i>
<i>Textile 1</i>	<i>Cost reduction</i>	<i>Saw others being succesful and saving money Desire to have best quality in best prices</i>
<i>Textile 2</i>	<i>Cost reduction with comparable quality of goods</i>	<i>Technological change is important in quality issues</i>
<i>Textile 3</i>	<i>Quality improvement</i>	<i>Growing by cost reduction</i>
<i>Textile 4</i>	<i>Cost reduction</i>	<i>Growing, risk seperation needed to be financial strength</i>
<i>Textile 5</i>	<i>Cost reduction, risk spreading</i>	<i>Saw the benefits of outsourcing in transportation, scheduling, profitability</i>
<i>Textile 6</i>	<i>Good price, competitiveness</i>	<i>Fast production is important, couldn't keep up in house</i>
<i>Textile 7</i>	<i>Flexible scheduling, cost reduction</i>	<i>Desired to find best suppliers in best prices with good service</i>
<i>Textile 8</i>	<i>Fast manufacturing at valuable price</i>	<i>Financial resources are valuable, desire to be a big brand, best in competitive prices</i>
<i>Textile 9</i>	<i>Risk spreading, cost reduction</i>	<i>Cost leadership strategy, core competence, being fast</i>
<i>Textile 10</i>	<i>Cost reduction and managing the risks</i>	<i>Supplier advantage in being flexible, various suppliers, best oursourced quality</i>
<i>Textile 11</i>	<i>Flexibility, core competence</i>	<i>If you want to grow and be a competitive brand, you have to use outsourcing.</i>
<i>Textile 12</i>	<i>Growth and profitability</i>	

Motivation for outsourcing

To gain more insight on the reasons/factors to outsource manufacturing services, as consistent with the popular belief, we have found strong emphasis on cost reduction/price saving according to the data analyzed. Risk is the second important given answer to our main question, that firms choose outsourcing as a strategy to mitigate risk and to manage the risk.

Quality is also relatively strong emphasis on firms on outsourcing decisions. Thus, given the strongest emphasis on cost reduction is one of the main reason on make or buy decisions. Textile 11 stated that they are paying more if the supplier has a good quality by adding: "for this reason we do not have the same profit margin as our competitors, but we sell high quality with higher price. We are aware of the cheap suppliers in North China, but we never go there. Value is an important matter, when it is not our core-competence, we are ready to pay more". According to RDT lens, this data can be a sign of outsourcing decisions are made deliberately in the purpose of growing and profitability. However, solely cost based decisions is not a concept of RDT.

In terms of RDT, the participants explanations of some can be underlined as; all 12 firms declared that outsourcing implication was decided on the strategy base in order to achieve competitive advantage. This point supports the actively managing organizations of RDT perspective.

Textile 2 had stated: "...cost is important, so quality is. Being cost oriented will not bring competitive advantage in today's market conditions. You have to control your suppliers to ensure the quality issue where this can sometimes cost you up more than you image..."

Textile 11 also emphasised profitability mentioning that: "...considering our country's resources (labor costs, energy costs, metarial costs) it is a must to outsource manufacturing function relatively cheaper offshore countries such as China, India and Bangladesh. This will bring you competitive advantage. If you want your brand to be a leader, first you have all the costs minimized, add the gained value to your profitability and grow as much as you can..." which shows that cost is the primary issue. However, underneath there are various sub-issues as quality, fast production, good supplier relations and sustainability.

The main insights of the firms into outsourcing in RDT concepts

In regard to the RDT concepts of uncertainty (see Table 3), dependence and power, all of the participants focused on outsourcing countries where they can mitigate uncertainty and dependence. Uncertainty perceived as a risk which is not completely avoidable. Textile 4 stated as: "uncertainty comes a level after competition when deciding outsourcing" while Textile 6 stating uncertainty: "over-commit issues, delivery dates, quality controls, currency and political factors are the uncertainty factors that suffer us in the beginning, however when you settle a good relations, all vanish". Textile 11, as one of the leader brand paying attention on the lobby activities and association in textile unions, states " it is important to have the

first information on the political and financial implications in domestic market, this can show you the next door to step in". This statement is an important emphasis on environmental uncertainty and actively managing organizations through RDT as environment is not a whole of explicit knowledge. In firms statements, outsourcing itself can be a useful tool to manage and reduce risk (which is perceived as uncertainty), on the other hand, outsourcing on the offshore countries can create uncertainty if all the insights of outsourcing is not well planned.

Table 3. RDT concepts with outsourcing

<i>Concept</i>	<i>How studied firms adapt</i>
<i>Uncertainty</i>	<p><i>Following leaders' actions</i></p> <p><i>Outsourcing countries' political, financial, geographical, cultural risks</i></p> <p><i>Retaining experienced suppliers domestically</i></p> <p><i>Taken place in lobby activities with other leader brands and association in textile unions.</i></p> <p><i>Supplier back-up, working with wide-spread suppliers in different offshore countries.</i></p>
<i>Dependence</i>	<p><i>Developing cooperative relationships in order to have long-term relations.</i></p> <p><i>Trust based relationships by having short-term contracts as long-term contract are not a motive to prefer in environmental uncertainty</i></p> <p><i>At least 3 to 4 years cooperation including training, monitoring suppliers to settle the quality and good relationship.</i></p> <p><i>Keep the power imbalance</i></p> <p><i>Being careful in emerging countries such as Africa where power matters.</i></p>
<i>Power</i>	

In the dependence concept; all firms were aware of the interdependence with suppliers they cooperate. Eventhough Textile 6 stated as: "we are not dependent on our suppliers, but all of them are on us". Afterwards re-considering the textile market where the season (delivery time), quality and fast production factors, admitted the interdependence is on, as facing a late delivery can cause a huge catastrophe. All firms were aware of interdependence is an important issue. To balance the dependency among suppliers-buyers, firms do; supplier back-up, developing long-term relationships (mostly on trust based), training the key suppliers, short-term contracts (as the long-term contracts are costly and no one desire to be dependent on one supplier knowing that the environmental uncertainty).

As a third concept, power is seen as an opportunity to keep the outsourcing implication by all firms. Participants agreed on they have the power to manage the risks in their environment. The more specific knowledge they have, the more power occurs in the competition. Textile 3 mentioned on power:"we have 300 suppliers in different countries that

makes us powerful on flexibility on suppliers". This point of view shows the situation of creating new trends on supplier basis and managing the dependency as well.

Conclusions

This research has both theoretical and outsourcing implication based views. In this situation analysis, firms had explained the reasons/factors in making the outsourcing decisions. The bottom line is that organizations should carefully consider, understand and manage outsourcing activities in their external environment. In theoretical standpoint, RDT is a relevant supportive characteristic, providing insights into outsourcing, the environmental uncertainty, interdependence, power and how to manage in external environment actively.

First pattern regarding outsourcing reasons observed in this study is; cost is the common answer. Most of the firms studied admitted that the cost is the main reason in outsourcing, but quality factor and mitigating risks should not be underestimated. Among the firms, it is also recognized that cost can relatively change. Cost does not always end with price reduction, supplier relations management, backing-up, switching due to uncertainty, training, controlling all are costs including in outsourcing. To be able to manage these unseen costs, firms need to be better understanding of outsourcing in all the way. This finding can make a contribution to other organizational theory that outsourcing should be studied through, Transaction Cost Theory (TCT). Within this theory, it is considered that the "factors that make something more expensive to outsource or perform internally" (Ellram et.al., 2008). TCT can provide all the information related with cost factor and guide firms when making outsourcing decisions.

One salient finding can also contribute to Institutional Theory as; "saw others being succesful and saving money" statement of one of the studied firms, ringing a bell that outsourcing should also be investigated in the concept of Institutional Isomorphism by DiMaggio and Powell (1983).

As a second pattern regarding RDT concepts, all firms agreed to avoid environmental uncertainty. By RDT, firms should focus a political implications as to avoid risks can cause eventually. To be sustainable, lobby activities and association in textile unions can help firms to manage the uncertainties actively. Hence, a very interesting finding of this study is that, firms that are associated in United Brands Association (Birleşmiş Markalar Derneği), lobbied with government in order to reduce extra tax practices planning to be implied in imported apparels and fabrics. This extra tax has reduced on apparels from %40 to %30 and on fabrics from %30 to %20 by negotiation. This finding shows a powerful example of RDT's standpoint of "actively managing organizations". Domestically, the studied firms have also been operating in such a country of import quotas that legislated away in past two years. The external environment they are in is so volatile, as they are now facing with extra tax which is a major problem of firms that are currently outsourcing from offshore countries. Creating a negotiated environment is one of the way out of uncertainties that could change the

competitive advantages. The participants stated as all the outsourcing processes can be change, eventhough they may outsource domestically after considering the cost issues. Here another finding emerges, the firms that have the lower dependence compared to the higher dependent suppliers can negotiate to alter this extra tax on their trust based relationships. Therefore the importance of buyer-supplier relationships emerge as a major study according this situation analysis.

Limitations and future research topics

This study is limited by the perspective of general managers and procurement directors of the studied firms. Even general managers are in the decision making process, procurement directors may not have direct responsibility. In focus of this study, both the decision making process and the involment in outsourcing services to confirm the importance of the relationships studied in both general manager and procurement directors. It would also be beneficial to have more key persons' perspective on RDT and outsourcing.

Another limitation is that the researchers focused only on outsourcing of manufacturing fuction in textile business without comparing it to inhouse manufacturing or domestic outsourcing. Even the studied firms have operated inhouse manufacturing or domestic outsourcing, it was not a main topic of our research. In this perspective, experiences and learned lessons might helped on the answers when framing the situation analysis.

There are many interesting and exciting areas found for the future research. This areas could be as following:

- Participants' perception of uncertainty,
- As outsourcing is a strategical decision, outsourcing impacts as an competitive advantage could be an interesting topic,
- Nature buyer-supplier relationship for a better understanding of outsourcing,
- Future research can take a more in-dept look of outsourcing reasons in context of other organizational theory perspectives such as, transaction cost theory and institutional theory.

In the summary, outsourcing is a developing phenomenon and containing fruitful insights with theoretical perspectives, with further quantitative researchs to expand RDT, thus outsourcing as a way to have better understanding of the implications on different markets.

MUSIC FESTIVALS: SUSTAINABLE FUTURES? THE CASE STUDY OF TWO SWISS EVENTS

Jenkins, Ian¹; Rios-Morales, Ruth²; Cervera, Ralph³

¹STAR (Swiss Tourism Applied Research), LRG UAS, Bulle, Switzerland

²STAR (Swiss Tourism Applied Research), LRG UAS, Bulle, Switzerland

³STAR (Swiss Tourism Applied Research), LRG UAS, Bulle, Switzerland

Abstract

This article explores perceived and real sustainability measures that are exhibited by two prominent, international Swiss music festivals: Montreux and Paleo. Festivals and events are important generators of income and hence their image and the products they deliver are very important to a locale, community and also the international profile. It would seem incumbent upon certain festivals, especially those with a hallmark status, to assure their audiences and communities that their provision, management and delivery are sustainable.

Montreux and Paleo attract large audiences (230,000) and tourists; in addition they both have different event time-frames and locales, but each affects the community within which they are located. The current research was completed during the summer of 2011. The Montreux Jazz Festival is internationally renowned and has been running for 45 years; Paleo is a festival similar to that of Glastonbury in the UK, having been running for 35 years. The evidence suggests that each Festival has approached sustainability in different ways. Paleo has clear policies and displays obvious evidence of sustainable management: including waste management, carbon foot print calculators and transport management. Montreux, however, displays little visible evidence of environmental sustainability, which is surprising given the international status of this Festival and also the attraction of musicians who have clearly supported the environmental movement, for example, Sting and Bono. This research raises questions of management and image development, especially as the Montreux Festival advocates that there may be adverse financial effects on attendance if visible sustainable policies were introduced. Therefore, we have two similar festivals with very different approaches to sustainable development.

Keywords: Switzerland Music Festivals, Sustainability, Tourism, Responsibility, Benchmarking,

Introduction

Events and festivals have now become an important element in the repertoire of a tourism destination. Indeed, since the inception of tourism, festivals and events have played a significant part in attracting tourists. In many respects, certain events have become *iconic* in terms of the semiotics they portray and emanate a pull factor in attracting tourists to a

location. This is also the case with music festivals, many of which have international status and global attraction including Glastonbury, the London Proms and the Montreux Jazz Festival. Perhaps the most iconic and memorable was that of Woodstock, in which the pop music festival was raised from being simply a regional to an international event.

Music festivals and other events have now become a growth industry, with even small destinations such as Hay-On-Wye in the UK, receiving both national and international prominence, attracting eminent guest speakers including former U.S President Bill Clinton. This growth has been exponential and some would argue that there are now too many festivals to choose from. *Hallmark* or *Iconic* events are now of great importance to a tourist destination and many countries compete for a share of this market.

In addition one could argue that a music festival, or for that matter any other iconic festival, is reflective of the cultural tenets of a country and imparts the culture and positioning of its tourist product. Glastonbury and The London Proms clearly reflect aspects of the culture of Britain. They can be regarded as *Hallmark* events, with the ability to attract large audiences from both the U.K. and abroad. Likewise, other European destinations holding similar *Hallmark* events are also able to attract considerable numbers of tourists. Certainly, the Montreux Jazz Festival currently ranked as one of the top events in Switzerland, appeals to a broad international audience.

The development of the tourism industry and the topical and important issue of climate change have run concurrently with the development of sustainability (Jenkins 2011). It is purported that a quality tourism product should be one which is linked to the notion of sustainable values. It necessarily follows that in the advent of climate change and the pressures that are being brought to bear on the environment and society, *Hallmark* events would at least try to follow some guidelines related to sustainability (Dredge & Whitford 2010). It is asserted that it would be expected that large events should also have sustainable principles (Mendiratta 2011). Certainly, sustainability has been growing in importance and is reflected in many tourism policy areas; consequently one would have expected that this would be seen in the running and management of important events (Mair & Jago 2010, Potts & Harrill, 2002).

This is a working paper that examines two Swiss music festivals considered to be prominent and *Hallmark* events. Both have been running for some considerable time and it was expected that they would be somewhat environmentally friendly, reflecting the image that Switzerland seems to portray to the world. As a working paper, the second stage will include two similar music festivals in Canada, in order to compare Canada's approaches and management of festival sustainability. Currently, a significant number of data collection elements have been completed but there are a number of outstanding interviews that need to be finished before the first phase of the research is completed.

Both the definition and understanding of sustainability are plagued with controversy so measuring the level of sustainability can be problematic and rather ephemeral. The theoretical approach adopted by this research utilised the Brandt Report's definition of sustainability, linking it to the Global Sustainability Criteria (GSTC 2009). This is considered a competent benchmark and is acknowledged as an effective measurement of sustainability. It was also a method used by the research team in previous research and proved valid and reliable and therefore worth using for the present study. As mentioned earlier, there was also *a priori* assumption that Switzerland would exhibit a strong tendency towards sustainability, given its image and tourism industry reputation.

The Literature

Festivals & Events

As noted earlier festivals and events are important products for most, if not all, tourism destinations (Getz 2007). A destination without festivals and events in its portfolio would be very difficult to find. Furthermore, such commodities are used as part of a marketing toolbox (Ali-Knight, Robertson, Fayali, Ladkin 2009) and can reflect a destination's cultural characteristics, resonating with marketing elements utilised to sell the destination and the country. However, the novelty of these products is by no means new, and a review of past literature, demonstrates the importance of culture and festivals in many products over the last 50 years and are reflective of the culture at a destination (Murphy 1985).

Additionally, Hallmark and Mega Events are always prominent in any country's tourist palette (Yeoman et al. 2004). An example of this is the way in which nations compete to secure major events such as the Olympics and the Soccer World Cup. Tourist destinations are anxious to capture these events, which are known to enhance the tourism product and bring increased monies into an economy (Leonardsen, 2007). These festivals and events can be seen as *beacons* of a country's sustainable tourism policy, especially if the management policies of these events are embedded into the ever prominent debate on sustainability and its relationship with climate change (Kinver 2011).

Festivals are also significant economically, socially and environmentally (Getz, 2007). Events impact upon a location in many different ways and generate both positive and negative outcomes; often the social and cultural effects on communities are overlooked (Inta Kotāne 2011).

Sustainability

As mentioned in the introduction, sustainability is still a misunderstood concept (Swarbrooke 1999). Companies and policy makers and tourism actors, do not always see eye-to-eye in the delivery and importance of sustainability. It can also have a number of meanings and perceptions depending upon the understanding and *raison d'être* of an organisation (Milne 1998). The emphasis is still mainly focused on the environment, often ignoring the

social /economic elements and the premise of the Four Pillars (Afgan et al. 2007) of sustainability. In addition there is also evidence of 'Green Washing', which is prevalent in certain companies (Greenpeace 2011). The literature suggests that a common understanding of sustainability is related to pollution, bio-diversity, ecosystems and landscapes (Afgan et al. 2007), overlooking elements of the social and cultural aspects of tourism delivery (Stiglitz, et al 2009).

Benchmarking Sustainability

There is clearly a need to develop a system of benchmarking that can be used as a competent guide to the sustainability of a product, company or destination. This research considered a number of alternatives to use for this purpose and decided upon the 'Global Sustainable Tourism Criteria' for Benchmarking (GSTC 2009); the rationale being that it was developed using actual companies and validated by tourism agencies. It appears to have developed following consultation with a number of tourism actors and agents and its strength lies in that it can be used by all members of the tourism fraternity, including consumers, to assess sustainable destinations and their products.

In order to make the criteria useable, the researchers summarised the Criteria into *seven general sustainability segments* from 60 identifiable outcomes used by the GSTC. These are presented below in Figure 1:

Figure 1:
4 SUSTAINABLE FACTORS

Table 1:
7 General Segments Used for the Evaluation

Environmental	Guidelines of behaviour for visits to culturally and historically sensitive sites and the purchasing policy for environmentally friendly products for buildings.
Legislation	Includes compliance with all relevant international or local legislation and regulations. The international or national legal protection of employees is respected and employees are paid a living wage.
Community	Community matters linked to activities which do not jeopardize the provision of basic services, fair trade and goods are purchased providing small entrepreneurs with the possibility to develop and sell sustainable products.
Cultural	Connected to historical and archeological artifacts which cannot be sold by the business or traded. The business contributes to the protection of historical, archeological and spiritually important properties.
Consumption	Related to precarious purchase of products and energy consumption ought to be indicated and measured. Water consumption should be indicated and greenhouse gas emissions from all sources need to be controlled
Humanitarian	Comprises the training of all personnel regarding their role in the management of environmental, socio cultural, health and safety practices. The international or national legal protection of employees is respected and employees are paid a living wage
Social issues	Related to education, health and community development. includes hiring a percentage of minorities and preventing child labour wherever the business operates

Case Study: Two Swiss Festivals; Montreux and Paleo

Both these Swiss festivals can be considered to be Hallmark events. One is internationally renowned and attracts many famous international musicians and the other is considered to be local and regional in orientation. The basic statistics for the festivals are as follows:

Montreux Jazz Festival

- 16 days
- 12 venues,
- 10 are free
- Open 18 hours a day
- Over 1000 musicians
- More than 1000 hours of music
- 230,000 visitors
- 1,400 staff
- 450 journalists

- 4,000 places in the Auditorium Stravinski
- 2,500 places in the Miles Davis Hall
- Music in Movement with Montreux Jazz Trains and Boats
- 3 World Famous Competitions
- 2 Night Clubs (Montreux Jazz Café & Studio 41)
- Workshops, film screenings, exhibitions, special projects
- Source MJF 2011

The Paleo Festival

- 36th year
- days
- 230,000 spectators expected
- 210 +, shows & concerts
- Six stages and a total of 200 stalls on site
- Biggest Swiss open-air festival
- Major European music festival
- Source: Paleo Festival 2011

Methodology

The research followed a deductive approach and started with the basic premise focused on the research question and supported by aims and objectives.

Research Question: To what extent are Montreux and Paleo festivals considered sustainable events?

Aims:

- To establish the extent of sustainability in the two Festivals.
- To evaluate the level of sustainability in the two Festivals.
- To identify where improvements can be made to ensure a sustainable product.

Objectives:

- To gather secondary data relating to the two Festivals.
- To interview prominent tourism actors connected with the Festivals.
- To draw upon experiential data from the two Festivals.
- To analyse the data collected via the two instruments.

- To decide the extent of sustainability offered by the two Festivals.

The approach taken is that of a qualitative methodology (Brotherton 2010). This is an explorative research project and it was considered that there was a need to gather rich in-depth information from prominent tourism actors, in order to begin to assess to what extent the two Festivals can be seen as sustainable. The two instruments used were those of:

- Experiential visit to the two Festivals and
- Collection of data questioning the visitors and employees.

The second instrument involves a semi-structured interview schedule with selective tourism actors linked with the two Festivals (Robson 2002). The questionnaire schedule involves 15 questions which are reflective of the GSTC (2009) criteria for sustainability. The interviews lasted between 30-40 minutes and are recorded and reviewed. The aim is to interview 16 tourism actors (10 interviews having so far been completed), as well as gaining interviews from Festival organisers, retailers, hotel managers/owners and tourism officials. The sampling frame used for this research was one of judgemental and snowballing selection (Brotherton 2010).

Analysis

The data has been analysed through the use of discourse analysis and content analysis (Robson 2002) in which the text is reviewed for key nodes and codes and then assembled in the form of matrix tables. These individual matrix tables are then further distilled into summary matrix tables to yield overall premises that the data may be showing. The data analysis includes the interview texts as well as the experiential visit comments and observations.

Findings So Far

As noted at the beginning of the paper, this research is ongoing with some remaining interviews still to be collected (6 interviews of the Paleo Festival still outstanding). However, there are apparent themes and indications of what may emerge once the complete data set has been analysed. The Montreux Festival interviews have all been concluded giving a complete picture of the approaches to sustainability at this Festival. The initial findings do tend to highlight a dichotomy between the two Festivals which is to a large extent, also reflective of their websites. The website of the Paleo Festival appears to have sound policies relating to environmental/sustainable management and to some extent social and cultural policies (Paleo Festival 2011). Montreux, however, has limited elements of sustainable policies both on its website and in its marketing information (MJF 2011).

Results and Discussion: So Far

Montreux Festival

An examination of the Montreux website reveals limited evidence of any sustainable approaches to the management of the Festival. The experiential evidence is also limited in terms of the visible signs of sustainable management seen mainly in terms of environmental rather than the social and cultural aspects of sustainability. On the website, there was little evidence of sustainability measures, such as carbon mitigation or the sourcing of goods and transport management. The area used by the Montreux Festival does have recycling bins but on visits to the Festival these were usually full with the contents often spilling onto the streets and surrounding areas. The food on sale also reflected less sustainable measures, with fast food dominating, being sourced nationally rather than locally. Interviews with actors also revealed that sustainability was not a priority, rather there appeared to be a reticence and even an anxiety to embrace it; it was felt that visitors might be *put-off* the Festival if sustainability was made too prominent. It is certainly not an immediate priority for the Festival, which is somewhat surprising, given the high profile of many of the participating musicians and also the alleged concern for the environment that many of them have (for example Sting and Bono).

However, free transport was provided to and from parking areas and around the centre of Montreux. Given that it is likely that most of the attendees arrived by car, this has a limited impact in reducing the carbon foot print and mitigating the carbon element of holding the Festival.

However in terms of the local community benefiting economically, there was some evidence to support this. Local hotels and entertainment establishments confirmed that their businesses did benefit from the Festival and that a large number of attendees would have a significant effect upon the area in terms of the economic income generated; it appears therefore that the Festival does bring significant income to the community. The Festival employs 20 full-time staff and 1200 part-time staff plus some 200 volunteers, mainly Canadians, Americans and French. However the part-time element has limited value as it is only for a 2 week period, which raises the question: what do these *local* employees do for the rest of the year?

Paleo Festival

As mentioned earlier, data is still being collected for this Festival. Paleo, similar to Montreux, has a prominent place in the Swiss calendar of events. The evaluation of its website reveals this Festival considers sustainability to be important and as noted in the literature review this relates primarily to the environment. Environmental strategies and concerns have a prominent focus, but they are not necessarily the main aim or an essential part of the Festival. There is evidence of strategic policy and action being carried out by this

Festival including visible signs of recycling and environmental action including a number of stalls focused upon environmental awareness. Perhaps, this is also helped by the fact that the Festival is on one site and does not have disparate functions elsewhere in the vicinity. It could also be classed as a rural rather than an urban location (Montreux being completely urban). The Festival also attempts to calculate its carbon footprint. In addition, the organisers seem less fearful of customer reaction to incorporating such measures and the transport system seems geared to trying to get the attendees *out of their cars*. There is also an environmental waste management policy which measures the waste produced by the Festival and there are also plans to reduce waste and energy consumption. Only two interviews have taken place with the Paleo actors (which are key) but the initial evidence and the experiential data seem to support the assertion that the Paleo Festival is committed to developing sustainable policies. It is hoped that the planned additional interviews, will support the emerging premise that Paleo is more sustainable than Montreux.

Tentative Conclusions

The two Festivals seem to show a varied response to sustainable measures and management. It was expected that the more renowned of the two Festivals (Montreux) would have exhibited stronger sustainable characteristics. However, it is the regional and less well known Paleo Festival that seems to have the more pro-active approach to sustainability. However, Paleo's focus is mainly on the environment and thus leaves out the six other GSTC factors in its management of sustainability (see Table 1). That said, this may well be down to the perception that the environmental measures are those which are perhaps the most visible and the easiest to market.

In addition the Montreux Festival and its supporting actors did demonstrate an initial reticence to engage in the research, which may be a signifier of the lack of sustainable measures that they are currently (or not) undertaking. Perhaps the urban location of the Montreux Jazz Festival also adds to the lack of sustainability exhibited by it. Although, as has been shown, the monetary contributions and employment factors do appear to have a positive effect upon the community and its economic status. One could also argue that the Festival contributes to the cultural tenets of the location and has certainly internationalised the destination. The dominating statue of 'Freddie Mercury' in the centre of Montreux, is possibly an indication of the importance of this Festival to the locale. However, one would have expected, with the growing importance of climate change and its now 'unquestionable' link to carbon emissions, that carbon foot print monitoring and mitigation, would have been, at least, fairly high in the visible policies and management of the Montreux Festival.

It would appear at this stage in the research, that Paleo is far more embracing of sustainable development, as evidenced by the information that is freely available on the internet, and through interview and experiential data. The Paleo Festival is not as well known internationally or regionally, and is also located on a single rural site which may make it

easier to manage. It appears evident that this Festival is certainly taking the environmental side of sustainability seriously and seems to be producing and delivering policies that are sustainable.

Once again the idea that consumers and attendees are not interested in sustainability is an interesting perspective. It is certainly one that occurs in other areas of the tourism product and perhaps has some validity here too. But to say that sustainability is not important is an entirely different statement. In essence the results suggest that Montreux should be doing more for sustainable development, especially, in terms of Carbon Footprints.

It is also interesting to note that websites can often be an indication of the policies and delivery of the product on offer. The Paleo site has many pages relating to its sustainable and environmental policy. Whereas the Montreux website, has little, if any, information on its environmental sustainability policy.

In conclusion, both Festivals, although within close proximity of each other, seem to approach sustainability in different ways. Currently, findings from the Paleo Festival suggest that in terms of the environmental sustainability aspects of the GSTC criteria, it is ahead of Montreux; however, both Festivals have a long way to go to ensure a completely sustainable product.

THE ROLE OF PSYCHIC DISTANCE ON FDI FLOWS FROM THE SOUTH TO THE EAST OF EUROPE

Abstract

The purpose of this paper is to examine the influence of psychic distance stimuli on foreign direct investment flows from countries located in the South of Europe towards the new members of European Union from Central and Eastern Europe. By applying panel data techniques, evidence of a negative relation is obtained for distance in democracy, whereas a positive one is obtained for per capita GDP and distance in education and industrial development, which demonstrates that these investment flows are characterized by an efficiency-seeking approach and low educational and technical requirements. This FDI motivation prompts firms to maximize cost advantages such as reduced salaries or input prices. Also interestingly, political risk does not seem an obstacle, in accordance with recent literature on political capabilities. The conclusions highlight the relevance of policies designed to create the appropriate structures for training a qualified workforce, combining attention to present-day economic needs and a wish to avoid a possible foreign investment dependence that generates few positive externalities for the host country.

Keywords: Foreign Direct Investment, Psychic Distance, Multinational Enterprises, Central and Eastern Europe, European Union, Panel Data.

Introduction

Outward and inward FDI from a country or geographical area, the great majority of which is today undertaken by Multinational Enterprises (MNEs), can be systematically related to the structural changes involved in economic development (Lall, 1996) as a consequence of the possible spillovers derived from FDI (see for instance Havranek and Irsova, 2008 or Meyer and Sinami, 2009 for a recent revision of the positive externalities of FDI). This is why nowadays, almost all countries and especially developing countries stimulate the attraction of FDI through financial or other sorts of incentives, reflecting a favourable environment for foreign investors that was hardly the reality some decades ago.

Together with the emerging economies in countries from South Asia, India and China, the new members of the European Union (EU) from Central and Eastern Europe have been able to increase its appeal as a destination for FDI from across the world. Despite the fact that inward FDI levels were below expectations in the 1980s (Baldwin, 1994), the negotiation to adhere the EU represented

a very important incentive to revitalize the FDI flows for the new members, namely Cyprus, Czech Republic, Estonia, Latvia, Lithuania, Hungary, Malta, Poland, Slovakia and Slovenia in 2004 and Bulgaria and Romania in 2007. Thus, according to UNCTAD data, total accumulated investment in the year 2000 stood at around 97,726 million dollars and rose to 229,734 million dollars in 2004, which reflects an increase of 135%. In this same period, the growth of accumulated FDI in the world grew by only 53.87%: in the developed economies by 62.7% and in Central and Latin America by 41.07%⁵³.

Southern European economies, despite not being the most important investing countries, represent precisely one of the regions that has most benefited from greater facilities to carry out FDI in the new EU members nowadays, such as infrastructural improvements, lower salary and raw materials costs and significant institutional development (Jiménez, in press). In fact, FDI from Southern European economies have increased their share up to close to 20% of total inward FDI in the region⁵⁴. However, according to Disdier and Meyer (2004) and Durán et al. (2008), as Eastern European countries have progressed in their transitional processes towards EU adhesion, developing economic, social and institutionally, and the factors that drive the decision to localize in Western Europe and Eastern Europe have also followed a convergent trend; there is evidence to demonstrate that relevant differences still exist that make companies, French and Spanish respectively, distinguish an East-West structure in the FDI location strategy. The existence of such a structure raises the question of whether these host countries, despite their adhesion to the EU, are still perceived as culturally and institutionally distant destinations for investing countries in the South of Europe.

As a consequence, this work centres on an analysis of the particular determinants of FDI among countries from the South of Europe and the new members of the EU, but paying special attention to the relevance of psychic distance. Cultural and institutional aspects may be considered one of the most relevant lines of study in the field of international business (Griffith et al. 2008). Precisely, the concept of psychic distance embraces and encompasses cultural distance among other dimensions (Dow and Karunaratna, 2006). Together with the formal ones, it forms part of the informal institutions that determine the third pillar of a new paradigm in business strategy comprising the resource-based, the industrial-based and the institutional-based approaches (Peng et al. 2008).

The use of psychic distance stimuli as the explanatory variable of various economic phenomena may be noted in studies on firm performance (O'Grady and Lane, 1996; Dow and Ferencikova, 2010), the relations between exports and imports (Prime et al. 2009), online internationalization (Yamin and Sinkovics, 2006), the internationalization of knowledge-intensive small and medium-sized enterprises (Ojala and Tyrvainen, 2009) and entry modes into foreign markets (Dow and Larimo, 2009; Dow and Ferencikova, 2010). However, to the best of our knowledge, and with the

⁵³ Preparation by the authors of the percentages from data in the UNCTAD World Investment Report 2005 Statistical Annex.

⁵⁴ Preparation by the authors of the percentage from data in the Eurostat database and World Development Indicators.

exception of a single Slovakia (Dow and Ferencikova, 2010) they have not been used as a determinant of FDI flows towards the Central and Eastern European countries as a whole region.

The remainder of the paper is structured as follows: section 2 undertakes a review of the literature on the determinants of FDI in Eastern Europe, section 3 describes the sample, the dependent, independent and control variables as well as the diagnosis of multicollinearity and the model, section 4 presents and discusses the results and, finally, section 5 sets out the conclusions.

Literature Review

Various studies highlight different determinants and features of FDI flows in the Eastern European countries. Lankes and Venables (1996) analyze the motivation -local market versus exports- of the investment, Lefilleur and Maurel (2010) highlight the importance of proximity to suppliers and Damijan et al. (2003) point out that FDI is not generating positive intra-industry spillovers for domestic firms in this region. Taking into account the increase of in the attractiveness of these countries as a destination for FDI, Buch et al. (2003) and Galego et al. (2004) study the possibility of a relocation process towards this region of flows which would otherwise have been destined for the South of Europe, although they found evidence against this hypothesis.

One of the key factor to attract FDI flows, according to the literature, is the institutional environment. Meyer (1995) claims that the political, economic and legal environment is one of the fundamental factors to attract investments to the region, especially in the manufacturing sector. Oxley (1999) and Smarzynska (2002) point out that greater protection of intellectual property rights also incentivize investments made through total ownership. Wheeler and Mody (1992), Brenton et al. (1999) and Bevan and Estrin (2004) also pay attention to the importance of institutional determinants, highlighting that progress during the negotiation process over the adhesion to the EU had a positive effect on inward FDI flows. Nevertheless, as underlined in the previous section, despite the convergent tendency in the determining factors, there is still evidence to demonstrate the existence of relevant differences, which suggests an East-West structure in the location decisions of MNEs (Disdier and Mayer, 2004; Durán et al. 2008).

However, as pointed out previously, literature on the effect of psychic distance as an explanatory variable of FDI flows in this region is very scarce. The analysis of perceived or psychic distance between countries was popularized by the Uppsala School (Johanson and Widarheim-Paul, 1975; Johanson and Vahlne, 1977) who defined the concept as *"the sum of factors preventing the flow of information from and to the market. Examples are differences in language, education, business practices, culture, and industrial development"* (Johanson and Vahlne, 1977, p. 24). Originally, however, the term was used by Beckerman (1956), when affirming that all other things being equal, given certain transport costs, there would be a preference for closer markets from a psychic point of view.

Regardless of the different factors included in the definition of the Uppsala school and in other subsequent positions, the greater part of works has centred solely on cultural differences. However, this constitutes a serious drawback, as psychic distance is a much broader concept that includes

many other sources of distance than cultural related ones (Dow and Karunaratna, 2006; Dow and Ferencikova, 2010; Hakanson and Ambos, 2010; Tung and Verbeke, 2010). Additional factors have to be included in the analysis such as education, industrial development and political systems, in order to be able to correctly understand the complex phenomenon of psychic distance (Shenkar, 2001; Evans and Mavondo, 2002; Dow and Karunaratna, 2006).

Given that measuring the perceptions of the manager just before the decision is taken is usually not possible, and that *ex-post* perceptions imply a causality problem due to the difficulties to differentiate between whether the *ex-ante* perceptions led to a decision being taken, or whether the *ex-post* experience influenced the manager's perception at the time of the survey, the majority of empirical studies centre on macro-level factors known as psychic distance "stimuli" (Dow and Karunaratna, 2006), although accepting that manager perceptions of psychic distance will depend on the psychic distance stimuli to which they are exposed modulated by their personal sensitivity.

On the one hand, a negative relation may be established between psychic distance stimuli between two countries and inward FDI. Greater distance in language and religion increase the uncertainty of the MNE over the correct interpretation and communication with various agents that intervene in the market in which it intends to maintain a presence (Johanson and Vahlne, 1977; Cavusgil, 1980, Dow and Karunaratna, 2006) reducing the appeal of such markets and the probability of the MNE investing in the country. In addition, large differences in the political systems between the home country and the host country will increase uncertainty in communications and the possibility of committing errors when anticipating how the society, local government or other institutions are going to behave in certain situations, or the reaction of competitors to a possible governmental measure, thereby reducing the interest of that marketplace as a possible FDI destination for an MNE (Dow and Karunaratna, 2006).

All in all, this greater foreseeable difficulty in understanding the idiosyncrasies and the environment of the host country, arising from the inexistence of perfect market competition, increases the transaction costs faced by MNEs (Williamson, 1975, 1985), which negatively influences outward FDI. This leads us to formulate the following hypotheses:

H1: "The greater the psychic distance in language between the home country and the host country, the lower the flows of FDI between both countries".

H2: "The greater the psychic distance in social system between the home country and the host country, the lower the flows of FDI between both countries".

H3: "The greater the psychic distance in democracy between the home country and the host country, the lower the flows of FDI between both countries".

H4: "The greater the psychic distance in religion between the home country and the host country, the lower the flows of FDI between both countries".

On the other hand, as Tung and Verbeke (2010) point out, researchers should avoid the trap of thinking that higher distance systematically engender negative outcomes, an assumption that needs

to be carefully reconsidered. In fact, it is also feasible to posit a possible positive relation between the psychic distance stimuli and inward FDI. This can happen when a more positive or neutral reception is given by nationals to individuals from culturally distant countries (Carr et al. 2001) who denominate this effect as *“inverse resonance”*. Also, distance can help firm to develop new capabilities or access to talent not available in closer countries. Finally, a greater distance, when it is positive for the investing country, can also positively influence FDI depending on the motivation of the investment (Jiménez, 2010b).

The different types of FDI can be separated according to their purposes, distinguishing between those that search for new markets into which products may be introduced (*“market-seeking approach”*), resources or factors that are not available in the market of origin (*“resource-seeking approach”*) or increased efficiency and cost reduction (*“efficiency-seeking approach”*). In this case, MNEs search for locations where they can take advantage of economies of scale or where they can carry out their business activity at a lower cost (salaries and other factors) than in the home market. This is especially feasible when the activities that are delocalized do not require excessive training, and frequently occur in the manufacturing sector in which knowledge of a more technical nature is needed. This can drive MNEs that plan the delocalization of their activities with low qualification requirements to attempt to maximize the reduction in salary costs that can they can achieve by investing in those countries in which the psychic distance in education is greater, although not so great that the workforce is unable to carry out the necessary tasks that constitute the activity undergoing delocalization. Equally, and provided a necessary minimum level, overly high levels of industrial development are not necessary in these types of activities, as they do not need the cutting-edge technology neither a very sophisticated buyer with high purchasing power because most of the production is intended to be exported. Thus, MNEs can try to maximize cost reductions of other factors by investing in locations in which the psychic distance in industrial development is much higher. This leads us to formulate the following hypotheses for the education and industrial development dimensions:

H5: “The greater the psychic distance in education between the home country and the host country, the greater the flows of FDI between both countries”.

H6: “The greater the psychic distance in industrial development between the home country and the host country, the greater the flows of FDI between both countries”.

Methodology

Sample and Data Collection

The sample is made up of outward FDI from Italy, France and Spain towards countries from the new members of the EU from Central and Eastern Europe: more specifically, Bulgaria, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, Slovakia and Slovenia, from 1999 to 2006, yielding a sample made up of 240 observations. Unfortunately, it was not possible to find reliable data from Cyprus and Malta for many of the variables used in the models which is why they were excluded from the sample.

In the few cases in which the sources that were consulted failed to provide data on a particular year of an explanatory variable, it was decided to estimate that value as an average of adjacent years, so as not to lose observations given the small size of the panel.

Dependent Variable

The dependent variable consists of inward FDI in millions of Euros in the corresponding host country from each of the investor countries included in the sample. This allows us to take into account the fact that in certain cases the investment flow from an investor country is zero or even a negative value in cases of divestment, which prevents calculation of the logarithm, except if the dependent variable is truncated to include only positive values, provoking distortions in the results (Santos Silva and Tenreyro, 2006).

The sources consulted to obtain the data were Eurostat and the DATAINVEX database of the Spanish Ministry of Industry, Tourism and Commerce. Annex 1 shows the descriptive statistics of the dependent variable as well as the independent and control variables included in the model.

Independent and Control Variables

Most studies rely on aggregated measures such as the Kogut and Singh formula (1988), despite the fact that adding the different dimensions in one single index might, erroneously, lead one to think that all of them together are equally significant of the relations under analysis (Sousa and Bradley, 2006; Dow and Karunaratna, 2006). This is the reason why the individual stimuli of psychic distance suggested by Dow and Karunaratna⁵⁵ (2006) in education, in industrial development, in language, in degree of democracy, in political ideology and in religion, are included as independent variables⁵⁶.

Each dimension is the single-factor solution of a principal component analysis for a set of instruments⁵⁷. For education, differences in literacy rate and enrolment in second and third-level education are included. For industrial development, ten different indicators are taken into account, namely differences in consumption of energy, vehicle ownerships, employment in agriculture, number of telephones and television, etc. The language dimension is based on 5-point scales that focus on the differences between the dominant languages between any two countries and on the incidence of the investing country's major language within the host country and vice versa. For degree of democracy, differences in political rights, civil liberties and the indices POLCON and POLITY IV are included. The political ideology dimension, following the procedure suggested by Beck et al. (2001), is calculated based on the ideological leanings of the chief executive's political

55 The reasons for using these scales instead of others that are also of an exogenous nature, such as those proposed by Brewer (2007), is because, although both overlap in many aspects, those of Dow and Karunaratna (2006) cover a greater set of factors that are normally associated with psychic distance, whereas those of Brewer (2007) are constructed from a perspective of a single country, in this case Australia and are not available for Central and Eastern European countries.

56 Following the recommendation of the authors of the psychic distance constructs (Dow and Karunaratna, 2006), in the case of stimuli in language and religion, the nominal and not the absolute value is used.

57 See the seminal paper of Dow and Karunaratna (2006) for a more detailed description of the procedure to calculate the different psychic distance dimensions.

party and the largest political party in the government. Finally, 5-point scales focused on the differences between the dominant religions of any two countries and the incidence of the investing country's dominant religion within the receiving country and vice versa are included in the religion dimension.

As control variables, various macroeconomic magnitudes are included such as the per capita income (GDP per capita) and the growth rate of GDP of the host country, as indicators of its economic development and attractiveness. It is expected that the sign of these variables, in case their relation with the dependent variable were significant, will remain positive. With regard to unemployment, the relation can not be determined *ex ante*, as high rates can signal to MNEs the possibility of contracting workers without difficulty, but also the possible existence of rigidity in the labour market (Disdier and Mayer 2004).

Furthermore, in the same way as Galego et al. (2004), a macroeconomic characteristic that is specific to the investor country –the growth rate of the GDP- is included to take the macroeconomic conditions of the FDI investor countries into consideration.

It may be expected that better infrastructure drives an increase in inward FDI given the greater facilities for transport and communication. To do so, however, not only should infrastructure availability be taken into account, but so should its reliability, in the absence of which the infrastructures lack utility (Asiedu, 2002). Therefore, following the recommendation made by Asiedu (2004), the percentage of electricity loss in transmission and distribution over total electricity produced is also included as well as the percentage of GDP earmarked for the fixed capital formation (which includes the construction of roads, railways, schools and other investments in development infrastructure) with an expected positive sign in the case of significant coefficients.

Together with the urban population rate as a proxy of the degree of development, the level of openness to FDI is also controlled and included in the percentage that the overall inward FDI flow from all over the world represents from total GDP in the host country. In addition, the score of the Corruption Perceptions Index is also included, bearing in mind the relevance of political risk for FDI in this region (Durán et al. 2008; Jiménez, in press). In order to take into account all the different aspects encompassed by the concept of political risk, additional alternative variables will be used as robustness checks (i.e. political restrictions on local government or economic freedom and the protection of property rights).

Finally, in order to take into account that the closer two countries are, the greater the volume of their commercial relations (Anderson and van Wincoop, 2004; Santos Silva and Tenreyro, 2006), the bilateral geographic distance is included, which is calculated as the sum of the distance between the main cities of the countries, weighted by the economic relevance of the different regions in each country (Disdier and Meyer, 2004).

The data sources are Dow (2007) for the psychic distance stimuli, the CEPII for bilateral distances, Transparency International for the Corruption Perceptions Index, and the World Development Indicators published by the World Bank for the rest of the variables.

Multicollinearity Diagnosis

Annex 2 shows the correlations matrix for the independent variables and its Variance Inflation Factors (VIFs). Given that all the values are below the limit of 10 as recommended by Neter et al. (1985), Kennedy (1992) and Studenmund (1992) and only the psychic distance variable in democracy exceeds the strictest limit of 5.3 proposed by Hair et al. (1999), it may be affirmed that there are no serious problems of multicollinearity.

Despite this, and given that the different constructs for psychic distance usually show high correlation rates between each other (Dow and Ferencikova, 2010), in addition to the model that includes all of them at the same time, the results were tested by including only one dimensions of psychic distance at a time.

Model

The chosen panel data technique for the analysis gets around some of the limitations of the ordinary least-squares regressions that do not allow the inclusion of the temporal dimension. In order to decide between the use of either a *fixed effects* (FE) or a *random effects* (RE) model, a Hausman test should be performed, such that if the specific common effects are found to correlate with the explanatory variables, a fixed effects model should be chosen. However, the Hausman test in our model does not reject the null hypothesis of no correlation between the specific common effects and the regressors, so the random effects model may be used, more exactly by employing the *Generalized Least Squares* estimation to obtain consistent and efficient estimators (Galego et al. 2004).

Using a random effect panel model enables to include many variables that are time-invariant, such as such as psychic distance stimuli or geographical distance, and to take into account time-variant shocks that affect investors from a home country to a host country (Bertrand et al. 2003; Cuervo-Cazurra, 2008).

Therefore, the following model is the basis for the empirical analysis:

$$\begin{aligned}
 FDI = & \gamma_0 + \gamma_1 ENROL. SEC. EDUC. + \gamma_2 UNEMPLOYMENT + \gamma_3 URBAN POPULATION + \gamma_4 \\
 & ELECT. LOSSES + \gamma_5 GDP GROWTH HOST COUNTRY + \gamma_6 FIXED CAPITAL FORMATION \\
 & + \gamma_7 GDP GROWTH HOME COUNTRY + \gamma_8 GEO. DIST. + \gamma_9 CORRUPTION + \gamma_{10} FDI/GDP + \\
 & \gamma_{11} GDP PER CAPITA + \gamma_{12} PSY. DIST. EDUC. + \gamma_{13} PSY. DIST. IND.DEV.+ \gamma_{14} PSY. DIST. \\
 & LANGUAGE+ \gamma_{15} PSY. DIST. DEMOCRACY + \gamma_{15} PSY. DIST. SOCIAL SIST.+ \gamma_{15} PSY. DIST. \\
 & RELIGION + \varepsilon_{ij}
 \end{aligned}$$

Moreover, as additional robustness tests, additional models will also be checked using *maximum likelihood* (ML) estimation. The results were also tested by using the *population-averaged* (PA) estimators with similar results to ML⁵⁸.

Results and Discussion

Annex 3 contains the results obtained from the different models under analysis. Models 1 to 7 provide the RE estimation results (first the global model and then models including a single psychic dimension) whereas Models 8 to 14 provide the ML estimation results, respectively. The results show a positive and significant relation between FDI flows and per capita GDP and psychic distance stimuli in education and in industrial development, validating hypotheses H5 and H6. On the contrary, a negative and significant one is obtained for perceived corruption and psychic distance stimuli in democracy. Thus, hypothesis H2 is also confirmed. The rest of psychic distance dimensions do not obtain significant coefficients, so H1, H3 and H4 cannot be validated or rejected.

These results show that FDI flows from the investing countries analyzed in this paper are favourably affected by a greater psychic distance with regard to education. Given that the distance scores are positive in nominal terms for the investing countries, this results demonstrates that the decision makers in charge of the FDI location strategy do not consider that high levels of qualification are necessary in this type of FDI. Instead, they opt to maximize cost advantages, especially salaries, which may be gained through delocalization of part of the productive processes to one region, which were earlier carried out in other regions where the workforce was more expensive because of its higher general level of training or simply because of a higher general level of prices. In fact, these results are consistent with those obtained by Jiménez (in press) and Jiménez et al. (in press), which provide evidence that the manufacturing sector in Spain is the one with the highest propension to carry out FDI in regions where it can benefit from the location advantages based on reduced costs. This bias towards FDI motivated by an efficiency-seeking approach is also confirmed by the positive and significant sign of distance in industrial development, which once again shows that this type of FDI needs relatively little technology development to be carried out, whereas consumer with high purchasing power are not required because most of the production output is sell abroad as exports. Thus, FDI flows can be relocalized in regions where the cost of these factors is advantageous for the MNE.

Consequently, given that the FDI flows are characterized by low qualification requirements, it is reasonable to think that educational policy, in the short term, may relieve the acute social problem of unemployment, if training linked to employment demands is encouraged, prioritizing *ad hoc* vocational training that can take advantage of the current relocation process of productive activities towards those countries. However, if it is intended that the country develop another type of production or industry in the long term, focusing more on value-adding activities (especially those

⁵⁸ Results of the estimation through "averaged-population" are available on request from the authors.

with a high R&D component and tacit knowledge) and less on cost competitiveness, it will be necessary to prioritize the requirements for the qualifications of the workforce. To do so, it is advisable to emphasise advanced level training and stimulate research with the aim of attracting FDI with higher qualification requirements. In spite of the above, it should be remembered that the political decision to invest more heavily in education will not necessarily guarantee the success in attracting FDI that needs a more qualified workforce, as it is a necessary but not a sufficient condition. It is also essential to implement policies that favour this type of FDI with respect to the construction of infrastructures and centres of excellence that achieve the creation of beneficial clusters for MNEs, productivity, fiscal incentives and the development of the financial system.

Regarding the enrolment rate in secondary education, this variable has turned out not to be significant, confirming that the determining variable of FDI flow intensity is the relative difference between the home and host country, and not the evolution of the specific absolute educational level of the host country. This suggests that those countries that wish to increase inward FDI in which high qualifications are necessary, should not only pay attention to improving their own educational levels, but should also try to reduce the distance or “gap” with respect to investing countries. Otherwise, improvements in absolute terms will be achieved but a deterioration of the situation will have occurred in relative terms. The fact that absolute educational levels lack relevance and, on the contrary, the distance with regard to the investor countries is significant, affects educational policy decisions that maintain a relation with the qualification of the workforce and consequent value creation, insofar as if the chosen focus is long-term economic and social development, it will be necessary to define the improvements in relation to indicators from the investing countries and to achieve that the possible investors perceive the reduction in the educational gap. Greater qualification will not reduce the psychic distance if improvements are below those of the investing countries.

The rest of the results are as expected, although the significant and negative sign of the corruption variable may be somewhat surprising. However, once again these results are consistent with those obtained by Hellman et al. (2002) and Jiménez (in press), which show that in certain markets, especially for those with a relatively less advanced institutional development, MNEs can obtain competitive advantages through the development of political capabilities. This means that those with greater advantages than their rivals may take advantage of them in more compromising environments to benefit from their greater experience in negotiating, create networks and even corrupt the authorities of local government, as has been shown for American MNEs (Holburn, 2001) and Spanish MNEs (García-Canal and Guillén, 2008; Jiménez, 2010a). In fact, the results do not vary substantially if, instead of a corruption variable, political restrictions on local government or economic freedom and the protection of property rights are included as variables⁵⁹.

As robustness checks, Annex 4 includes Models 8 to 14 which offer the results when using the *maximum likelihood* (ML) estimation. Results do not change significantly, although the psychic

⁵⁹ Results available on request from the authors.

distance in industrial development is no longer significant when included as the only psychic measure in the model. However, we are confident in our results as it holds its positive and significant coefficient in the global model. Psychic distance in education and per capita GDP keep their positive and significant coefficient whereas corruption and psychic distance in democracy also maintain their negative and significant relations.

As a final robustness check, the results when the dependent variable is truncated to allow the calculation of the logarithm of FDI flows, giving a value of 1 to negative numbers or zeros, were also checked to be able to compare the results obtained from the different models. The results show no significant changes in comparison to those described earlier, except in this case the fixed capital formation coefficient is positive and significant and greater geographic distance has a negative influence on the intensity of FDI flows⁶⁰. However, these results must be taken with caution given that the procedure to calculate the dependent variable provokes distortions (Santos Silva and Tenreyro, 2006).

Conclusions

The present work, conscious of the changes arising from the enlargement of the European Union, has embarked on an analysis of the relevance of psychic distance variables to the intensity of FDI flows from investor countries from the South of Europe to new members of the EU from Eastern Europe. To do so, a study was conducted on the determinants of FDI flows by using panel data techniques so as to include the analysis of the temporal dimension.

One of the main contributions of the study lies in the empirical evidence it offers on the influence of psychic distance stimuli in education, which favours FDI from these investor countries in Eastern Europe. Broad differences in educational levels between home and host countries act as an incentive to take advantage of lower salary costs in comparison with alternative locations, supporting the delocalization of productive activities, especially those with lower qualification requirements. This result has also been confirmed by the positive influence of psychic distance stimuli on levels of development, which has shown that this type of FDI from the South of Europe is positively motivated by locations in which it is possible to benefit from significant reductions in the costs of factors. In contrast, the absolute educational levels of the host countries did not turn out to be a significant variable, showing that the relative difference in the home/host country combination is the true factor to take into account.

Moreover, it has been shown that per capita GDP and a reduced psychic distance in democracy have a positive effect on the attraction of larger flows of FDI, which undoubtedly reinforces the move towards the cohesion of educational, social and economic EU policies. Besides, greater perceived corruption in the country is revealed to be a factor that also attracts FDI, demonstrating that a significant part of this FDI is carried out by MNEs that are able to manoeuvre with ease in environments that are compromised by high political risk; a result that echoes a recent line of

⁶⁰ Results available on request from the authors.

research into the so-called political capabilities of MNEs, which warns of a possible divergence of interests between the business, the political and the social world.

The results demonstrate that the educational and economic policy of a country, as well as the EU's own policies, should in no way ignore the territorial changes that have taken place over recent years. This is especially relevant for policies linked to employability and vocational training, as there is a very close relationship between the dominant trends in economic investments and perceived educational variables. If Central and Eastern European countries wish to increase inward FDI flows with a higher level of added value for the host economy, not only it is necessary to minimize the educational distance with respect to investing countries, but also to effectively make this reduction perceptible to possible investors.

Also, the results highlight the importance for policy-makers to lend attention to the type of FDI that is attracted to cover the needs or limitations of a country. FDI characterized by low levels of qualification requirements, with the sole objective of reducing costs, might not contribute as many advantages as others with a greater knowledge content and added value in which positive spillovers might turn out to be more beneficial. However, if the aim is to attract other types of FDI, it is necessary to offer the key resources that are sought by the MNEs: a highly qualified workforce, transport and communications infrastructure, the creation of technological parks that generate clusters of centres of excellence, and fiscal incentives for those investments with high R&D components.

It should be pointed out that a limitation to this work, in addition to the small size of the panel, is the impossibility of including other European investor countries from the Mediterranean (Greece and Portugal) in the sample. Reliable data for these countries, and variables such as effective levels of taxation imposed on the MNEs or salaries in the host country are unfortunately unavailable⁶¹. Also, only the psychic distance stimuli based on exogenous scales and their impact on investment locations have been studied, due to the previously mentioned difficulties to measure the effect of the real perceptions of the managers. It is precisely the combination of both variables which constitutes one of the most important lines of future research that would, in turn, widen our knowledge of the determining effect of psychic distance on firm's decisions.

UNFOLDING THE ROLE OF TEAM DIVERSITY IN THE ENTREPRENEURIAL PROCESS

Kakarika, Maria¹; Biniari, Marina G.²

Abstract

Research on entrepreneurial team diversity has been emerging, but findings have been inconclusive. We argue that the way entrepreneurship scholars approach diversity can benefit from examining three important diversity types: separation, variety, and disparity. We examine the meaning, shape, and assumptions underlying each type and the implications of diversity for key aspects of the entrepreneurial process as occurring at different stages of the development of an entrepreneurial team. We conclude by discussing future research directions, in order to enhance theory development and address inconsistencies in previous research.

Keywords: Entrepreneurial teams, diversity, entrepreneurial process

Introduction

Recent developments in the entrepreneurship literature acknowledge the importance of entrepreneurial teams as “catalysts” in the creation of new ventures (Harper, 2008: 614). Although traits of team members influence how they frame issues, it is the heterogeneity of these traits among team members that affects how they work together and thus the success of the new venture (Murray, 1989). Hence, a core theme occupying the interest of entrepreneurship scholars is the composition of entrepreneurial teams that successfully recognize opportunities, acquire appropriate financial and human resources, develop broad social networks and respond to highly dynamic environments (e.g., Amason, Shrader & Tompson, 2006; Ensley & Hmieleski, 2005; Forbes, Borchert, Zellmer-Bruhn & Sapienza, 2006; Knockaert, Ucbasaran, Wright, & Clarysee, 2011). However, the success of entrepreneurial teams lies in their ability to act as teams and manage their endogenous diversity as a unity of different individuals (e.g. Blatt, 2009; Vanaelst, Clarysse, Wright, Lockett, Moray, & S'Jegers, 2006; West, 2007; Ucbasaran, Wright, & Westhead, 2003; Zimmerman, 2008).

Despite the emerging interest entrepreneurship scholars have taken on diversity and the way it contributes to the behavior of entrepreneurial teams, their findings have been inconclusive. Firstly, diversity has been approached through different dimensions, for example as differences in cognitive schemas (West, 2007), variation in expertise, functional role and other demographic variables (e.g., Ucbasaran et al., 2003; Zimmerman, 2008). As a consequence, there is conceptual confusion and

inconsistencies in theorizing about the nature of diversity and its role in entrepreneurial teams. Secondly, diversity has been hypothesized as a predictor of various variables such as the ventures' performance (e.g., Amason et al., 2006; Chandler et al., 2005; Knockaert et al., 2011), team effectiveness (e.g., Chowdhury, 2005; Ucbasaran, et al., 2003), and raising capital (e.g., Zimmerman, 2008) in separate studies. As a consequence, the findings have been inconclusive and the holistic impact of the construct on the entrepreneurial process has yet to be understood.

Drawing on the organizational behavior literature and Harrison and Klein's (2007) typology of diversity, we seek to address these inconsistencies by outlining the implications of studying diversity as *variety*, *separation* and *disparity* for entrepreneurial teams. In particular, informed by several examples of diversity theory and research, we explore the impact of diversity on key aspects of the entrepreneurial process that have been found to influence the success of new ventures. These aspects include opportunity recognition; acquisition of financial and human resources; the capacity to respond quickly and effectively to highly dynamic environments (Shane, 2003); the entry of new members (Forbes et al., 2006); and the management of agency costs (Chrisman, Chua, & Litz, 2004; Karra, Tracey, & Phillips, 2006) emerging from the delegation of tasks to new members. We focus on these aspects of the entrepreneurial process, as they comprise different stages of development for an entrepreneurial team. Expanding Kamm and Nurick's (1993) theorization, we propose that the impact of diversity on the entrepreneurial process is relevant at the pre-founding, founding and post-founding phases of a team.

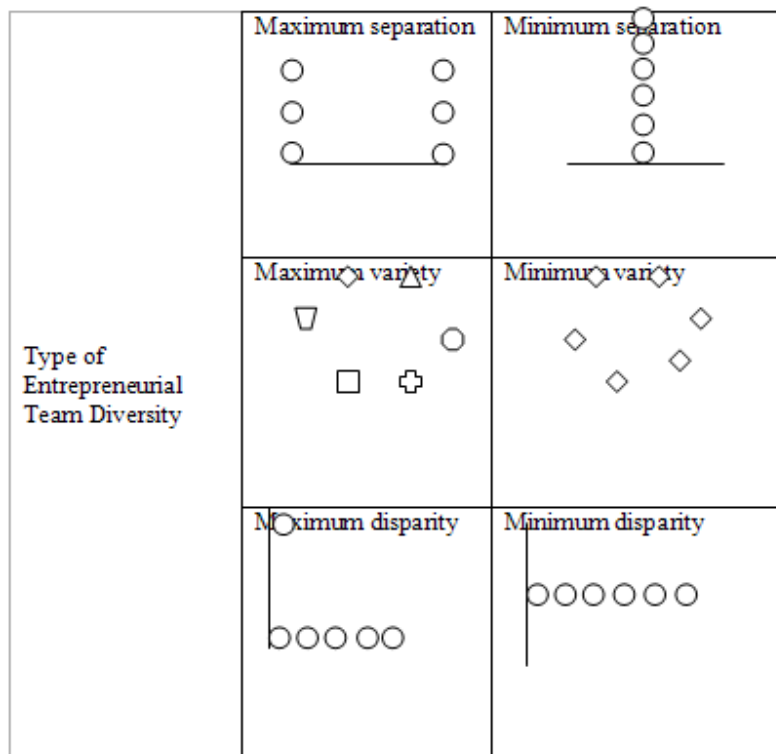

In doing so, we build on previous research and contribute to the entrepreneurship literature in the following ways. First, we integrate the literature on entrepreneurial team composition with research on team diversity, thus identifying the reasons for its inconclusive findings. Second, we explore diversity as *separation*, *variety* and *disparity*, in order to gain a better understanding of the way the three types apply differently to several aspects of the entrepreneurial process, and we deliver propositions. Finally, we discuss the implications of diversity in the context of entrepreneurial teams and suggest directions for future research.

A TYPOLOGY OF ENTREPRENEURIAL TEAM DIVERSITY

The attempts of entrepreneurship scholars to define entrepreneurial teams have not been conclusive. For the purpose of our theorizing, we approach entrepreneurial teams as comprising of a) members "who jointly establish a business in which they have an equity (financial) interest" and "are present during the pre-start-up phase of the firm", (Kamm, Shuman, Seeger, & Nurick, 1990: 7), b) members who hold significant ownership stakes in the venture and/or are involved in strategic decision making (Ensley, Carland & Carland, 2000; Ucbasaran, et al., 2003), and c) members who join the team as employees and may influence the entrepreneurial process (Shane, 2003). In this way, we approach entrepreneurial teams as adaptive and dynamic systems (McGrath et al., 2000) whose membership and development change as the venture develops.

In addition, we define entrepreneurial team diversity as the degree to which the entrepreneurial team is heterogeneous with respect to various attributes, such as personality, knowledge, perspectives, experience, and power. Drawing on Harrison & Klein (2007), we examine three specific diversity types and their relevance for entrepreneurship. First, diversity as *separation* refers to team members that differ from one another in their position along a continuous attribute—a lateral continuum (e.g., personality, perceptions of opportunities,). It reflects disagreements or opposing positions on issues regarding the new venture’s goals and processes. Second, diversity as *variety* refers to team members that differ from one another qualitatively on a categorical attribute (e.g., functional background, expertise). It reflects unique or distinctive information regarding aspects of the new venture. Third, diversity as *disparity*, rooted in sociology (Blau, 1977), reflects vertical differences in proportion and inequality among entrepreneurial team members on a socially valued or desired resource (e.g., power, status, equity). Figure 1 presents a graphical representation of the three diversity types at their maximum and minimum levels. Maximum separation occurs when team members are equally split and at opposing end-points of the continuum of the given attribute (Harrison & Sin, 2006). Maximum variety is present when each team member comes from a unique category of the attribute and represents the biggest possible distribution of information. Finally, maximum disparity occurs when only one team member outranks all others; that is, when he or she is at the top of the continuum of the given attribute and all other members are at the bottom.

Figure 1: A Typology of Entrepreneurial Team Diversity

Conceptualizing team diversity-as-variety has been the predominant trend in the entrepreneurship field, assuming that conflicts in entrepreneurial teams are outcomes of the variety of the members' functional position or entrepreneurial experience (e.g., Amazon & Sapienza, 1997; Chandler et al., 2005; Chowdhury, 2005; Ucbasaran, et al., 2003). In the existing literature, it is not explicit why researchers chose to conceptualize diversity as variety, and the other types of diversity remain underexplored while implied (e.g., West, 2007). As Harrison and Klein (2007) note, the explication of diversity can advance the theorization on the composition of teams by providing a better understanding of the impact of attribute-specific diversity. Further, by approaching diversity in entrepreneurial teams as a multidimensional construct (separation, variety, and disparity) entrepreneurial scholars can a) disentangle the assumptions associated with each type of diversity, and b) explore the relationships among and the interactive impacts of diversity types (Harrison & Klein, 2007). Incorporating such insights from the diversity literature into entrepreneurship research seems necessary for future researchers investigating the outcomes of entrepreneurial teams.

THE IMPACT OF THREE team DIVERSITY TYPES ON THE ENTREPRENEURIAL PROCESS

The remainder of this paper outlines specific propositions with respect to the role of team diversity on specific aspects of the entrepreneurial process. For the purpose of theorizing, we focus on a) opportunity recognition and the acquisition of initial resources as the two core aspects (Shane, 2003) of the initiation stage of an entrepreneurial team (pre-founding team) (Vanaelst et al., 2006), b) the capacity to respond to dynamic environments (Shane, 2003) as a core aspect of the implementation stage of the team (founding team), and c) the changes of the members and the management of agency costs, as core aspects of the expansion phase of the entrepreneurial team (post-founding team⁶²). Although in previous studies the evolution of the team has been associated with changes occurring at the life cycle of a venture (Vanaelst et al., 2006), in this paper we approach entrepreneurial teams as adaptive systems (McGrath et al., 2000) whose composition changes as they mature and new members join them. Table 1 (Appendix) summarizes the typology of diversity and its implications for the entrepreneurial process.

Pre-founding team: Opportunity recognition

Several scholars stress the novelty of an entrepreneurial idea as a precondition for success of new ventures and a key aspect of new venture creation. Hence, an important first step in the entrepreneurial process refers to how founding teams identify new or emerging opportunities and understand their nature (Ardichvili, Cardozo, & Ray, 2003). Opportunity recognition involves cognitive processes (Herron

62 Following Shane's (2003) conceptual distinction between founding and venture team, we approach the post-founding team as comprised of both the founding team members (who have ownership and control of the venture) and new employees.

& Sapienza, 1992) characterized by the elements of creativity (e.g., Hills, Shrader, & Lumpkin, 1999), as well as alertness (Gilad, Kaish, & Ronen, 1989), and active search for opportunities (Hills & Shrader, 1998). Since diversity may influence these processes, we propose that diversity may also affect the identification of new opportunities indirectly.

Separation. Maximum diversity as separation reflects perfect disagreement on a) which creative cognition process to adopt, and b) the existence or not of a need for active search and alertness in order to discover new ideas (see Table 1). This perfect disagreement among team members is likely to be detrimental for opportunity recognition. Theories of similarity attraction (Byrne, 1971), as well as social identity and self-categorization (Hogg & Terry, 2000; Tajfel & Turner, 1986) suggest that differences may engender the classification of others as in-group/similar and out-group/dissimilar (subgroups) that may disrupt group processes (Brewer & Brown, 1998; Tajfel & Turner, 1986). Specifically, while people are attracted to similar others and socially identify with them, diversity in teams interferes with identification processes, highlighting the differences between in-group / out-group and leading to difficulties in interaction (e.g., Tsui, Egan & O'Reilly, 1992). Individuals may view the out-group of dissimilar others less favorably, suggesting the possibility of prejudices that people may hold against people who are different from themselves. These biases are likely to create disagreements and maximum conflict (e.g., Jehn, Chadwick, & Thatcher, 1997). For example, in an entrepreneurial team where members have dissimilar beliefs and attitudes, social identification may cause disagreement and conflict over the choice of creativity approaches. One of the robust findings in the conflict literature is that high levels of conflict are likely to be dysfunctional (e.g. De Dreu, 2006; Jehn, 1995). Based on these arguments, we propose that maximum diversity-as-separation may be detrimental for creativity, alertness and active search for new ideas, and in turn for opportunity recognition.

On the other hand, an entrepreneurial team with similar perceptions and attitudes that works closely together also risks the problem of diminishing ability to combine creativity approaches. Extending the previous arguments, minimum diversity as separation or perfect agreement within the team on a) which creative cognition process to adopt, and b) the existence or not of a need for active search and alertness in order to discover new ideas is likely to suppress constructive conflict. Organizational behavior research has shown that the relationship between conflict and performance is inverted U-shaped, where both very low and very high levels of conflict are detrimental to performance (e.g., De Dreu, 2006; Jehn, 1995). Consequently, moderate disagreement and conflict, and creative dialogue among entrepreneurial team members may be beneficial for generation and implementation of new ideas to successful innovations:

Proposition 1a: Moderate diversity as separation improves creativity, alertness and active search for novel ideas, thus adding to the process of opportunity recognition.

Variety. Maximum diversity as variety reflects multiplicity and plurality of information and perspectives among team members that may encourage creative cognition and enhance alertness and

active search for new ideas. While the process itself is likely to be complex, the basic mechanism that appears to play an important role in the relationship between diversity and the entrepreneurs' discovery of new business opportunities is related to information (Shane, 2003). According to the information/decision-making approach in diversity research (Van Knippenberg & Schippers, 2007), differences in knowledge and expertise may help groups reach higher quality and more creative and innovative outcomes through the integration of different opinions and the stimulation of thinking. When the distribution of knowledge, such as education and functional backgrounds, is at its maximum, "everybody is different, and everybody has a unique viewpoint to offer" (Gibson & Vermeulen, 2003: 208). The latter may enhance brainstorming and alertness, and active search for new ideas. For example, the combination of technology-related and marketing knowledge may serve as the foundation for competitive technological inventions. On the contrary, minimum diversity as variety may reflect redundant knowledge, when for example all members have the same technology-related background, which would restrict the creativity process of the team (Shannon, 1948).

Empirical findings in the organizational behavior literature support the above arguments. Differences in knowledge and skills have been found to increase team creativity and innovation, by enhancing the quality of new ideas (Bantel & Jackson, 1989; Hoffman & Maier, 1961; Nemeth, 1986). Further, diversity has been found to affect performance in terms of alternatives generated (Watson et al., 1993). Among the few entrepreneurship studies that examined such relationships, Henneke & Luthje (2007) found that interdisciplinary heterogeneity in entrepreneurial teams was positively related to product innovativeness in high-tech ventures:

Proposition 1b: Maximum diversity as variety improves creativity, alertness and active search for novel ideas, thus adding to the process of opportunity recognition.

Disparity. Minimum diversity as disparity reflects equal distribution of power in determining which creative cognition process to adopt and in engaging in active search for new ideas. When no member is disadvantaged with respect to power, this parity is likely to be perceived as fair (e.g., Cohen & Zhou, 1991; Lefler, Gillespie, & Conaty, 1982). On the contrary, maximum diversity as disparity reflects concentration of power of opinion regarding creativity and active search for new ideas on one individual, which is likely to be harmful for opportunity recognition. When one member outranks all others because he or she "owns" a great deal of power, while the rest of team members have very little, the rest of the members are disadvantaged relative to the privileged one. This asymmetry may cause perceptions of injustice and inequity within the team regarding the dominance of one cognitive process of a powerful member over the cognitive process of other members. In a family business context for instance, the father's power as owner of the business over his children may overshadow the creativity of the latter.

The consequences of injustice are widely documented in the organizational behavior literature; they include competition, reduced collaboration and members' input, and even resentful deviance (e.g.,

Bloom, 1999; Pfeffer & Langton, 1993; Siegel & Hambrick, 2005). In addition, research has shown that disparity fosters conformity, silence, suppression of creativity, and withdrawal (e.g., Pfeffer, 1998; Pfeffer & Davis-Blake, 1992):

Proposition 1c: Minimum diversity as disparity improves creativity, alertness and active search for novel ideas, thus adding to the process of opportunity recognition.

Pre-founding team: Acquisition of initial resources

Following the recognition of an opportunity, entrepreneurs require resources to exploit it. Such resources are often scarce (Aldrich, 1999), yet obtaining them is significant for start-ups, as new ventures tend to be more successful by their acquisition (e.g. Shane, 2003; Singh, 2000). Two factors can help obtain such important financial and human resources: (a) persuasiveness (Baron, 2000; Barron, 2008), and (b) social networks, since they give a firm access to information and influence (e.g., Adler & Kwon, 2002; Hoang, & Antoncic, 2003).

Separation. Diversity may influence the entrepreneurial process of gaining necessary financial and human resources, since it advances persuasiveness and creates linkages with individuals outside the team (Milliken & Martins, 1996). Moderate diversity as separation reflects space for compromise and negotiation among team members regarding the potential and viability of the new venture. This creative negotiation and the resulting moderate level of conflict is likely to enhance members' persuasiveness in demonstrating to third parties that the new venture will be a success, thus enhancing the acquisition of initial resources. Similarly, creative negotiation among members regarding the range, the nature and the necessity of the external networks each member can contribute to the venture is likely to be beneficial in acquiring the necessary resources. On the contrary, perfect agreement or disagreement among members on these issues will generate maximum or minimum conflict, both with negative team outcomes (e.g., De Dreu, 2006).

Empirical results in past group diversity literature support the previous arguments. For example, heterogeneous groups were found to produce higher quality ideas in brainstorming tasks than more homogeneous groups (McLeod, Lobel & Cox, 1996), which may enhance persuasiveness. In addition, this stream of research shows that one of the benefits of diversity in teams lies in the creation of linkages to those not on the team (e.g., Milliken & Martins, 1996). In the entrepreneurship literature, diverse contacts with others in the industry and financial community have been positively related to access to venture capital (e.g., Shane & Stuart, 2002):

Proposition 2a: Moderate diversity as separation improves persuasiveness and enhances the breadth of social networks, thus adding to the process of acquisition of initial resources.

Variety. Maximum diversity as variety reflects multiplicity and plurality of perspectives that enhance the ability of the team members to influence the opinion of others about the potential and viability of the

venture (Baron, 2000). It also reflects a high range of social contacts among the team members increasing the breadth of the venture's social networks. Consistent with the information/decision-making perspective of diversity research (Van Knippenberg & Schippers, 2007), team members may draw from multiple perspectives and hence improve their persuasive behavior in order to acquire valuable resources. They may also utilize the diverse information from non-redundant social ties and improve the acquisition of initial resources. Past entrepreneurship research supports these arguments; Beckman, Burton & O'Reilly (2007) found that functional and affiliation diversity was positively associated with attraction of venture capital. In addition, a recent study by Foo, Wong, & Ong, (2005) found that diversity of educational level was positively related to the external evaluation of a team's business ideas, the implications of which can be important for the acquisition of necessary resources:

Proposition 2b: Maximum diversity as variety improves persuasiveness and enhances the breadth of social networks, thus adding to the process of acquisition of initial resources.

Disparity. Finally, maximum diversity as disparity represents concentration of persuasive behavior regarding the potential and viability of the venture on one individual. Consistent with the justice theory (Greenberg, 1987), such disparity is likely to be detrimental for the acquisition of resources. If a single person holds the valued element of persuasiveness, the entrepreneurial team has maximum centralization and members may turn to only that person for advice on acquiring resources (a form of expert power; French & Raven, 1959). In addition, if the valued element is social capital, and it is concentrated on one individual, the structure of the resulting social network is highly centralized, and the network ties unevenly distributed. Only one member is highly central and thus highly influential. The other members are on the periphery of the network with few or even no links to other interpersonal ties (Adler & Kwon, 2002). Centralization may thus restrict the breadth of social networks and negatively influence the acquisition of initial resources:

Proposition 2c: Minimum diversity as disparity improves persuasiveness and enhances the breadth of social networks, thus adding to the process of acquisition of initial resources.

Founding team: Capacity to respond to dynamic environments

Since entrepreneurs operate in an uncertain and volatile environment, they must be capable of reacting readily and efficiently to changes in such external conditions (e.g., Lichtenstein et al, 2006). Past entrepreneurship research has shown that founders and founding teams shape a firm's first strategies and actions (e.g., Beckman et al., 2007). New venture success then depends on how the founding team responds to changes in its environment, and how it reflects on possible actions and makes decisions. Diversity has been found to help the team deal with the demands of strategic complexity (Richard, 2000) because the group thinks in more realistic and complex ways about its context. Hence, it may play a role in the capacity to respond successfully to entrepreneurs' environments in many ways. Specifically, diversity can influence the decision-making regarding three elements, which are vital for responding to

volatile environments (e.g., Hitt et al, 2001): (a) new skills' development; (b) social network expansion; and (c) required flexibility.

Separation. Moderate diversity as separation reflects an area for creative dialogue and negotiation among members regarding the necessity and the nature of new skills, the expansion of networks, and the level of flexibility required by the venture to respond to a dynamic environment. Moderately opposing views regarding these issues may create the need for reconciliation among the team members. Thus members may engage in elaborate information processing due to constructive conflict and make a better decision (De Dreu, Harinck, & van Vianen, 1999). In support of this argument, empirical research has found that diverse groups with broad network of contacts have better sources of new information in order to respond effectively to uncertain environments (Donnellon, 1993; Tushman, 1977). In addition, environmental scanning is a prerequisite to recognize and adapt to changing requirements of the environment in order to innovate successfully (Miller & Friesen, 1982) and it can be enhanced by diversity as separation. The various "thought worlds" represented in diverse teams may also match different aspects of their environments, thus enhancing the potential for environmental analysis (Rindova, 1999). Nemeth (1986) further argued that the quality of reasoning in majority opinions is enhanced by the existence of consistent counterarguments from a minority:

Proposition 3a: Moderate diversity as separation improves decision-making regarding needs for new skills, social network expansion and flexibility, thus improving the entrepreneurial team's responses to the dynamic environment in which it operates.

Variety. Maximum diversity as variety also suggests multiplicity and plurality of perspectives regarding building new skills for the venture, deciding on the required expansion of the social network, and the degree and level of flexibility needed by a venture to cope with a dynamic environment. These actions may need important adjustments during the process (e.g., Shane, 2003), which in turn may benefit from the positive consequences of diversity related to processing information and perceiving and interpreting stimuli. Diverse groups have been found to perform better by capitalizing on the diversity of knowledge, functional tools, skills and abilities they possess and improving the breadth of their cognitive ability (Van Knippenberg & Schippers, 2007).

Specifically, diversity as variety tends to encourage problem solving (e.g., Hoffman & Maier, 1961; Watson et al, 1993). Given a problem, people will look for a way to solve it that capitalizes on the knowledge they already possess. Hence, diversity of knowledge may help finding ways to build new skills and expanding social networks. In addition, members of diverse groups communicate more frequently with those outside the group (e.g., Ancona & Caldwell, 1988). This finding suggests that diversity may allow a group to better fulfill any boundary-spanning role it might have as well as to manage relations with the outside constituents (Ancona & Caldwell, 1988) and thus be more flexible and

respond more efficiently to dynamic environments. The combination of diverse experiences and knowledge also fosters the propensity of a team to formulate flexible strategies and to initiate strategic reorientation processes (Wiersema & Bantel, 1992) and increases the team's ability to respond to environmental changes (Cannella, Park & Lee, 2008):

Proposition 3b: Maximum diversity as variety improves decision-making regarding needs for new skills, social network expansion and flexibility, thus improving the entrepreneurial team's responses to the dynamic environment in which it operates.

Disparity. Maximum diversity as disparity implies unequal team distribution of the power to broaden and build new skills, to expand the social contacts of the venture and to decide on the required degree and level of flexibility, which may impair the team's capacity to respond to changes in its environment. Eisenhardt and Bourgeois' (1988) study of top management team (TMT) strategic decision-making processes provides a relevant example. When a CEO's power far exceeded that of other TMT members, creating high power disparity in the team, the CEO was likely to engage in "tactics for controlling and withholding information," and the other executives in the team were likely to engage in "alliance and insurgency behaviors" (1988, p. 743). Ultimately, evident disparities in team member power impaired team performance by distracting team members from key tasks and interrupting the flow of information. Using another example, in high-tech ventures, team members directly involved in developing the technological solution provided by the venture may often be hesitant to integrate partners with other backgrounds and share decision-making control. This may be perceived as unfair by the rest of the team and disrupt its capacity to responding effectively to dynamic environments:

Proposition 3c: Minimum diversity as disparity improves decision-making regarding needs for new skills, social network expansion and flexibility, thus improving the entrepreneurial team's responses to the dynamic environment in which it operates.

Post-founding team: Entry of and delegation of tasks to new members

As the venture team develops, one of the most important decisions it needs to make is to determine the number of new members to add / hire in the existing team (Chandler et al., 2005; Forbes et al., 2006; Shane, 2003). Prior studies have approached the selection process of new members from a resource-dependency view (e.g., Kamm & Nurick, 1993; Ucbasaran et al., 2003) and from a social psychology perspective (e.g., Ruef et al., 2003). According to the first view, the choice to add new members is motivated by the matching between the venture's resource needs and the resources the new members can contribute in order to improve the performance of the venture. The second view argues for the powerful influence of relational trust and homophily between the existing and the new members of an

entrepreneurial team in informing this decision. Each view represents different but not mutually exclusive (Francis & Sandberg, 2000) aspects of the decision-making process the existing founding team may follow to add a new member. This decision becomes more pivotal at the post-founding stage of a venture, as adding a new member requires substantial socialization and adaptation by both the existing and the new members (Adelman & Frey, 1997). Thus, team diversity can influence the addition of new members (the selection criteria and the recruitment process) determining the human and social capital (Forbes et al., 2006) that the new members can bring into the venture and indirectly influencing the entrepreneurial process.

In theory, founding teams should also require less control for agency problems due to the shared interests of the principals and agents (Ang, Cole, & Lin, 2000). The small size of the team also allows for perfect information symmetry within the team. However, professionalization and the addition of new members (regardless if they carry ownership such as in family businesses or not (Chua et al., 2009)) gives rise to the need for the founding team to delegate authority to managers and subsequently monitor their behavior (Hofer & Charan, 1984). The growth potential of a new venture is significantly related to founders' (existing team members) willingness to delegate decision-making authority (Ginn & Sexton, 1990), and diversity on how to approach this decision may significantly affect the entrepreneurial process.

Separation. High diversity as separation reflects perfect disagreement regarding how new members can be identified and recruited. It challenges a) the main assumption of human and social capital and resource dependency theories that all existing team members have a common opinion on how to "attract individuals who have the capacity to generate returns or to procure resources" (Forbes et al., 2006, p. 230); and b) the assumption of the social psychological / homophily view that team members are attracted to similar others in terms of attitudes. In the case of an equal split of opinions regarding efficiency and homophily criteria to recruit new members, the team delays the selection process, and creates confusion over the recruiting process and its timing (Forbes et al., 2006). On the other hand, moderate diversity as separation allows existing members to identify a balance between the relational trust and the efficiency characterizing a new member in order to join the venture. Through this balancing process and the resulting moderate level of conflict, existing team members may gain clarity (Chandler et al., 2005; Kemer et al., 1985) over their and the new members' goals and expectations, and diminish the length of the recruitment and socialization process of the latter (Hainen & Jacobson, 1976). Moderate separation of opinions over the identification of new members is expected also to facilitate a more efficient utilization of the social networks of the existing members, as well as the timing of hiring new members.

Similarly, high diversity as separation regarding the delegation of tasks to new members reflects perfect disagreement among existing members on the governance structure of the venture, which directly influences the performance of the latter (Daily & Dutton, 1992). Disagreement over governance choices creates delays in the process and prevents the team from developing common and shared goals regarding the distribution of tasks to new members and the monitoring of their behavior. On the other hand,

minimum disagreement within an entrepreneurial team may facilitate the process of delegating tasks to new members but prevents the exploration of alternative choices of governance structure, which is likely to expose the team to unforeseen agency costs:

Proposition 4a: Moderate diversity as separation improves the entry of new members and facilitates the delegation of tasks to them.

Variety. High diversity as variety reflects multiplicity and plurality of experience regarding a) the selection criteria and recruitment process of the potential new members, and b) delegating specific functions to new members and monitoring their behavior. Brown and Campion (1994) highlight how recruiters' perceptions and the way they interpret and use biographical data influences the screening process of potential employees. As biographical data reflect abilities the potential employee possesses and predict performance (Howard, 1986), the recruiters' cognitive process of recognizing abilities may be influenced by their prior recruiting experience and their functional background. In this way, the lower the variety of the cognitive processes adopted by recruiters, the more likely it is for biases to occur and restrict the screening and selection process. High levels of similarity among the recruiters' cognitive process and perceptions on abilities lead to hiring individuals who share the same perceived abilities with their recruiters (Reuf et al., 2003). For example, teams that consist predominantly of engineers and scientists run the risk of focusing on technology-oriented abilities and underestimating the need for additional abilities that add to strategic flexibility in order to meet changing competition and demand. Thus, even though the similarity attraction paradigm (Byrne, 1971) suggests homophily as key determinant of the selection process, such a rationale restricts the range and scope of the screening and selection of new members. This might not be of urgency in the case of pre-founding and founding teams, but it becomes pivotal when the founding team needs to expand and accommodate the venture's growth needs. Conversely, high diversity as variety among recruiters reflects multiple selection criteria, plurality of recruitment practices and diversity in terms of perceived new members' abilities.

Similarly, the wider the experience of the team members with different governance structures and mechanisms to manage agency costs, the more likely it is for the team to facilitate the delegation of tasks to new managers. Limited or no experience at all in delegating authority to new members may lead to errors of judgment in terms of anticipating agency costs that emerge following the recruitment of new members. Driven by similarity in their experience of governance, the existing members may choose a governance structure which might be close to their experience but not satisfying the needs of the new members, leading the latter toward free-riding behavior:

Proposition 4b: Maximum diversity as variety improves the entry of new members and facilitates the delegation of tasks to them.

Disparity. Building on theories of relative deprivation (e.g., Deutsch, 1985), researchers commonly predict that status or power disparity incites competition, differentiation, and (resentful) deviance among

unit members (e.g., Bloom, 1999; Pfeffer & Langton, 1993; Siegel & Hambrick, 2005). Maximum diversity as disparity, regarding the selection, recruitment and task delegation to new members, reflects concentration of power over this decision and process on one individual. The top-management-team literature suggests that the concentration of power may result from the legitimate hierarchical status of these individuals within the team (e.g., Hambrick, 1981) due to their ownership stake in the venture or their presence in the founding team. In entrepreneurial teams, the founder CEO occupies a position of unique influence “serving as the locus of control and decision-making” (Daily et al., 2002; p.391). In the context of family businesses, attributes such as age and gender may also allow for emerging disparity over power in the entrepreneurial team.

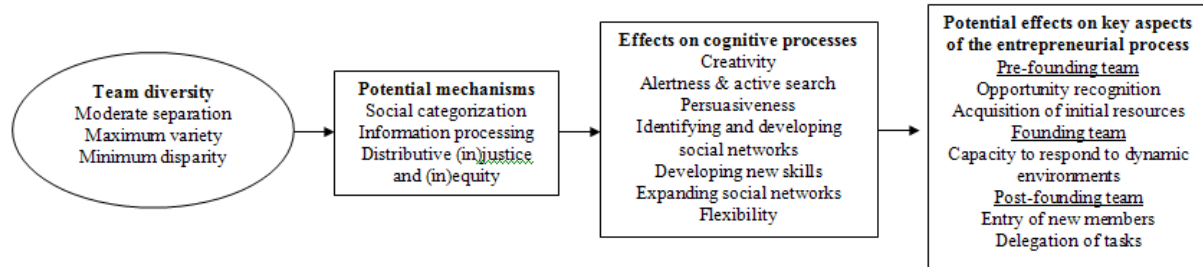

While the concentration of power on one individual may speed up the screening and selection process of new members, the bounded cognitive process of recognizing abilities of these influential members may restrict the range of potential new members screened and eventually selected. Further, the fact that other existing members cannot influence the selection process of new members may cause deviance and increase perceptions of distributive injustice (Rock & Shanock, 2006). The powerless members may view the recruitment of a specific new member as favoritism (i.e., in a family business, the father hires his daughter without consulting the rest of the team members). Even though minimum disparity of power over the decision to recruit a new member may slow down the screening and selection process, it is also associated with increased information flow and communication (Glick et al, 1993). Thus, at the post-founding stage of their development, entrepreneurial teams appear more efficient in recruiting and selecting new members with a minimum diversity of power among existing members.

Similarly, a founder’s status influences governance choices. Agency theory suggests that such centralized leadership leads to domination within the team and poor performance (Daily & Dalton, 1992). This may discourage new members’ participation and commitment to the team, making them more prompt to withhold information from the founders / owners and create agency costs for the latter. In addition, centralization of decision-making power over delegating tasks to new members may activate perceptions of distributive injustice within the post-founding entrepreneurial team. Therefore, minimum disparity of power within the post-founding team reflects fair distribution of decision-making authority to all team members, which may improve the delegation of tasks to new members:

Proposition 4c: Minimum diversity as disparity improves the entry of new members and facilitates the delegation of tasks to them.

The framework we presented is intended to be indicative of the broad range of effects team diversity may have on the entrepreneurial process through various mechanisms. Figure 2 presents an overview of the effects proposed.

Figure 2: Theoretical Framework of the Role of Team Diversity in Entrepreneurship

Discussion AND RESEARCH IMPLICATIONS

The motivation of this paper is threefold. First, diversity in entrepreneurship and organizational behavior research has produced inconclusive results. Second, a recent conceptualization of diversity as separation, variety and disparity (Harrison & Klein, 2007) appears relevant for understanding the effects of entrepreneurial teams' composition. Third, each type of diversity may influence differently key aspects of the entrepreneurial process, such as opportunity recognition, acquisition of initial resources, the ability to respond effectively to dynamic environments, and the selection and delegation of tasks to new members, as the team evolves. We draw from the organizational behavior literature on diversity and propose a new point of view to theorize on, and operationalize, diversity in entrepreneurial teams. Thus, we contribute to the entrepreneurship literature in the following ways.

First, by reviewing the existing entrepreneurship and organizational behavior literature on the ways team diversity has been approached, this paper is a first attempt to understand holistically how the different diversity types may be potential antecedents of enhanced aspects of the entrepreneurial process. In this way, diversity is not approached as a one-dimensional but rather as a multifaceted construct, with each of its facets affecting the entrepreneurial process in different ways. This in-depth holistic view of team diversity may stimulate reflection and help increase our understanding of the effects of entrepreneurial team composition.

Second, we propose a role for distinct amounts of the three diversity types on the entrepreneurial process. Drawing on Harrison and Klein's (2007) argumentation, we deliver propositions, which disentangle the impact and assumptions of each type of diversity at different amounts and on different aspects of the entrepreneurial process. Future research can benefit from empirically testing these propositions, thus reconciling inconsistencies of past research findings regarding the impact of team diversity.

Third, by studying entrepreneurial teams as adaptive and dynamic systems, we propose that issues of diversity need to be approached differently at each stage of the team's development. For example, while high homophily (minimum variety) may be present during the pre-founding team formation, low homophily (maximum variety) might be more appropriate and beneficial at both the initial and later stages of the development of an entrepreneurial team, when it tries to expand resources and support the growth needs of the venture.

Further, although we focused on several specific aspects of the entrepreneurial process, we also acknowledge that diversity has more general behavioral implications on how a team copes with novelty (Blatt, 2009) and uncertainty (McMullen & Shepherd, 2006). Novelty is conceptualized based on a) the team, with implications for the levels of trust among the team members, b) the market, with implications for the venture's identity, and c) management, with implications for the knowledge and experience specifically required to manage the venture (Blatt, 2009). Maximum diversity as separation and as disparity within an entrepreneurial team reflects a high degree of uneasiness, unfamiliarity, disagreements and power distance among the team members regarding key aspects of the venture, the market, and work-related attitudes and behaviors, prolonging team-, market- and management-based novelty. On the other hand, maximum variety of experience among the team members may assist the members to better cope with novelty in terms of the team, market and management of the venture, as team members complement on their competencies and information they hold.

Uncertainty is conceptualized in terms of a) the amount of uncertainty perceived by team members, and b) the members' willingness to bear uncertainty (McMullen & Shepherd, 2006). Maximum diversity as separation over the amount of perceived uncertainty among the team members and their willingness to bear uncertainty may result in conflicts, causing delays in recognizing and enacting on an opportunity. On the other hand, maximum diversity as variety reflects non-redundant information and knowledge which may actually help the team to realistically determine the amount of environmental uncertainty and resolve issues regarding uncertainty, as each member draws from different experiences in perceiving and bearing uncertainty. Maximum diversity as disparity may also have significant implications for the dynamics of the team and the success of the venture. The concentration of power on one team member in determining the amount of environmental uncertainty may limit the responsiveness of the venture, as the rest of the members do not equally contribute to the collective understanding of the uncertainties the venture is facing. Similarly, maximum disparity of power, as reflected by only one team member's decision-making power over the entrepreneurial action required to face uncertainty, leads to low levels of commitment by the rest of the members and increases the likelihood of free riding behavior of the latter.

Theoretical and methodological implications

Albeit not exhaustive, our framework begins to address how entrepreneurship research can advance our understanding of the effects of entrepreneurial team composition. Having argued that specific types

of diversity at different amounts would have positive effects on the entrepreneurial process, we also acknowledge that team diversity has to be interpreted as a double-edged sword (Milliken & Martins, 1996) since its effects can be complex. For instance, while increased heterogeneity may produce productive group tension, reduce groupthink (Janis, 1972), and improve decision-making (Sawyer, Houlette, & Yeagley, 2006), different educational and functional backgrounds may also render effective group functioning more difficult (Murray, 1989; Williams & O'Reilly, 1998) and inhibit decision-making. In addition, while similarity implies high consensus and strong continuity of strategy (Pfeffer, 1981; Wiersema & Bantel, 1992), as well as greater trust and comfort (Byrne, 1971), homogeneous teams are also less inclined to introduce new ideas and discuss entrepreneurial issues (Murray, 1989; Wiersema & Bantel, 1992).

We thus avoid simple conclusions and clarify that neither more nor less diversity is beneficial to the entrepreneurial process. Rather, its effects depend on the three types of diversity and the three mechanisms of social categorization, information processing and distributive injustice (inequity) through which core cognitive processes of the team and the members are affected by diversity. Accordingly, careful examination of the possible diversity effects may enrich the entrepreneurship literature by shedding light on how entrepreneurial teams can influence new venture success. Future research might further consider whether diversity needs to exist within the founding team, or if team members can tap into the value of diversity through their network (e.g., advisors). Systematic entrepreneurship research through this lens is thus needed and this paper offers a thorough theoretical framework in this direction.

Moreover, while diversity as variety has been well received by entrepreneurship scholars, approaching diversity as separation and disparity presents two fruitful areas for future research. For instance, family businesses represent empirical settings in which disparity of power, as resulting from age, gender and other ownership attributes, is a significant factor that may influence the entrepreneurial process and the dynamics of the entrepreneurial team (i.e., succession, delegation of authority and power to younger generations). Similarly, corporate entrepreneurial teams, where separation of opinions results from the social-identification of members with different in-groups (e.g., internal vs. external to the corporation, middle- vs. low-level managers), can also provide a fruitful empirical setting for entrepreneurship scholars to expand the scope of their research.

Approaching diversity as a multidimensional construct also has significant methodological implications for research designs. Harrison and Klein (2007) provide a thorough discussion on how researchers can design studies that capture the three types of diversity, operationalize diversity driven by the theoretical specification of diversity as separation, variety or disparity, and distinguish between perceived and actual diversity. Entrepreneurship scholars can benefit from these suggestions. Borrowing from research on diversity faultlines (Lau & Murnighan, 1998), future research may also approach diversity of specific attributes simultaneously as separation, variety and disparity, and methodologically explore the interactions and appropriate combination of diversity types in an entrepreneurial team.

Further, we have adopted a dynamic view in approaching team diversity as a construct that changes over time, influenced by the work of Vanaelst and colleagues (2006). We encourage entrepreneurship scholars to incorporate time into their studies as reflected at the stages of team development, which are different from the stages of development of the venture. Future research may thus benefit from longitudinal designs that capture the evolution of an entrepreneurial team while examining the impact of its diversity.

Practical Implications

As we learn to better understand the dynamics associated with start-up team diversity and entrepreneurial outcomes, we may offer valuable insights and guidelines to founders about how to compose new venture teams. We proposed that maximum diversity-as-variety is beneficial to the entrepreneurial process and underscored the importance of fostering heterogeneous compositions of entrepreneurial teams. Considering that most studies on entrepreneurial teams identify homophily as a significant factor in determining the composition of the pre-founding team (e.g., Ruef et al., 2003), we encourage business founders to consider closing potential gaps in their competency maps at the pre-founding stage, rather than seeking similar others, perceived as more familiar and trustworthy. In addition, actors such as universities, business angels or venture capitalists may need to encourage leading entrepreneurs or technical-oriented entrepreneurial teams to integrate partners with complementary knowledge and abilities, from different disciplines, at the early stages of their development. Finally, family businesses can benefit from considering how disparity of power among the family members may impair specific aspects of the entrepreneurial process and the development of the team.

Appendix

Table 4: The implications of maximum and minimum degree of three types of diversity on the entrepreneurial process

<i>Diversity type</i>	<i>Separation</i>	<i>Variety</i>	<i>Disparity</i>
<i>Meaning and synonyms⁶³</i>	<i>Composition of differences in (lateral) position or opinion among unit members, primarily of value, belief, or attitude; disagreement or opposition</i>	<i>Composition of differences in kind, source or category of relevant knowledge or experience among unit members; unique or distinctive information</i>	<i>Composition of (vertical) differences in proportion of socially valued assets or resources held among unit members; inequality or relative concentration</i>
<i>Attribute examples</i>	<i>Opinions, beliefs, values, and attitudes, especially regarding team goals and processes</i>	<i>Content expertise, functional and educational background, industry experience</i>	<i>Income, prestige, status, decision-making authority, social power, equity</i>
<i>Pre-founding team</i>			
<i>Opportunity recognition</i>	<i>Creativity</i>		
	<i>Maximum diversity: Equal split within the team and on opposing end-points regarding which creative cognition process to adopt Minimum: Perfect agreement within the team regarding which creative cognitive process to adopt</i>	<i>Maximum diversity: Multiplicity and plurality of information and perspectives enhancing creative cognition Minimum: Lack / similarity of information and perspectives restricting creative cognition</i>	<i>Maximum diversity: Concentration of power on one team member in determining the creative cognition process Minimum: Equal distribution of power among all team members in determining the creative cognitive process.</i>
	<i>Alertness and active search</i>		
	<i>Maximum diversity: Equal split within the team and on opposing end-points regarding the required level of alertness and active search in order to discover new ideas Minimum: Perfect agreement within the team regarding the required active search in order to discover new ideas / High (or low) levels of collective alertness in order to discover new ideas</i>	<i>Maximum diversity: Multiplicity and plurality of information and perspectives enhancing alertness and active search for new ideas Minimum: Lack / similarity of information and perspectives restricting alertness and active search for new ideas</i>	<i>Maximum diversity: Concentration of power on one team member in engaging in active search for new ideas Minimum: Equal distribution of power among all team members in engaging in active search for new ideas</i>
<i>Acquisition of initial resources</i>	<i>Persuasiveness</i>		
	<i>Maximum diversity: Equal split within the team and on opposing end-points regarding</i>	<i>Maximum diversity: Multiplicity and plurality of perspectives in determining</i>	<i>Maximum diversity: Concentration of persuasive behavior on one team member</i>

⁶³ Source: Harrison & Klein (2007)

	<i>the potential and viability of the new venture</i> <i>Minimum: Perfect agreement within the team regarding the potential and viability of the new venture</i>	<i>the potential and viability of the new venture</i> <i>Minimum: Lack / similarity of perspectives in determining the potential and viability of the new venture</i>	<i>regarding the potential and viability of the venture</i> <i>Minimum: Equal distribution of persuasive behavior among all team members regarding the potential and viability of the venture</i>
	<i>Breadth of social networks</i>		
	<i>Maximum: Equal split within the team and on opposing end-points regarding the range, the nature and the necessity of the contacts each member can contribute to the venture</i> <i>Minimum: Perfect agreement within the team regarding the range, the nature and the necessity of the contacts each member can contribute to the venture</i>	<i>Maximum: High range of social contacts among the team members increasing the breadth of the social networks of the venture</i> <i>Minimum: Low range of social contacts among the team members decreasing the breadth of the social networks of the venture</i>	<i>Maximum: Concentration of social contacts which can benefit the venture on one team member</i> <i>Minimum: Equal distribution of social contacts which can benefit the venture among all team members</i>
	<i>Founding team</i>		
<i>Capacity to respond to dynamic environments</i>	<i>Developing new skills</i>		
	<i>Maximum diversity: Equal split within the team and on opposing end-points regarding the necessity and the nature of the new skills</i> <i>Minimum: Perfect agreement within the team regarding the necessity and the nature of the new skills</i>	<i>Maximum diversity: Multiplicity and plurality of perspectives in broadening and building new skills for the venture</i> <i>Minimum: Lack / similarity of perspectives in broadening and building new skills for the venture</i>	<i>Maximum diversity: Concentration of the power to broaden and build new skills for the venture on one team member</i> <i>Minimum: Equal distribution of the power to broaden and build new skills for the venture among all team members</i>
	<i>Expanding networks</i>		
	<i>Maximum diversity: Equal split within the team and on opposing end-points regarding the necessity of expanding the venture's social network and the nature of the required new social contacts</i> <i>Minimum: Perfect agreement within the team regarding the necessity of expanding the venture's social network and the nature of the required new social contacts</i>	<i>Maximum diversity: Multiplicity and plurality of perspectives regarding the required expansion of the venture's social network and the nature of the new social contacts needed</i> <i>Minimum: Lack / similarity of perspectives regarding the required expansion of the venture's social network and the nature of the new social contacts needed</i>	<i>Maximum diversity: Concentration of the power to expand the venture's social network on one team member</i> <i>Minimum: Equal distribution of the power to expand the venture's social network among all team members</i>

	<i>Flexibility</i>		
	<i>Maximum diversity: Equal split within the team and on opposing end-points in determining the required level of flexibility Minimum: Perfect agreement within the team in determining the required level of flexibility</i>	<i>Maximum diversity: Multiplicity and plurality of perspectives regarding the required level of flexibility Minimum: Lack/ similarity of perspectives regarding the required level of flexibility</i>	<i>Maximum diversity: Concentration of the decision-making power on one team member regarding the required level of flexibility Minimum: Equal distribution of the decision-making power among all team members regarding the required level of flexibility</i>
<i>Post-founding team</i>			
<i>Entry of new members and delegation of tasks</i>	<i>Maximum diversity: Equal split within the team and on opposing end-points regarding: (a) the selection criteria and recruitment process of new members; and (b) delegating specific functions to new members and monitoring their behavior Minimum: Perfect agreement among team members regarding: (a) the selection criteria and recruitment process of new members; and (b) delegating specific functions to new members and monitoring their behavior</i>	<i>Maximum diversity: Multiplicity and plurality of experience regarding: (a) the selection criteria and recruitment process of new members; and (b) delegating specific functions to new members and monitoring their behavior Minimum: Lack / Similarity of perspectives and experience regarding: (a) the selection criteria and recruitment process of new members; and (b) delegating specific functions to new members and monitoring their behavior</i>	<i>Maximum diversity: Concentration of power on one team member regarding: (a) selecting and recruiting new members; and (b) delegating specific functions to new members and monitoring their behavior Minimum: Equal distribution of power among all team members regarding: (a) selecting and recruiting new members; and (b) delegating specific functions to new members and monitoring their behavior</i>

AUTOTELIC CAPABILITIES AND KNOWLEDGE INTENSIVE ENTREPRENEURSHIP IN LOW TECH SECTORS

Karagouni, Glykeria¹

¹Laboratory of Industrial and Energy Economics, National Technical University of Athens,
School of Chemical Engineering. Email: karagg@teilar.gr

Abstract

In this paper Autotelic Capabilities (ACs) are introduced as the necessary abilities for the individual firm to create new forms of competitive advantage based on knowledge, in order to survive early death and prosper in the mature business ecosystems of low tech sectors, in a first attempt to shed light on the unexplored strategic side of the entrepreneurial start up activity in low tech sector within the notion of knowledge intensive entrepreneurship (KIE).

The logic of grounded theory was followed in the analysis of multiple exploratory case studies with the individual low-tech company as the unit of analysis. Companies of the three most representative low tech sectors in Greece were selected from databases after sectoral experts' recommendation. Triangulation through the use of multiple data sources, theoretical perspectives, and methods increased the credibility and validity of the results.

This exploratory research is a first endeavor to specify a conceptual framework and the nature of the capabilities necessary for new knowledge intensive ventures to achieve a strong initial competitive position in an open economy. It introduces autotelic capabilities (ACs) (bricolage, improvisational and transcendental), which enable enterprises create and deploy the intangible, mostly knowledge- based assets that will prevent early death and permit market dominance, as well as the conditions to do so. The present research further introduces the integration of bricolage and improvisation into second order strategic capabilities, offers insight on dynamic capabilities origins and establishes relations among dynamic and autotelic capabilities. Finally, we articulate the implications of ACs for managerial practices and future entrepreneurship research.

It is the very first research on KIE conceptual frameworks in low tech sector with a capabilities' approach. The concept of Autotelic Capabilities is a first attempt to connect corporate, knowledge intensive and strategic entrepreneurship, regarding the emerging stage of venture creation and the initial competitive advantage. The autotelic capabilities framework comprises a rather aspiring research agenda for many research fields within the unexplored concepts of both KIE and low tech. Novel concepts such as the transcendental capability and the entrepreneurial landscape spaciousness are introduced. It is further the first attempt to indicate the significant role of dynamic

capabilities in low tech firms providing some primary relations among autotelic and dynamic capabilities and offering insight on the origins of the second ones.

Keywords: new venture, low-tech, knowledge intensive entrepreneurship, competitive advantage, dynamic capabilities, autotelic capabilities

Introduction

During the last ten years at least, a significant number of firms in traditionally named low tech (TLT) sectors enclose a dynamic approach of knowledge in order to flourish in saturated and vulnerable markets. Entrepreneurs start new knowledge intensive business, transcending traditional limits and combining several knowledge bases.

The recent focus on capabilities in entrepreneurship has allowed researchers to unfold abilities necessary for effective entrepreneurial activities. Successful companies appear to benefit from a well-honed set of entrepreneurial capabilities which they have developed and refined over time (Zahra, 2006). Yet, strategic entrepreneurship lacks relevant integrative frameworks- especially for the “take – off” level.

Our approach through the autotelic capabilities (ACs) framework tries to explain how and why the launch of new ventures that intensively use and/or create new knowledge in order to acquire a strong hold in the markets can be successful. Exploring the black box of Knowledge Intensive Entrepreneurship (KIE) sectors and more specifically trying to answer questions on how KIE is established in traditional sectors in terms of knowledge – based competitive advantage that provide the company’s successful evolution is a matter of strategy. Corporate entrepreneurship research would benefit from examining the nature and content of ACs as well as when and how it affects KI new ventures. A first stage of such an examination is the focus of this article.

This is the very primary work on it and the very first statements. We try to sketch an outline for the autotelic capabilities approach taking into account the increased importance of KIE in TLT sector. ACs create external changes in the domain of the existing business ecosystem. Limited research exists today on the entrepreneurial capabilities that affect the start-up stage and no research when referring to TLT sector or KIE. The autotelic capabilities approach is promising both in terms of future research in many research fields including strategic management, entrepreneurship, innovation and knowledge management, as well as of entrepreneurial and managerial aids in order to shape new entrepreneurial courses in today’s complex business environments.

Knowledge Intensive entrepreneurship in Traditional Low Tech sectors

Entrepreneurship has been correctly characterized as one of the most intriguing but equally elusive concepts (Peneder, 2006). Scholars of entrepreneurship have struggled to create an appropriate conceptual framework for the field (Ihrig *et al.*, 2006; and Venkataraman, 2000)

with dozens of definitions of entrepreneurship (e.g. Schumpeter, 1934; Kirzner, 1973; Zahra and Garvis, 2000; Ireland *et al.*, 2001; Langlois, 2007; Henrekson, 2007).

The term knowledge-intensive entrepreneurship has been used mainly for technology based firms in high tech sectors and lacks a very clear definition (Brännback *et al.*, 2003; Burger and Helmchen, 2008; Malerba, 2004, 2008, 2010). Furthermore, there is no definition while there is still a debate on whether KIE can exist in low tech sectors.

Burger and Helmchen (2008) labelled “knowledge-based” entrepreneurs those entrepreneurs who meet at least two of the following conditions: (i) creation of a new combination, (ii) creation of new knowledge, (iii) employ knowledge developed originally in science.

Traditional Low Tech (TLT) sectors cannot easily produce extreme novelties based on new, “out of the lab” technology. Their markets are generally mature, slow-growing and subject to over-capacity and high levels of price competition. Traditional industries have been seen as more prone to competition from low-wage countries and less aggressive in terms of competition and innovation. Thereupon, when a new venture enters the market, it owns to surprise in order to survive and become competitive. Knowledge bases, combinative knowledge and absorptive capacity contribute to the creation of novelties to serve the above precondition. On the other hand, the ability of transcending the sectoral context is crucial for KIE in TLT sectors (Kreinsen and Schwiege, 2010). Knowledge generation in LMT companies can be linked to knowledge beyond internal sources, derived widely from other firms and institutions of relevant or non relevant sectors.

Combining the general and rather abstract definitions of KIE with the views on KIE and innovation in TLT sectors insofar, the following definition for the purposes of the present study is developed:

Knowledge Intensive Entrepreneurship in Traditionally Low Tech sectors exists when, with the purpose of creating a venture, the agents build on knowledge in order to turn a transcendent idea into business, putting knowledge in the core of all entrepreneurial activities instead of physical assets. This is mainly done by questioning existing knowledge and identifying and collecting new knowledge of various areas and levels, which has to be integrated and transformed for novel independent knowledge production (either productive or reproductive).

Knowledge-intensive entrepreneurship as the act of establishing a new venture is about cognition, heterogeneous knowledge selection and coordination in order to commercialize novel combinations or re-combinations at areas of products, processes, services or organizational models and acquire a first share in an existing or a new market. Autotelic capabilities enable the triggering of all mechanisms needed to establish the initial knowledge

based advantages through the exploration, creation and exploitation of opportunities that give birth to transcendent ideas.

Capabilities Approaches and New Venture Creation

Research on entrepreneurship has extended from the exploration of the dynamics of entrepreneurship in terms of opportunity recognition (Shane and Venkataraman, 2000), corporate innovation and new product development (Deeds et al., 2000), organizational birth and evolution (Aldrich, 1999), and the growth of new and small organizations (Hanks et al., 1994). Hanks, C. Watson, E. Jenson and G. Chandler, Tightening the life-cycle construct: a taxonomic study of growth stage configurations in high-technology organizations, *Entrepreneurship Theory and Practice* 18 (1994) (2), pp. 5–29. Hanks et al., 1994). Soon enough the resource-based perspective drove the entrepreneurship literature to develop the notion of “entrepreneurial capabilities” in order to explain new venture performance (Arthurs and Busenitz, 2006) or innovativeness (Picot et al., 1994). The term refers to the ability of identification and exploitation of the necessary resources in order to act upon opportunities in the market, or to create new market opportunities. Later Zahra stated that nascent firms' entrepreneurial activities entail the element of innovativeness. Ihrig et al (2006) attempting a knowledge-based approach to entrepreneurship, described the entrepreneurial process, from the venture idea to the newly formed business's strategic success, in terms of the development of knowledge following Boisot (1998).

On the other hand, in the field of strategic management, numerous theories and frameworks have been developed that attempt to explain how firms achieve and sustain competitive advantage finding substantial relevance within the field of entrepreneurship; the resource based view and the dynamic capabilities framework were the most dominating ones among them. Still, the resource-based view of the firm only tells why firms have success in the present context. It gives no clear understanding about how a firm through entrepreneurial action achieved their present fit (e.g. Alvarez and Busenitz, 2001). Bocardelli and Magnusson (2006) also argue that the important seed and start-up phases are not sufficiently covered by the resource-based theories which rarely have considered the early stages of firm development.

The dynamic capabilities perspective (Teece, Pisano and Shuen, 1997; Teece, 2007) focuses on the competitive advantage that is provided by a certain resource constellation over time to fit changing business environments (Baretto, 2010). Teece (2007) states that the ambition of the dynamic capabilities framework is: “nothing less than to explain the sources of enterprise-level competitive advantage over time”. Dynamic capabilities have been detected and analyzed in high – technology industries, large, diversified and multidivisional firms (Zollo and Winter, 2002) and multinational companies in international environments (Teece, 2007). They presuppose a rapid technological change and ignore the huge importance and potential of LT industries, as well as SMEs which constitute the majority of European firms at all

sectors. There are hardly any studies on the relationship between dynamic capabilities and knowledge intensiveness in low tech sectors. There is no evidence of the dynamic capabilities' existence and role in low tech companies either in their start up stage or later in their life and the development of their competitive advantages. Moreover, there is little evidence on their role in Knowledge Intensive Entrepreneurship (KIE) and none when KIE refers to low tech sector.

Although a growing body of research highlights the importance of entrepreneurial activities for the conception, development, configuration and maintenance of dynamic capabilities in new ventures (Boccardelli and Magnusson, 2006; Zahra *et al.*, 2006; Sapienza *et al.*, 2006), there is little or no research on whether dynamic capabilities exist during venture creation. Arthurs and Busenitz (2006) draw a clear distinguishing line between entrepreneurial and dynamic capabilities, while Helfat and Peteraf (2003) argue that an organization in the founding stage cannot have any dynamic capabilities.

Regarding knowledge-intensive entrepreneurship, an essential prerequisite is the capability to question existing knowledge and identify and acquire (new) relevant knowledge from other knowledge bases (Kirschen 2010). According to Kreinsen (2010), such reflective competences of low-tech firms depend heavily on specific *capabilities*, such as the configurational and the transformative ones (cf. Bender and Laestadius, 2005; Hirsch-Kreinsen, 2008). Literature on knowledge intensiveness in TLT sectors has been questioned through kinds of knowledge and ways of combining existing codified knowledge with practical knowledge in competitive ways (Pavitt, 1984; Napolitano, 1991; Hirsch-Kreinsen *et al.*, 2005; Robertson and Patel, 2007; Lichtenthaler, 2009), and a clear orientation to process innovation (Fagerberg, 2005; Heidenreich, 2009). Papers drawn from Economics of industrial dynamics (e.g. Gans *et al.*, 2002; Kirzner, 1973 etc) have outlined the importance of innovativeness as closely related to KIE as well as the important seed and start up phases of traditional firms but haven't gone further till now.

The recent focus on entrepreneurial capabilities has allowed researchers to specify the abilities and resources required for effective entrepreneurial activity providing a deeper understanding of the entrepreneurial process (Foss *et al.*, 2004; Arthurs and Busenitz, 2006). Yet, the numerous theories over the past two decades (e.g. Henderson and Clark, 1990; Zahra and George, 2002; Bender, 2004; Grimpe and Sofka, 2009) do not refer to innovative knowledge intensive start-up entrepreneurial actions. According to Zahra *et al.* (2006), most research and theory building focuses on established firms in high technology industries thus ignores new ventures and SMEs, and most have emphasized innovation, new product development, or new market entry activities to illustrate concepts.

Furthermore, the entrepreneurship literature has been criticized for being too concentrated on the process of launching new business concepts neglecting the strategic element of it (Hitt & Ireland, 2000; Hitt *et al.*, 2003; Boccardelli, 2006). Even when management scholars began to

recognize the value of incorporating entrepreneurship into strategic management research (e.g., Ireland, *et al.*, 2001; Alvarez & Barney, 2007), there was no effort to relate a capabilities framework with the early stages of firm creation and development, especially in low tech sectors. Paradoxically strategists seem to neglect the process by which resources are discovered, turned from inputs into heterogeneous outputs, and exploited in order to create a new business. Even the few ones that have tried to partly explore it, stay caged in high tech sectors. (e.g Boccardelli and Magnusson, 2006; Zahra *et al.*, 2006), ignoring the importance of TLT sectors and still not incorporating knowledge intensiveness of such ventures.

Objectives

In this paper, we seek to accomplish two objectives. First, we establish, define and discuss the nature of autotelic capabilities and show their importance and role in the starting stage of any type of KI venture after having defined KIE in low tech sector. Second, we discuss the key conditions under which ACs can bring about appreciable initial competitive advantage, keen to allow a successful venture entrance in existing mature and saturated competitive arenas.

Considering that the general and broad views on entrepreneurship and the existing capabilities' frameworks cannot capture the specificities and peculiarities of KIE in TLT sectors, the fundamental concept of knowledge intensive entrepreneurial process signifies a "black-box" challenge. In cases of KIE in traditional sectors there are usually no investments in direct R&D which secure patents and exclusiveness on unique products or academic patenting in various technological classes (Kreinsen, 2010). On the other hand it seems obsolete to start a new business or approve a spin off in the clothing sector in Europe or USA, a conventional wheat mill or another furniture plant. And yet, there are new firms or spin offs in these sectors that start dynamically, survive and prosper.

We argue that possessing and cultivating further the autotelic capabilities is a major success factor when knowledge intensiveness is engaged. ACs drive the cognitive process of forward-looking imaginative choice, enact the acquisition and management of knowledge and information and enable the triggering of changes that can greatly alter the rules of the saturated competitive arenas and determine victorious entrants in the marketplace. ACs provide the bridges between entrepreneurs' aspirations and visions, opportunities and resources where knowledge is both the mediator and moderator on a constant interaction with the external environment.

'And, when you want something, the entire universe conspires in helping you to achieve it.' (The Alchemist, Paulo Coelho, 1988)

Research Method

The logic of grounded theory was followed in the analysis of a multiple exploratory case study (Yin, 2003) with the individual low-tech company as the unit of analysis. Data were

collected from sectoral databases, the Amadeus data base and ICAP, while sectoral experts were interviewed and gave information about new, knowledge intensive ventures. The most representative low tech sectors in Greece are the food and beverages, wood and furniture, and textiles and clothing industry. The identified sectors have also a significant share of employment and value added for the European manufacturing industry and economy as a whole.

The goal was to acquire a sample of knowledge intensive ventures covering all Greece, which would satisfy the following criteria:

- KI venture creation among 1998-2007 in order to have survived early death
- More than three employees
- The company should evidently be a first mover or assigned to the most innovative companies in the market or product field.

The final sample consists of thirty case studies, ten from each sector carried out from November 2009 to January 2011. Three pilot interviews (one for each sector) permitted the improvement of protocols and interview general guidelines.

Multiple sources were used such as information by different interviewees (entrepreneurs, core team members), visits to the plant and reviews of company and public documents, such as administrative documents, reports, news (internet and press), secondary sources (literature, awards and information from company web sites) and a standardized questionnaire on hard facts and data of the cases. Triangulation through the use of multiple data sources, theoretical perspectives, and methods (Schwandt, 2001) increased the credibility and validity of the results.

Entrepreneurs of each firm and other senior managers were asked about the story of their venture's creation, on the innovative business concept, history and firm's evolutionary behavior up to the present time, biographies, and future expectations. They generally offered very detailed responses, timelines and histories for their firms. The typical interview lasted 2.5-3 hours, with some lasting much longer followed by supplementary telephone conversations. All interviews were taped and transcribed.

Although none of our questions asked directly about capabilities and were more directed to the exploration of KIE within the founding processes through main characteristics, determining factors and impacts, the reviews of transcripts revealed a wealth of data on certain capabilities' dimensions that led to the autotelic capabilities concept. It further proved the existence of the dynamic capabilities in these low tech firms and offered rich information on the transformation of the autotelic to dynamic capabilities and how the first become expressions of the second in the company's lifespan.

The Autotelic Capabilities approach: an overview

KIE processes which shape the starting competitive advantage in TLT competitive arena may be analysed in terms of capabilities for orchestrating and mobilising knowledge and other resources at the disposal of firms.

Paraphrasing Eisenhardt and Martin (2000), we assume a strategic and organizational lens, rather than an economic one and we refer to "Autotelic capabilities" which constitute the foundations of successful KIE and play the starring role in the start of a new enterprise or corporate venturing. They are precursors of dynamic capabilities at the venture creation stage and turn into expressions of dynamic capabilities in the company's lifespan.

The term "autotelic" denotes that the motivational driving force ("telos") comes from the agent itself ("auto") and not by any external source. It belongs to the humanistic psychologist Csikszentmihalyi who studied the creative activities of people who were deeply involved in very complex activities. Since knowledge intensive entrepreneurship is a rather complex and multifaceted phenomenon, the term describes perfectly the endogenous character of the agents' capabilities which are responsible for KIE in TLT sectors.

Traditional sectors act today in environments open to international competition and well developed global markets. Traditional companies need to constantly reinvent their trajectories and unshackle from the past, due to the constant devaluation of conventional products. That presupposes that at various points in time they make certain decisions on the domains they prefer to be committed to. Autotelic capabilities enable the successful choice, elaboration and implementation, offer excellence in being ready to take over when a

prosperous innovative idea or opportunity arises within environments where knowledge is till now rather poorly developed by the majority.

We define Autotelic capabilities the entrepreneurs' / firm's abilities to engage in non routine activities, improvisation and a flexible and paradox way of collecting and establishing knowledge assets and asset combinations in order to realize transcendent business ideas and address complex entrepreneurial environment through new ventures.

Autotelic capabilities influence the location, selection and the ways of selection of resources and skills and use a priori knowledge in order to capture existing knowledge from various domains. They are strategic higher order capabilities since they enable the shaping of the entrepreneurial ecosystem and ensure and support the creation and successful implementation of dynamic capabilities.

Autotelic capabilities involve organizational as well as individual skills. When a new venture is established, they are more individual - centric, while later they are embedded in the organization. They are characterized by the interplay of entrepreneurs' abilities to envision cognize and mobilize action. ACs are distinguished from dynamic capabilities by the existence of an action orientation and an emphasis on both individual and collective aspects of the process which DCs miss (Bingham et al., 2007).

Autotelic capabilities incorporate the search for novelty through improvisation and bricolage, and creativity through transcendental thinking in order to build a competitive advantage at the early stages of a firm. ACs are responsible for the shaping of emergent conditions by creating and not simply discovering opportunities. They engage in exploration out of the boundaries of the firm and usually even of the industry they belong which is a vital role of ACs in building initial competitive advantages.

They activate the "entrepreneurial" and cognitive component of the dynamic capabilities and provide their flexible shaping and use, as well as the flexible transitions from individuals to processes. They precede dynamic capabilities and prepare and frame the "when" and "how" dynamic capabilities can be developed and successfully applied. In our research all, except two firms were found to have developed dynamic capabilities although most of the respondents could not recall the exact time they engaged their routines and dimensions. Still, none had started using them in the founding stage.

Over time, according to the present research the relationship between autotelic and dynamic capabilities becomes intricately interwoven. The autotelic capabilities become partly expressions of the dynamic ones. Still they dominate again when a new challenge appears (corporate venturing). At this stage, although firm -embedded, the autotelic capabilities become again a matter of entrepreneurs or selected managers. Autotelic activities are then mostly a matter of sensing and seizing, in order to create novel future paths.

The emerging autotelic capabilities can play a role in filling the gap between mainstream resource-based and dynamic capabilities strategy and knowledge based entrepreneurship literature – at least for traditional sectors.

Toward an Autotelic Capabilities Framework

Knowledge Intensive Entrepreneurship in low tech sectors enacts mechanisms and processes of selection, association, elaboration and/or simplification that allow an unexplored till now way of combining different and complementary information, technology, tacit and codified knowledge borrowed from various sectors, disciplines and regions in the solution of a specific problem set by the agents, which stimulates action and which usually requires the joint contribution of various stakeholders. Consequently the emergent innovations are both the media of applying successful KIE and the results and outputs of KIE.

Even in so-call mature markets products have become complex, supply chains have become global and niche producers emerge around the globe enhancing competitiveness. New entrants need to establish and develop their own ecosystem (Teece, 2009) where they can network in order to reap knowledge, resources and innovations of other firms (e.g. suppliers or machinery makers) and create the conditions necessary for them to be welcomed in the markets. KI entrepreneurs of the present research made literally hundreds of decisions on their way to a finished entrepreneurial concept. They occupied capabilities to improvise and re-interpret knowledge and resources at hand in order to cope with changing and demanding although mature - called markets.

Therefore, there is substantial space for autonomous creation (Kor *et al.*, 2007). Conceiving the entrepreneurial process as “the process, from the venture idea to the newly formed business’s strategic success, in terms of the development of knowledge”, according to the broader knowledge-based approach to entrepreneurship of Ihrig *et al.* (2006), autotelic capabilities constitute the driving force of all necessary actions and decisions, by complementing each other and acting simultaneously and not sequentially as the existing models propose. Moreover, knowledge is in the core of all relevant activities focusing on assets of strategic interest.

Bricolage capability

KIE activities of TLT firms need to transcend the sectoral borders for the sake of resources and mostly knowledge. Knowledge and information have no limits today, while on the other hand entrepreneurs and organizations suffer certain limits and are terribly finite actors. KI entrepreneurs develop *bricolage capabilities* in order to successfully tap distributed competence and knowledge, reemploy and reframe them, and recombine them creatively, or otherwise, create a concept of intuition. This may be scientific, technological, technical or practical knowledge, design competence, or expertise, codified or tacit knowledge.

TLT KI entrepreneurs create new ventures out of loosely pieces of knowledge, which are derived by trans-sectoral search and which alone may be nothing in terms of novelty or differentiation. This capability to “...creating new forms with current resources” has been defined as “bricolage” by anthropologists (Levi-Strauss, 1966). The notion of bricolage has been already used in entrepreneurship, innovation, organization and knowledge management research (Duymedjian & Rueling 2010; Garud and Karnoe, 2003; Baker *et al.*, 2003). In terms of levels of analysis, bricolage has been considered as an individual activity (e.g. Weick 1998), an organizational process (e.g. Ciborra 2002) and a form of inter-organizational dynamics (e.g. Garud and Karnøe 2003).

The present research proved that KIE in TLT sectors presupposes the existence of a *bricolage capability* that is strongly shaped and affected by knowledge and scientific areas, knowledge bases and networks within the value chain.

Across our case studies, founders engaged in bricolage with regard to knowledge providers, suppliers, customers, financing, advice and employees. Close co-operations were developed in a concentric way, using pre-existing networks as a basis for networking expansion. At start up stage, team based structures, built on trust and proximity enable founders to be involved in rapid decision making and have access to knowledge and information.

Compared with the spectacular advancements in high-tech sectors, the bricolage approach appears as more simplistic. Yet, in order to be effective, bricolage tends to release synergies and certain processes of learning. This is achieved by merging and adjusting pieces of knowledge and other resources of different actors involved in research, design and production, which transcend sectoral limits. Learning can come from any piece of the value chain including advice from suppliers, feedback from customers or market information.

Bricolage capability is well recognized among entrepreneurs or entrepreneurial teams at the early stages of KI entrepreneurial activities in TLT sectors. In many cases it is successfully transferred in procedures and processes as all autotelic capabilities at an organizational level. In all cases where dynamic capabilities were detected, bricolage acted as the precursor of sensing (first microfoundation as described by Teece (2007)), while it then turned to an expression of it as well as of reconfiguration.

Improvisation

The initial entrepreneurial idea as shaped in the mind of the entrepreneur(s) or the organization will have to be many times reshaped, whether it is knowledge, production technology, an organization or a marketing mix matter. In all case studies, the ability to create and execute new plans on the fly proved to be an important ability to possess, since all agents were often forced to make decisions extemporaneously, using only the resources available to them in the moment.

What is rather oxymoron in a case of startup is that while the first movements are vital for its sudden death or survival, there is the most ambiguous period in its life. TLT enterprises need knowledge but almost always cannot lean on the assistance of a unique innovation as in high tech sectors. Still they act in an exponentially changing and constantly evolving environment. The need to repeatedly rework the initial concept in the light of new knowledge or other changes accentuates the volatility of the existing frameworks.

Literature on improvisation has been growing substantially since the mid 1990s, building on the organizationally oriented work within Weick (1979). Improvisation has been discussed in literature of strategic decision making (Eisenhardt, 1997), organizational learning (Barrett 1998; Miner *et al.*, 2001), product development (Kamoche and Cunha 2001), technology adoption (Orlikowski 2000), and strategic adaptation (Crossan and Hurst, 2003).

Improvisation implies the pre-existence of a set of resources upon which variations can be built (Orlikowski & Hoffman, 1997). All cases also highlighted real-time information as a crucial dimension. Real time information can be formal or informal, internal or external, generalized and vague, or very precise and unique. Regardless the degree and type, available information especially on knowledge allows a fluid communication and interaction among founders and the environment.

The target is to fill in the gap between vision and action, dream and reality. In order to achieve the desired results, a wide range of cross-functional skills, competences and extensive knowledge are required by entrepreneurs and members of the entrepreneurial team at the startup stage. An important number of the founders referred to learning through feedback from collaborators, suppliers, machine manufacturers, competitors and other members of the business ecosystem. Small failures and mistakes were also treated as sources of knowledge that could be directly useful or kept in mind for later use.

Improvisation entails flexibility, a spontaneous respond to arising circumstances and obstacles and allows exceptions to rules. Mixtures of try and error, and experimentation exploit information, crosscheck science results and “technology pushes” or integrate pertinent available knowledge. The research revealed that improvisational capabilities enabled exploring, continuous experimenting, tinkering with possibilities without knowing where one’s queries will lead or how action will unfold. *“Once we had decided the basic materials, we tried many possible combinations in lab. Even when presenting some at the international trade show, we were not sure about the final results....”* (A1’s president).

In all cases, there exists also a constant trend to dissatisfaction, which does not apply a negative sense or a rejection of the present state, but a constant need for something new and different. By doing this, the organization is articulating a future state of the reality it wants to achieve, inducing action in its members by making explicit the distance between current reality and vision (Senge, 1990). Teamwork and collaboration supports other’s leads.

Improvisation supports the birth of the sensing processes, while it then turns to expression of many dimensions of all three dynamic capabilities such as the business model delineation, effective communication, decentralization and co-specialization (Teece, 2007).

Transcendental Capability

Improvisation and bricolage capabilities, although fundamental, are not adequate to support KIE in TLT sectors, especially in turbulent environments. The actual and main question of KIE focuses on why and how TLT entrepreneurs create new opportunities. A novel idea within the everyday company's course can succeed or fail with all known consequences. But the introductory to the entrepreneurial ecosystem idea, where the new venture will challenge a place and a share, is decisive for its survival or the straightforward entrepreneurial "death".

In entrepreneurship literature there is a common acceptance that entrepreneurs think differently and see new opportunities where most others see either a benign environment or even emerging threats (Alvarez and Busenitz, 2001). This capacity is due to *the transcendental capability (TC)*, the ability to see beyond symptomatic solutions (Senge, 1990) and come up with an innovative opportunity, beyond the simplistic combination of pieces of knowledge, derived from any point of the value chain.

In order to go beyond stereotyped solutions, certain kinds of knowledge enlarge the sphere of an individual's / organization's judgments beyond the limits of experience. And it is in this very kind of knowledge which transcends the world of the senses, and where experience can neither guide nor correct, that TC enables investigation in a variety of fields- be them knowledge, empirical or of other types-, which by their importance can be considered far more excellent and by their tendency far more elevated than anything common entrepreneurial practice can find in the sphere of common entrepreneurial phenomena. This is precisely the meaning of KIE in TLT sectors, as well as the reason of why and how it is successfully applied through a variety of means, processes and mechanisms.

Entrepreneurs form by anticipation genuine concepts which do not relate immediately to the object but for the use of conscious rational processes instead of the use of empirical origin. This cognitive capability has to determine the origin, the extent, and the objective validity of knowledge and is derived by Transcendental Capability. This ability facilitates a path carving within chaos, limiting any "deals" with the laws of market / technology and business understanding and reason in so far only, as they refer *a priori* to set objects, as well as both the empirical and the pure knowledge of existing sources – internal or external. It forms the specific difference between KIE and plain entrepreneurship, enacting all mechanisms needed to allow unexplored knowledge paths and produce innovative business concepts. Entrepreneurs further exercise original choices and syntheses and create business concepts through such imaginative mental *a priori* acts.

Here lays the answer to questions such as: How do entrepreneurs create forward-looking concepts and knowledge intensive novel combinations? The fruits of TC are the only ones that can permit a newcomer to be established in an already hard and seemingly saturated market environment, entice customers, deliver value to them and persuade them to pay for value. TC enacts the mechanism of risking rather anything, even at the peril of error, than that one should surrender such investigations, either on the ground of their uncertainty, or from any feeling of contempt.

TC holders develop *a priori* knowledge which is transcendental, or based on the *form* of all possible experience, while the rest lay on *a posteriori* knowledge which is empirical, based on the *content* of experience. They resemble Copernicus who revolutionized astronomy by changing or reversing the point of view and taking the position of the observer into account.

Transcendental capability enables the ability to cognize the nature of what is going to offer competitive advantage according to *a priori* principles, to paradoxically thinking. It recognizes and analyzes all resources of knowledge and its abilities that lead to knowledge – based entrepreneurial results by a constant interplay between the adjustment of the objectives to the abilities and the adjustment of the abilities to objectives making use of the “Copernican Turn”. It is responsible and the driving force for the initialization of sensing and seizing, while it is the main cause of reconfiguration, in terms of constant alignment and realignment of assets.

Conditions

Within the AC framework, knowledge does not depend so much on the object of knowledge as on the capacity of the knower. Within the existing chaotic knowledge system an organization needs to have a constant sensation of where it is and where it wants to go, a type of “knowledge strategy”. This task involves the thorough determination of its cognitive situation and the search for ways that lead to objective knowledge. In order to position themselves and prepare to take off, agents have to (1) start from a higher sphere of entrepreneurial being, and (2) make sense of the entrepreneurial landscape spaciousness. Our research revealed that all asked entrepreneurs and organizations fulfilled both.

In traditional sectors markets seem saturated and innovation is not easy. Globalization and trade liberalization make spaciousness in traditional business seem utopian. Most entrepreneurs tend to protect themselves from emerging threads and changes. On the other hand, at the founding process space is limited to the agents’ experience and knowledge. Efforts turn to low price strategies, faster deliveries for bulky products (e.g. furniture – a last bastion that fell after IKEA’s smart idea) or locality (e.g. fresh milk and feta cheese).

Cognition of space leads to conscious efforts to widen ranges and scopes. *Spaciousness* is the conscious excess of the limited “known” because of the existence of the unlimited “unknown” which stimulates forward looking thinking and shapes visions. It enacts the two

other autotelic capabilities in order to cause expansion, enrich experience and locate gaps and opportunities. It depends on the agents' attitudes and cognitive capabilities. Actually it is the entrepreneurs' sense of spaciousness that defines the width and the quality of sources to seek, resources required and combinations made.

Entering a *higher sphere of entrepreneurial being* denotes the ability to have a panoramic view of global markets, value chains and inter-sectoral industry potential. Inspirations come from complex data retrieved by multiple sources and alternative directions and surpass the mere defensive attitudes of survival through common strategies. Entrepreneurs of the sample admitted to have started out of the tight local and sectoral limits, recognizing connections among different input and translating information in novel ways so that their outcomes could inspire new ways of thinking. A9 company started by seeking reasons in global markets for transforming traditional Greek products into gourmet delights, while A1 and A5 engaged in a search of science to overcome simplicity and add value to similar products.

In traditional sectors there are core rigidities in both innovating and market shares, which seem unimportant or do not even exist in high tech sectors. Advances in ICT are welcomed but innovative food is treated with suspiciousness. Entrepreneurs have to anticipate that their ideas and judgments will be confirmed; otherwise the new idea will result in early death. Likewise, Casson notes that: 'The entrepreneur believes he is right while everyone else is wrong.' (1982) but this is not a feeling of superiority but a result of judgment.

In the framework of autotelic capabilities the dimension of judgment and the evaluative concept based on knowledge, specify the above conditions under which a concept in question is acceptable and realizable with some degree of confidence. According to Penrose (1959) "astute entrepreneurial judgment goes beyond vivid imagination, good insights, and self-confidence". It also involves "organization of information-gathering and consulting facilities within a firm, and leads into the whole question of the effects of uncertainty on, and the role of expectations in, the growth of firms" (in Korr *et al.*, 2007). Judgment brings together understanding and sensibility, hence concepts and ideas by making difficult decisions in a short time frame with imperfect data.

Discussion

Literature has so far emphasized the risk-protection function of dynamic capabilities in response to exogenous shocks (Newey and Zahra, 2009) and their recognition as a potential source of achieving and sustaining competitive advantage in established organisations (Teece *et al*, 1997; Eisenhardt and Martin, 2000; Zollo and Winter 2002; Zahra *et al*, 2006), failing to consider or question whether these capabilities can sustain the birth of a new company. Literature has further neglected the significant amount of low tech SMEs while KIE is still in its infancy although there is a rich literature regarding high tech and technology based sectors.

The present exploratory study which initially intended to explore KIE as a central transformative mechanism for low tech sectors i.e. find out what KIE can mean in the context of low-tech sectors and which specific characteristics it has, turned to surprising results regarding the strategic side of entrepreneurship. It proved not only the existence of dynamic capabilities in low tech established companies, but also the existence of a capabilities' set which seems to be vital for the birth of KI low tech ventures.

KIE opportunities within the low-tech sectoral system are very seldom and hard to identify. Thus, ACs enable the breaking of the barriers of established developmental paths by selecting new knowledge and technologies that stand out from the resources of the existing sectoral systems, such as scientifically generated knowledge. Using improvisation they combine and recombine knowledge, resources and opportunities in order to alter the existing business and question the entrance of new products, processes or services.

The transcendental capability is a totally novel concept which explains "*how*" innovative knowledge intensive concepts are built in order to offer the competitive starting advantage. TC in coexistence with bricolage and improvisation capabilities creates the entrepreneurial platform for innovation. Autotelic capabilities allow the transcendence through non convenient but rather functional ways. Knowledge and transcendental thinking presupposes consequence of opinions and beliefs, as well as communication. Reasonable grounding can refer to future conditions and aspirations and thus this ability to ground reasoning under future parameters constitutes the distinctive difference among success and failure in KIE at least in TLT sectors.

KIE's definition is also a first attempt to imprint this key socio-economic phenomenon that drives innovation and economic growth within the framework of low tech sectors. KI companies are involved in the economy as mechanisms to translate knowledge into innovation which can be radical or incremental but in any case will facilitate entrance to a complex and rather hostile business ecosystem.

Improvisation and bricolage have been treated till now as concepts, mechanisms, media, or just activities of an organization. The present research reveals that they are both more than that; they are integrated structured capabilities. The results are among the first in literature to confirm their existence in low tech sectors and their role in the founding process and the company's strategy.

The development of the ACs concept contributes to the literature on strategic management, dynamic capabilities and entrepreneurship, in several ways. Our definition and description of ACs and their role for new entrants into the competitive game of so – called saturated markets challenges multiple aspects of research and theory grounding. Our approach highlights the major problem of new venture creation under the scope of strategic management and expands the capabilities view to both corporate and knowledge intensive entrepreneurship. It further shifts focus from high tech to low tech which due to path

dependences and mostly incremental innovations have been almost ignored, as well as towards SMEs which constitute the majority of companies in Europe.

ACs framework further bridges the gap between opportunity discovery and creation or knowledge exploitation and implementation, engaging a real time interaction among them through bricolage and improvisation. Adding the transcendental capability we try to answer the “how” questions on new venture creation based on knowledge, innovation and new path creation.

ACs can also be considered as an extension of the dynamic capabilities framework. Although they may start as individual capabilities, they soon turn to organizational ones, being embedded in systems and the new venture’s culture. Although the mechanisms of their embeddness have not been studied yet (and this is a suggestion for further research) they do become expressions of dynamic capabilities, since they can be recognized among their microfoundations. This is a new direction for the dynamic capabilities framework, since there is some new insight on the origins, the content and the transformation of DCs depending on the stage of the company.

Daring a comparison to the radical changes that high tech introduces in an increasingly faster pace, ACs allow a potential of altering industries even in low tech sectors. The so called traditional food sector has lately embraced biochemistry and biotechnology, denoting novel relationships among new stakeholders. ACs facilitate new networks and alternative and transcendent ways of knowledge combination in order to create viable and novel business opportunities. The conditions described above of spaciousness and an overall knowledge of the entrepreneurial landscape allow for a good manipulation of potentials, resources and opportunities.

Implications for Practice

Several implications for entrepreneurs or top managers arise from this study. Strategy in the early stages of firm development appears to be difficult to address with traditional, analytical management approaches (Boccardelli and Magnusson, 2006). The ACs framework facilitates the start of any new knowledge –based venture in low tech sectors. It underlines the importance for entrepreneurs to balance the three autotelic capabilities that provide competitive advantage when crafting their strategies which is missing from the relevant literature so far.

Cognition and experimentation, planning and improvisation go hand in hand in order to be novel and flexible and offer the new in the shape of the familiar. An exaggerated focus on building core competencies such as dynamic capabilities at the very early stages of a venture may be dangerous, as such a focus applies for known markets, something which may apply to an established firm, but not when entrance denotes changes and innovation.

The framework will help entrepreneurs / managers to consider the individual components of the cognitive process, the rules, resources and skills necessary to achieve initial competitive advantage. Yet, the transcendental capability will make them consider paradox thinking, see beyond the simplistic combination of pieces of knowledge, which may come from any point of the value chain. They actually need to create new knowledge and information, from the inside out, "in order to redefine both problems and solutions and in the process, to re-create their environment" (Nonaka and Takeuchi, 1995).

Implications for Theory and Future Research

The concept of Autotelic Capabilities is a first attempt to connect corporate, knowledge intensive and strategic entrepreneurship, regarding the emerging stage of venture creation and the initial competitive advantage. This new theory is not offered as *a fait accompli*. Further theoretical and empirical research is needed to establish the existence of ACs, tighten the framework, describe dimensions and their measures and construct a compact and comprehensive relevant theory which would act as an umbrella of the few but fragmented existing theories on low tech entrepreneurship and further explain KIE where theory is still in its infancy.

The study has certain limitations. First, it is based on a grounded method approach to formulate the theory from data collected in thirty companies in low tech industries. Despite the fact that this methodological approach provides an opportunity for rich data collection and theory development and the fact that thirty cases is a considerable number, it still imposes some limitations on the findings. Second, the findings from this research do not confirm a theory but create a theory, which is limited to companies participating in this research. Hence, it requires for follow-on study using the framework to test the findings and evaluate the theory and also provide in-depth detail on the phenomenon.

Researchers should also show how ACs are related to dynamic and operational capabilities, and try to watch and describe the mechanisms of their embedness and existence as expressions of the dynamic capabilities. Some other areas of research would be the evaluation of the relationship between ACs and performance, whether ACs exist in high tech and the determination of the conditions under which ACs are effective.

The fields of strategy, entrepreneurship, innovation, knowledge and organizational behavior, manufacturing and business management should be engaged in order to unlock the riddles behind the term of KIE in low tech sectors. The autotelic capabilities framework comprises a rather aspiring research agenda. The framework advanced can help scholars understand the foundations of KIE in TLT sectors and assist agents delineate strategic decisions, actions and priorities.

Besides the new framework, the present research introduced the upgrade and integration of bricolage and improvisation into second order strategic capabilities under the umbrella of the

autotelic capabilities. More evidence is needed through field research in both high and low tech SMEs.

Conclusion

We have sketched a mere synopsis of the autotelic capabilities approach, a first attempt to touch the unexplored strategic side of the entrepreneurial start up activity in low tech sectors within the notion of knowledge intensive entrepreneurship. This exploratory research has set the existence of the autotelic capabilities framework as critical to understand the origins of KIE at least in low tech sectors, based on thirty samples of knowledge intensive firms of three main traditional sectors, “born” in the contemporary turbulent business ecosystem. We have highlighted the importance of ACs in the achievement of initial competitive advantages for KI low tech enterprises; this explanation together with the attempt to define KIE in low tech sectors adds to the literature of both entrepreneurship and strategic management. We have further defined the conditions under which autotelic capabilities can flourish and stimulate novel knowledge intensive venturing that promises survival and competitiveness. We have also drawn some attention on the existence of dynamic capabilities in low tech firms and their emanation by the autotelic ones, which is to our knowledge the first attempt to examine their existence in low tech arenas. Our discussion sets an agenda for research on several issues and invites future empirical examinations of how KIE is established in both low and high tech sectors as well as relations and interactions among autotelic and dynamic capabilities.

Abstract

Recently, there has been growing interest in understanding the influence of leaders on followers as a process related to followers' identity and self-concept (e.g., Kark and Shamir, 2002; Kark and Van Dijk, 2007; Lord and Brown, 2004; Lord, Brown, and Freiberg, 1999). Substantial research on leader-member exchange (LMX) has contributed to the understanding of leader-follower (or supervisor-subordinate) relationships (Gerstner and Day, 1997; Graen, 2006). Though substantial research has indicated that building high quality LMX has beneficial effects on the well-being of the dyad and on work and organizational outcomes, limited attention has been devoted to understanding how such relationships develop (House and Aditya, 1997; Wang, Law, Hackett, Wang, and Chen, 2005). Kark and Van Dijk (2007) have linked the theory of leadership with the theory of self-regulatory focus (SRF; Higgins, 1997), and recently they have focused on the relationships between the theory of LMX with the theory of SRF (Kark and Van Dijk, 2008).

Keywords: Self regulatory focus, leadership, LMX, organizational commitment

Introduction

The current study examines the effect of self-regulation congruency between leader and follower on leader-member exchange (LMX), and follower's organizational commitment. Based on Self Regulatory Focus theory, two types of leader-follower dyads were identified: A congruent dyad, in which both leader and follower are holding the same regulatory focus (i.e. both of them are promotion-focused; both of them are prevention-focused) and a non-congruent dyad, in which each of the dyad's parts hold different regulatory focus (i.e., promotion-focused leader with prevention-focused follower and vice versa).

We hypothesized that leader-follower dyads with congruent SRF will be characterized by higher LMX in comparison to non-congruent dyads. We also hypothesized that the dyad's congruency will affect follower's level of commitment to the organization. Finally, we hypothesized that the effect of the dyad's congruency on organizational commitment will be stronger among high LMX dyads than among low LMX dyads.

Summary of hypotheses

H1. Congruent dyads (promotion-promotion; prevention-prevention) will experience higher quality of LMX than non-congruent dyads (promotion-prevention; prevention-promotion).

H2. Congruent dyads (promotion-promotion; prevention-prevention) will experience higher levels of follower's organizational commitment than non-congruent dyads (promotion-prevention; prevention-promotion).

H3. LMX will moderate the effect of congruent versus non-congruent dyads on organizational commitment: Specifically the effect of dyad's congruency on commitment will be stronger when LMX is high as compared with low LMX.

Method

A total of 122 workers consisting 61 dyads of managers and their direct subordinate were sampled. The manager's sub-sample consisted of 33 males and 28 females. The overall mean age was 40 years (range 23 to 65), their seniority in management positions ranged between 1 to 35 years (mean=5.4, *SD*=5.6), and their mean education (years) ranged between 12 to 23 (mean=15.7, *SD*=2.0).

The subordinates sub-sample consisted of 27 males and 34 females. The overall mean age was 33.5 years (range 21 to 62), the majority (64.5 %) had no management experience, and their mean education (years) ranged between 7 to 20 (mean=14.8, *SD*=2.5).

Managers responded to a questionnaire that included measures of Self Regulatory Focus (Lockwood, Jordan, and Kunda, 2002), and Leader Member Exchange (Liden and Maslyn, 1998). Subordinates received the same measures and one more additional measure for subordinate's Organizational Commitment (Meyer and Allen, 1991). Consistent with the suggestion of Gerstner and Day (1997), data on the LMX was collected from both sources, managers and subordinates. In the introductory page of the questionnaires, the participant's confidentiality was guaranteed. Participants got the questionnaire via e-mail or personally.

Results

In contrast to our prediction, the congruent dyads were not characterized by higher quality LMX compared to the non-congruent dyads. Thus, H1 did not confirm. The sum of LMX for each type of dyad's congruency is summarized in Table 1.

In accordance to our prediction, the levels of commitment were higher in the congruent dyads compared to the non-congruent dyads, for affective and normative commitment but not for continuance commitment. Table 2 summarizes the means of commitment types (affective, normative, continuance) according to four types of dyads congruency. A demonstration of the effect of dyad's congruency on organizational commitment is presented in Figure 1a (affective commitment) and Figure 1b (normative commitment).

Also as predicted, for affective and normative commitment, the results show that manager's LMX moderates the congruence-commitment relationship. Specifically, the relationship between leader-follower congruency and follower's commitment is higher when the LMX (perceived by the manager) is high. This interaction effect is presented in Figure 2a (for affective commitment) and in Figure 2b (for normative commitment).

Discussion

The results presented in the current paper could further our understanding of the underlying mechanisms of leader-follower dyadic relationship and self-regulation congruency. They indicate that congruency in SRF does not effect the level of LMX. However, in situations in which there is high level of LMX congruency can contribute to organizational commitment. LMX can develop based on other aspects, such as gender, life history, professional background or other characteristics. When a high quality relationship develops than fit becomes more meaningful and moderates certain outcomes. Future researches should further examine the hypotheses using a larger sample and conceptualizing promotion and prevention regulatory focus nt only as a stable characteristic, but also as a situational variables. It should also focus on other outcomes (organizational identification, employees well being and performance). Implications for theory and practice will be further discussed.

Table 1: LMX Quality in four groups of Congruent and Non-congruent Dyads

	Promotion-focused Subordinates		Prevention-focused Subordinates

Abstract

Franchising is a very popular business development form in the world, especially in service sector. However, it is not widely used in new EU member states, such as Lithuania, and other developing countries. Therefore, the aim of this article is to analyze prevalence of franchising in Lithuania and potential of its usage among Lithuanian capital companies operating in catering sector. It is determined that franchise system has five main elements and all process of franchising business system establishment, which consists of four steps, is influenced by four groups of factors: marketing, management, legislative and human. To find out the situation of franchising business in Lithuania a questionnaire survey of Lithuanian capital companies operating in catering sector was carried out based on the model of franchise system development created by article authors. Seven assumptions about unfavourable business conditions were tested and six were found to be unsupported. Results of investigation revealed that these companies have a strong potential to develop their businesses using franchising, however, it is not mainly the business conditions that stop the use of franchising. The main obstacles are: the lack of knowledge about intellectual property protection and foreign markets, lack of unique and exclusive business ideas and strong brands, as well as lack of information about franchising as a business development form.

Keywords: franchising, internationalization, business development, catering sector, contractual business relations.

Introduction

Franchising as a business development form dating back more than one hundred years and in last decades franchising popularity extremely increased due to intensive processes of globalization, because all customers seek for the same well-known brands and quality (Mendelsohn, 2004a, Alon, 2006; Blair, Lafontaine, 2005).

In Lithuania as in the whole world franchising is the most popular in services sector. However, only 0.2 % of the whole catering sector companies in Lithuania operate in franchising mode, whereas only 0.02 % of all companies in Lithuania operate in franchising mode (according to the data of Lithuanian statistics department in 2009). Therefore, it can be stated that franchising is very poorly extended in Lithuania.

However, franchising as a business development form is very relevant in the context of international business environment, especially for such a small country as Lithuania. Thus, the aim of this article was to determine current situation of franchising in Lithuania and potential prevalence of franchising among Lithuanian capital companies operating in catering sector.

Franchising system development model

Development of franchising business consists of particular steps, starting from favourable conditions for the system to emerge (Mendelsohn, 2004b), intention and ability of franchisor to form franchise based on his business (Ehrmann, Spranger, 2007a; Sherman, 2004; Windsperger, Clinquet, 2007), then the establishment and initial development of franchising system and its further functioning. It is determined that business can be expanded using franchising if it has well-known brand (Sherman, 2004; Mendelsohn, 2004a; Blair, Lafontaine, 2005; Combs et al, 1994) business performance is successful (Windsperger, Clinquet, 2007; Tuunanen, 2007; Sherman, 2004; Majocchi, Pavione, 2002) and can be formed into clear system (Blair, Lafontaine, 2005; Sherman, 2004; Mendelsohn, 2004a; Ehrmann, Spranger, 2007b; Perrigot, Clinquet, 2007). Also when brand and other intellectual capital of the company are secured by legal system and laws (Mendelsohn, 2004b), business owner does not have sufficient financial resources for independent business development (Ehrmann, Spranger, 2007a) and/or quite big differences of potential market exist (Windsperger, Clinquet, 2007). Finally, potential franchisees have to exist, who would be interested in particular franchise (Sherman, 2004; Majocchi, Pavione, 2002).

Six areas influencing franchising business development conclude the model: elements of franchising, process of franchising development and functioning, management, marketing, legislative and human factors. Those franchising elements are the most important factors influencing franchising system, whereas management, marketing, legislative and human factors are their supplements. All these factors in one or another stage of franchising establishment and/or development influence franchising system and determine its successful and effective growth. Franchising cannot exist without its main elements, whereas all other factors are at some level necessary to determine good operation of the system.

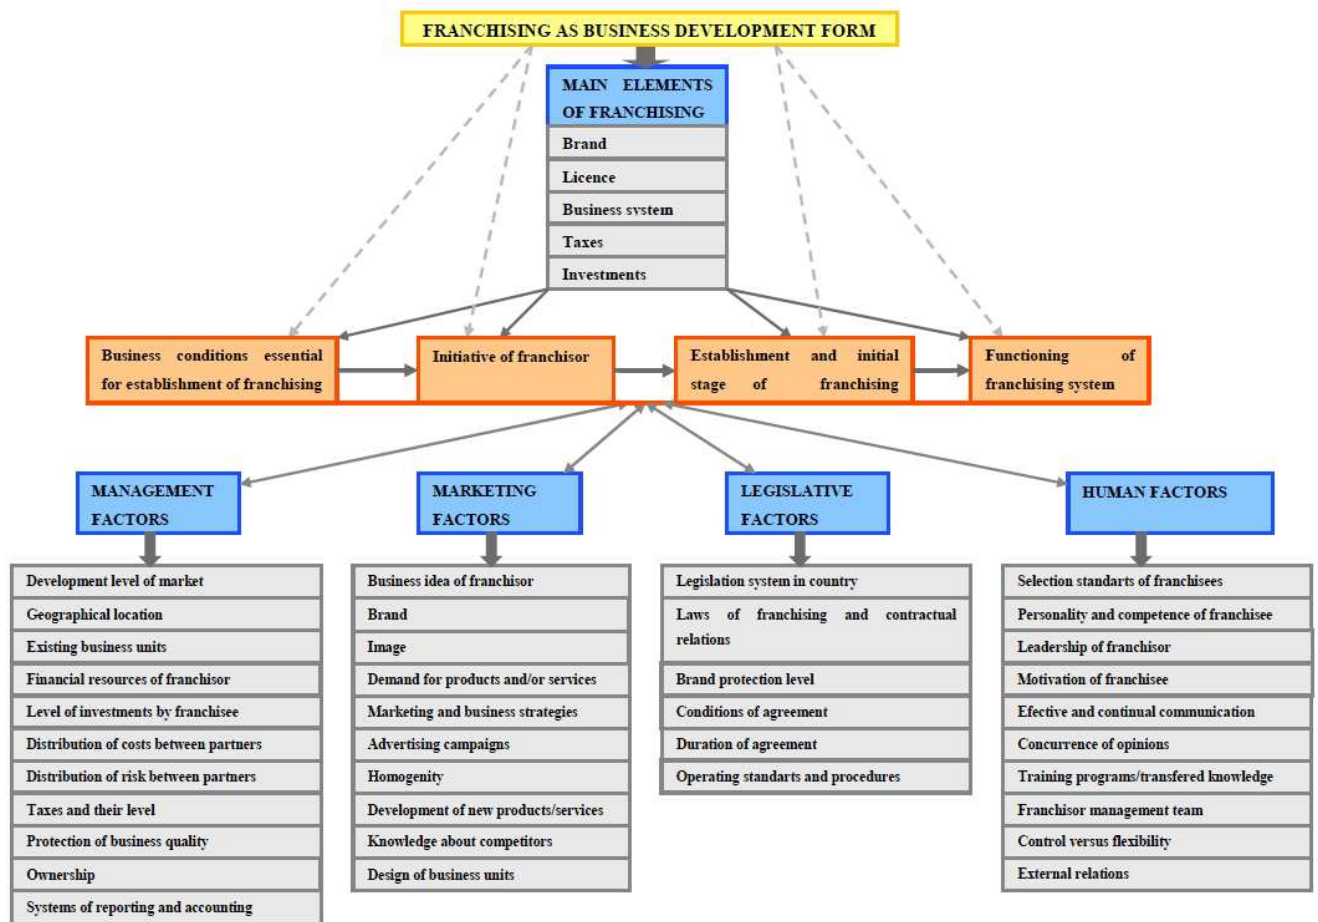

Fig 1. Franchising system development model

(Prepared by the authors)

Methodology of research on franchising business situation in Lithuania

The goal of empirical research was to determine current situation of franchising in Lithuania and potential prevalence of franchising among Lithuanian capital companies operating in catering sector. Quantitative research method was chosen, therefore questionnaire was designed and research was carried out from 7th of May to 18th of April, 2010 according to the factors named in the model (Fig. 1). Current franchising situation in Lithuania was investigated from the perspective of franchisor. During the investigation only Lithuanian capital companies (one respondent per company) that have a potential to use franchising in the future were analyzed, because establishment of new business units and therefore growth of Lithuanian companies is very positive expression for economy in Lithuania. The problem defined in the goal of empirical research was analyzed by verifying seven **assumptions**.

Lithuanians lack entrepreneurship, also the market of Lithuania is very small and the biggest part of Lithuanian capital companies are small or middle size, so they can be managed from one operating center.

P1 Small market of Lithuania is negatively related to tendency to develop business independently, therefore, it is no need to use such business development forms as franchising.

The main problem of Lithuanian capital companies is the lack of financial resources, because these companies do not have enough cumulated finances to operate successfully if demand for goods and services disconcerts.

P2 Due to lack of financial resources, Lithuanian capital companies do not want to expand their business, especially to foreign markets.

Lithuania lacks well-known global level brands, because main part of Lithuanian capital companies are oriented towards the local market and due to their small scale cannot dedicate big financial investments to increase popularity of their brands.

P3 Lithuanian brands are not known because companies almost do not invest into their brands.

Big part of customers in Lithuanian are sensitive to prices, so they choose suppliers of goods or services firstly by the price and are characterized as not loyal and with unstable demand.

P4 Business is not suitable for development using franchising because it does not have stable demand for its production and has little loyal clients.

The main characteristics of Lithuanian capital companies is their small scale, limited to one or two business units, usually without long term strategy and standards to ensure business quality.

P5 Lithuanian capital companies cannot form their business model and propose it for the potential buyers because they do not have homogenous business units' style, business standards and quality requirements.

Many of Lithuanian capital companies are orientated towards the local market, therefore are limited only to local market perception and do not analyze events influencing business environment on the global scale.

P6 Perception of advantages and disadvantages of franchising by Lithuanian businessmen are in line with their perception about business environment they are operating in.

Companies in Lithuania lack confidence and cooperation between each other, especially during negative economic situation.

P7 In case of franchising, when relations between franchisor and franchisee are so intensive, franchisors are not minded to trust other company that can influence their business negatively, because there is lack of confidence among all business partners and clients in Lithuania.

In 2009 (Lithuanian Statistics Department) there were 2769 companies in catering sector in Lithuania, but there is no exact number how many of them were in Lithuanian capital only. Therefore with 95 % probability and 10 % error 93 companies in total had to be surveyed. Companies for the survey were

selected using convenience sampling method (*Pranulis, 2007*), therefore only companies that could be reached by email were surveyed and the counted number (93 in total) was used only as orientation for determination of the total amount of respondents. In public information resources 450 different emails of Lithuanian capital companies operating in catering sector were gathered, to which the link to the questionnaire was sent. In total 95 appropriate answers of the Lithuanian capital companies operating in catering sector were collected.

Survey instrument

Questionnaire consisted of five blocks. The first block identified particular business area of the company, background of capital and business size. The second block determined respondents experience and opinion about franchising as business development form. The third block determined the specificity of respondents business taking into account management, marketing, legislative and human factors. The fourth block revealed opinion of the respondents about franchising advantages and disadvantages and the most important characteristics of potential franchisee. Finally the fifth block of the questionnaire identified demographic characteristics of respondents and function in the company. *Cronbach alpha* coefficient was used to evaluate reliability of the questionnaire, which was very high for the whole questionnaire (0.938).

Results

Investigation revealed that only 7 out of 95 respondents had business units abroad. 63% (N=60) of the respondents managed only 1 business unit (Table 1). Respondents represented only small and middle enterprises, as 40% (N=38) of them had up to 10 employees and 52% (N=49) of them had from 10 to 50 employees. Quite young respondents were surveyed, as even 50% (N=48) of them were 20 – 30 years old. Distribution of the respondents according gender was quite equal, 52% (N=49) of men and 48% (N=46) of women were surveyed. Even 81% (N=77) of the respondents had higher education, in addition 13% (N=12) had unfinished university education which can be explained by their young age. 64% (N=61) of the respondents had top occupation in the company, 43% (N=41) of them were the owners or shareholders of their company and 21% (N=20) were the top managers. The fact that most of the surveyed companies were small or middle size and had quite small amount of employees, so the owners or shareholders of these companies also work in them and were surveyed during this research, was realized before the survey.

*Table 1. Characteristics of survey respondents
(Prepared by the authors according survey results)*

Characteristics of survey respondents	Options of the answers	Distribution of the answers
Number of company business units	1	63%
	2	18%
	3 – 5	15%
	>5	4%
Number of company employees	Up to 10	40%
	10 – 50	52%
	50 – 250	8%
Distribution of respondents by age	20 – 30	50%
	30 – 40	32%
	40 – 50	15%
	>50	3%
Distribution of respondents by gender	Men	52%
	Women	48%
Distribution of respondents by education	Higher university education	66%
	Higher non university education	15%
	Unfinished university	13%
	Professional education	3%
	Secondary education	3%
Status of respondents in company	Owner/Shareholder of the company	43%
	Top level manager	21%
	Middle level manager	17%
	Specialist	19%

Evaluation of possibilities of Lithuanian capital companies operating in catering sector to develop their business using franchising

In Figure 2 statements divided into different groups according to assignment to particular business function are represented. All of these statements were valued by the respondents in 7 points scale from “totally disagree” to “totally agree”. Neutral position “neither agree, neither disagree” was valued by 4 points. Mean of every statement evaluation and means for separate categories of business factors were derived.

*Fig. 2 Characteristics of business in the companies where respondents work
(Prepared by the authors according to the survey results)*

Therefore, it can be stated that respondents worstly evaluated the legislative factors related to their company environment, as their total mean is only 3.9 points. In the field of legislative factors, legal scheme and laws related to protection of brand are more applicable to franchisor, that legal and safe franchising business operation could be determined. Worstly in this category respondents evaluated legal system of the country (3.05 points) and that Lithuania has sufficient intellectual protection (3.37 points). Generally, even 68% (N=65) of the respondents did not trust the legal system in Lithuania, 18% (N=17) neither trusted nor did not trust and only 14% (N=13) of them trusted the legal system in Lithuania. However, the other two statements related to internal legislative factors of company, particularly that respondents have patented their brand and their business unit/s have homogenous operating procedures were evaluated more positively (respectively 4.41 and 4.76 points). On principle, potential franchisor cannot expand his business using franchising if he has not patented his brand before hand, because it is necessary to patent the brand in case of franchising. Only 47% (N=45) of the respondents had truly patented their brand. Conclusively, it can be stated that only a little less than half of the respondents patented their brand, but more than a half of them had homogenous operating procedures that could allow for almost half of them to develop their business using franchising immediately, but the other half should patent their brand before hand. After estimating the correlation between legislative factors (Table 2), it can be stated that correlation is the most significant between trust in legal system and sufficient intellectual protection (coef. 0.552, when $p=0.01$). This means that trust in external legislative factors and sufficient intellectual protection are related, and the more legal system of the country is trusted, the more trusted is the level of intellectual property protection.

Table 2. Correlation between legislative factors (Spearman coefficient)
(Prepared by the authors according to survey results)

	Your business units/s have homogenous operating procedures	You trust the legislative system of the country	Intellectual property protection is sufficient in Lithuania	You have patented your brand
Your business units/s have homogenous operating procedures	1.000			
You trust the legislative system of the country	.365(**)	1.000		
Intellectual property protection is sufficient in Lithuania	.347(**)	.552(**)	1.000	
You have patented your brand	.220(*)	.016	-.048	1.000

** When two-sided correlation significance is less than 0.01

* When two-sided correlation significance is less than 0.05

Group of marketing factors (Fig. 2) was evaluated more positively than negatively (on average 4.42 points) by the respondents. Business idea, brand and its popularity of potential franchisor business can be assigned to the most important marketing factors because they determine if particular business can be attractive for franchisees. However, these factors were evaluated just slightly positively, respectively 4.34, 4.37 and 4.05 points. Therefore, it can be stated that for the respondents their business idea did not seem totally unique or exceptional, their brand was only slightly known, but they invested to popularize their brand only on average. As the brand is one of the five main elements of franchising, it can be stated that only 51% (N=48) of the respondents had well-known brands, so they could expand their business using franchising, but the remaining part of the respondents should additionally invest to make their brand more attractive for potential franchisees. However, in this case the respondents evaluated popularity of the brand, so it is possible that they evaluated their brand popularity better than it is really known in the market. Strategic business/marketing plan is one of the main factors enabling the development of franchising system. In this case the respondents stated that they had business/marketing strategy (4.87 points). The other essential factor is demand for the goods and services of franchisor, because it determines the attractiveness and possible business success. However, this factor was evaluated the most negatively of all marketing factors, on average 3.88 points. It was determined by the fact that equal number of respondents stated that they are satisfied and unsatisfied by demand to their services (particularly over 37%, N=35). And even more than one quarter of the respondents stated that they were neither satisfied, nor unsatisfied by the demand for their services. Other very important factor related to demand is loyalty of clients. However, in this stage some contradiction emerged, because most of the respondents stated that their clients are loyal (4.88 points). So this fact shows that although part of the respondents are not satisfied by demand of their services, but remaining clients are quite loyal, so the

respondents have to increase the amount of loyal clients to expand their business using franchising successfully. Homogenous style and design of business units determines that franchisor is able to expand all franchising system by the same principle. This factor was evaluated by the respondents more positively (4.39 points), because slightly more than half of them (53%, N=50) confirmed that they were able to determine homogenous style and design of their business units. However, almost one third of the respondents stated that they were not able to determine homogenous style and design of their business units, which is a very big disadvantage for business development in franchising mode when all business units have to be the same or very similar. Respondents more positively (4.56 points) evaluated the statement that they develop new products or services. After assessment of correlation between marketing factors (Table 3), it was determined that among most of them medium or at least weak positive relation existed. Therefore, it can be stated that by improving some of marketing factors in company, other marketing factors also improve because their development usually is carried out in complex and depends on the efforts of the particular company.

Table 3. Correlation between marketing factors (Spearman coefficient)
(Prepared by the authors according to survey results)

	Your business idea is unique	Your company clients are loyal	Demand for your services satisfies you	Your business unit/s have similar style and design	Your company brand is well known	You strongly invest in popularity of your brand	You have business/marketing strategy	You develop new products and services
Your business idea is unique	1.000							
Your company clients are loyal	.225(*)	1.000						
Demand for your services satisfies you	.508(**)	.392(**)	1.000					
Your business unit/s have similar style and design	.262(*)	.186	.252(*)	1.000				
Your company brand is well known	.179	.235(*)	.161	.362(**)	1.000			
You strongly invest in popularity of your brand	.284(**)	.233(*)	.467(**)	.215(*)	.511(**)	1.000		
You have business/marketing strategy	.094	.437(**)	.383(**)	.256(*)	.064	.303(**)	1.000	
You develop new products and services	.570(**)	.381(**)	.405(**)	.343(**)	.259(*)	.286(**)	.421(**)	1.000

** When two-sided correlation significance is less than 0.01

* When two-sided correlation significance is less than 0.05

Group of human factors (Fig. 2) was also evaluated slightly more positively than negatively (on average 4.40 points) by the respondents. Human factors influence both franchising business partners similarly. In this case, respondents agreed more that they consider their employees as professionals and trust their

business partners and suppliers (respectively 4.64 and 4.46 points). Trust and ability to select appropriate employees allow us to make an assumption that potential franchisor will be able to select appropriate franchisees for their business. External relations determine effective operation of business and later of all franchising system, therefore are very important for franchisor. However, respondents evaluated their knowledge about foreign markets the most poorly compared to other human factors (particularly 4.11 points), although it is a necessary factor for expanding business abroad. Though, almost half of the respondents (46%, N=44) stated that they had the knowledge about at least one foreign market, but even 38% (N=36) of them stated that almost or totally did not have any knowledge about foreign markets. That is a very big disadvantage for potential business expansion using franchising.

Respondents evaluated group of management factors the best compared to other business factors (Fig. 2). These factors influence both business parties. Because whether franchisor evaluates the market positively and sees any possibilities to expand there using franchising also depends on the management factors. Existing franchisor business units show if business is successful and has potential to operate in franchising mode. Therefore, the statement related to this fact was evaluated the best among other management factors, particularly 4.82 points. Other very important management factor is risk tolerance, which was also evaluated very positively (4.66 points). This means that business risk is acceptable for the respondents so it can also be acceptable for potential franchisees. The last management factor is financial resources of franchisor, which have to be sufficient for business development. However, in this case the respondents evaluated their financial resources only on average (4.01 points) because the answers of respondents split almost equally, 43% of respondents stated that their financial resources are sufficient for business development (43%, N=41), whereas even 39% (N=37) of them stated that their financial resources are not sufficient for business development. Therefore, it can be stated that if financial resources of a company are not sufficient for business expansion, franchising business system cannot be formed and proposed in franchising mode as initial financial investments are requested. However, if amount of financial resources is average in the company, it can still have enough money to form franchising system and then expand business by using franchising, because it requires much lower amount of money than developing business alone. After assessment of correlation of management factors, it should be stated that all management factors had positive relation with each other.

Verification of research assumptions

After empirical investigation was carried out and results were evaluated, verification of seven research assumptions can be done.

First research assumption (P1) – WAS NOT CONFIRMED. Because 57% (N=54) of the respondents stated that they see possibilities to expand their business in Lithuania, and only 32% (N=30) neither agreed, nor disagreed with this statement. This means that a part of Lithuanian capital companies operating in catering sector that see possibilities to expand their business abroad, also still see some possibilities in Lithuania. Therefore, it can be stated that Lithuanian capital companies for business

expansion can use business development form, like franchising, both: in Lithuania, and in foreign markets. What is more, when asked about real plans of business development, 51% (N=48) of the respondents agreed with the statement that they plan to expand their business in Lithuania in the next 2 years. It is also approved by positive correlation between three statements: that small Lithuanian market stimulates business development in Lithuania; that respondents see some opportunities for business development in Lithuania; and that they even plan to do that in the next 2 years (Table 4).

Table 4. Correlation between business development factors (Spearman coefficient)
(Prepared by the authors according survey results)

	Small market in Lithuania induces to expand business in Lithuania	You intend to expand your business in Lithuania during the next 2 years	You see possibilities in the market of Lithuania to expand your business
Small market in Lithuania induces to expand business in Lithuania	1.000		
You intend to expand your business in Lithuania during the next 2 years	.250(*)	1.000	
You see possibilities in the market of Lithuania to expand your business	.359(**)	.594(**)	1.000

** When two-sided correlation significance is less than 0.01

* When two-sided correlation significance is less than 0.05

Second research assumption (P2) – WAS NOT CONFIRMED. Because despite the fact that 39% (N=37) of the respondents did not agree with the statement that their financial resources are sufficient for business development, 43% (N=41) of them stated that their financial resources are sufficient for business development. And although just 26% (N=25) of the respondents planned to expand their business in foreign countries, even 51% (N=48) planned to do that in Lithuania. Thus, limited financial resources did not discourage Lithuanian capital companies operating in catering sector to plan their business expansion.

Third research assumption (P3) – WAS NOT CONFIRMED. Because 51% (N=48) of the respondents stated that their brand is well known, and 36% (N=34) of them agreed with the statement that they invest into their brand. Although even 38% (N=36) of the respondents neither agreed, neither disagreed with this statement, it can be stated that despite the fact, that only average level of Lithuanian capital catering sector companies investment into the popularity of the brands, they are quite well-known. However, it should be pointed out that the evaluation of the popularity was rather subjective, as it was made by the representatives of the companies.

Fourth research assumption (P4) – WAS NOT CONFIRMED. Firstly, 65% (N=62) of the respondents stated that their clients are loyal, but their opinions about the demand for their services differed, because equally 37% (N=35) of the respondents agreed and disagreed with the statement that demand for their

services satisfies them. Therefore, it can be concluded that Lithuanian capital catering sector companies have their loyal clients but this number is not satisfying, so the companies have to invest resources to increase the number of loyal clients and this way overall demand for their services, and only then think about business expansion in franchising mode.

Fifth research assumption (P5) – WAS NOT CONFIRMED. Because the respondents agreed with all three statements: that their business units have homogenous style and design (53%, N=50), that their business units have similar procedures and operations (56%, N=53) and that they are able to ensure the same and stable business (68%, N=65). This means that Lithuanian capital companies operating in catering sector are able to ensure condition of their business and business units' homogeneity, so they are able to form their business model and propose it to potential franchisees.

Sixth research assumption (P6) – WAS NOT CONFIRMED. No significant difference was observed between the answers of the respondents which agreed and disagreed that franchising is a perspective way of business development. Because in total 60% (N=57) of the respondents stated that their business is influenced by events from both: Lithuania and rest of the world and even 53% (N=50) of them stated that franchising is a perspective way of business development. Therefore, it can be stated that Lithuanian capital companies operating in catering sector evaluate franchising as business development form positively and understand that they operate not only in Lithuania, but also in global market.

Seventh research assumption (P7) – WAS CONFIRMED. Respondents agreed with statement that conformity of franchisees interests with interests of franchisor is an advantage (80%, N=76), also 61.1% (N=58) of them confirmed that possibility of not conformed interests is a disadvantage of franchising. Also weak correlation was observed between these factors (coef. 0.232, when $p=0.05$). However, the respondents stated that they rely more on their business partners and suppliers (61%, N=58). Therefore, it can be stated that Lithuanian capital companies operating in catering sector do not lack trust for their business partners, but they understand how important the conformity between interests of franchising business partners is, because it can determine fluent development of particular business.

Even six out of seven assumptions were not confirmed, therefore it can be stated that before the investigation it was thought that business conditions and factors are worse among Lithuanian capital companies operating in catering sector than they really are.

Knowledge level and opinion about franchising of Lithuanian capital companies operating in catering sector

In order for businessmen to make decision to develop his business using franchising, he has to be introduced to this business form and evaluate it positively. Even 17% (N=16) of the respondents stated that they have expanded business using franchising. However, respondents who only were interested in possibility buying franchise of foreign company also could have answered positively, so this statement should be evaluated critically.

Only 25% (N=24) of the respondents stated that they are minded to expand their business using franchising and even 31% (N=29) of them neither agreed, nor disagreed with this statement, so it can be stated that either they have not made a decision yet or they are not aware about advantages and offered possibilities of this business development form. This statement can be confirmed by the answers of the respondents to another statement. Only 35% (N=33) of the respondents stated that they have enough information how to develop franchising business system, and even 41% (N=39) of them more disagreed with this statement. So it can be stated that approximately half of Lithuanian capital companies operating in catering sector lack information about franchising business development form, therefore do not consider using it for their business expansion. Although, it can be stated that franchising is considered as a perspective business development form, because the respondents agreed with this statement (4.78 points). In general, only 9% of the respondents disagreed with this statement. Answers to the question, in what market would the respondents expand their business if they were using franchising, divided equally (40%, N=38) between the options "Lithuania" and "Lithuania and foreign markets". Only 11% (N=10) of the respondents stated that they would expand their business starting from foreign markets. therefore, in general it can be stated that although some of the Lithuanian capital companies operating in catering sector think that franchising is perspective business development form, but due to lack of information and experience are not minded to use it for their business development (Fig. 3).

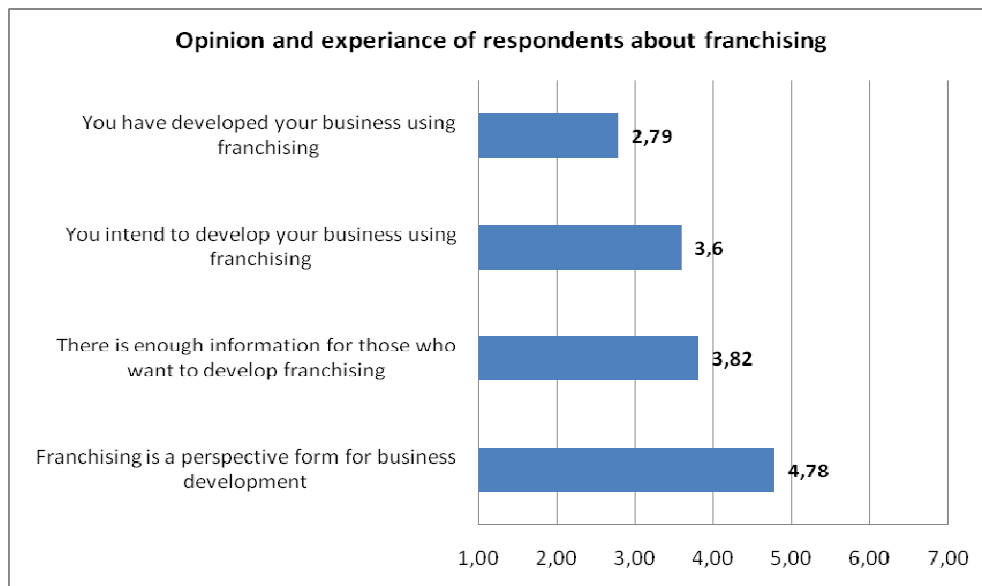

Fig. 3 Opinion and experience of respondents about franchising (means)

(Prepared by the authors according to survey results)

Main advantages and disadvantages of franchising for Lithuanian capital companies operating in catering sector

For the businessmen to decide to expand his business using franchising, he has to admit that franchising as business development form has more advantages than disadvantages and the existing advantages make it superior against other ways of business development. Therefore, it is very important to find out what advantages of franchising are marked by Lithuanian capital companies operating in catering sector. Respondents got fifteen advantages of franchising (Fig. 4), which they had to evaluate. In general, all of them were evaluated more positively than negatively.

New clients and increased brand popularity were determined as the biggest advantages of franchising (respectively 5.4 and 5.37 points) by the respectively 79% (N=75) and 75.4% (N=72) of all respondents. This fact conforms to the main advantages of franchising determined in scientific literature. Further advantages rated by the respondents were ability to attract new clients much quicker and with fewer resources and to increase market share through the new business units of franchisee (respectively 5.29 and 5.14 points). Clients' loyalty (5.13 points) is also related to the mentioned advantages, as the loyalty increases when clients can find catering unit in a convenient place, as increases the popularity of brand they are loyal to, similarly as increased value of brand (5.05 points). Further, the respondents more agreed that unified advertising and public relations are advantage of franchising (5.03 points). Other advantages of franchising, like increased operating effectiveness (4.86 points), shared business costs (4.80 points), achieved economy of scale (4.80 points) were evaluated more moderate, as they can be achieved not only using franchising. And such specific factors as change of internal personnel to motivated business owners (4.73 points), permanent income from taxes (4.73 points), transfer of responsibility of primary business factors were evaluated the as average because lack of information about the advantages of franchising and its superiority against other business forms. By this fact also the lowest evaluated statement about required minimal investments into business development (4.52 points) can be explained, because investments depend on new business unit establishment place, size and other specific factors that might significantly differ in separate cases. Therefore, even 29.5% (N=28) of the respondents neither agreed, nor disagreed that this is advantage of franchising. However, in general it can be stated that Lithuanian capital companies operating in catering sector evaluate advantages of franchising positively and think that franchising is a perspective form for business expansion.

Fig. 4 Advantages of franchising business (means)

(Prepared by the authors according survey results)

Every business development form despite its advantages has some disadvantages, which can be the reason for not using it. Therefore, the respondents had to evaluate nine disadvantages of franchising as business development form (Fig. 5). Six of nine were evaluated as more or less important, but such factors as loss of business control, possibility that business partner might not pay franchising taxes and possibility that business idea might be copied were evaluated as neither important, nor unimportant (respectively 4.11, 4.37 and 4.39 points). However, both factors related with finance were allocated as more important. Almost half of the respondents (49.5 %, N=47) stated that possibility that income can be lower when acquired from taxes than when earned by themselves from the particular business unit (4.56 points) is disadvantage. And even 63.2% (N=60) stated that financial investments for the establishment of franchising system is also a disadvantage (4.83 points). It can be related to the fact that 39% (N=37) of the respondents stated that their financial resources are not sufficient for business development, therefore any financial investments or possibility to receive less money seem as a disadvantage for them. Respondents also stated that inadequacy of interests is a very important disadvantage of franchising (4.57 points). Also respondents were afraid that when business control is delegated to a different person, their business quality might suffer and some harm might be made to their brand (respectively 4.66 and 4.65 points). However, these losses might be avoided if suitable franchisee is selected and franchising agreement is appropriately made, as these are very important steps in the establishment of franchising system. Finally, as the biggest disadvantage of franchising, according to 66.2% (N=63) of the respondents is the required specific knowledge about franchising (5.07 points). It can be related to opinion of the respondents where 41% (N=39) of them disagreed with the statement that there is enough information about development of franchising.

*Fig. 5 Disadvantages of franchising business (means)
(Prepared by the authors according survey results)*

Conclusions

Lithuanian capital companies operating in catering sector have a strong potential to develop their businesses using franchising, because the business conditions are favoring and not hindering for it. These companies understand what kind of motivated person should franchisee be and how important it is that his interests conform to interests of franchisor. In addition, they positively evaluate almost all advantages of franchising business, especially when they are related with business development, popularity of brand and new clients. However, they objectively understand the disadvantages of franchising, especially when they are related to the financial side of business development and possibility to harm business. Nevertheless, as the main disadvantage they mention specific knowledge required for usage of franchising, as well as some other obstacles, like lack of knowledge about intellectual property protection and foreign markets, and lack of unique business ideas and strong brands. Therefore, not so much the business conditions have impact on franchising in Lithuania's catering sector, as the lack of education and information about franchising. Therefore, additional investments of education of Lithuanian capital companies operating in catering sector about development of franchising business could help in making this business development form much more popular.

Abstract

Learning is of strategic importance and this is confirmed by many researchers. But learning and development can be organized in a wide range of forms. Roughly, these can be categorized into three groups: a top-down planning strategy, a bottom-up driven activation strategy and a network-based learning strategy. Research has shown that learning in networks is more efficient than other types of learning, especially when the traditional forms of inward looking development concepts such as "Business Process Reengineering", "Total Quality Management", proved less successful.

In this paper we develop a theoretical framework for a research project in which we will study a learning network for development. The purpose of the project is to increase knowledge and understanding of how learning networks work and what is needed for a development oriented learning network. We also want to explore the possibilities and difficulties in working in a learning network. The issues underlying this study are the following:

- How does learning take place in a learning network?
- What makes a learning network function efficiently?
- What opportunities and difficulties are associated with work in a learning network?

The empirical basis for this investigation is a case study focusing on a learning network in Uddevalla, Sweden. In the study we use a number of complementary approaches for data collection.

Keywords: Learning, Network, Development, Learning Network, Inter organisational learning

Introduction

We live in an ever changing and dynamic world. The changes are often very rapid and dramatic, which increases demands for development and change in all social institutions. Here, learning is of strategic importance and this is confirmed by many famous scientists.

Porter for example argues that price is no longer critical to business competitiveness, but the ability to create opportunities for learning and skills is important for the competitiveness of an organisation (Porter, 1990). Drucker believes that the importance of the traditional factors of production such as labor, land and capital for the welfare of a society has declined, and "the only - at least, the main - producer of wealth are information and knowledge" (Drucker, 1993). A number of Swedish researchers also show that learning is of great importance to innovation and development within companies, organizations, and regions (Svensson, Jakobsson & Åberg, 2001; Bergh, 2006; Holmquist, 2010).

But learning and development can be organized in a wide range of forms. Roughly, these can be categorized into three groups: a top-down planning strategy, a bottom-up driven activation strategy and a network-based learning strategy (Svensson & von Otter 2000). These strategies have been used in parallel, but we can also see an evolution over time, where the activation strategy has been popular for several decades. More recently, interest in the network-based learning approach has increased (Svensson, Jakobsson & Åberg 2001). Research has shown that learning in networks is more efficient than other types of learning, especially when the traditional forms of inward looking development concepts such as "Business Process Reengineering", "Total Quality Management", proved less successful (Holmquist, 2010).

The network based approach has proved to have a range of benefits and opportunities. It is flexible and facilitates development oriented learning of the actors. The approach provides the actors with a development competence which enable them to quickly respond to the increased demands of flexibility that society places on organizations. This does not mean that the network strategy is without difficulties. It is considered difficult to control, focus and to build broad participation. Furthermore the results of the strategy are difficult to measure (ibid). However, research has shown that the above mentioned problems can be overcome and that the strategy can be used successfully in development work. The network-based strategy significance has increased with time and it is used more and more. But for the network to function a development oriented creative learning is required (ibid). But what characterizes the development oriented learning?

Ellström distinguish development oriented learning and reproductive adaptation oriented learning from one another (Ellström, 2003). The adaptation oriented means that the individual learns things from given data, goals and conditions without questioning them. In the development oriented, creative learning, however, the individual is assumed to have a questioning, critical approach both to his own habitual behaviour, attitude, and knowledge to the task or situation that he or she faces. The task is thus to learn to deal with complex situations and problems. The first step here is not to develop and propose a solution, but rather to identify and define the situation, task or problem (ibid).

To enforce development requires an understanding of learning and the learning processes in the network and how learning leads to the development that the network, and the members of the network are aiming for (Svensson, Jakobsson & Åberg 2001). In order for a development-oriented learning to be implemented there must be a solid base - a "platform" - that the networking can rest on. Trust, equal relationships, time and resources, external support and feedback are mentioned as some important conditions for an effective learning process (ibid). Floren & Tell also mention three conditions (Prerequisites) for learning in a network (Floren & Tell, 2004). These are: reciprocity, the receptive and confronting capacity of learning actors and transparency in the dialogue among the learning actors.

Erschammar (2000) also mentions a number of factors that he believes are crucial for the effectiveness when a partnership is built, for example the vision, knowledge transfer, and continuity of the network.

The above description shows the importance of development in today's society and the importance of learning networks. It also shows that learning networks are associated with opportunities, but also a number of difficulties. To make the most out of the opportunities the learning networks can provide us with we need to have development oriented learning networks.

Purpose and research questions

The purpose of this study is to increase knowledge and understanding of how learning networks work and what is needed for a development oriented learning network to operate. We also want to explore the possibilities and difficulties in working in a learning network. The questions underlying this study are therefore the following:

- How does learning take place in a learning network?
- What makes a learning network function efficiently?
- What opportunities and difficulties are associated with work in a learning network?

Methodology

The empirical basis for this investigation is a case study focusing on a learning network in Uddevalla city in Sweden. In the study we use two complementary approaches for data collection. We use a combination of interviews and participation in various scheduled network meetings as the basis of our data collection. The method is based on a hermeneutic approach in which discussions with the interviewees are subject to interpretation.

The research approach behind this paper can be described as "abductive" (Alvesson & Skoldberg 1998). One way to do a case study with an abductive approach is called "systematic combining" (Dubois & Gadde, 2002). Systematic combining can be described as a non-linear, path dependent process of combining efforts with the ultimate objective of matching theory and reality. The case and the theoretical framework concurrently evolved through a process

where new empirical findings directed the search for theoretical concepts, and where the use of new theoretical concepts conversely directed the empirical field work (Dubois & Gadde, 2001).

Network-based learning strategy

In today's society there is an increasing need for development and renewal of all organizations and regions as a result of the changes occurring in all parts of the society. A change that we cannot stop, but we can manage and influence. The literature suggests a number of strategies for development and renewal.

Angelöw distinguishes between three different strategies of development. In the top-down approach management defines the problem, initiate change and implement it. In the representative approach representatives for the groups concerned, together with the built upon that all participants are involved in all phases of strategic planning. (Angelöw, 1991).

Svensson & von Otter also mention three different strategies: a top-down planning approach, a bottom-up driven activation strategy and a network-based learning approach (Svensson & von Otter, 2000). The network-based learning strategy is a combination of the activation strategy and a broad voluntary collaboration between different entities with common interests. Here the governance is horizontal and the management consists of the coordinator. The strategy is used when projects are more open, when the target and the expected outcome is not as clear as in for example the planning strategy. The objectives can be different for instance various forms of cooperation between enterprises, to improve the climate for innovation or to contribute to regional and local development, etc (Svensson & von Otter, 2000).

The driving forces of the social institutions of today suggest that the network strategy has some advantages, when compared with the other two strategies. The strategy can offer a range of possibilities (ibid):

- It is flexible, which means that the working arrangements and activities quickly can adapt to external changes and internal needs.
- Development and distribution are process oriented and handled in parallel. The spread of experience is facilitated by that the participants early come into contact with each other.
- When many actors cooperate economies of scale are provided, increasing the development capacity and reducing vulnerability.
- The cooperation is demand driven, thus it is based on the perceived problems and actual situation of the participants, which makes networking concrete and result oriented.
- It stimulates development oriented learning. The open and flexible way of working facilitates creativity and innovation.

- The cooperation is horizontal and is based on voluntary participation, equal relationships and exchange of experience.

- The potential to exploit external knowledge is increased and it is easier to organize cooperation on an equal footing.

- The ability to achieve more fundamental change is increasing. A network-based approach involving key stakeholders can have greater impact.

But there are also a number of difficulties with a network approach. Awareness of how these can be handled is important for a network to function effectively. The literature mentions the following difficulties (ibid):

- It is often argued that the network is an effective method to strengthen the development capability, but it is difficult to show that this is the case, and show concrete results.

- One difficulty is the vagueness and ambiguity about the purpose, methods and results.

- The division of responsibility is unclear. Ideas and proposals are arising - but who implement them?

- A major weakness is the representativeness. A few participate. There is no broad-based participation.

- The feedback is hard and difficult to control and focus. There is also a risk that the network is limited to confirmation, namely that the network participants make up a closed club, and thus the risk that the development to stop at the personal level increases.

But despite the above mentioned difficulties, the network approach has proved to have the advantage that the actors involved acquire a development expertise. This is resource building and provides an organizational learning, which gives a network the ability to respond quickly to growing demands for adjustment and renewal (Svensson , Jakobsson & Åberg 2001). But to utilize the potential of the network strategy and to understand the learning process, we need to bring clarity to the concepts of networks and learning networks.

Networks and Networking

Network is not a new word. Today it is used in many contexts and can have different meanings. Earlier there was much talk about collaboration, but in the early 1990's the word network became more commonly used. Some claim that the reason for this was the changes in the laws of competition in the United States made during the 1980s making it easier for firms to cooperate (Utbult, 2000).

But there are those who argue that the concept dates back to 1950, then used in particular treatment contexts to develop supportive relationships between vulnerable individuals. (Svensson, Jakobsson & Åberg, 2001).

Despite this long history, the network remains a vague and ambiguous concept. The word can be used to describe relationships within the family or neighbourhood as well as within grand organisations or between states. This multi clarity and vagueness of the term implies, as mentioned above, problems for both practitioners and researchers.

Some argue that the concept expresses a perspective rather than a well defined concept. But whereas Gustavsson & Hofmaeir claim there is no idea to attempt to define the concept or to try find a general definition of the term (Gustavsson & Hofmaeir, 1997). Svensson, Jakobsson & Åbery recommend that the concept in different contexts at least should be made clear. (Svensson, Jakobsson & Abery, 2001).

Utbult refers to Axelsson and distinguish between synthetic and organic networks. The former is considered to be organized and consists of a group of actors coming together to achieve a certain goal. The latter however, is disorganized, spontaneously emerging and difficult to identify. The boundaries of the exchange are not always clear, and those covered by the network may not even be aware of or understand that they are a part of a network structure (Utbult, 2000).

Lind categorizes network in four different areas or perspective (Lind, 2002):

- Network as a perspective
- Network as a specific social phenomenon
- Network as a research method
- Network as an organizational development strategy

It is the last of the above perspectives we are interested in this investigation and we are therefore trying to see how this area is treated in the literature. Network development approach is a conscious strategy or technique, which aims to change something. Here, the participants set mutual goals, or perhaps a policy regarding how a development project will be implemented and there is an emphasis on learning. Here we can distinguish between different directions: those who study networks within and between large organizations (Gustavsen & Hofmaier, 1997), those who study networking small businesses (Utbult, 2000; Svensson, Jakobsson & Atkins, 2001) and the literature that attempts to provide practical advice and tips of how networks can be formed (Network of Education and Development, Swedish National Quality and Development, 2003).

The view of networks as a strategy for development and skills is therefore an approach which seeks to develop everything from individuals, organizations and regions (Lind, 2002). The growth of this perspective is mainly due to the increased need for enterprise development. Here the network form is seen as a process that promotes this. The actors can join together in networks to support and develop skills. In this perspective, the networks are a number of autonomous organizations that together can help each other to achieve a

development or an objective that would not be possible for each one separately (Smith, Jakobsson and Åberg 2001). Dalsgaard & Bendix mean that many companies and organizations are working in a network model without having put a label on their work processes and identify sex characteristics for the network organization (Dalsgaard & Bendix 1998).

- Shared values, ie. common values (norms, morals, ethics)
- Decentralization, which means that small units are built up and will have responsibility and influence.
- Complex leadership roles, where for example a person can be a manager of a colleague, but in another context, the roles are reversed.
- Flexible organizational boundaries. The players use each other's knowledge as well that of external partners to benefit from such a large information and knowledge flow as possible.
- High degree of interdependence. Employees must admit the mutual dependent to each other both inside and outside the organization to promote both cooperation and competition.
- Transparency. Transparency about who takes care of the financial resources, objectives and results.

There is a wide range of literature which discusses what networking is and what the differences are between networks and non networks . There is no need to go further in this discussion. We therefore provides one example of such literature (Network of Education and Development, National Quality and Development, 2003) and end the debate on the network here and go over to the other central concept namely learning and learning processes in network.

Network and project group - differences

Network:

- Controlled on the basis of the members common professional aspirations, the members set the agenda
- Self-Organized, based on relationships between individuals
- Voluntary membership
- The group evaluates its own activities
- The group will choose who / which ones to take leadership tasks (leadership may rotate among the leaders and spread over several people)

project group

- Controlled on the basis of a formal mission, a mission that someone from the outside ordered the group
- Is part of the formal organization structure, part of the rules of procedure
- Membership is included in the individual's work (and the individual cannot always choose whether you want to participate or not)
- The group is evaluated against the objectives that have been decided in the formal organization
- The formal organization appoints the leader and give him / her authority and responsibilities

Source: Nätverk för lärande och utveckling, Statens kvalitets- och kompetensråd, 2003

Above, we had a discussion regarding network-based development strategy in which learning had an important role in the development of the network. But what is learning, and what distinguishes learning from the education?

Learning and Learning Network

Education is often used to achieve development, but it has been shown that development cannot be organized by education and with top-driven methods, but it can be stimulated by developing targeted learning processes. It is therefore more appropriate to talk about learning and learning process instead of education (Svensson, Jakobsson & Åberg 2001).

In development processes learning precedes the change itself. Thoughts, beliefs and values change leading to new activities and actions. But learning can involve a variety of things and aspects (Holmquist, 2010). It can be seen as a part of the activities we engage in, which means that the behavior is the focus of learning. Learning and action are two sides of the same thing. Learning will thus depend on the actions we perform (Svensson, Jakobsson & Åberg, 2001; Holmquist, 2010).

The literature distinguishes between a development-oriented and an adjustment-oriented learning (Svensson, Jakobsson and Åberg). The development-oriented learning means that

individuals themselves take responsibility for identifying, interpreting, formulating and challenging the task, and the feasibility for this (ibid.)

But how does learning in a network work and how does the learning process look? In an article Louise Knight distinguishes between learning network and network learning. She believes that this distinction is important for the understanding of the learning process in an inter-organizational context. She describes these two concepts as follows (Knight, 2002):

“Network learning is learning by a group of organizations as group. If, through their interaction, a group of firms change the group’s behavior or cognitive structures, then it is the group of organizations that is the learner, not just individual organizations within the group. In such a case, the network can be said to have learnt.”

“The second subject closely associated with network learning is learning networks- groups of organizations that interact with the express purpose of learning together, from another and through their interaction”.

To describe the learning process in 14 network projects Svensson, Jakobsson and Åberg used the American philosopher John Dewey's model of development and learning. The focus of the model is the individual's learning, but Svensson et al used the model for describing learning in a number of networks. In the model, learning is perceived as a movement forward, from habitual behavior through problem definition, analysis and understanding into action. It is the behavior which is the focus of the model. Learning and action are seen as two sides of the same thing. Learning will depend on the actions we perform. The behavior of an organization in a network promotes learning and thereby innovation and development.

Svensson, Jakobsson and Åberg mean that the networking project that they have examined could be described in terms of Dewey's model. But they mean that some of the networks had more than others a learning process that consisted with the model. Nevertheless they argue that the model provided a framework to structure the description of the learning process in the different learning networks. What they mean is that learning occurs more effectively in an unstructured manner which may not necessarily conform to the model. They also feel that the learning processes as they attempted to portray worked in several different ways, the starting point might be different, many learning processes was going in parallel, and that some process was interrupted. Despite these differences they mean that the model on the whole worked well.

During the last decade researchers have developed different models to study the learning process in a learning network (Bergh, 2006; Holmquist, 2010). In order to understand the learning process in this study we will use all of these models as a ground for our study

Prerequisites for learning

As we mentioned above learning is a process consisting of a number of steps. But a development oriented learning process requires a solid foundation, a platform that

networking can rest on. Svensson, Jakobsson & Åberg identify four building blocks: trust, equal relationships, time and resources and external aid (Svensson, Jakobsson & Atkins, 2001). But in a study of 14 network projects they find that there is need for additional building blocks. These are ; motivation and curiosity, clear objectives and performance criteria. They also find that structuring the first meetings provide security and support (Svensson, Jakobsson & Aberg, 2001).

Floren & Tell also believe that there must be a number of prerequisites for learning in a network (Floren & Tell, 2004). They also emphasize the importance of trust for learning especially in the so-called "higher-level learning, development-oriented learning, or what Argyris & Schore calls for double-loop learning.

Holmquist particularly stresses the importance of two concepts in terms of knowledge sharing in learning networks. One is the strategy and the other is absorption. He argues that network participation is needed as an important condition to be put in a larger strategic context in order not to be a temporary activity. He also emphasized that the absorption is a key issue. Without a good absorption capacity the network performance could not be maximised to its full potential . He also mentions that there are a number of factors that influence this ability. Ershammar also mentions a number of factors that he believes are essential for an effective collaboration (Ershammar, 2000). These are; the network's vision, knowledge transfer, tempo and continuity, communication within the network and reward methods

Bergh gives the following recommendations to those involved in inter-organizational learning networks (Brgh, 2006)

- Be prepared to invest time and energy in the participation in the network
- Try to get others involved
- Be active when the program for the network is formulated

Conclusions

The purpose of this paper was to develop a theoretical framework to study a learning network. The framework shows that a network-based development approach has proved to have a range of benefits and opportunities. It is flexible and facilitates development oriented learning of the actors. The approach provides the actors with a development competence which enable them to quickly respond to the increased demands of flexibility that society places on organizations. But the network strategy is not without difficulties. It is considered difficult to control, focus and to build broad participation. Furthermore the results of the strategy are difficult to measure. However, research has shown that the above mentioned problems can be overcome and that the strategy can be used successfully in development work. All this according to literature and research in the area. In the continuous reserach we

want to use these theories as a base to see how a learning network for development in the city of Uddevalla, Sweden works.

Abstract

The article contains analysis of Russian companies expansion to global markets and integration into the World economy. It shows major Russian players in international business, identifies some important problems which limit opportunities for Russian companies for efficient development overseas, compares Russian companies' expansion overseas to the same activity of companies from BRIC countries. Shows how important is state regulation for successful integration of domestic companies into international environment – country image, taxation, political and legal support, development of financial system, including securing bank sector. The authors underline that in order to increase capitalisation and risk diversification, and to expand geographical sales of goods and services, acquisition of the new resources, to gain access to new technologies and operational methods, Russian companies undertake dynamic expansion in the world markets.

Keywords: Russian companies, World economy, integration, international expansion, acquisition, business-government relations

Introduction

World globalisation continues involving more and more countries. After having passed the period of destruction of the old economic system and implementation of a market management approach, Russia also strives to integrate into the World economic environment. Large Russian companies have achieved success on the domestic market and expand internationally, looking for new opportunities and resources. Depending on strategic objectives, each company selects its proprietary way of international expansion. One expansion option more appropriate in the contemporary environment involves transformation from a national business to a full-scale transnational corporation (TNC).

According to research by the Russian World Economy and International Relations Institute (IMEMO), at the end of 2008 there were 20 companies which could be included in a list

of the leading Russian non-financial TNC by the size of their overseas assets. See the diagram below.

Figure 1. Twenty largest Russian non-financial TNC by the size of overseas assets, \$ US mln.

However, in this article we will deal with the Russian companies featuring on the UN Trade and Development Conference (UNCTAD) 2008 Top-100 Non-financial Developing and Transition Economy Countries TNCs Rated by Overseas Assets List published by UNCTAD in 2010 Annual Investment Report. Therefore only 8 leading Russian TNCs will be taken into account since they comply with the criteria of overseas assets amounting to at least 10% of the capital.

As can be seen from the table, the list is dominated by companies operating in the natural resources area: steel, mining and oil. However the rating also features telecoms companies. This is a positive sign that Russia moves towards expansion of sector diversification and high-tech development.

Russian TNCs featuring on the list are private companies and their controlling shares are concentrated in the same or several hands, while the rest are vastly dispersed. It should be noted that the capital has also foreign participation.

Private companies are more competitive and show more dynamic development compared to cumbersome state corporations. Making comparison with other countries from the same group of emerging economies, the so called BRIC, (Russia, Brazil, India and China), we note that international expansion, in China for instance, is vastly instigated by state corporations with strong support from the local government. Indian TNC list by the size of overseas assets is also headed by state companies, but major share is taken by private companies.

Table 1. Top 100 non-financial TNCs from developing and transition economies, ranked by overseas assets, 2008, \$m

Corporation	Industry	Assets	
		Foreign	Total
Lukoil	Petroleum and natural gas	21 515	71 461
Evraz	Metal and metal products	11 196	19 448
Severstal	Metal and metal products	8 066	22 480
JSFC Sistema	Telecommunications	5 698	29 159
MMC Norilsk Nickel		4 389	20 823
VimpelCom	Telecommunications	3 726	15 725
Mechel	Metal and metal products	2 911	12 010
TMK	Metal and metal products	2 361	7 071

Resource: UNCTAD

It should be noted that there are some extra risks common for private ownership: such companies are more exposed to business environment fluctuation and can fall victim to larger TNCs. The Russian Government still has a weak system of supporting businesses striving to expand to international markets, the legal system is immature, there is no proper information, technological and economic support, and this complicates the operations of corporations.

China presents a bright example of cooperation between the state and businesses. For example, the Chinese Government realised serious problems existing in the country in the area of energy security and the need for new resources and subsequently loosened investment outflow while eliminating the red tape for international expansion this way supporting the operations of Chinese companies abroad. As a result, the outbound investments have grown several times, Chinese companies expanded their geographical presence and their capitalisation has increased.

Although the Russian companies are leaders on the domestic market, their capitalisation is still at a low level compared with foreign competitors. In the Financial

Times Global 500 2010 UNCTAD List, which reflects the market value of companies, Lukoil could only reach position 140 with capitalisation of US\$ 48,29 bln., Norilsk Nickel took 203rd position with US\$35,18 bln., and Vypelcom 493rd with US\$16,26 bln.. At the same time, all three transnational Brazilian companies from the UNCTAD list made their way into the Financial Times rating: Petroleo Brasileiro S.A. – Petrobras is 13th with capitalisation US\$186,24 bln., followed by Vale S.A at 22nd with US\$162,83 bln., and finally Metalurgica Gerdau S.A. at 371st place with US\$21,26 bln.. This very clearly shows that the Russian companies have a goal to achieve.

It should also be noted that, in the Global 500 2010 list, Chinese companies mainly come from banking, which indicates successful and efficient economic growth in general. The unstable position of the Russian banks does not promote active international expansion of Russian companies. Financial capabilities of the Russian companies could not be compared with those of the world leaders, and little can be achieved without robust support from the banking sector.

At this stage Russian companies are able to integrate into the World economy only through cross-border acquisitions and mergers of assets with relatively low market value. In most cases their acquisition targets are operating factories and companies. Because development of a new property “from scratch” requires substantial capital investment and may be rather risky. Facing tough competition companies cannot afford to invest in inefficient and unprofitable projects. From this point of view Russian businesses lag behind foreign investors. However there are exceptions: Russian state company Rosneft, together with Chinese national company CNPC, will build an oil refinery in Lingan Indurtail Zone, and this is to become the first oil refinery built by a Russian company abroad.

According to FSC report, in 2010 total volume of cross-border deals involving Russian companies was US\$24,6 bln., while acquisitions of foreign assets by the Russian companies amounted to US\$3,64 bln. High merger and acquisition activity in 2010 was demonstrated by Mechel Group operating in the metals and metal products sector. As a result, during the year it acquired two companies: Romanian Donau Commodities, owner of Laminorul steel plant (acquisition value US\$12,4 mln.), and Turkish steel services company Ramateks (acquisition value US\$3 mln. In addition, Mechel has undertaken the liability of the company at US\$13,8 mln.), as well as assets of Cosipar in the Brazilian steel sector.

Lukoil, Russian leader by foreign assets, in 2009 bought the 46% share of BP in their joint venture Lukarco for US\$1,6 bln. and gained ownership of the company. In the same year Lukoil signed a contract for the acquisition of a 45% share in the Dutch Total Raffinary Netherlands Oil Refinery from the French Total. The refinery also holds a share in the Rotterdam Maassvlakte Olie Terminal.

In Europe, Lukoil is primarily concentrated on the sale of their own products. Since the most efficient way of achieving this objective lies through proprietary gas stations, Lukoil runs expansion of their sales network, which spans over Finland, Czech Republic, Poland, Slovakia, Romania, Bulgaria, Ukraine and Cyprus. The company does not look at the European market only. In North America the company also owns a network of 2100 gas stations. Apart from sales the company also conducts exploration and extraction in Columbia, Venezuela, Ghana, Egypt, Azerbaijan, Kazakhstan, Uzbekistan, Saudi Arabia and the Gulf of Guinea. In 2009, Lukoil won a contract for the development of Iraqi oil field West Kourna-2 in partnership with Norwegian Statoil. In 2011 the company commenced operations in Vietnam. It is evident that Russian companies are becoming global players.

Other Russian transnational companies invest in the same regions: Europe, Latin America, North America and Africa. Regretfully, the Asian market is hardly accessible to the Russian companies. This is due to tough competition with the national companies and lack of sufficient capital experienced by the Russian companies. In any event, the Asian Pacific Region holds high potential and is very attractive for investors.

Here are some examples of geographical the expanse of international business by the Russian TNCs.

Fully integrated steel and mining company Evraz Group conducts operations in the USA, Canada, Italy, Czech Republic, South Africa and Ukraine. The company holds second position in North America in terms of steel sheet production capacity and is one of the North American leaders in pipe production, primarily referring to large diameter pipes and oil pipes.

Sistema Financial Public Limited Company subsidiaries operate in the telecoms sector in the CIS, Central and Eastern Europe and India. The business of the corporation subsidiaries is mainly focused on the implementation of state of the art technologies facilitating advanced development of participated sectors and the improvement of lifestyle.

Norilsk Nickel, the world's largest producer of nickel and palladium, one of the biggest platinum, copper and residual metals manufacturers. Production facilities of the Group are located on three continents and in four countries: Australia, Botswana, Finland and South Africa.

VympelCom Plc is a member of VympelCom Ltd. Group, one of the world's largest operators incorporating companies doing business in Russia, Ukraine, Kazakhstan, Uzbekistan, Tajikistan, Armenia, Georgia, Kyrgyzstan, Vietnam, Cambodia, Laos, Algiers, Bangladesh, Pakistan, Burundi, Zimbabwe, Namibia, Central African

Republic, Italy and holding indirect interest in the capital of Globalive Wireless Canada (Wind Mobile).

Chinese companies mainly undertake expansion in the Asian Pacific Region, Africa and the USA. A regional approach is evident. Brazilian companies also direct their investments into neighbouring countries. However the common feature for the 3 countries is that the bulk capital export is channelled through offshore zones: BVI, Cayman Islands and so on. Historically, big Russian capitals are concentrated in Cyprus. This gives rise to an obvious question how to differentiate real investment from simple capital diversion. For instance, Cyprus is one of the biggest investors into the Russian economy. In other words, to minimise the risks, Russian capital flows into Russia as foreign investment.

Political situation is one of the major factors in the choice of domiciliation. Tested positive and friendly relations between the countries facilitate privileged treatment for Russian companies.

International operations of the Russian companies are greatly affected by the image of the country. Widespread negative perception of Russia is an obstacle to desired development of corporations. Significant number of deals were cancelled because of negative opinion of investors, society and governments. Extensive variety of research and reports were dedicated to this subject. Such attitude stems from past stereotypes and practical acts of the Russians. Usually the society makes no differentiation between the activities of the state and the companies, therefore the attitude towards Russia expands to the Russian companies too. Lack of economic and ownership transparency, impact of informal connections and nepotism on the business, unstable legal system, unreliability, human rights issues, corrupt society, aggressive foreign policy all constitute conditions resulting in negative perception of foreign countries towards Russian business. Due to cultural differences, customary attitudes and stereotypes common misunderstanding occur regularly, and this is a direct cause for sometimes biased reflection of Russian governmental and business activities in the foreign mass media. This also adds fuel to the fire.

In order to achieve positive results, the companies and the state must act together. Primarily corporations need to improve transparency, pay more attention to the social and environmental projects and maintain the good reputations of their executives. At the same time, the state needs to procure legal protection of the companies, restrict excessive involvement in the operations of the companies, implement the policy of support to the Russian corporations in their international expansion.

Solution of these issues will inevitably open new horizons to Russia and its companies.

Finally, the following conclusions can be made. In order to increase capitalisation and risk diversification, and to expand geographical sales of goods and services, acquisition of the new resources, to gain access to new technologies and operational methods, Russian companies undertake dynamic expansion in the world markets. This is mainly attributable to private companies with modest capitalisation, which acquire foreign assets through cross-border merger and acquisition deals. The main destinations of corporate internationalisation are Europe, USA and Africa, while the Asian Region still remains the closest perspective goal. In order to be successful in business ventures abroad, Russia and Russian companies need to resolve a number of issues, overcome negative perception of Russia and Russian businesses.

Overall, Russian TNCs successfully integrate into the World economic arena and Russia can be definitely considered as a member of the globalisation process.

CSR CONTRIBUTION AND COMPETITIVENESS: THE CYPRIOT EXPERIENCE

Krambia-Kapardis, Maria¹; Pavlou, Iphigenia²

¹Assoc. Prof. of Accounting, Cyprus University of Technology. Email: maria.kapardis@cut.ac.cy

²Doctoral Student and Research Fellow, Cyprus University of Technology. Email: iphigenia.pavlou@cut.ac.cy

Abstract

Corporate Social Responsibility has been a term used for the last decade and has been asserted that by contributing to CSR a firm becomes competitive. Whilst it has been argued that CSR contribution does increase a company's profit there has been little work to develop a tool in assessing the CSR contributions made and the impact on competitiveness.

The current paper is identifying the areas SMEs in Cyprus concentrate their CSR contribution, the barriers and enablers making CSR possible as well as the tools used to evaluate the CSR contributions.

The purpose is to identify the components so as to enable the research team of seven euro-Mediterranean countries to develop a tool on CSR competitiveness. This project is funded by the European Union.

Since Cypriot SMES operate in a small country with the idiosyncrasies and needs of a small country tend to emphasise the community rather than the market needs. Given the financial crisis at the moment the barriers are not only lack of resources but also lack of knowhow. The owners of the companies tend to be the major enablers which is a strong point and the government is making every effort to assist them.

Keywords: CSR Competitiveness, Cyprus, SMEs

Introduction

Corporate Social Responsibility relates to how the "companies integrate social and environmental concerns in their business operations and in their interactions with their stakeholders on a voluntary basis" (European Commission, 2001). The Commission extended this expectation on CSR and in the Lisbon Strategy in 2005, the Commission stated that CSR "can play a key role in contributing to sustainable development while enhancing Europe's innovative potential and competitiveness" (European Commission, 2005). The Commission went even a step further and in their Integrated Guidelines for Growth and jobs "recommend to Member States to encourage enterprises in developing their corporate Social Responsibility" (European Competitiveness Report, 2008:106).

Corporations, as argued by Porter and Kramer (2006:80), “will discover that CSR can be much more than a cost, a constraint, or a charitable deed- it can be a source of opportunity, innovation, and competitive advantage”. To do this however they need to embed in their strategic plan, the CSR actions and address the needs of the stakeholders by taking a long term perspective. CSR is an investment that will pay up in the long run, one does not rip the benefits in the short run. In this report the author will illustrate that whilst the literature has demonstrated that CSR does exist, its linkage to actual improvement in competitiveness has not been achieved. However, companies have realised the benefits and are persisting to contribute towards CSR.

Literature Review

As Vilanova et al. (2009:57) states, CSR has become one of the “central issues on the agenda of organisations today, but is still a long way from being a centre stage on corporate strategy”. As stated in the Cosmic Project (2009) in order for benefits to be derived from CSR, an organisation should try to achieve long-term internal stability and competitiveness. From an internal perspective an organisation ought to address the following areas: Mission, vision and leadership; Workforce activities; Marketplace activities; Supply chain activities; Stakeholder engagement; Community activities and Environmental activities (Cosmic, 2009).

It was asserted in the European Competitiveness Report (2008:5) that “CSR is not so much about what enterprises do with their profit, but how they make that profit”. CSR is approached from different perspectives. It is approached from social performance (Carroll, 1999), business ethics (Solomon, 1993), corporate governance (Freeman and Evan, 1990), social contract (Donaldson and Dunfee, 2002), stakeholder management (Donaldson and Preston, 1995).

Vilanova et al. (2009) has grouped CSR into five dimensions, these being: (a) Community relations, (b) Workplace, (c) Accountability, (d) Marketplace and (e) Vision. However many obstacles are placed on corporations that prohibit or at least do not encourage them to proceed with CSR. There are however a number of obstacles (Reich, 1998; O’Brien, 2001) placed which make companies hesitate to contribute towards CSR.

In this day and age reputation of a product or an organisation plays a major role in its survival. Stakeholder groups are becoming more sensitive to CSR issues and reputation “is a factor which affects the market value of companies” (Carlisle and Faulkner, 2005:413). Good CSR “enhances reputation”, makes a company more attractive as an employer, staffs are more innovative and creative and this will lead to differentiation advantages over the competitor.

The European Commission (European Competitiveness Report, 2008) states that the concept of competitiveness can be applied at different levels, from “the firm (micro) level, to the sectorial, regional and national (macro) level. At macro-economic level, competitiveness is taken to mean rise in the standards of living, whereas at micro level refers to the performance of a given

industry in a given country or region relative to the same industry in other countries or regions. Francis (1989) states that “a firm is competitive if it can produce products or services of superior quality or lower costs than its domestic and international competitors”.

Considering the European Commission’s (European Competitiveness Report, 2008) and Francis (1989) it is argued that in order for an organisation to achieve competitiveness at micro-economic level through CSR the following six parameters need to be considered:

- Cost structure- achieving cost savings with the use of CSR e.g., applying energy saving methods.
- Human resources- attracting, motivating and retaining employees, thus employee turnover rate is low.
- Customer perspective- find methods to drive customer loyalty and demand e.g. encourage customers to pay premium price for environmental or social products or impose social procurement on suppliers.
- Innovation- Using CSR to find new ways of working, new products, services, processes and new market space.
- Risk and reputation management- enterprises are now under greater pressure and more scrutiny to embedded CSR practices. When organisations are forced to deal with transparency, human rights, supply chain management they are therefore forced to discover additional impacts of CSR
- Financial markets- Investors analysts, creditors are now looking for corporate social investments, for information on intangibles and firms that look after their employees, customers etc because that would mean lower litigations.

Whilst some authors have argued that CSR is a “cosmetic effort on the part of the companies to respond to societal demands” (Vilanova, 2009:59; Porter and Kramer, 2006), others have found that CSR affects competitiveness (Chand and Fraser, 2006), and some have suggested that competitiveness is one of the key drivers for adopting a CSR approach (Bansal and Roth, 2000).

Assessing the degree of competitiveness is not an easy task. Murths and Lenway (1998) have described competitiveness as the strength of an organisation in comparison to its competitors, and of course productivity was assumed to be a good indicator of competitiveness at a firm level (Porter, 1985). More recently, Lowell (2007) has argued that tangible performance is inadequate as it does not take into account key competitiveness generating resources in the form of intangible capital as knowledge, relationships, reputation or talent.

As an alternative to the above and in an effort to use a framework taking into consideration flexibility, adaptability, quality as well as the dimensions asserted (Kay, 1993; Mintzber, 1993; Porter, 1985; Barney, 1991; Hamel and Prahalad, 1989) Vilanova et al. (2008) proposed a model of competitiveness to address the following dimensions:

- Performance, including standard financial measures such as earnings, growth or profitability
- Quality, not only for products and services, but also the capacity to satisfy customer expectations
- Productivity, in terms of higher production and lower use of resources
- Innovation, including products and services as well as management process
- Image, including corporate branding in terms of building trust and reputation

Applying CSR in a way to achieve competitiveness and ensure stakeholders' needs

O'Brien (2001) has developed a model which he refers to it as the socially anchored competency model, whereby the company's core business competencies are examined to determine the potential impact on stakeholders. The core competencies serve as the primary input into the stakeholder analysis. "This allows managers to determine not only whether stakeholders are negatively affected by the company's core businesses, but how competencies can be leveraged in innovative ways that maximize social benefits as well as benefits to the company's business... it does require managers to define the core competencies, identify and assess any negative affect on key stakeholders, and determine ways competencies can be used to benefit the company's stakeholders and businesses." (p. 9)

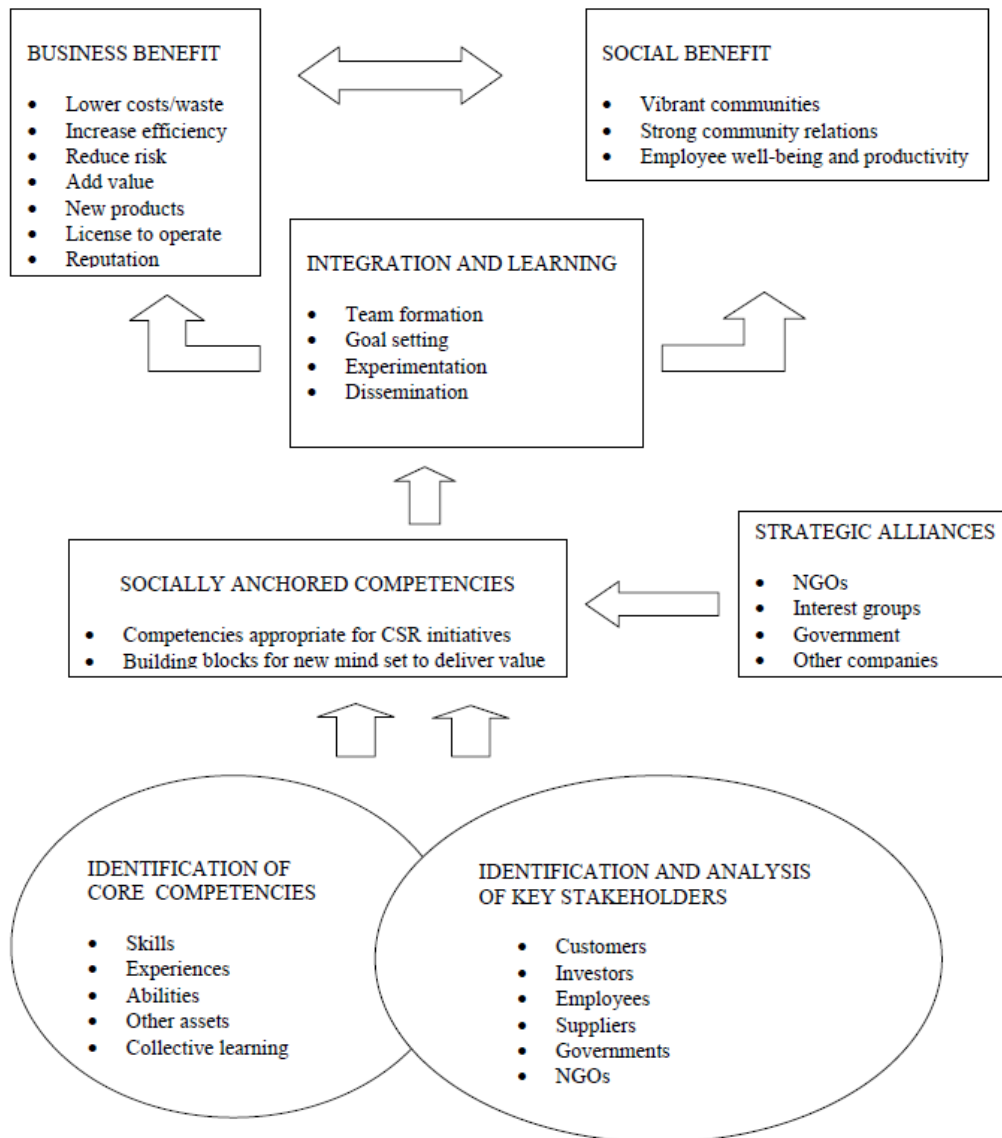

The model is presented below in figure 2 and it does indicate that in order for companies to integrate CSR and achieve competencies they need to identify their core competencies, the expectations of the stakeholders and build those together with strategic alliances in a integrated model to achieve both business and social benefits.

Stakeholders

Porter and Kramer (2006:78), argue that "governments, activists, and the media have become adept at holding companies to account for the social consequences of their activities". O'Brien (2001:3) has argued that stakeholders are requiring companies to go beyond the notion of strategic philanthropy and international codes of conduct". Investors want to see not only profit but they want to see these financial gains from the firm's investments in CSR initiatives.

Companies can no longer be content to monitor only the obvious social impacts of today and ignore the social effects of tomorrow because if they do they risk their survival. Corporations

need to address the needs of the human resources they use if they do not want to be left without workers, they need to ensure they not only comply with the rules and regulations imposed by the authorities but go beyond that and address social issues eg. not only are they providing safe products but they ensure these products are environment friendly etc. Of course no business can solve all of society's problems or bear the cost of projects that the authorities should have carried out but society expects of organisations to be given something back in return for the profits being made. A case that comes to mind is a few years back when one of the semi government organisations in telecommunications (CYTA) was criticised because it made huge profits and the government imposed a penalty on them. There was a public outcry for the profits made and as a result the organisation build a bridge on the main road where many school children crossed everyday on their way to school, offered money for research, gave free telephone cards to soldiers etc.

SOCIALLY ANCHORED COMPETENCY MODEL

Source: O'Brien (2001:7)

Porter and Kramer (2006) have argued that corporations need to prioritise the social issues into generic social issues, value chain social impacts and social dimensions of competitive context. (see diagram 3 below). It is about identifying the particular set of societal problems that a corporation is best equipped to help resolve and from “which it can gain the greatest competitive benefit” (92) By creating such a corporate social agenda a corporation will look beyond community expectations to opportunities to achieve social and economic benefits simultaneously. Corporations need to “move from mitigating harm to finding ways to reinforce corporate

strategy by advancing social conditions” (p. 85). In other words corporations need to apply responsive CSR i.e. acting as a good corporate citizen, “attuned to the evolving social concerns of stakeholders, and mitigating existing or anticipated adverse effects from business activities”(p. 85). Good corporate citizenship goes beyond merely writing a cheque, it is about doing business differently from competitors and in a way that will lower costs or serve better customers.

Prioritizing Social Issues		
Generic Social Issues	Value Chain Social Impacts	Social Dimensions of Competitive Context
Social issues that are not significantly affected by a company's operations nor materially affect its long-term competitiveness.	Social issues that are significantly affected by a company's activities in the ordinary course of business.	Social issues in the external environment that significantly affect the underlying drivers of a company's competitiveness in the locations where it operates.

Source : Porter (2006)

An idea proposed by Porter (1998) has been the development of Clusters. Clusters promote “both competition and cooperation. Rivals compete intensely to win and retain customers” (p.79) Corporations can also cooperate to have better access to employees and suppliers, access specialised information, one organisation complements another (eg. in the tourism industry is not enough for a tourist to be satisfied with a hotel facility but be disappointed with the restaurant or leisure activities around the hotel). Clusters not only provide opportunities for innovation but also provide capacity and flexibility. Thus in small or developing economies if clusters are developed then CSR strategic plans could be introduced and benefit all the companies in the clusters.

CSR in Cyprus: Legislative and other framework

As stated in the European Commission (2010) report many countries do not have a strategic document in place. This does not mean that they have not adopted an advanced approach to CSR. In Cyprus “the Planning Bureau is currently developing a National Plan on CSR. The government has prepared the terms of reference, which consist of two priorities. First, Cyprus wants to promote CSR as an aspect of the sustainable development of business and to develop measures to promote socially responsible investment, comprising interventions that contribute to social, environmental and economic responsibility by acting as a point of reference for the relevant policies. Particular emphasis will be given to further promoting socially responsible purchasing and investment by the government, enhancing transparency, promoting corporate

governance and human resources development, energy saving and environmental protection, and combating poverty and social exclusion (p.13).

More specifically several initiatives (Bakalouris 2011) have already been undertaken by the Public Sector, either at an ad hoc basis in view of the crisis, or more permanent ones.

Such measures include: (a) the “In-company/On the job training programme” (b) Schemes Providing Incentives for Hiring Disadvantaged Individuals and Individuals with Disabilities (c) a Project co-financed by the European Social Fund, which aims at reducing the gender pay gap between men and women, (d) The Department of Labour Inspection promotes CSR in the sector of Occupational Safety and Health.

“In order to promote sustainable production and consumption patterns the Cypriot government continues to provide grants to support the introduction of EMAS. The aim is to improve the environmental performance of organisations in all sectors through the implementation of the scheme. The initiative, among other things, covers the costs of consultancy for establishing EMAS that result from the verification and validation of the system. Cyprus also continues to financially support the promotion of the EU Ecolabel” (European Commission, 2010:35). Furthermore, in order for Cyprus to promote emission reductions by businesses, Cyprus launched a comprehensive initiative in 2009. A Charter of Climate Change was launched and in addition an IT tool has at the time of writing launched to enable companies to trace all energy savings activities they have undertaken and to measure the amount of emission reductions they have achieved. It measures the decrease of their carbon footprint (in tons of Co²).

As far as reporting of CSR, Cyprus does not have any specific requirements. It does however indirectly through its Corporate Governance Code 2002 has a requirement that listed companies should disclose in their annual report a corporate governance report.

Based on an earlier research Doukakis et al. 2005; Krambia-Kapardis, 2007) 95% of businesses who responded to the survey were contributing towards CSR and 82% of those believed that there is a direct connection between profit and CSR’ (p. 271). Most respondents expressed the view that CSR in Cyprus began between 1981-1990, even though they did not think it was CSR at the time. The emphasis of CSR in Cyprus appeared to be towards the employees (35%) , consumers (26%) and community (10%), environment (6%), investors (5%), suppliers (4%) and other 14%. Like other European companies however, the Cypriot companies contributing towards CSR lack strategic planning and do not measure the benefits derived from CSR. It is evident therefore that companies in Cyprus have been contributing to CSR for almost a decade.

Methodology

Seven Euro-Mediterranean countries including Cyprus are currently funded by the Med programs of the EU to identify a tool in testing CSR contributions and determining their competitiveness. In order to develop the tool the researchers had to carry field work in each country to answer a number of research questions. Thus in this paper the research findings are those relating to Cypriot SMEs. A questionnaire was developed and pilot tested by the research team and then each country had to identify 20 SMEs and 3 institutions and carry out interviews.

Cypriot companies have begun in recent years to take CSR more seriously and to realise that CSR is not simply helping out the poor, the orphans and the government when they needed to build a bridge or a park but to form strategic plans, appoint an employee responsible for CSR and prove that they are ethical. Two Charters were set up one following a European project and the other being an initiative of the Cyprus Chamber of Commerce and Industry. The former, the European Road Safety Charter was signed by 63 companies and the latter, the Climate Change signed by 55 companies.

In reference to Companies (SMEs) in Cyprus who are active on CSR the following research questions are to be answered:

- What are the objectives in the implementation of the companies of their CSR actions and policies?
- What motivates the companies to contribute towards CSR?
- Are there any supports for the companies in implementing CSR policies?
- Are there any links between CSR and competitiveness?
- Are there any evaluation tools used in the implementation?
- What are the barriers and the enablers of CSR policies and actions?
- What are the lessons learned by the companies?

Once the State of Art and State of Practice was completed by each partner, a questionnaire was developed to be used on companies and organisations. The research team, had the questionnaire pilot tested and then distributed to 20 organisations and 3 public institutions. In order for the research team in Cyprus to identify which SMEs would be interested to participate the assistance of Cyprus Chamber of Commerce (CCC) was sought. The Chamber emailed all the companies in their database asking them to respond to an email and provide their details if they wanted to participate in the study. A total of 23 companies responded. Some of those were excluded because they were not SMEs and smaller one were excluded because they did not contribute towards CSR but wanted to find out what this tool is all about.

The questionnaire was then emailed to the 20 companies wishing to participate and a face to face interview was organised March of 2011.

Survey Findings

Demographics

The 20 companies that took part in the survey were from the service industry (6), wholesale and trade (3), Agriculture and forestry (2), manufacturing (2), accommodation and food service (2), information and communication (2), financial and insurance activities (1), education (1), construction (1). For the 14 companies there is a person responsible for CSR and that person is in Marketing, Human Resources, Management, or Ownership position. For the majority (17) CSR is integrated in the company's strategy.

Research findings for the companies (#20) and institutions (#3) that responded to the questionnaire.

- What are the objectives in the implementation of the CSR actions and policies? The main objectives in implementing CSR actions for the companies are to: (a) bring value to the image of the company, (b) improve social relationships in the company, (c) to limit the impact on the environment, (d) to gain market share, (e) to improve skills and productivity of the employees, (f) to improve the intensity and quality of relationships with their stakeholders. (see Diagram 1) For the institutions the objectives are centred around economic performances, improvement to the environment and opportunities to support the youth.

The companies tend to place a lot of emphasis in community related CSR, secondly on workplace CSR, environment and the least in the marketplace. This is in line with the Doukakis et al. (2005) survey. Indicating that the CSR idea has not changed much in six years' time. (see Diagram 2)

For the institutions the most important category is the market place

driven rather than market driven. The institutions are motivated by their own strategic goals and funding. In addition stakeholders and pressure groups for one of them appear to have a major role in motivate a local authority to be active in CSR.

- Is there any support for the companies in implementing CSR policies? Cypriot companies are provided with limited support for the implementation of CSR policy. Those that were supported, the assistance were mainly from a research department or expert or an associated company. The assistance provided was not financial. Those that were assisted by public organisations it appears that local authorities had a major role to play. Again this is consistent with earlier findings since Cypriot companies tend to focus on the community needs. Non-Financial Assistance as support was granted to the institutions. The support varied from advice, training, promotion of social and green procurement
- Are there any links between CSR and competitiveness? The companies appear to contribute most in initiatives in favour of local communities, charities, ethical codes of conduct and equal opportunity in this order.

	<i>Very strong contributions</i>	<i>Least contributions</i>
<i>Labour Contribution Policy</i>	<i>Increase in commitment, loyalty, motivation, morale Increase in productivity</i>	<i>Participation in R&D projects Entrance in new markets</i>
<i>Health contribution Policy</i>	<i>Increase in commitment, loyalty, motivation, morale Increase in productivity</i>	<i>Participation in R&D projects Entrance in new markets</i>
<i>Training contribution policy</i>	<i>Increase in commitment, loyalty, motivation, morale Increase in productivity</i>	<i>Better recognition by society Strengthening of community ties</i>
<i>Equal contribution policy</i>	<i>Increase in productivity Improvement of image</i>	<i>Entrance in new markets Participation on R&D projects</i>
<i>Adoption of Environmental Management Systems</i>	<i>Improvement of image Anticipation of new regulations</i>	<i>Entrance in new markets Improved response to tender requirements</i>
<i>Environmental friendly production process</i>	<i>Improvement of image Modification of internal values</i>	<i>Entrance in new markets Increase in innovation</i>
<i>Ethical codes of conduct</i>	<i>Improvement of image Modification of internal values</i>	<i>Participation on R&D projects Entrance in new markets</i>
<i>Sourcing ethics</i>	<i>Modification of internal values Increase of commitment loyalty, motivation, morale</i>	<i>Participation in R&D projects Entrance in new markets</i>
<i>Environmental protection</i>	<i>Improvement of image Modification of internal values</i>	<i>Entrance in new markets Improvement of product quality</i>
<i>Charity contribution</i>	<i>Strengthening of community ties Improvement of image</i>	<i>Increase in innovation Participation in R&D projects</i>
<i>Initiatives in favour of local communities</i>	<i>Improvement of image Better recognition by society</i>	<i>In crease in innovation Anticipation of new regulations</i>
<i>Fair Trade</i>	<i>Better recognition by society Improvement of image</i>	<i>In crease in innovation Participation in R&D projects</i>

- Are there any evaluation tools used in the implementation?
The majority of the respondents do evaluate their CSR policies. The performance measure used relates to brand reputation, product quality, market position, and cost savings. To evaluate their CSR policies they use questionnaires, mainly qualitative

performance measures. The evaluation process is predominately internal. For those who use external evaluation procession they use an evaluation agency.

The majority of the respondents do not use any guide, website or book to help them start CSR. For those who do use tools, the tools used to assist in intensifying their CSR development are: EU manuals on road safety, GRI, AA1000, ISO 26000, EMAS or guidelines set up the Head Office.

The tools that could be used to intensify CSR are:

- A CSR forum or a local panel for CSR
 - A management tool in measuring and monitoring performance
 - A tool that evaluates and measures the effectiveness of CSR actions
 - CSR handbook, consultation or a person in Charge of CSR
 - Personnel training for CSR
 - Training, Seminars, a local forum for promoting CSR
-
- What are the barriers and the enablers of CSR policies and actions?
The barriers encountered by the respondents were mainly lack of expertise, and lack of financial resources. In addition the government bureaucracy appeared to be a major barrier for the Cypriot companies. The enablers appeared to be the Board, the owner's ideology and the local authorities. Barriers were faced by some institutions from opposing interests, public opinion, financial crisis, and internal politics. Enablers were the vision and planning of the organisation, the interests by SMEs to invest in CSR and assist the local authority to do so and the well versed employees.
 - What are the lessons learned by the companies?
The lessons learned from the implementation of CSR are:
 - Any contribution to CSR programs is always beneficial
 - By implementing CSR one gains awareness, satisfaction, appreciation and value
 - CSR actions are appreciated.
 - CSR increases the brand value of the bank. It also bring better recognition by society
 - CSR programs get a positive response from the public
 - Commitment from Top Management is crucial

- It gives great satisfaction
- It helps to get feedback from their Associates and the Society: Having a CSR strategy is necessary.
- It is a good Public Relations tool.
- It is always deeply appreciated.
- It is always helpful to be involved in such activities
- It is never enough
- It is something that can be easily implemented
- The company learned to communicate with young people
- There is not yet enough interest in CSR
- You have to communicate your policy

In addition to the quantitative study a qualitative study was carried out to identify good practices that perhaps other companies can replicate or get ideas from.

Conclusion

It can be concluded that in Cyprus the SMEs that are active in CSR place emphasis on the community and the workplace. This is understandable given the size of the country. It is part of the culture of the enterprises that you need to help out the local community and this will add value to the company. However the institutions tend to be driven by economic performances and the environment, which is quite understandable since the Board of a local authority or a public body is appointed on actions implemented.

The SMEs' main objectives in implementing CSR actions are focused on bringing value to the image of the company, improving social relationships in the company and attempting to limit the impact to the environment. The SMEs are motivated by internal rather than external factors such as Board and owners' decisions whereas the institutions are driven by the pressure groups and stakeholders.

Unfortunately no financial support is provided to either the SMEs or the institutions and there is lack of training on how they can be active in CSR actions. If an SME has the resources and knowhow as well as top management who are sensitive on CSR issues it will proceed to create CSR actions, otherwise it will not. The institutions do not have any tools that are currently being

used to evaluate their CSR actions whereas the companies appear to be in somewhat informed on tools that can be used.

As Vilanova et al (2009:65) argues “CSR will become a truly strategic business issue when the financial sector in general and financial analysts in particular broadly use CSR criteria to evaluate firms”. Until that is done SMEs and institutions will do the bare minimum.

“Successful corporations need a healthy society. Education, health care, and equal opportunity are essential to a productive workforce. Safe products and working conditions not only attract customers but lower the internal costs of accidents. Efficient utilization of land, water, energy, and other natural resources makes business more productive. Good government, the rule of law, and property rights are essential for efficiency and innovation. Strong regulatory standards protect both consumers and competitive companies from exploitation. Ultimately, a healthy society creates expanding demand for business, as more human needs are met and aspirations grow. Any business that pursues its ends at the expense of the society in which it operates will find its success to be illusory and ultimately temporary” (Porter and Kramer, 2006:83)

STRUCTURAL CORRELATES OF ENVIRONMENTAL BEHAVIOUR: THE CASE OF BIO-FUELS

Krystallis, Athanasios¹; Pagiaslis, Anastasios²

¹Aarhus University School of Business and Social Sciences, Denmark. Email: ATKR@asb.dk

Abstract

The study explores the interrelationships between environmental concern knowledge, beliefs about and behavioral intention for bio-fuels. Data was collected from 1,695 respondents. Hypotheses were based on literature, and a conceptual model was tested through SEM. Results show that environmental concern has a positive and direct impact on knowledge, beliefs and intention. Demographics determine levels of concern and knowledge. All constructs associate with each other positively. Future research should validate results using cross-cultural samples. By examining the effect and interrelationships of environmental concern, knowledge and beliefs on behavioral intention for bio-fuels the study adds to the evolving literature on green consumer behavior.

Keywords: Bio-fuels, green consumer, concern, knowledge, beliefs, intention

Introduction

“Bio-fuels” are environmentally friendly liquid fuels that can be used in the transportation sector and substitute for conventional petroleum-based oil fuels; they usually have fewer emissions and are produced in an environmentally sustainable manner. The term bio-fuels includes: bio-diesel produced from oil bearing seeds, animal fats and recycled greases; bio-ethanol produced from various grains and sugar components of various plants; and bio-gas produced from the biological breakdown of organic matter in the absence of oxygen. Bio-fuels will account for approximately 20% of the fuels used in the EU in the next 20 years (EBTP, 2010). Bio-fuels are the only sustainable energy resource that can most prominently reduce dependence on traditional oil reserves. In both EU and US’s environmental policies bio-fuels play an important role in the effort for cleaner development. In the EU, the importance of bio-fuels is apparent also from the relevant market indices. In 2009, bio-fuels represented 4% of the total road travel fuel consumption, while the market grew to 12,092 million tons of oil equivalent, an exceptional +18.7% from 2008 (EurObserver, 2010).

As long as sustainable consumption remains top priority, understanding the behavior of green, ecology-sensitive consumers is a key issue. Given the high growth conditions of the bio-fuels market (which to a large degree is still fueled by the existence of relevant tax exemptions

and not by the marketability of the end-product) understanding the antecedents of consumer behavior is crucial to operate under unconstrained competitive conditions. The aim of the present study thus is to explore the observed inter-relationships among determinants of green consumer behavior, as described in the literature. Especially, how does consumer environmental concern relate to knowledge of environmental issues, the shaping of environmental beliefs, and the intention to behave in an environmentally sustainable way?

Environmental concern can possibly influence various green consumer behaviors, such as willingness to pay (WTP) for renewable energy (Bang et al, 2000) and usage intentions (Alwitt and Berger, 1993). Nevertheless, the results of different studies remain confounded. Environmental knowledge represents what consumers know about the environment and about fundamental relationships that lead to different environmental views and have significant ecological effects (Mostafa, 2007). Earlier literature suggests that the kind of knowledge that correlates strongly with green consumer behavior is not clear (Mostafa, 2007; Tilikidou and Delistavrou, 2006). Environmental knowledge can be distinguished broadly between objective knowledge and perceived or subjective knowledge about concrete environmentally friendly actions (e.g. use of bio-fuels). Objective knowledge separates further in knowledge regarding the reasons of environmental problems (abstract / factual / declarative knowledge) and knowledge regarding the possible actions consumers can take to counteract these problems (concrete / procedural / action-related knowledge). Abstract knowledge is positively correlated with green purchasing behavior (Mostafa, 2007), while other examples from literature suggest concrete knowledge (Tanner et al, 2004), and yet other research (Ellen, 1994) suggests that objective knowledge has a much smaller impact on green consumption behavior compared to subjective knowledge.

Beliefs have been used widely in green behavior research (e.g. Bang et al, 2000; Kalafatis et al, 1999). Literature (De Groot and Steg, 2007; Mostafa, 2007; Bang et al, 2000) uses beliefs as significant influencers of attitudes and intention to use or purchase environmental products. Beliefs may be behavior- / product-specific or general. The relationship between beliefs and green behavior is essential since beliefs affect a wide range of green behaviors and can shed light on the variables on which is best to focus (De Groot and Steg, 2007).

All the aforementioned research is captured in the hypothesized, estimated structural model (c.f. Figure 1), as follows: environmental concern is treated as a general attitude construct that influences subjective knowledge, product-specific beliefs and behavioral

intentions, as reflected through hypotheses H1a-c respectively. Then, the model explores the relationship among these three constructs by hypothesizing a hierarchical set of relationships from knowledge through beliefs (or directly) to intentions (hypotheses H2a-b respectively), and

then from beliefs to intentions (H3). Testing and statistically validating the model satisfies the overall aim of the work as described above.

Data and method

The survey uses a random sample of 1,695 Greek consumers. The data were gathered in June 2008 by a professional research agency. Sample's mean age is 41.04 years. The sample is nationally representative in terms of education, income, and geographical distribution.

The questionnaire used in the survey comprised four multi-item questions following the postulated model. The first question examines consumers' concern about the environment measured on a scale with end-points 1: "Very unconcerned" to 7: "Very concerned" (5 items); the second question measures consumers' knowledge of renewable energy and bio-fuels on a scale with end-points 1: "Non Knowledgeable" to 7: "Very Knowledgeable" (3 items); the third question relates to consumer beliefs about bio-fuels on a scale with end-points 1: "Strongly agree" to 7: "Strongly disagree" (5 items); finally, the fourth question includes consumers' behavioral intention, namely their willingness to use and pay (a premium) for bio-fuels measured on a scale with choices 1: "Very unwilling" to 7: "Very willing" (5 items).

All scales were constructed following the accepted methods of item generation and scale construction (Churchill, 1979), thus after surveying the literature (see previous section) a preliminary questionnaire was created, which was then submitted to a panel of 5 experts requesting feedback on wording, relevance, presentation and validity of the items included. After the proposed changes, the amended questionnaire was pilot tested with a sample of 150 consumers. The results of the pilot test showed no significant changes to be necessary.

The scores on each of the 4 constructs are computed by averaging item ratings per factor. Descriptive analyses were employed in order to check the properties of the data and determine their suitability for the intended analyses. Internal consistency of the various constructs is assessed by computing Cronbach alpha coefficients. (Mean/SD & Cronbach alphas: Concern: 5.5/1.52 & 0.93; Knowledge: 2.8/1.60 & 0.92; Beliefs: 4.7/1.39 & 0.92; Intention: 4.1/1.54 & 0.93; All items to total correlations were > 0.60; Results available upon request).

To investigate the interrelationships between different constructs and test the hypotheses put forth previously two kinds of analyses were used. Initially, the median of the summation scores of the relevant variables was used to classify respondents in two groups, either high or low, with respect to concern, knowledge and beliefs. Then, t-tests were run to examine the existence of significant differences between group means.

After running the t-tests and in order to gain a more robust understanding of the interrelationships among the various constructs, the proposed model was tested using SEM.

Initially, the measurement model containing all latent constructs and indicators was analyzed; then, the hypothesized structural model was estimated afterwards. Given that the observed variables were slightly non-normal, the method of estimation was Maximum Likelihood (LISREL 8.80) with its correction for non-normality (Robust ML; Satorra and Bentler, 1994).

Analysis and results

The slight non-normality of the data is due to a specific, readily recognizable pattern in the respondents' ratings of the concern and knowledge items. That is, responses in the concern items exhibited a high concentration around 6-7, while responses in the knowledge items exhibited high concentration around 1-3. In line with previous research (Bang et al, 2000), the present sample comprises respondents with very high concern regarding environmental issues, who nevertheless exhibit a low level of (subjective) knowledge regarding bio-fuels (mean scores "Knowledge": 2.82 and "Concern": 5.54). In this respect, Gärling et al. (2003) claim that questions on environmental issues evoke skewed response distributions due to the difficulty of consumers to clearly distinguish among the constructs and social desirability response bias. Tilikidou and Delistavrou (2006) confirm that Greek consumers exhibit low objective environmental knowledge (both specific and general) .

T-tests results confirm all hypothesized relationships (Table 1). As in previous studies (Bang et al, 2000), consumers with low environmental concern are underrepresented, since those classified in the low environmental concern group (984 consumers scoring less than 31 in a 5-35 potential score range) actually have moderate to high absolute levels of concern. Comparing between those more concerned and those less concerned, a statistically significant difference emerges regarding knowledge about bio-fuels (t-value: 6.214, $p < 0.001$; mean scores: 2.61 and 3.11 for the low and high concerned respectively), their willingness to use and pay for bio-fuels (t-value: 12.578 $p < 0.001$; mean scores: 3.60 and 4.50 for the low and high concerned respectively), as well as their beliefs towards bio-fuels (t-value: 11.811, $p < 0.001$; mean scores: 4.42 and 5.17 for the low and high concerned respectively). The findings support hypotheses H1a-H1c.

Table 1. T-tests of Construct Mean Differences per Sub-group

		Mean	SD	t	p
<i>Knowledge X Concern</i>	<i>Low concern</i>	2.6	1.47	6.214	0.000
	<i>High concern</i>	3.1	1.73		
<i>Willingness to Use & Pay more X Concern</i>	<i>Low concern</i>	3.6	1.50	12.578	0.000
	<i>High concern</i>	4.5	1.49		
<i>Beliefs X Concern</i>	<i>Low concern</i>	4.4	1.47	11.811	0.000
	<i>High concern</i>	5.2	1.14		
<i>Beliefs X Knowledge</i>	<i>Low knowledge</i>	4.6	1.45	6.233	0.000
	<i>High knowledge</i>	5.0	1.28		
<i>Willingness to Use & Pay more X Knowledge</i>	<i>Low knowledge</i>	3.6	1.58	11.433	0.000
	<i>High knowledge</i>	4.5	1.42		
<i>Willingness to Use & Pay more X Beliefs</i>	<i>Low beliefs</i>	3.5	1.47	18.008	0.000
	<i>High beliefs</i>	4.7	1.40		

The median summed response for environmental knowledge is 8.00 on a 3 – 21 potential score range. Thus, 940 and 755 respondents are classified in the low and high knowledge group respectively. Regarding beliefs towards the positive environmental consequences of bio-fuels, those less knowledgeable exhibit statistically less positive beliefs (t-value: 6.233, $p < 0.001$) than those more knowledgeable (mean scores: 4.55 and 4.97 respectively), supporting hypothesis H2a. Similarly, results for willingness to use and pay yield a statistically significant relationship (t-value: 11.433, $p < 0.001$) between the less and more knowledgeable (mean scores: 3.60 and 4.50 respectively), supporting hypothesis H2b.

Finally, the median summed response for beliefs is 25 on a 5 – 35 potential score range. Thus, 941 and 754 respondents are classified in the less positive and more positive beliefs group respectively. Those with less positive beliefs exhibit reduced willingness to use and pay for bio-fuels compared to those with more positive beliefs (t-value: 18.008, $p < 0.001$; mean scores: 3.50 and 4.70 respectively), supporting hypothesis H3.

Following, in order to gain a more robust understanding of the interdependent relationships between the various constructs, a SEM procedure tested the proposed model. The measurement model showed that all items load significantly on their corresponding latent variables ($p < 0.01$). All indicators load only on one latent variable while error terms were not allowed to co-vary. Overall, the goodness-of-fit indices indicate a good fit of the measurement model: SBS chi-square 572.88 [df.118], $p < 0.01$, RMSEA 0.048 [0.044 - 0.0525], GFI 0.95, AGFI 0.93, TLI- NNFI 0.99, CFI 0.99, PNFI 0.76. The estimated structural model can be found in Figure 1. Model estimation

enabled empirical testing of the hypotheses posed. All estimated coefficients were significant at $p < 0.05$, with the hypothesized direction of effect.

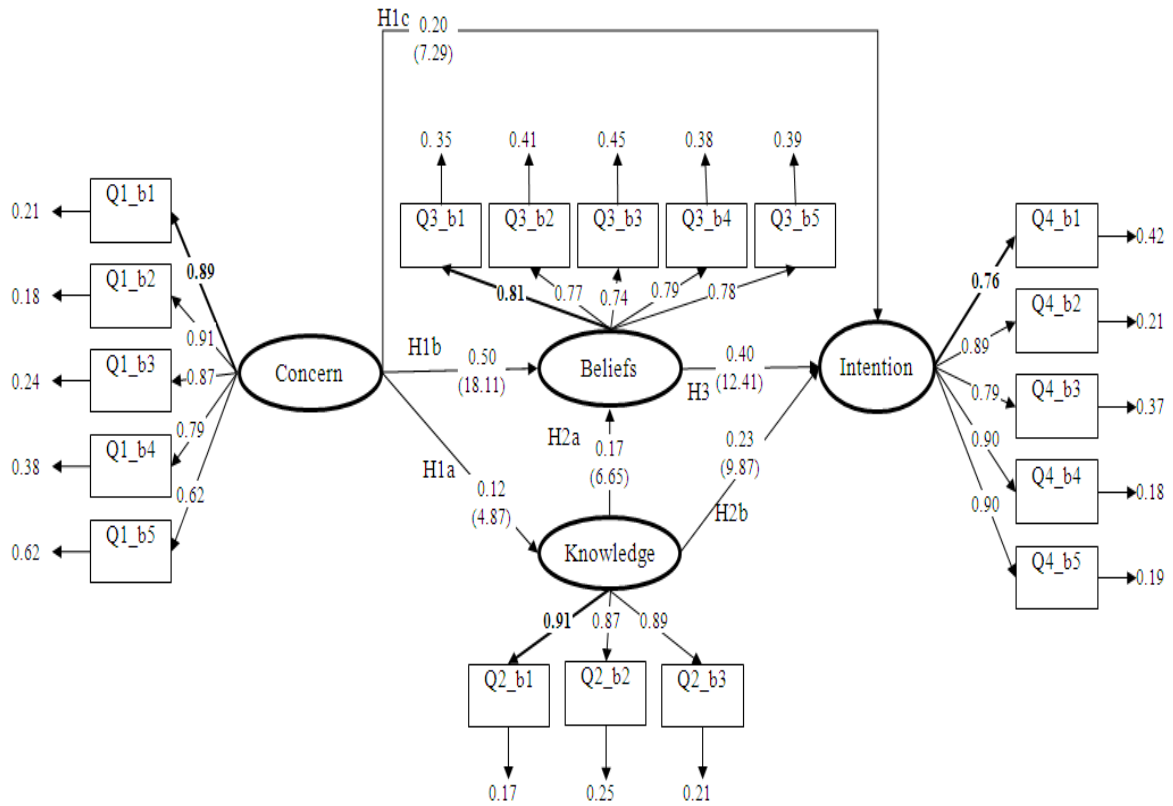

Table 2 presents the relevant correlations, average variance extracted, covariances and reliability for all latent constructs of the structural model. The estimated model covers all assumptions pertaining to convergent and discriminant validity, as well as a re-confirmation of the constructs' reliability. Convergent validity is assessed through the Average Variance Extracted (AVE; all estimates > 0.50) while discriminant validity is assessed by comparing the AVE of each construct to the squared correlation of every other construct (Garson, 2010). Finally, construct (or composite) reliability is a measure of internal consistency different than Cronbach alpha with a common cut-off level of 0.70, which all of the constructs superseded.

Discussion and conclusions

The findings of this study offer implications for both marketers and public policy makers.

Results suggest that concern for the environment, subjective knowledge about environment related behaviors, and beliefs towards bio-fuels have direct and indirect effects on environmental behavioral intention (i.e. use and pay premiums for bio-fuels), albeit some of the inter-relationships are rather weak.

Table 2. Correlations, Average Variance Extracted, Covariances, and Construct Reliabilities, Latent Constructs

	Concern	Knowledge	Beliefs	Intentions
Concern	0.68	0.27	0.98	0.82
Knowledge	0.12	0.79	0.48	0.71
Beliefs	0.52	0.23	0.60	0.94
Intentions	0.44	0.35	0.56	0.73
CR	0.91	0.92	0.88	0.93

Note :

Average Variance Extracted is bold on the diagonal.

Correlations are in the lower triangle and covariances are in the upper triangle.

Average variance extracted = $\frac{\sum(\text{standardized loadings})^2}{\sum(\text{standardized loadings})^2 + \sum \epsilon_{ij}}$

Construct Reliability = $\frac{\sum(\text{standardized loadings})^2}{\sum(\text{standardized loadings})^2 + \sum \epsilon_{ij}}$

Convergent validity AVE > 0.50; Discriminant validity AVE > Corr² (between the latent and all other variables)

The weak impact of concern on knowledge and the weak effect of knowledge on beliefs partially agree with previous research (Bang et al, 2000) and support the literature that questions the effect that both general attitudes (i.e. concern) and knowledge have on purchasing behaviors and behavior-specific attitudes. Past research suggests that environmental concern may not have any effect on knowledge or green behavior. The present study points more to the direction of existent relationships, which however may be rendered insignificant in the presence of other stronger explanatory factors, such as consumers' personal values (Mostafa, 2007), and situation specific cognitions (Bamberg, 2003).

Concern impacts on intention directly as well as indirectly, through both beliefs and knowledge. As hypothesized, concern is a very strong antecedent of green consumer behavior that may not be left out from future studies. Following, the strongest structural relationships form the path "Concern – Beliefs - Intentions" and secondarily with knowledge and concern bearing directly on intentions. This finding suggests that "concern for the environment" and "environmental-subjective knowledge" remain important antecedents of green consumption behavior. As in earlier research (Bamberg, 2003) "concern" has a strong direct impact on bio-fuel-related beliefs, pointing to its effect as an underlying mechanism in shaping belief-regulated situation-specific perceptions that frame consumers' attitudes towards bio-fuels. Furthermore, the direct, positive impact of both "concern" and "knowledge" on behavioral intention (in particular WTP) confirms previous research (Mostafa, 2007; Bang et al, 2000) and suggests that consumers possessing higher concern for the environment and higher bio-fuel specific knowledge may be more inclined to behave in a way that reflects these elevated levels of knowledge and concern. Results suggest that enhancing consumer awareness of environmental issues may lead to an important shift in their beliefs towards various aspects of green consumer behavior thus increasing their intention to behave accordingly. The more intensive cognitive reflections on the ramifications of certain behaviors may lead to enhancing personal beliefs and attitudes towards the behaviors themselves, thus offering a chance to drive motivation for action.

Knowing the profile of the green consumer is important, since such information allows marketers to construct specific strategies to target especially this segment. For bio-fuels, but also for renewable energy sources in general, both consumers' knowledge and beliefs should be strengthened in order to change their consumption behaviors. Practically, marketers have to communicate to the consumers the effects and costs for relying on traditional energy sources, as well as the fundamental benefits and consequences from using renewable energy sources. Such communication efforts should find increasing support by the government as well as local policy makers. In the present study, a substantial number of consumers show increased willingness to use and – most importantly – pay premiums for bio-fuels. The extent to which people would actually prefer a slightly more expensive fuel source be that such fuel is actually available in the

market still remains unclear, especially in times of economic turmoil. Nevertheless, the present results suggest that the market for bio-fuels has, in general, a lot of potential for growth and expansion. Given the fact that the European bio-fuels market and consumption thereof is still evolving (albeit with a different rate across the different countries), understanding the interplay of the various motivators of bio-fuel consumption is important if the various EU states are to move in an effective and efficient way towards the design and putting in place environmental policies and actions that will give rise and strengthen green consumption, especially bio-fuels consumption.

Introduction

Information technology is an imperative for organizations to remain competitive and grow in the present environment. Electronic banking is the latest delivery channel for banking services. The definition of e-banking varies amongst researches because electronic banking refers to several types of services through which bank customers can request information and carry out most retail banking services via computer, television or mobile phone (Daniel, 1999; Mols, 1998; Sathye, 1999). Burr (1996), for example, describes it as an electronic connection between bank and customer in order to prepare, manage and control financial transactions. Electronic banking can also be defined as a variety of following platforms: (a) Internet banking (or online banking), (b) telephone banking, (c) TV-based banking, (d) mobile phone banking, and (e) PC banking (or offline banking). Among these Internet banking and mobile banking are considered to be the fastest developing areas.

The use of technology in banking has direct relationship with the profitability of the service providers also. *Ceteris paribus*, investment in electronic banking increase the profit margin of banks by reducing costs and increase in non-interest income, which will increase the ROA and ROE (Sinkney, 1998). Scott (1999) commented the integration of the banking services with e-commerce and emergence of e-cash would positively affect the efficiency scores of the banks. Implementation of IT opens the floodgates to a whole set of new policies for development (Howkins and Valantin, 1997). The diffusion of new technologies with user-friendly service models is expected to improve the banking services (Akinci, Aksoy, and Atilgan, 2004). Technology Acceptance Model (TAM) proposed by Davis et al (1989) suggests that use of technology depends on ease of use and its perceived usefulness by the consumers. In the study on online banking drivers Aladwani (2001) has found, that providing faster, easier and more reliable services to customers were amongst the top drivers of e-banking development. Consumer's preferences, attitudes and motives are governing factors for developing service delivery options (Byers, Lederer, 2001). Moreover, technology helps in standardizing banking services (Quinn, 1996) and reducing operating costs (Hewer, Howcroft, Durkin, 2003). Technology has improved the service quality and encounters (Beatson, Lee, Coote, 2007) and

consumers can have direct access to online banking from home, workplace, or any other place at their leisure (Suominen, 2001). Low penetration level of ICT in many developing countries hinders efforts to harness the technologies for development (Akpan, 2003).

The advent of Internet changed banking in India though the process of technology adaptation has been slow in India over the last several years. It was a silent revolution and became prevalent in only a few years. During the 1990's banks started offering rudimentary banking services via Internet sites and early in the 2000 decade this feature was being widely used. Basically, the emergence of new private-sector banks in the country in the mid-nineties has changed the scenario drastically, as the business model of these new banks revolved around a strong IT backbone. The volume of transactions and the monetary value grew dramatically to a point where i-banking is probably the biggest source of electronic banking transactions.

Internet penetration is rising appreciably in India today. Urban India which accounts for about 28% of the total population, has witnessed the bulk of this growth. On the other hand, as per the latest round of research conducted by IMRB International with ICube 2010, as per all India estimates, rural India is projected to have 10.6 Mn claimed Internet users and 8.5 Mn active Internet users in June 2010 and 15.2 Mn claimed Internet users and 12.1 Mn active Internet users in December 2010. This shows an over 40% growth in both claimed as well as active Internet users. Only 5% of the rural population is accessing Internet using mobile phones. However, the mobile medium presents an exciting medium for the Internet in the near future. Cost effective and feature laden mobile phones are increasingly available and Internet data plans become cheaper. With the launch of 3G services, there will be a greater number of people using these services in urban India at first, and with time will trickle down to the rural parts as well. 6% of the rural population is using Internet for Financial products, online banking, and insurance. (IAMAI Internet in Rural India, 2010)

On the other hand mobile phones as a delivery channel for extending banking services have off-late been attaining greater significance. The rapid growth in users and wider coverage of mobile phone networks have made this channel an important platform for extending banking services to customers. With the rapid growth in the number of mobile phone subscribers in India (about 261 million as at the end of March 2008 and growing at about 8 million a month), banks have been exploring the feasibility of using mobile phones as an alternative channel of delivery of banking services. Some banks have started offering information based services like balance enquiry, stop payment instruction of cheques, transactions enquiry, and location of the nearest ATM/branch etc. This is the most basic type of m-banking. Acceptance of transfer of funds instruction for credit to beneficiaries of same/or another bank in favor of pre-registered beneficiaries have also commenced in a few banks. Some banks offer only the option of text alerts, which are messages sent to cell phone that alert the customer regarding the activity on his /

her account such as deposits, withdrawals, and ATM or credit card use. A more involved type of m-banking allows the user to log into his or her account from a cell phone, and then use the phone to make payments, check balances, transfer money between accounts, notify the bank of a lost or stolen credit card, stop payment on a check, receive a new PIN, or view a monthly statement, among other transactions. With m-banking facilities, one can bank from anywhere, at anytime and in any condition or anyhow. The system is either through SMS or through WAP. In several countries (like Korea) two SIM Cards are used in mobile phones; one for the telephonic purpose and the other for banking.

It is expected that the adoption of m-banking will be fueled by two primary factors: consumers' increasing preference for real time, self-service transactions; and their growing adoption of mobile data services and applications.

TowerGroup estimates that up to 30 percent of online banking users will adopt the mobile channel in the next five years. However, m-banking is also likely to appeal to a segment of the banking population that accesses services via ATMs, but is not willing to use or comfortable with online banking. TowerGroup expects that by 2012, approximately one-fourth of all m-banking users will come from outside the online banking channel. It also estimates that m-banking usage will grow from 10 million active users in 2009 to over 53 million active users in 2013, representing a compound annual growth rate of 51.8%. Two factors that have helped the rapid growth of m-banking are the lower cost of mobile calls and the rapidly growing mobile penetration.⁶⁴

Objective of the study

m-banking is seen as an alternate delivery channel of i-banking as banking services provided by the m-banking and i-banking are more or less same. Various literatures are talking about the superiority of m-banking over i-banking in terms of its easy access, cost effectiveness, strong network, and security issues etc. This research paper tries to find out for which specific banking services customers prefer to use m-banking over i-banking and vice versa. It will be done by evaluating the customer perception and satisfaction related to use of i-banking and m-banking. In doing so the research work contributes to the literature on the relationship between perception and satisfaction of electronic delivery channel of banking in a number of ways.

First, this study examines the perception and satisfaction level of i-banking and m-banking customers of Indian PSBs.

Second, it provides a comparative analysis of i-banking and m-banking on some selected parameters of perception and satisfaction.

⁶⁴Feature – Mobile banking in India, June 14, 2009 – 5:23 pm by Shalini Amarnani

Third, this paper makes a more general theoretical contribution towards adaptation of delivery channels by the Indian PSBs in a segmented service delivery context.

Literature review

As Internet banking is a relatively new concept in banking service delivery, not many studies are available in Indian context. The major distinction between the electronic and mobile business transaction prefixed as "e" and "m" is that the electronic medium offers "anytime access", while mobile medium offers "anytime and anywhere access" to business processes respectively (Tiwari et al, 2006).

i-banking

Internet banking can be defined as the use of technology to communicate instructions and receive information from a financial institution where an account is held. Internet banking includes the system that enables financial institution customers, individuals or business to access accounts, transact business, or obtain information on financial products and services through a public or private network, including the Internet. Sournata, Mattila and Munnukka (2005), Al-Sabbagh and Molla (2004)- all explore the various inhibitors and drivers of electronic banking adoption. They believe there are relatively few empirical analyses of the impact of electronic banking on customers.

According to Wheri, Internet banking was used mainly as an information presentation medium in which banks marketed their products and services on their Web sites. With the development of asynchronous technologies and secured electronic transaction technologies, however, more banks have come forward to use Internet banking as transactional as well as an informational medium.

Gender is one of the relevant issues in the adoption of Internet banking. Shergill and Li's (2005) study of Internet banking consumers found that women regarded privacy protection and ethical standards more seriously than men did. The desire for control of service delivery was found important by Ramsay and Smith (1999) while habit may also play a role (Wan et al., 2005). The information provided on the banking web site may help provide needed knowledge and thus helps to motivate adoption (Waite and Harrison, 2004).

Consumer concerns about Internet security, privacy and trust have also been noted by many experts (Miyazaki and Fernandez, 2001; Gefen et al., 2003; Nissenbaum, 2004). Survey by Chung and Paynter (2002) identified consumer fears regarding transaction security as an inhibitor to the adoption of Internet banking. Security has also been identified as a key consumer concern in other Internet banking adoption studies (Black et al., 2002; Siu and Mou, 2005). In the context of consumer attitudes toward Internet banking systems, trust may be related to consumer judgment on security and privacy issues (Wang et al., 2003).

m-banking

Mobile banking, or m-banking, is the term we use to describe financial services delivered via mobile networks using mobile phones. Mobile business (m-Business) can be defined as electronic business interactions/transactions enabled at least in part by mobile technology that may target businesses and consumers alike (Coursaris and Hassanein, 2002). M-banking is separated into two categories; additive and transformational, where the additive model uses M-banking as an extra access channel for existing clients Porteous (2006).

M-banking has increasingly been heralded as the tool for bringing financial services to the largely unbanked population. Its potential to transform the livelihood of people – who previously have been outside the formal financial sector – is the key rationale put forward (Dr. LennartBångens and BjörnSöderberg,2008).

Charles et al. (2007) conducted a study on the M-commerce in the banking sector of Nigeria - it deals with the issue of adoption of ICT in the banking sector using SWOT analysis. It was found out that all banks in Nigeria offer e-banking and around 52% of them also offer some form of M-banking services. The paper reflected that the potential is great for M-Commerce but due to lack of infrastructure support the implementation is not smooth.

Coursaris & Khaled (2003) has done an analysis of the Canadian Mobile market with respect to both E-Commerce and M-Commerce focusing on the issue of wireless privacy. Needs and concerns of the mobile customers has been highlighted in their research.

Tiwari, Buse, and Herstatt (2007), in their study titled, "Mobile Services in Banking Sector: The Role of Innovative Business in Generating Competitive Advantages" have empirically assessed the customer acceptance of the M-Commerce in Germany. The study found that the highest users of mobiles are the top management of the corporate, self employed, salaried persons, students and others. It was found that Government employees were found not supporting mobile banking. Some of the reasons that came in favor of mobile banking is its ubiquity, overview of bank account and immediacy. However the concerns of the users were mainly regarding the insecurity and high cost.

Much of the attraction of the mobile banking channel lies in the "do-it-yourself" mindset it enables. Consumers can cash their own checks and transfer money-without visiting the branch or picking up the phone. In today's world, digital transactions equal dollars saved (Vemuri, 2010).

The results of a recent global survey by KPMG indicate that 91% of U.S. consumers have not tried banking through a mobile device, but 85% would like to try if offered free. Of the respondents that haven't tried mobile banking, 48% cited security and privacy concerns as the reason for not going for it. And while nearly 20% expected to break down and give it a try within

the next year, 66% found financial transactions on mobile devices to be more daunting of a proposition. Again 68% of KPMG's respondents said their current bank does not offer transactions through a mobile device - or if it did, they haven't been made aware of it.

Vital Analytics Team has done a survey based on data gathered in April 2009 for Feb/March m-banking in urban Indian the result of which is shown in the figure below:

Figure1 : Statistics on most popular m-banking services

Filtering the data further, we can try to understand which of the income groups in urban India use m-banking more. m-banking is most used by subscribers falling in Rs. 1 Lakh to Rs. 2.99 Lakhs income bracket followed by less than Rs 1 Lakh income bracket. Therefore it is observed, m-banking is more popular among low income group of mobile users than higher income group of mobile users.⁶⁵

However, the growth of m-banking still faces cultural, technical and business challenges. Chief among the technical challenges are information security and consumer privacy. Charul Vyas, an analyst in the Emerging Technologies research service said "Beyond technology, broad participation in m-banking will be most encouraged by maximizing and improving the customer experience," "Banks must invest substantial marketing dollars to increase consumer awareness about m-banking, as well as remain vigilant regarding privacy and data security in this area."

⁶⁵Mobile banking report: "Most popular services and income profile" (Two month ended March 2009, Urban Indian Mobile Phone Users).

The mobile payments market is still at its infancy in India and it is estimated that the current daily transaction volumes today will be in the range of Rs 5-10 Million. Even if 5% of mobile bill payment and recharge shifts onto mobile payments platform the industry can grow to a size of Rs200 Million a day.

Methodology

This work was done mainly as an exploratory research to do a comparative analysis on i-banking and m-banking on some selected service areas.

Questionnaire

This research paper evaluates the Customer Psyche i.e, it finds out customer perception and satisfaction level of i-banking and m-banking focusing on the different services provided by these two delivery channels. This research study has found out nine such service attributes and has measured how the perception and satisfaction level of these services differs with the channels of delivery. Primary data has been gathered on the perception and satisfaction level of i-banking and m-banking from the customers of Indian PSBs.

For this purpose customer of Indian banks which have implemented i-banking and m-banking has been surveyed. There were 36 questions altogether divided under four subheadings:

- Customer perception on i-banking services provided by Indian PSBs
- Customer perception on m-banking services provided by Indian PSBs
- Customer satisfaction with the present service level of i-banking
- Customer satisfaction with the present service level of m-banking

Scaling Technique

We have used Likert-type Scales, consisting of a number of statements which express either a favourable or unfavourable attitude towards the given object to which the respondent is asked to

react. The respondent indicated his agreement or disagreement with each statement in the instrument. Each response is given a numerical score, indicating its favourableness or unfavourableness, and the scores are totaled to measure the respondent's attitude. In other words, the overall score represents the respondent's position on the continuum of favourableness or unfavourableness towards an issue.

Sampling

Users of i-banking and m-banking services as offered by Indian Public Sector banks forms the population to evaluate the perception and present satisfaction level of these two delivery channels. The banks which have a high rating in the usage of electronic payment systems

(volume and value of transaction wise) were chosen for this study. Three PSBs has been selected which have high value and volume of Internet banking transactions, namely State Bank of India, Punjab National Bank, Bank of Baroda. Major cities are considered as subgroups here as the customers of the major metro cities are the main users of i-banking and m-banking. Among these subgroups the four major metro cities are selected for collecting the sample. To decide the sample to be taken for each of these three banks and again each of the four cities within these three selected PSBs, number of ATM outlets of the banks in four metro cities have been collected. The assumption was ATM users are the prospective user of i-banking and m-banking.

Percentage has been worked out to find out the ranking of the banks in terms of no. of ATM outlets in these three banks and four cities within in each of the three banks. Accordingly 131 customers from SBI, 65 from PNB and 86 customers from BOB were selected. The banks were not willing to share the list of Internet banking and m-banking users due to security reason. Therefore quota sampling method was applied to select the customers of i-banking and m-banking. A total of 282 customers were given the questionnaires out of which 240 were usable the average response rate being 85%.

Statistical Techniques Used

The data collected through questionnaire were analyzed using the following statistical techniques:

- Univariate statistical technique: the measures of central tendency, namely, mean were used for determining customer satisfaction on various dimensions of Indian retail banking sector.
- Multivariate statistical techniques: factor analysis was carried out to identify the different dimensions of Indian retail banking industry, and the variables that impact the dimensions.

The above analysis was carried out using SPSS version 17.0 software.

Analysis

The data collected were analyzed and tested under two categories :

- Category I : Customer's perception on different services provided by i-banking and m-banking
- Category II : Customer's satisfaction on different services provided by i-banking and m-banking

The table 1 given below shows the variables and their description on which data has been collected and analyzed.

<i>Sly no.</i>	<i>Variable name</i>	<i>Description</i>
1	<i>perception_fundtransfer_ibank</i>	<i>Fund transfer (RTGS, NEFT) can be done easily though i-banking</i>
2	<i>perception_balanceenquiry_ibank</i>	<i>Balance enquiry can be done easily through i-banking</i>

Table 2: Name and description of the variables used in SPSS ver 17.0

Findings on category I :customer's perception on different services provided by i-banking and m-banking

Mean value analysis

Figure 3:Comparative mean value analysis of customer perception regarding i-banking and m-banking services

Figure 3 gives a comparative mean value analysis of the user perception regarding m-banking and i-banking. Customers prefer i-banking over m-banking in the services like fund transfer, balance enquiry, bill payment, tax payment, e-shopping and online service request. Nevertheless the intensity of the preference varies from service to service. m-banking is a preferred channel over i-banking for the services like ticket booking, movie ticket booking and online trading.

Factor analysis

Factor analysis has been performed separately on i-banking and m-banking related to perceptual attributes.

<i>Perception_movieticket_ibank</i>	-.858	

Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser Normalization.

a. Rotation converged in 3 iterations.

Table 3: Factor analysis of customer perception regarding i-banking services

There were 9 items related to perception of i-banking services. The significance values in the correlation matrix were scanned and the variable for which majority of the significance value is greater than 0.05 were noted. We also identified correlation coefficients which had greater than 0.9. Accordingly three variables were eliminated. The KMO measure of sampling adequacy gives a value of 0.658 which is mediocre. Barlett's Test of sphericity is highly significant ($p < 0.001$) and therefore factor analysis is appropriate.

Two factors were extracted through varimax with Kaiser Normalization rotation method, having

eigen value more than 1. Rotation converged in 3 iterations. Variables which had factor loadings lesser than .40 were deleted from the analysis.

Factor 1 includes variable Perception_balanceenquiry_ibank, Perception_taxpayment_ibank, Perception_movieticket_ibank indicating the time dimension.

Factor 2 comprises of the variables Perception_fundtransfer_ibank, Perception_billpayment_ibank and Perception_eshopping_ibank indicating transaction-intensive dimension because they generally involve a considerable amount of transaction.

Rotated Component Matrix^a

<i>Perception_ticketbooking_mbbank</i>		-.533
<i>Perception_eshopping_mbank</i>		.542
<i>Perception_movieticket_mbbank</i>	-.630	.568

Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser Normalization.

a. Rotation converged in 3 iterations.

Table 4: Factor analysis of customer perception regarding m-banking services

There were 9 items related to perception of m-banking services also. The significance values in the correlation matrix were scanned and the variable for which majority of the significance value is greater than 0.05 were noted. Accordingly two the variables were eliminated. The KMO measure of sampling adequacy gives a value of 0.724 which is considered good. Barlett's Test of sphericity is highly significant ($p < 0.001$) and therefore factor analysis is appropriate.

Two factors were extracted through varimax with Kaiser Normalization rotation method, having

eigen value more than 1. Rotation converged in 3 iterations. We also eliminated from the analysis those variables which had factor loadings lesser than 0.40 .

The first dimension comprises of the factors Perception_fundtransfer_mbank, Perception_balanceenquiry_mbank, Perception_billpayment_mbank and Perception_movieticket_mbank indicating *frequent service dimension*.

The second dimension indicating *occasional service dimension* consists of three parameters - Perception_taxpayment_mbank, Perception_ticketbooking_mbank and Perception_eshopping_mbank.

Findings on category II: customer's satisfaction on different services provided by i-banking and m-banking

Mean value analysis

Figure6 : Comparative mean value analysis of customer satisfaction regarding i-banking and m-banking services

Here again figure 6 gives a comparative mean value analysis of the user satisfaction regarding m-banking and i-banking. The analysis indicates:

- Customer has a much high satisfaction level for shopping electronically using i-banking than m-banking.
- Customers are more satisfied with m-banking for movie ticket booking.
- For tax payment customers are having higher satisfaction level with i-banking
- customers are more satisfied with balance enquiry service of m-banking

- Customer satisfaction is again higher in i-banking than m-banking for fund transfer (RTGS, NEFT).
- On the other hand for issues like balance enquiry, bill payment (Electric, Telephone, Mobile), ticket booking, online trading and online service requests (a/c opening, dd issue, cheque book issue, loan application, stop payment of cheque, cheque status ATM / branch locator, new a/c or fixed deposit) customers are showing a higher satisfaction level with m-banking delivery channel as compared to i-banking.

Factor analysis

Rotated Component Matrix^a

	Component	
	1	2
<i>Satisfaction_fundtransfer</i>		-.594
<i>Satisfaction_balanceenquiry</i>	-.606	
<i>Satisfaction_billpayment</i>	-.620	.572
<i>Satisfaction_taxpayment</i>	.734	
<i>Satisfaction_onlinetrading</i>	.631	
<i>Satisfaction_eshopping</i>	.820	
<i>Satisfaction_servicerequest</i>		.848

Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser Normalization.

a. Rotation converged in 3 iterations.

Table 5: Factor analysis of customer satisfaction regarding i-banking services

There were nine items related to perception of m-banking services also. Measure of sampling adequacy (MSA) measures the magnitude of observed correlation coefficients to the magnitude of partial correlation coefficients (Agarwal, 2008). Values of MSA above .50 for entire matrix and for individual variable indicate appropriateness for factor analysis (Hair et al., 2009). Accordingly two variables were dropped. The KMO measure of sampling adequacy gives a value of 0.749 which is considered good. Barlett's Test of sphericity is highly significant ($p < 0.001$) and therefore factor analysis appropriate.

Factor analysis on the satisfaction of i-banking brings out twodimensions. The first factor consists of Satisfaction_eshopping_ibank, Satisfaction_taxpayment_ibank, Satisfaction_onlinetrading_ibank, Satisfaction_billpayment_ibank and Satisfaction_balanceenquiry_ibank indicating value-added service dimension.

The second factor consists of Satisfaction_fundtransfer_ibank and Satisfaction_servicerequest_ibank indicating core service dimension.

Rotated Component Matrix^a

	Component		
	1	2	3
<i>Satisfaction_fundtransfer</i>	-.812		
<i>Satisfaction_balanceenquiry</i>			.898
<i>Satisfaction_billpayment</i>	.492	.593	
<i>Satisfaction_taxpayment</i>		-.587	.593
<i>Satisfaction_ticketbooking</i>		.677	.418
<i>Satisfaction_onlinetrading</i>		-.743	
<i>Satisfaction_eshopping</i>	.626		-.662
<i>Satisfaction_movieticket</i>	-.531	.754	
<i>Satisfaction_servicerequest</i>	.866		

Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser Normalization.

a. Rotation converged in 5 iterations.

Table 6: Factor analysis of customer satisfaction regarding m-banking services

Factor analysis on the satisfaction level of the m-banking again brings our three dimensions.

Factor 1 consists of Satisfaction_fundtransfer and Satisfaction_servicerequest indicating *core service dimension*.

Factor 2 consisting of Satisfaction_movieticket_mbank, Satisfaction_onlinetrading_mbank, Satisfaction_ticketbooking_mbank, and Satisfaction_billpayment_mbank indicates the *value-added service dimension*.

Factor 3 consists of Satisfaction_balanceenquiry_mbank, Satisfaction_eshopping_mbank and Satisfaction_taxpayment_mbank and indicates *time dimension*.

Findings and conclusion

From the above analysis on the customer perception and satisfaction regarding nine identified i-banking and m-banking service attributes some major findings are coming out. The mean value analysis of customer perception shows services like e-shopping, electronic fund transfer, utility bill payments, tax payments and balance enquiry i-banking is more suitable as a channel of delivery. While shopping people generally like to see the product physically. None of the

electronic channel can serve the purpose. However, a computer screen is a preferred medium than a mobile screen as it can give a larger and more detailed image with higher precision. May be due to this reason the customer perception is more favourable towards i-banking for e-shopping. There is a limitation of 5000 rupees for each and every transaction using m-banking. Whereas there is no limit on NEFT transaction and the minimum amount to be remitted through RTGS is Rs.1 lakh. For this reason probably customers are still reluctant to perceive m-banking as a suitable delivery channel for fund transfer. For rest of the issues like utility bill payments, tax payments and especially for balance enquiry, may be the low adaptation of m-banking is the cause for lower preference. It is expected that more and more people will get accustomed to m-banking the more they will rely on this delivery channel.

Coming to the satisfaction level of the i-banking and m-banking customers of Indian PSBs it has been found that they are more satisfied with i-banking when the issue of e-shopping arises, which actually echoes customer perception. Those who have experienced m-banking have shown a clear inclination towards m-banking for value-added services like movie ticket booking. For issues like tax payment which have to be done once in every year people are having high satisfaction level with i-banking. For more frequent issues like balance enquiry, bill payment (Electric, Telephone, Mobile), ticket booking, online trading and online service requests (a/c opening, DD issue, cheque book issue, loan application, stop payment of cheque, cheque status ATM / branch locator, new a/c or fixed deposit) customers are showing a higher satisfaction level with m-banking delivery channel as compared to i-banking. However as depicted in the perception analysis also people still rely more on i-banking for issues like fund transfer where dealing with a lump sum amount is concerned.

The factors identified from the perceptual analysis of i-banking indicates people like to use i-banking mainly for two reasons a) for reducing the lead-time of operation and b) for transaction intensive services. The analysis on the satisfaction level clearly brings out two factors core service dimension and value added service dimension both for i-banking and m-banking. The core services of banking are fund transfer and various service requests of banking. Bill payment, tax payment, ticket booking (train, air, and bus), online trading, electronic shopping and movie ticket booking has been identified as value added services. This implies the customers of Indian PSBs measure the performance of core banking services and value-added banking services separately. The difference of factor loadings within the factor for i-banking and m-banking bears that, both the channels are suitable to offer the various banking services and customers expect to receive these services through these two channels because of the respective advantages of the channels. Therefore i-banking and m-banking, these two delivery channels can be regarded as complementary to each other. May be the perception and the satisfaction level will be more

inclined towards m-banking in coming days with more adaptation of m-banking as a delivery channel and less stringent rules by the government.

Limitations

Only nine service types have been selected for comparison m-banking and i-banking. There are many more services that can be taken into consideration and if added to this analysis may open up separate dimension related to this research area.

Only 240 samples have been collected for this research study. More related data can provide with more valuable findings in this regards.

Very few Indian PSBs are practicing m-banking though most of them are providing i-banking facilities. It is believed that when all of the PSBs will come up with m-banking facilities in its full flair this will add more dimension to this kind of research work.

No demographic analysis has been provided in this research paper though as specified in the literature review various demographic analyses has already been done regarding the adaptation of m-banking services.

Abstract

This paper presents a study of learning, entrepreneurship and service quality in the health and fitness sector. The purpose is to outline the theoretical framework and to propose a methodological approach for the study. The theoretical basis for the project lies in the field of service dominant logic of marketing. One aim is to develop this field by integrating knowledge from organisational learning, entrepreneurship and quality management. Theories from those fields are presented and their relevance is discussed. On this basis, a methodology for an empirical study is proposed.

Keywords: Organisational learning, service dominant logic of marketing, service quality, entrepreneurship, health and fitness

Introduction and Purpose

Systematised methods for quality management started to form around the last turn of the century (Lagrosen and Lagrosen, 2009). During recent decades they have also been thoroughly researched in many different sectors. One of the sectors that have attracted substantial research is the health sector. Nevertheless, virtually all research has concentrated on traditional health care, e.g. hospitals. On the other hand the recreational health sector which includes activities such as SPA, fitness and wellness is insufficiently researched.

Traditional quality management theories focused on industrial manufacturing companies and were developed by researchers from the technical disciplines. About 25 years ago theories specifically concerning quality in services started to appear. This coincided with the rapid expansion of the field of services marketing (Brown et al., 1994). In developing theories for services management the scholars realised that quality issues needed to be included. As no such theories existed at that time, service quality came to be a field within services marketing.

Later, services marketing has matured as a research field with vast amounts of research being produced and numerous scientific journals having this focus. Nevertheless, the last few years have seen interesting developments in the field. Leading scholars have begun to question the relevance of services marketing as a field focusing solely on marketing of services. Rather, they

claim that there is a certain service logic that can be applied to any offering. This new way of regarding service marketing, called the service dominant logic of marketing, SDL, is promoted as a completely new logic for all marketing activities (Lusch and Vargo, 2006). The approach has gained considerable ground and is becoming more and more established.

There is, however, room for further theoretical development of SDL. The connection between SDL and quality, both traditional quality management and service quality, is in no way clear and need to be investigated further. Ideally, lessons learned in the quality field should be incorporated into SDL. Since it is relationship oriented and based on co-production by the customer (Vargo and Lusch, 2004a), the success of SDL hinges on the ability of organisations to uphold balanced and trustful relationships internally as well as with networks of external customers and other stakeholders (Gummesson, 2008). Developing such ability requires profound and sustainable learning touching on values and culture. Ways of achieving this are studied in the field of organisational learning (Senge, 2006). Therefore, organisational learning theories should be integrated in SDL for it to have a profound base needed for real changes to take place.

Moreover, the technical progress in information and communication technology, ICT, has to a large extent altered the conditions for conducting marketing activities and will probably continue doing so (Hair and Money, 2006). The advent of the Internet has changed the way people and companies communicate providing companies with novel approaches for marketing communications. In particular, the recent upsurge in the use of social media (Facebook, Twitter etc.) is rapidly changing the ground for marketing activities (Scott, 2010). This new development remains to be included in SDL. In particular, entrepreneurs have been quick to adopt the social media in their marketing activities. The health and fitness sector mainly consists of small and medium sized companies. Furthermore, the sector is characterised by fast changes in the output and demand for various health offers. Thus, successful actors need to have entrepreneurial skills.

The overall scientific purpose for the project is twofold:

- To investigate service quality based on the service dominant logic of marketing in the health and fitness industry, an empirical area which has so far attracted far less research than its importance merits.
- To develop means of integrating knowledge from the fields of quality management, organisational learning, social informatics and entrepreneurship into the framework of the service dominant logic of marketing.

The research contribution from the project will be a development of the service dominant logic, SDL, framework into a more complete system for generating quality and marketing success in the modern business context. Another contribution will be additional understanding of service

quality and marketing in the health and fitness industry. The purpose for this paper is to outline the theoretical framework and propose a methodological approach for the study.

The main basis for the project is found in the newly developed field of service dominant logic of marketing. In order to further develop this field, we will also include theories from quality management, organisational learning and entrepreneurship. In the following sections, we will briefly review some relevant aspects of those areas.

Quality Management

Management of quality has been an issue for all organised human activity since time immemorial. However, systematised quality management methods were first employed around of the turn of the last century (late 19th and early 20th century). The early quality management approaches focused mainly on inspection (Lagrosen and Lagrosen, 2009). Next stage came to be the development of statistical tools for quality control. After the Second World War the development was led by Japan with the aid of the American scholars W. Edwards Deming and Joseph J. Juran. This resulted in quality management being developed into an advanced framework for continuous improvement, employee motivation and leadership (Deming, 1986; Ishikawa, 1985; Juran, 1989). Today, quality management can be viewed as an integrated system consisting of managerial values, techniques and tools (Hellsten and Klefsjö, 2000). Research has found that the methods included, and in particular the values, are effective for achieving a well-functioning quality management in companies from all sectors (Lagrosen and Lagrosen, 2005).

Traditional quality management was developed in the industrial manufacturing sector. In a separate development marketing emerged as an academic discipline. It started as an offspring of economics but advanced into a number of different schools during the first half of the 19th century. From the early 1960s, the discipline came to be dominated by the managerial school containing practical and concrete methods for marketing management (Lagrosen and Svensson, 2006). Starting from the late 1970s this dominance came to be challenged by two different strands: industrial marketing and services marketing. The latter came from the realisation that marketing services was different from traditional marketing which made the managerial school of marketing lack relevance. The field expanded rapidly during the 1980s and 1990s aided by the fact that global deregulation led to substantial changes taking place in many service sectors. Some general models for service quality that were presented quite early had a large impact and they are still referred to (see e.g. Grönroos, 1990; Parasuraman et al., 1985). In addition, related methods for quality measurement such as the SERVQUAL (Zeithaml et al., 1990) has continued to be popular in spite of later criticism. More recently service quality has expanded its scope in different directions, coming to include important aspects such as the role of feelings (Edvardsson, 2005). In addition, the importance of relationships has been emphasised. In this way, service

marketing together with industrial marketing formed a basis for the emergence of relationship marketing (Gummesson, 1999).

The Service Dominant Logic of Marketing

In recent years, a new way of approaching marketing related to services has come to light – the service dominant logic of marketing, SDL, (Vargo and Lusch, 2004a). Its originators claim that this is a completely new paradigm of marketing thought and that it will change the way marketing is viewed in the same way that traditional physics was revolutionised by the advent of quantum mechanics (Lusch and Vargo, 2006). The novelty lies in the fact that it does not focus on services as such. Services marketing is usually seen as a way of conducting marketing for a certain kind of products i.e. services. Therefore, much effort has been wasted on identifying differences between goods and services while still departing from a goods-based perspective (Vargo and Lusch, 2004b). SDL in contrast regards service marketing as an approach, a way of conducting marketing for any kind of products in which the focus is on providing value for the customer. SDL builds on a number of fundamental premises which were originally formulated as follows (Vargo and Lusch, 2004a):

- The application of specialised skills and knowledge is the fundamental unit of exchange
- Indirect exchange masks the fundamental unit of exchange
- Goods are distribution mechanisms for service provision
- Knowledge is the fundamental source of competitive advantage
- All economies are service economies
- The customer is always a coproducer
- The enterprise can only make value propositions
- A service-centered view is customer oriented and relational

SDL has had a large impact on marketing thought and the framework is evolving. In a later paper (Vargo and Lusch, 2008) the authors have revised the premises and added two additional:

- All social and economic actors are resource integrators
- Value is always uniquely and phenomenologically determined by the beneficiary

Despite its impact, critics hold that SDL need further development (Brookes, 2007) and particularly that more empirical research is needed (Winklhofer et al., 2007). One area that needs further development is the connection between SDL and branding (Brodie et al., 2006). Interestingly, SDL may lead to branding being extended into wider communication modes

(Ballantyne and Aitken, 2007). For this reason, we will also include studies of the branding situation in the companies and we will examine their use of social media (see below).

Organisational Learning

Organisational learning is a theoretical field that has been formed based on the ambition to promote sustainable success in organisations. Thus, it is meant to counter reductionist approaches and provide a more holistic view. Its basis lies in systems thinking and consequently it draws its roots to general systems thinking as formulated by von Bertalanffy (1950) and its later developments in organisational theory. Seeing organisations as systems implies that shifts in processes, strategies, practices and systems must be based on inner shifts in people's values, aspirations and behaviour (Senge, 1999). This resembles the view of quality management as a system of different components presented above. Thus, quality initiatives, in order to be effective must be based on profound organisational learning, which is often not the case (Argyris, 1999).

Another interesting aspect on learning is the difference between knowledge of individual actors and knowledge documented in routines, policies, information systems, documents etc. Both forms influence individual possibilities for learning and development (Giddens, 1984)

Profound learning in an organisation requires an influence on its core values (Argyris, 1993; Argyris and Schön, 1996). Often organisational change is attempted through changes in organisational structure, ways of working, technology, communication etc. However, these changes will only be effective if they are related to changes in principles and values of the employees (Schneider et al., 1996). Often, there is a difference between the values that an organisation officially promotes, the espoused values (Schein, 1992) and what it actually does, the theories in use. Although much research has indicated inconsistencies between these two, not enough is known about how to handle these inconsistencies (Argyris, 1999). There are often hidden attitudes that need to be brought to surface for continuous learning to be possible (Senge, 1999).

Learning in organisations often involves tacit knowledge (Polanyi, 1967) and actions that are skilful are usually based on tacit knowledge that have been transformed into manageable routines (Argyris, 1999). Hence, methods for transforming tacit knowledge to explicit knowledge and vice versa are particularly useful (Nonaka and Takeuchi, 1995). Therefore, our studies will contain qualitative methodologies aimed at understanding subtle aspects such as values and tacit knowledge. Organisational learning theories tend to emphasise collaboration, decentralised structures and multi-disciplinary work-teams (Beeby & Booth, 2000). Consequently, the experience of studying teams that the research group has (see e.g. Berlin & Carlström) will be beneficial for understanding these learning processes.

Although, organisational learning usually deals with separate organisations its scope should go beyond the individual organisation. Current business is becoming ever more interconnected and value is usually created in networks. Ideally, learning networks can be created (Garcia, 2006). One ambition for the proposed project is to create a learning network in the Swedish health and fitness industry.

Entrepreneurship

The term entrepreneurship derives from the French words "entre" (between) and "prendre" (to take). Thus, literally, an entrepreneur is someone who takes a position between a supplier and a customer. According to the French economist JB Say, an entrepreneur is a person who "shifts economic resources from an area of low productivity into an area of higher productivity and greater yield" (Chaston, 2000). This definition would probably cover most activities of business but entrepreneurship has developed into a concept including elements of risk taking and innovation. Entrepreneurial marketing is different from traditional marketing management, business marketers act differently, and thus their behaviour enriches the understanding of the possibilities of marketing (Hills and Hultman, 2006). In many cases, entrepreneurship is used to describe the activities of smaller firms. Yet not all small businesses are entrepreneurial. On the contrary, many conduct marketing in a very traditional way. For them to be considered entrepreneurial there must also be some novelty and creativity in the way they act. In addition, entrepreneurial marketing, may also be applicable in large firms, given the turbulence, risks and uncertainties surrounding today's markets (Hills and Hultman, 2006).

Moreover, entrepreneurial thinking is making its way into other areas than the industry. For example, social entrepreneurship is used to describe business activity in the social field as a complement or alternative to traditional welfare systems (Thompson et al., 2000). Similarly, cultural entrepreneurs are individuals or companies who act in an entrepreneurial way in the cultural sphere (Wilson and Stokes, 2002)

Several researchers have noted characteristics or personal tendencies that are common among entrepreneurs, that distinguishes them from other managers. Some examples of such properties that are particularly relevant in this case are (Lamping and Kuehl, 1997):

- *A passion for business.* This should include both personal and emotional commitment. Many professionals in the health and fitness sector are themselves passionate about their own training, fitness and general health.
- *Confidence.* Entrepreneurs often have profound knowledge of their products and markets which makes them confident in themselves. Managers in the health and fitness sector are often personally engaged in health and fitness activities as well as having

substantial theoretical knowledge of anatomy, nutrition etc. This gives them a firm knowledge base for their management.

- *Management of risk.* Entrepreneurial activities usually contain an element of risk taking. Nevertheless, many entrepreneurs manage risks very carefully. Several activities in the health and fitness sector require substantial investment which contributes to an element of risk.
- *Changes are opportunities.* Entrepreneurs are not frightened by change. Rather, they search for it and exploit it. They have a capacity to master change to their own advantage. The health and fitness sector is characterised by fast changes in that new treatments and training methods quickly come in and out of fashion. Handling this requires entrepreneurial ability.

Previous Research Regarding Quality in Health and Fitness

Studies connecting health and quality have almost exclusively concerned traditional health care such as hospitals (see e.g. Arcelay et al., 1999; Wagar and Rondeau, 1998; Yasin and Alavi, 1999).

On the other hand, organisations focusing on promotive health care such as the fitness, SPA and wellness sectors have received surprisingly little attention from the research community (Mueller and Kaufmann, 2001). This is even more surprising since some of the studies made have indicated that the sector suffers from quality problems (e.g. Hurley, 2004).

As service operations in the fitness sector are especially complex (Chelladurai et al., 1987) and distinctive (Chang and Chelladurai, 2003) often including bundling of different services (Woolf, 2008), research into this field could contribute to the general development of service quality theory and the development of the service dominant logic of marketing. Some previous studies into quality dimensions in the sector exist (Afthinos et al., 2005; Athanasopoulou, 2008; Chang and Chelladurai, 2003; Chelladurai et al., 1987; Lagrosen and Lagrosen, 2007; Papadimitriou and Karteroliotis, 2000; Tawse and Keogh, 1998) as well as their relationship to branding (Alexandris et al., 2008). However, the research is rather disparate and no consensus regarding the dimensions of quality in the area has been reached (Lam and Ocker, 2004).

Consequently, studying marketing and quality management in this field based on the new SDL framework should be of substantial scientific interest.

Methodology

We have seen the relevance of the theoretical fields described above. In order to integrate them an empirical study will be carried out. As the research is explorative to its character, the empirical research will mainly be of qualitative character. The research process will consist of co-

production involving the researchers as well as staff from the participating companies. Together, we will carry out case studies at each company and the results will be integrated into a larger whole as a learning network is formed.

The following methods will be used:

- *The quality café.* This is a method for analysing quality problems and possibilities for improvement. Having the method “The world café” (Brown, 2005) as its basis, quality management analysis tools have been integrated so as to make it suitable for analysing quality issues. In an interactive seminar consisting of a systematised number of phases engaging employees as well as customers, creative solutions and novel opportunities are often found. By allowing the space in-between the participants speak, even tacit knowledge can be expressed.
- *Definition and measurement of quality dimensions.* This is another method developed by Stefan and Yvonne Lagrosen which has been used successfully in a number of studies (e.g. Lagrosen, 1997; Lagrosen, 2000). The method is based on qualitative interviewing and analysis inspired by the grounded theory-approach (Glaser, 1992; Glaser and Strauss, 1967; Strauss and Corbin, 1990). The aim is to gain profound understanding regarding the meaning of quality for customers and staff. Based on the quality dimensions and the service context model (Gummesson, 1993), matrices are formed describing the quality dimensions in relation to modes of interaction. On this basis questionnaires of high validity are constructed and delivered to customers and staff.
- *Analysis using the MOA-model.* The MOA-model especially focuses consequences of implementation and use of information- and communication technology (ICT) in the organization for different interest groups such as employers (work process), employees (work situations) and customers (quality of the service produced) (Grundén 2009c). The model has been used in several studies (e.g. Grundén 2009a,b). The model will be used in workshop activities with each organization, both as a scenario model and as an evaluation model.

The data from the research methodologies will be immediately useful for the companies and they will be continuously implemented into their operations. Furthermore, they will bring ample possibilities for theoretical development. An in-depth understanding of vital aspects regarding quality, organisational learning and entrepreneurship in the health and fitness sector will result from the data collection and the direct analysis of the data. This knowledge will be used for development of the theories regarding the service dominant logic of marketing so as to make them more complete and valid.

Conclusions

We have seen how the new service dominant logic of marketing has developed and that it should have relevance for the health and fitness industry. Moreover, we have found that quality management, organisational learning and entrepreneurship all are vital fields both theoretically and in practice for the health and fitness industry. In addition, there is a theoretical value of integrating these fields in the service dominant logic of marketing theories. It is our ambition to contribute to this development with the proposed study.

SOCIAL MEDIA MARKETING AS AN ENTREPRENEURIAL LEARNING PROCESS

Lagrosen, Stefan¹; Josefsson, Pernilla²

¹University West, Email: stefan.lagrosen@hv.se

²University West, Email: pernilla.josefsson@hv.se

Abstract

The purpose for this paper is to explore social media marketing from the perspective of entrepreneurial learning. The theoretical basis consists of contributions from the fields of organisational learning and entrepreneurship. An empirical study involving ten companies has been carried out. The data were analysed with methods inspired by grounded theory. Categories describing the companies' social media presence from an entrepreneurial learning perspective are provided. Thus, the paper presents a novel way of studying social media activities which should contribute to the theoretical fields of organisational learning and entrepreneurship as well as to the understanding of social media marketing. For practitioners, the findings provide additional knowledge that should be useful for their own social media activities.

Keywords: Social media, Entrepreneurship, Organisational learning, Marketing communication

Introduction and purpose

The advent of social media has changed the marketing landscape in a profound way. Conducting marketing in social media carries many opportunities but it may also entail many difficulties. As developments in the social media are very fast, many companies are uncertain as to how they should act. A major difference between many traditional marketing communication tools and social media is that the latter builds on interaction. Consequently, an ability to handle relationships is vital. In general, relationship marketing builds on factors such as trust, commitment and attraction (Gummesson, 1999). These factors become even more vital when companies can be in constant interaction with their customers while the customers have ample opportunities to interact between themselves.

Interaction between companies and customers can be seen as a mutual learning process. Companies have excellent opportunities for learning about their customers' needs and wants as well as providing useful information for their customers. If companies pay attention on this, a more profound learning may take place in which the organisation as a whole is developed. This in turn may be a basis for entrepreneurial activities. Successful entrepreneurship requires an

ability to find new opportunities in the market or even create a new value balance in the market (Hills and Hultman, 2006). An in-depth learning about customers' needs and wants can enable them entrepreneurs to develop offers that better satisfy customers, thus leading to marketing success. Profound learning in organisations is studied in the field of organisational learning. By applying this theoretical field to the field of entrepreneurship a vantage point for studying entrepreneurial learning could be created.

The purpose for this paper is to explore social media marketing from the perspective of entrepreneurial learning. An empirical study, involving ten companies of different size and industry has been carried out. The findings are analysed from an entrepreneurial learning perspective.

The rest of this paper is structured as follows. First, we present the theoretical bases for the study i.e. social media marketing, organisational learning and entrepreneurial learning. Second, our methodology and the findings that it generated are described. Third, the analysis is made and conclusions are drawn.

Social media and marketing

Social media in itself is a widely described term, and there are many who try to define it. In general, social media is considered to include a new layer to information. The technologies associated with social media offering services such as, search functions, analytics and social networking (O'Reilly and Battelle, 2009). These services described in social media is said to have revolutionized our social contacts not only in every-day life.

The use of social media has also become more and more popular as a marketing tool for the establishment and management of customer relationships as it offers for an example marketing principles as to influence a specific target of audience, based on voluntarily acceptance as well possibilities for addressing social issues (Kotler et al., 2002). According to the traditional marketing paradigm, marketing is seen according to the one-way interaction model, where the producer is the sender and the customer is the receiver. In contrast, the use of social media in marketing is based on a multi-way interaction approach, in which the roles of sender and receiver are mixed (Ström, 2010). A pull marketing strategy is more efficient for the use of social media than the traditional push-marketing approach. This means that the producer uses social media for the communication of information, knowledge, values and ethics related to the service or product, in order to entice the customer to interact. When the customer is interested in taking part in the interaction, valuable information about interests, preferences and values could be interchanged in an informal process and affect the further customer relationship and marketing activities in order to make the product or service more attractive. Ethics and values are important aspect of the interaction, as they could contribute to mutual trust in the relationship building

(Brown, 2005). The combination of the use of different social media could also reinforce the marketing effects. Social media can be an economic alternative especially for entrepreneurs and smaller businesses, as low costs are needed, apart from working hours.

Organisational learning

In order to survive in a competitive context organisations need to constantly develop. Thus processes of learning throughout the organisation are necessary. Organisational learning theories have been developed in order to provide a more sustainable perspective on organisational success. One aspect that is of particular importance for organisational learning is the leaning of leaders and their learning is related to their emotional intelligence (Goleman et al., 2002; Grewal and Salovey, 2005). Emotional intelligence has been defined as the ability to conduct emotional self-leadership and it is related to intra-psycho and intra-personal function (Mayer et al., 1991). The learning of the leaders will be more effective if their emotional self-awareness, one of the dimensions of emotional intelligence, is high (Goleman et al., 2002).

A learning organisation is characterised by people learning together and thereby developing new and expansive patterns of thought which in turn leads to better results (Senge, 1990). Achieving this is related to values such as trust and common visions being present in the organisation (Senge et al., 2005; Senge, 2006). From a social constructivist perspective organisations are seen as having no objective existence; rather they are enacted constructions of the interacting organising parties (Weick, 1979). Assuming this line of thought organisational learning becomes a way of actually constructing organisations.

Moreover, Senge et al. (2005) define different levels of learning. The more profound levels require awareness of a greater wholeness. In order for learning to be profound, the organisational values must be influenced (Argyris, 1993; Argyris and Schön, 1996).

Perhaps, the most influential framework in organisational learning theory is the five disciplines presented by Senge (2006):

- *Personal mastery*. There are two aspects of personal mastery as a discipline:
 - Continually clarifying what is important to us. We need to approach our lives as creative work directed towards higher ideals.
 - Seeing current reality more clearly. Many organisations and people live in a self-made web of illusions. Breaking out of this trap is a process of learning.
- *Mental models*. Our behaviour is usually unconsciously controlled by deeply held internal images of the world around us. These images tend to limit our thoughts and actions to areas that are familiar. Therefore, clarifying these assumptions is a first step

towards change. This requires us to slow down our thinking processes so as to become aware of the mental models that they are built on.

- *Shared vision.* A shared vision is a vision that people throughout the organisation carry. Having impressive power, it can be viewed as a force in people's hearts. As such it provides focus and energy for learning. Achieving a shared vision may be difficult but it can lead to profound organisational learning.
- *Team learning.* If the energies of the members in a team are aligned, striving in the same direction, their effect is extremely powerful. However, the individual members often have different ambitions and priorities which leads to waste of energy. Aligning the team requires dialogue and deep listening between members.
- *Systems thinking.* This is the discipline which contains the main argument of Senge. It integrates and forms the basis for the other four disciplines, implying that organisations should be seen as open systems in which all parts constantly interact with each other and with the environment. This is a holistic viewpoint seeing deeper patterns which enable sustainable solutions. Moving away from the traditional reductionist linear way of analysis, the fifth discipline is built on a language of circles including feedback loops where all influences can be both causes and effects.

Consequently, systems thinking is the main basis for organisational learning. Systems thinking is an established feature of organisational theory, going back at least to the original theories regarding a general systems theory by von Bertalanffy (1950). The merits of Senge lies in establishing systems thinking in relation to organisational learning which should be particularly useful for studying organisational change.

Entrepreneurial learning

Entrepreneurship has become popular as a solution to many of the world's current problems. One way of succeeding as an entrepreneur is by finding unexplored niches in markets where all actors have incomplete and often inaccurate information (Kirzner, 1979). Another way is to radically alter the balance of the market by inventing new products, processes, channels etc. This leads to what can be called creative destruction in that the old order is destroyed in the process that something new and more effective is created (Schumpeter, 1934). Both these processes have obvious implications for learning. Entrepreneurial learning needs to be active leading to the acquisition of entrepreneurial patterns rather than just experiences and skills (Wing Yan Man, 2006).

Methodology

An empirical study has been carried out. Since the study is of an explorative character we chose to use qualitative methods for data collection. A multiple case study was chosen and ten companies were chosen for investigation. The selection was based on theoretical sampling (Glaser and Strauss, 1967). Accordingly, companies and respondents were selected based on their perceived ability to contribute to the theoretical understanding being developed. For this reason the range of companies is very diverse spanning many different industries and ranging from one-man companies to very large enterprises. A list of the companies is provided in table 1.

In-depth interviews (Patton, 1990), were carried out with managers responsible for marketing communications in the companies. In total, eleven interviews were carried out by students trained by the authors. The interviews were of a conversational character. No fixed questionnaire was used. Instead the respondents were encouraged to speak freely from their own hearts so as to not superimpose the presuppositions of the authors on the respondents. The data from the interviews was analysed by the authors based on methods inspired by the constant comparative technique from the grounded theory approach (Glaser and Strauss, 1967; Glaser, 1992).

Findings

The analyses of the interviews revealed the following categories:

Use

This category concerns the level to which they use social media and which media they use. Several companies use social media to a rather low extent. Some others use it much more. The varying degrees of use do not seem particularly related to the size of the organisation. The largest organisations are the most active users but some of the very small companies are also very active. From this small sample it seems to be the medium sized companies that lag behind. Regarding the choice of social media tools, all companies currently use Facebook (networking site) which seems to be the completely dominating tool. A few of the companies also use Twitter (microblog service), YouTube (video sharing site) and blogs. One company also uses Scribd (a publishing site) and LinkedIn (networking site). Interestingly, although all the companies use Facebook, they have adopted it lately. Thus, those companies that use Twitter began using it before they entered Facebook. Concerning the companies' use and adoption of microblogging, this application allows and meets a need of regular and fast communication, which requires less time investment from the user (Java et al., 2007; Naaman et al., 2010).

COMPANY	TYPE OF COMPANY	COMMENTS
<i>Anonymous</i>	<i>Photography and journalism</i>	<i>A free-lance photographer and journalist</i>
<i>Arena Älöhögsborg</i>	<i>Real estate, health care</i>	<i>A real estate company focusing on facilities for health care, fitness and sports</i>
<i>Fregatten Atletica</i>	<i>Fitness centre</i>	<i>A fitness centre offering gym facilities as well as a wide range of training classes</i>
<i>Kurortsstaden</i>	<i>SPA-company</i>	<i>A separate SPA-company that collaborates with a major hotel</i>
<i>Marknad Varberg</i>	<i>Networking company</i>	<i>A company aimed at developing the business and society in the town of Varberg</i>
<i>SATS</i>	<i>Fitness chain</i>	<i>The largest fitness chain in Scandinavia with 116 fully owned fitness centres</i>
<i>Sports international</i>	<i>Sports arrangements</i>	<i>A small company that arranges cups, voyages and other events</i>
<i>Statens järnvägar</i>	<i>Railway operator</i>	<i>Sweden's main railway operator. State owned but competes in a market with private actors.</i>
<i>Stena Fastigheter</i>	<i>Real estate</i>	<i>One of Sweden's largest real estate companies focusing on private tenants</i>
<i>Strömstads Badanstalt</i>	<i>Spa and fitness centre</i>	<i>A company offering baths, SPA-treatments and fitness activities.</i>

Table 1. The companies included in the study.

Aims and results

The aim that most companies emphasise is providing information for their customers. The information can be of concrete nature informing current customers about changes in services, delays, problems or new procedures. Alternatively, the media are used for more traditional selling messages intended to push products. Nevertheless, some companies are eager to promote an active dialogue with the customers and in a few cases also between the customers. Certain companies have noticed a need from the customers to communicate between each other. In addition, such possibilities are believed to make the customers more committed to the companies and their products.

There seems to be an almost linear development in the ambitions of the companies, going from fairly traditional one-way communication to encouraging an active dialogue; and finally to aim for a community of interacting customers and prospects. Regarding the media, there is also a difference in that microblogging is seen more as a tool for one-way communication while social networking sites are perceived to be more interactive. Facebook for example is also regarded as more private and intimate whereas Twitter is thought to be more as a business like information media.

When this living dialogue is achieved, it is seen as a learning process in which feed-back from the customers is used for developing the companies' offers. In this way, companies can get fast and direct knowledge regarding developments in the market. It is also seen as a wider environmental analysis tool. Active response from customers is sometimes stimulated by contests and special offers for social media contacts.

The information giving is also seen as a kind of education process for the customers. In particular, one company uses YouTube as a channel for conveying knowledge about fitness activities and news in the health area. For this purpose, they have started their own YouTube channel. Moreover, the companies link Facebook visitors to their homepage on the web where they can provide more information.

By answering to criticism the companies are able to provide their view and explain their activities. They can react to critical tendencies very quickly. Sometimes satisfied customers "defend" the companies against criticism which is very valuable due to their much higher credibility. Moreover, they regard social media presence as a way as giving additional service to customers using it as an "online customer service centre".

The image factor

From the interviews it was clear that several companies have more than just concrete aims for their social media presence. They see presence on social media as a way of seeming to be modern and up to date. Thus, social media presence in itself is viewed from a branding perspective. Nonetheless, they realise that their social media pages must be updated and active in order not to give an amateurish impression. In addition, companies that are active in company networks need to co-ordinate their different social media activities so as to not confuse customers and public.

Uncertainty

There is a substantial uncertainty among the companies regarding their media presence. They have difficulties in assessing the costs. The direct costs are normally very low. On the other hand, the time it takes for employees to work with the social media presence entails substantial costs that are hard to gauge since the same employees often work with many different tasks at the

same time. Measuring the effects of the presence is even more difficult. Only a few very basic things, like the number of followers on Twitter or the number of likes on Facebook is immediately quantifiable. Sometimes they can also get a feeling for the power of the media by providing special offers only available through social media and measuring how many customers take advantage of them. In appreciating other effects, the companies usually have to be content with mere guesswork. This makes it problematic to decide how much to invest in social media presence and which activities to engage in. In addition, they are uncertain as to how they should handle criticism or abusive behaviour on the social media. All in all, this uncertainty was rather marked and troubling for the companies. The consequence is that most of the companies in this study do not have any specified aims for their social media presence and the activities are often the result of ad-hoc decisions.

Connection to organisational learning

In order to assess the connection of these findings to organisational learning, we chose to relate them to the five disciplines framework of Senge (2006) presented above. This lead to the following inferences:

- *Personal mastery.* Used in a suitable manner social media should give organisations a possibility of seeing their reality more clearly. Many organisations have lacking understanding of the experiences, attitudes and feelings of their customers and other publics. By promoting interaction with and among social media users, as some of the respondents did, they may begin to see their organisation in a new light.
- *Mental models.* If a profound dialogue on social media is achieved the limits set by organisations' mental models may be widened. Nevertheless, this also requires slowing down the thinking process in order to reflect. The studied companies reported that working with social media can require substantial input of time from the employees. If this time is spent in too superficial information handling the opposite of this discipline might result.
- *Shared vision.* A shared vision need to be built on dialogue which is respectful and profoundly focuses on learning to understand other people's viewpoints. Interaction on social media could ameliorate such learning. Nevertheless, this again requires the social media interaction to be of a more profound nature than it was for most of the companies included in the study.
- *Team learning.* Aligning the team requires dialogue and deep listening between members. Is this deep listening possible on social media? If so this could be a way of forming aligned teams. This should be an important issue for further research to examine.

- *Systems thinking*. Based on the interviews, we can conclude that those companies that use social media most successfully have managed to integrate them into a larger system. This reduces the uncertainty that many companies experience. Using social media as a separate addition without connection to the other activities of the company will not lead to any useful results. Instead, their role in the greater open system, that includes the company, the customers and other stakeholders of importance, should be assessed. By utilising social media in this context as a means of gaining profound knowledge as noted above, they could become a very useful tool for entrepreneurial learning as well as for entrepreneurial success.

Conclusions

We have seen that the use of social media varies substantially between the companies. Those who use them most successfully have managed to stimulate interactivity and put them into a larger context. Viewing the findings of the study through the lens of the five disciplines of the learning organisation (Senge, 2006) provided additional understanding. The importance of achieving a profound dialogue and handling social media in the context of the larger system became clearer.

Suggestions for further research

This is a first, limited study of an explorative character involving a small number of companies. It provides some preliminary knowledge that can be used for more in-depth research. Larger studies involving many companies and going more into detail regarding success factors and hurdles should be welcome.

Acknowledgement

The authors wish to acknowledge the students for their professional performance of the interviews with the company representatives.

Abstract

The primary aim of this paper is firstly to investigate the relationship between customer satisfaction with e-service quality attributes and certain demographic and behavioral variables. The secondary aim is to identify detractors and non-detractors. Based on a convenience sample, the perceived e-quality and user satisfaction on a sample of three hotel sites was examined by using the instruments of WebQual 4.0 and Net Promoter Score (NPS) respectively. Multiple regression was applied to identify significant relations while discriminant analysis enabled the identification of the attributes which distinguish detractors and non-detractors. The important variables in determining satisfaction were found to be "attractive appearance", the "ease of use" of the web-sites, and the age of the users. The former was found to be a key discriminator between detractors and non-detractors followed by "ease of use" and "accuracy of information". Finally, this study by employing the Net Promoter Score offers practical help to researchers and practitioners in providing directions for e-quality improvement and produces a stimulus for further investigation and future research in a variety of areas and sectors.

Keywords: e-quality, e-services, customer satisfaction WEBQUAL, Net Promoter Score, hospitality sector

Introduction

Quality of services and customer satisfaction has been for several years a wide research theme mainly due to its immense importance for commerce (Johnston, 2004; Caruana, 2002; Parasuraman et al., 1988). The higher the quality the more likely it is that the customer feels satisfied (Getty and Getty, 2003). Therefore, customer satisfaction leads to positive behaviours towards the interpreting the data. Net Promoter Score (NPS) creates a different way of measuring customer satisfaction by simplifying the procedure. Companies obtain their Net Promoter Score by asking customers a single question: "How likely is it that you would recommend this

company to a friend or colleague?" (Reichheld, 2003). Based on their responses, customers can be categorized into one of three groups: Promoters, Passives, and Detractors.

Over the last few years the introduction of the internet as a new powerful tool for service production gave completely different aspects to quality and its measurement. It is natural that this new technology opened up a new area for research to scholars who tried to provide new tools for measuring web-quality by trying to decode the new dimensions of e-commerce. It has been claimed by Zafiroopoulos and Vrana (2006) that it is vital to examine users' perceptions about a website, because these views give general guidelines to manage a website effectively and determine its' eventual success. Researchers have come up with many dimensions and models that can define web-quality. An effective and well known instrument to measure user perceptions on quality of web-sites is WEBQUAL 4.0. It has evolved by means of a process of iterative refinement and consists of 22 items gathered up into three dimensions namely, usability, information and interaction (Barnes and Vidgen, 2001, 2002, 2003)

As far as tourism is concerned the internet has changed the traditional behaviour of the consumer in terms of searching, choosing and buying a tourism product.. Rocha and Victor (2010) assert that tourism is one of the sectors where the internet is heavily used. Therefore, it is obvious that the internet can promote the abundance of tourism choices that Greece has, especially due to the fact that it is a tool that has no geographical boundaries and which is highly connected to tourism itself.

The objectives of this study are twofold. The first is to investigate through regression analysis the relationship that might exist between WEBQUAL's measurement items and user satisfaction as expressed by NPS for 3 website hotel portals. The second is to identify through discriminant analysis which items are in a position to differentiate respondents who act as detractors from those who do not act as detractors. Furthermore, an attempt to connect the results with the demographic information will be made. The effects that socio-demographics have on customers satisfaction is an area that is very often neglected by the researchers (Tsai et al., 2002). For this purpose the relation of demographic factors, frequency of use and type of users in relation to overall quality and satisfaction will be also examined.

Theoretical background

E-services' Qualities Dimensions and Measuring Models

One of the earlier attempts were to measure the quality of web-sites came from Griffith and Krampf (1998). Their research was mainly based on the time needed to answer customer's e-mails and they suggested that the access and the responsiveness of a website were the main criteria for measuring quality in websites.

Voss (2000) claimed that the five dimensions of the SERVQUAL (SQ) model can be applied to measure e-quality if the empathy dimension that has to do with human interaction is excluded. For Voss assurance is highly connected to the extent to which a website can handle quickly, and accurately, the needs of the clients; credibility refers to the fast connection to the web-site, the correct and fast loading of the page and the accuracy of the commands, and also refers to the security and trustworthiness of a web-site.

An important effort to adapt the SQ model in e-services came from Kaynama and Black, (2000). After a subjective evaluation of the e-services of 23 traveling agencies seven dimensions of model SQ were extracted: Responsiveness, Content and purpose (reliability), Accessibility, Navigation, Design and presentation, both of which derive from the dimension of the material property of the company, tangibles, Background, (derive from assurance) and Empathy, personalization and customization. Zeithaml *et al.*, (2000) also presented a list of criteria in an effort to provide a revised model for the measuring of web-quality: Access, Assurance/trust, Ease of navigation, Efficiency, Flexibility, Personalization, Price knowledge, Reliability, Responsiveness, Security/privacy and Site aesthetics. The above characteristics more or less cover a wide range of the characteristics of web-quality.

Even if there are several pieces of research available and a variety of dimensions proposed, the research on complete models is relatively limited. Yoo and Donthu (2001) used a sample of students for the creation of a model named SITEQUAL, in order to measure the perceived quality of a web portal. This research concluded with nine basic points and four dimensions: ease of use, aesthetic design, processing speed and security. SITEQUAL was developed to evaluate the perceived quality provided by internet shopping sites (Yoo and Donthu, 2001) although Sohail and Shaikh, (2007) expressed the view that it does not capture the complete purchasing process. Wolfinbarger and Gilly (2003) created the eTailQ model for the quality of services in the web retail business. Their research proved that the designed model of the webspace and the dimension of credibility were immediately related to the overall quality, satisfaction and loyalty of the users of the webspace.

Zeithaml *et al.*, (2000, 2002) defined the electronic service quality as the degree to which a web space is efficiently aiding the purchase, the delivery and the shipping of goods and services. The e-SQ model was applied on focus groups and through this procedure they ended up in seven dimensions: efficiency, reliability, fulfillment, privacy, responsiveness, compensation and contact. From the seven dimensions the first four were considered important while the last three had a role only when a customer was dissatisfied. Parasuraman *et al.*, (2005) continued the research on the model and they renamed the dimension of 'reliability' to 'system availability'. Furthermore they gave a new name to the model, E – S – QUAL for the basic four dimensions and E – RecS – Qual for the second level dimensions.

Loiacono *et al.*, (2000, 2002) developed a scale with 12 core dimensions that fall into four major higher order factors: ease of use, usefulness, entertainment and complementary relationship, indicating the WebQual™ model. However this model's primary purpose is to generate information for web site designers as it examines the internet retailer's website, rather than to measure service quality as experienced by customers (Parasuraman *et al.*, 2005; Francis and White, 2002).

Mich *et al.*, (2003) developed a model called 2QCV3Q with seven dimensions: identity, content, services, location, maintenance, usability and feasibility, oriented as a quality model for web site development. Bauer *et al.*, (2006) based on E-S-QUAL proposed an instrument for measuring e-markets. The model added the factor of enjoyment as an important dimension, together with functionality/ design, process, reliability and responsiveness.

The development and progress of webqual (WQ)

WQ's first version was developed at UK Business Schools (WebQual 1.0, Barnes and Vidgen, 2000) based on Quality Function Deployment (QFD). In their research 54 raw qualitative characteristics were gathered and structured into relational groups. From these characteristics, a questionnaire with 35 parts was created which was then filled out by respondents and used to enhance the initial questions. The first comment on the questionnaire was about its considerable size. Applying WQ to B2C websites, it was obvious that the interaction element, examined from a quality point of view, was absent from WQ 1.0. Barnes and Vidgen, (2002) suggested that the interaction quality is equally or even more important to the success of the web corporation, given the absence of human communication. In WQ v2.0, the interaction point of view was widened with the integration of previous research in service quality, with SQ as the predominant model. While WQ 1.0 aimed to information quality, it was less focused on the interaction aspect. Likewise, WQ 2.0 emphasized the interaction quality but lacked WQ's 1.0 abundance in information quality. Both tools included a width of quality characteristics about the website as a software project. Reconsidering the tools, Barnes and Vidgen, (2001) found out that all the qualitative characteristics could be categorized into 3 discernible categories: a) quality of website, b) information quality, and c) quality of interaction services. This reconsideration resulted in a new version of WQ (3.0) which was tested in web auctions.

In WQ v4.0, the focus on quality of websites was replaced by a focus on usability which emphasised the user and their perception, instead of focusing on the design and the website as a context free software artifact. The term Usability also mirrors the interaction of information and services. In WQ 4.0, the usability aspect is extracted from the human-computer interaction bibliography (Davis 1989, 1993; Nielsen 1993), and recently from the usability on the Web (Nielsen, 1999, 2000; Spool *et al.* 1999). Usability is related to the perception and interaction of the

user with a website, for instance; the ease of browsing if the design model is appropriate for the kind of website kind. The following Table 1 shows the actual structure of WEBQUAL 4.0 and its relevant dimensions where it is obvious that the model is influenced from many service quality models and especially from the SERVQUAL one.

Table 1. WebQual 4.0

<i>Description</i>
<i>Usability</i>
1. <i>I find the site easy to learn to operate</i> 2. <i>My interaction with the site is clear and understandable</i> 3. <i>I find the site easy to navigate</i> 4. <i>I find the site easy to use</i> 5. <i>The site has an attractive appearance</i> 6. <i>The design is appropriate to the type of site</i> 7. <i>The site conveys a sense of competency</i> 8. <i>The site creates a positive experience for me</i>
<i>Information</i>
9. <i>Provides accurate information</i> 10. <i>Provides believable information</i> 11. <i>Provides timely information</i> 12. <i>Provides relevant information</i> 13. <i>Provides easy to understand information</i> 14. <i>Provides information at the right level of detail</i> 15. <i>Presents the information in an appropriate format</i>
<i>Interaction</i>
16. <i>Has a good reputation</i> 17. <i>It feels safe to complete transactions</i> 18. <i>My personal information feels secure</i> 19. <i>Creates a sense of personalization</i> 20. <i>Conveys a sense of community</i> 21. <i>Makes it easy to communicate with the organization</i> 22. <i>I feel confident that goods/services will be delivered as promised</i>
<i>Overall Impression</i>
23. <i>My overall view of this Web-site</i>

Net promoter score (NPS)

According to Reichheld (2003, 2006) the best predictor of top-line growth can usually be captured in a single survey question: Would you recommend this company to a friend? Reichheld arrived at the “recommend to a friend” question by testing around 20 customer

satisfaction and retention questions among a sample of customers across a range of products and industries and then correlating their responses with future purchase or referral behavior. The NPS question was found to have the best correlation out of the 20 questions tested, 80% of the time (Satmetrix, 2004). According to this research there are the answers between 1-6 belong to a group that was called “detractors” while answers between 9 and 10 are called “promoters” and are the ones that will actually promote the company to a friend. It is also worth mentioning that 7s and 8s are called “passives” and they do not take part to the equation at all. The equation to calculate the NPS is: $NPS = \% \text{ of Promoters} - \% \text{ Detractors}$.

NPS also echoes the veracity of word of mouth in the sense that Promoters offer positive word of mouth, and Detractors hold a negative word of mouth about the firm and its products or services. Before Net Promoter, many customer satisfaction programs yielded management reports that lacked credibility (Owen and Brooks, 2008). The main reason for the rapid popularity of NPS is that it takes a very complicated theme that is customer satisfaction and turns it into one simple question, enabling companies to address this subject easily, cheaper, and with a good reaction results.

Despite its great success NPS has been severely criticized as simplistic (Molenaar, 2007) but it has especially been attacked by Reichheld’s point that it can be directly related to growth (Reichheld, 2006). Keiningham *et al.*, (2007) compared the NPS with the Net Promoter American Customer satisfaction Index (ACSI) which is an index for measuring customer satisfaction and not growth, and found that the results between the two metrics are similar in relation to driving growth. Fleming, (2006), Morgan and Rego (2006), Keiningham *et al.*, (2007), are among those researchers who through research tried to prove the absence of a relation between NPS and growth. However, it still remains one of the most popular ways for companies to address customer’s satisfaction.

Hypothesis formulation

Many researchers in services studies recognized that there is a strong and positive relation between the quality of services and the satisfaction of customers (Caruana, 2002; Parasuraman *et al.*, 1988). In the virtual environment Website design or usability is one of the most important factors for determining the quality of a website (e.g. Yang *et al.*, 2005; Yang and Fang, 2004; Aladwani and Palvia, 2002; Loiacono *et al.*, 2000) and therefore, it may influence the levels of user satisfaction. Palmer (2002) found that customer satisfaction is significantly associated with usability and design features unique to the Web, and Casalo *et al.*, (2008) also found that usability of websites influences satisfaction and plays a special role in the loyalty formation process. Bai *et al.*, (2008) in research based on three Chinese hotels found that website quality expressed in terms of usability and functionality has a direct impact on users’ satisfaction and their purchase

intentions. According to the above findings we expect that quality dimensions will have an impact on satisfaction. Thus the following hypothesis is formulated:

H1: Website quality variables (items) have an influence on user satisfaction in the e-hotel business.

It is obvious that companies should look beyond the strictly technical issues and look into ways of analyzing the factors that affect web customer satisfaction (Wang and Fesenmaier, 2006). Individual loyalty is considered to be the outcome of customer satisfaction and that is what makes the latter so important (Anderson and Sullivan, 1993; Hallowell, 1996; Yoon and Kim, 2000). Furthermore, it is noted that greater degrees of customer satisfaction create loyal customers (Methlie and Nysveen, 1999) who in their turn create positive word of mouth which is likewise significantly important for e-businesses (Reichheld and Scheffer, 2000).

Mazzarol *et al.*, (2007) back up the notion that the word-of-mouth is a new tool in gaining competitive advantage. It can be viewed as an indicator of customer loyalty. Srinivasan *et al.*, (2002) suggest that one of the behavioral outcomes of e-loyalty is positive word of mouth. Dick and Basu (1994), state that loyal customers are more likely to engage in positive word of mouth. Indeed, executives from some of the world's most prestigious firms have wholeheartedly adopted Net Promoter as the gauge of their firms' efforts to improve customer loyalty (Keiningham *et al.*, 2007). In the context of NPS, Promoters are the ones that create positive word of mouth while Detractors are those that should be targeted by marketing due to the fact that their bad word of mouth is damaging the growth and image of the company. Therefore, taking these considerations into account it is of great importance for a web-site to be effective and efficient in order to identify the quality factors (items) that discriminate between detractors and non detractors. The second hypothesis is proposed as follows:

H2: There are specific quality factors (items) which are significant in dividing users into detractors and non detractors.

The effects that socio-demographics have on customers satisfaction is an area that is very often neglected by researchers. However, there is research that proves and supports the importance of socio-demographics in customer satisfaction. A survey conducted by Skogland and Siguaaw (2004) examined such factors as purpose of travel and demographics, the study revealed that Business travelers were among the least loyal of the guests responding which may puzzle the business if that group deserves the expenditure on marketing policies that could be used for a more loyal group instead. Moreover it revealed that men were more interested than women in reducing risk by purchasing a known hotel. This finding may mean that men should be targeted with loyalty programs more strongly than women. Tsai *et al.*, (2002) also notes about the neglect of demographics that "It was often forgotten by those who used the ServQual scale that the model was originally located by Parasuraman *et al.*, within a framework where socio-

demographic variables, like life-stage and gender, had a role to play in the formation of both expectations and perceptions” (p. 8). Apart from age and gender and the type of user (leisure, business, etc.) it is expected that behavioral measures such as frequency of booking a hotel through internet may also determine the level of quality and satisfaction. Accordingly the following hypothesis is formulated.

H3: Age, gender, type of user and frequency of booking are factors which can have an impact on quality and satisfaction.

Methodology

The WEBQUAL 4.0 was the survey instrument and was distributed to a convenience sample of 127 adults. Ritter *et al.*, (2004) supported the idea that convenience samples can be used for web research. All the participants had access and prior experience of using the internet as a tool and had previously agreed to join the research. Also, they were familiar with the websites in order to have more accurate results; therefore they were provided with access to the three websites while completing the questionnaire. The collection of the results was completed in two big meetings in a university library where computers were provided for the completion of the questionnaires. Although the hotels offered to host the survey, we preferred to avoid using existing customers of any of the hotels. This survey judges the quality of the website and not of the hotel itself, therefore it was believed that existing customers of any of the three hotels may had a difficulty in differentiating between what they liked or not in their hotel and what they liked or not on the website. The completion of the 7-scale questionnaire was time consuming, varying from 30-45 minutes per user and therefore not an easy or lighthearted task since they had to navigate back and forth towards the three websites for every question. The websites chosen for the research belong to three hotels located centrally in a large city of Greece named El Greco, Metropolitan and Plaza, they all belong to the three star category. For convenience, their sites will be addressed as Site A, B and C respectively throughout the research.

The questionnaire is divided into three main sections. The first section includes personal information about the user such as gender and age accompanied by questions that state the type of traveler and how accustomed the user is with booking hotels through the internet. From the initial questionnaire three questions were removed (number in the original as questions 17, 18, 22). This adjustment took place because the abovementioned questions did not apply to the hotels in question. Related research from the creators of WEBQUAL (Barnes and Vidgen, 2002) supports this adjustment. Question number twenty is a ten scale rating question regarding the Net Promoter Score (NPS).

To test the first and third hypothesis regression analysis was used. NPS was the dependent variable and the three dimensions were the independent variables. Demographics and type of

user and frequency of booking also served as explanatory variables. To satisfy the second hypothesis a discriminant analysis was performed. It was applied in order to be able to classify the users based upon whether they are detractors or non-detractors. All items of the WEBQUAL 4.0 were used as discriminating variables. Detractors received the value of zero and non detractors received the value of 1.

Findings

As a first step a regression analysis was run to find the influence that certain variables might have on the overall view of the sites that users can have. Table 2 illustrates the estimated regression models.

Table 2. Results of regression analysis with dependent variable overall view of sites

Variables	Model 1		Model 2		Model 3	
	Coef.	Sign.	Coef.	Sign.	Coef.	Sign.
<i>Easy to Navigate</i>	-	-	-	-	0,426 (4,691)	0,00
<i>Easy to Use</i>	0,397 (4,686)*	0,000	0,449 (4,791)	0,000		
<i>Attractive Appearance</i>	-	-	0,182 (2,152)	0,039		
<i>Appropriate Design</i>	0,345 (3,806)	0,001			0,330 (3,616)	0,001
<i>Accurate Information</i>	0,298 (3,157)	0,003	0,281 (2,651)	0,012	0,249 (2,511)	0,017
<i>constant</i>	-0,863 (-1,244)	(0,222)	-0,327 (-0,414)	0,682	-0,676 (-0,992)	0,328
<i>R-adj.</i>	0,645		0,555		0,645	
<i>F-value</i>	23,427		16,364		23,456	
<i>S.E.</i>	0,446		0,500		0,446	

**t-ratios in parenthesis*

The analysis has shown that there are three models that best explain the overall view that users have about the sites. Model 1 and Model 3 appear to prevail over model 2 which has the lowest adjusted R2 value and standard error. "Appropriate design" and "Accurate Information" provided by the sites are the two variables that were found to be significant in both models. The variable "Easy to navigate" and "Easy to Use" was found significant in models 3 and 1 respectively. These two variables seem to have the same contribution in explaining overall view. However, when both are simultaneously treated as explanatory variables they appear to absorb each others explanatory power. The same happens with the variables appropriate design and

attractive appearance. Therefore, one of them was retained in the right hand side of the equations.

Table 3 illustrates the results of two regression models having as dependent variable the satisfaction as it is expressed by NPS. Model 4 shows that the users' overall view of the sites is an important explanatory variable of satisfaction at the borders of 5% significance level. For the determination of satisfaction two statistically powerful variables was found. These two variables, which also appeared significant in model 2, were the attractiveness of the appearance of the websites and the ease of use of the websites. The latter was considered to be significant at 10%. The positive signs they receive indicate that the higher their value the higher the level of satisfaction and vice versa. That is, the easier the websites are to use and the more attractive they are the higher the level of satisfaction of users.

Table 3. Results of regression analysis with dependent variable NPS

Variables	Model 4		Model 5		Model 5	
	Coef.	Sign.	Coef.	Sign.	Coef.	Sign.

**t-ratios in parenthesis*

As to the relation of satisfaction with demographics (gender, age) and behavioral variables (frequency of booking, type of user) the analysis showed that only age has a determinant role on the level of satisfaction. However, its significance lies on the borders of 10% level. The application of discriminate analysis on the groups of detractors and non-detractors produced the results illustrated in Table 4. The analysis was broken into two steps. In the first step all variables were included resulting in a non significant discriminant function (function 1). In the second step a more specific function (function 2) was estimated with variables which successfully differentiated the two groups. Specifically, the estimated canonical correlation of function 1 is higher than of function 2. However, the estimated chi-square statistic based on Wilks' Lamda rejects at 5% significance level, the hypothesis that there is no difference in the group mean scores on the discriminant scores only for function 2. Therefore, function 2 instead of function has a

discriminatory ability and it succeeds to discriminate between the two groups to a degree that is unlikely to be due to a chance.

Table 4. Discriminant analysis results

Variables	<i>Function 1</i>	<i>Function 2</i>	<i>Function 2</i>
	<i>Standardized coefficients</i>	<i>Standardized coefficients</i>	<i>Structure coefficients</i>
<i>Easy to Learn & Operate</i>	-4,315		
<i>Clear & Understandable</i>	0,685		
<i>Easy to Navigate</i>	3,472		
<i>Easy to Use</i>	1,699	0,302	0,231
<i>Attractive Appearance</i>	2,467	1,004	0,901
<i>Appropriate Design</i>	-3,06		
<i>Sense of Competency</i>	2,746		
<i>Positive Experience</i>	-1,501		
<i>Accurate Information</i>	0,971	0,227	0,111
<i>Canonical correlation</i>	0,928	0,462	
<i>Wilks' Lambda</i>	0,139	0,786	
<i>Chi-square (sign.)</i>	8,894 (0,447)	8,287 (0,040)	

To assess the contribution of the variables to the discrimination process the correlations between the values of the discriminant function and the original variables was examined. The correlations are given by the structure matrix. The variable which discriminated the two groups ranked by importance are: attractiveness of appearance, ease of use, and accuracy of information. The positive signs indicate that the large discriminant scores are associated with higher values of the variables. Finally, an interesting finding is that the three variables compiling the discriminant function were found to be statistically significant in determining the overall view users have about the sites.

To sum up the empirical findings satisfy all three hypothesis of the study. However among the 19 variables only two of them were found to determine satisfaction. These were: attractive appearance and ease of use. The former was found to be a key discriminator between detractors and non detractors followed by ease of use and accuracy of information.

Discussion and conclusions

In a highly technological reality where the virtual world has become as important as the real one, web-quality should not be neglected by companies that want to stay competitive and grow; especially for the tourism industry where web-sites are one of the most important tools available for information and communication across countries. In the heart of the tourism product lies the hotel sector which is regarded as a highly competitive market place. In this market hotels' strategic position depends greatly on their ability to provide a superior tourist experience which

could generate satisfied and loyal customers (Anderson and Srinivansan, 2003) leading to the sharing of favorable word of mouth and publicity (Wong, 2004). Given the significance of word of mouth intentions in tourism, fostering and managing electronic positive word of mouth behaviors is necessary (Park and Gretzel, 2007).

The main purpose of the present study was to investigate perceived quality and satisfaction in the hotel sector. Results was expected to provide information about the relation between satisfaction and web quality and reveal those factors which are significant in separating respondents into those who spread negative word of mouth about the hotels and those who do not. To measure quality the Web-Qual 4 was adopted slightly modified since our sites have an informational character and not a transactional one. Satisfaction was represented by a new simple instrument called NPS. To our knowledge this is the first time evidence has been provided about relationships between quality and satisfaction using these two instruments in the hotel sector.

Empirical findings of the research largely support the proposed hypothesis. Initially regression analysis showed that on line users evaluate website quality of hotels' on the basis of the attractiveness of their sites, the ease of use, the accuracy of their information, the appropriateness of their design, and the ease of navigation. These results are in line to a large extend with the findings of other studies in tourism where information quality (87%) and ease of use (60%) are the dominant factors in users assessments of web-site quality (Park and Gretzel, 2007). Further empirical estimates revealed that among the 19 measuring items that make up Web-Qual 4.0, only two of them were found to be significant in determining satisfaction. These were: attractive appearance and ease of use. The former was found to be a key discriminator between detractors and non detractors followed by ease of use and accuracy of information. It appears that aesthetics and the absence of difficulties to use the web sites are the major sources of user satisfaction and together with accuracy of information (when scored high) can function as shields to potentially negative recommendations by users. Websites must be seen as a shopping window, in the same way a well designed and pretty shopping window will attract customers a well designed website will too. Since the customer has no immediate or physical contact with the product the website works as the face of the company. A messy and an inconsistent window can turn off on line users. The factor of attractiveness also be compared to the factor of cleanliness of the hotels which is regarded as an important quality attribute. Therefore, when building their web-sites hotels should pay attention to the way information is presented in terms of color use, font size and style and the relevance and quality of pictures so as to end up with a clean and enticing site. It is also essential for hoteliers to provide an easy to use interface so potential customers can conveniently obtain information or even complete a transaction.

Navigation bars or buttons should be in the right position so browsing between pages or having access to various information (e.g. price lists, booking options, maps, currency

converters), can be done easily. Also cumbersome browsing or processes that constantly block can frustrate the user and create negative feelings which can be spread by word of mouth. Inaccurate information can also allow a propagation of negative word-of-mouth. Users often rely on the site's reputation in hopes that the information they provide will be precise. However, most hotels are not known or do not carry a brand name. By providing accurate information online hotels can inspire trust in their potential market thus fueling positive recommendations and other behavioral intentions like revisiting and reusing the website. Therefore, hotels must make sure they often revise their web pages in order to achieve up to date information (Baloglu and Pekcan, 2006). Lastly and Cunliffe (2000) pointed out that a bad site can lead to a loss of even 50% in sales and that bad experience is also a reason for low repeated visits on that webpage.

An interesting result was found on the role of age on both variables of "overall view" and of the "chance to recommend" a site. It appeared that age has a positive impact on those two variables. The older the respondents the more likely they are to favor the overall quality of the web sites and the more satisfied they will be. This finding has a twofold aspect. The first can be linked to the need for further investigation, both qualitative and quantitative, about this relationship. The second aspect deals with the need to redesign the web-sites according to the wants and needs of the specific age groups.

Limitations

Some limitations of this research should be acknowledged and directions for future studies should also be suggested. The quality measuring items used in this study do not include those regarding transactional purposes. This fact does not devalue our findings since the internet is used primary as an information gathering tool to enable potential customers to be better prepared to make purchases (Schulze, 1999). Furthermore virtual customers first test the virtual environment of the web site and then they decide whether they will purchase or not (Nielsen, 2000). However, the fact that the survey is based on a small number of web sites with 127 respondents and in a specific geographical region limits the generalizability of its results.

A further investigation with a larger sample could assess the relationships between quality satisfaction and other constructs like loyalty in a way that the current study cannot. Also, research with a larger sample and with more information about respondents of different cultures, education, occupation and traveling purposes, could reveal more reliably the reasons behind the differences between detractors and non detractors. In this way web sites can be structured and designed to target specific on line groups.

DETERMINANTS OF EARLY RETIREMENT IN THE EUROPEAN UNION

Lamprianou, Iasonas¹

¹Lecturer, Department of Social and Political Sciences, University of Cyprus. Email: iasonas@ucy.ac.cy

Abstract

Early retirement is a phenomenon which has been studied in some depth in the last three decades. However, the literature has not studied adequately the variables that relate to the

desired age of retirement and the variables that explain the discrepancy between the desired and the actual age of retirement, in the European Union.

This study uses a subsample of 18 European countries of the first release of the dataset of the fifth round of the European Social Survey to investigate the factors that affect the desired age of retirement and the discrepancy between the actual and the desired age of employment. We focus on a subsample of around 9.000 respondents who are in the age range of 50-64. People in this age range, not in active employment, may be considered to have retired early.

We used multilevel linear regression models to investigate our research questions. We found that the desired age of employment is explained by both personal (demographic and career) characteristics as well as country-specific characteristics (e.g. the GDP). However, the discrepancy between the actual and the desired retirement age is explained only by personal (demographic and career) characteristics.

We conclude that early retirement is frequently imposed on people by external factors, beyond their control. Early retirement is not just a habitus which appeared in the last decades, but also a complex phenomenon with social as well as financial characteristics.

Keywords: Early retirement, multilevel linear regression

Introduction

Early retirement has traditionally been distinguished from retirement. The former may be defined as the situation at which people do not work, do not seek work and also consider themselves retired, although their age is below the official (depending on the situation and the country) retirement age. Although many definitions of early retirement exist, OECD (2005) has defined early retirement (*retraite anticipée*) as “*a situation when an individual decides to retire earlier and draw the pension benefits earlier than their normal retirement age*”.

The international literature has identified many reasons that lead people to early retirement. These reasons may vary according to personal (e.g. health), social (e.g. social status and occupation) and situational (e.g. country) characteristics. It was very early suggested that economic as well as health reasons may make people decide to go on early retirement (Bazzoli, 1985) e.g. poor health can force people to retire; on the other hand, poor economic conditions may discourage people from retiring early because they need to keep their income at higher levels.

Bould (1980) found that unemployment is another factor that encourages people to proceed to early retirement. More specifically, Bould used regression analysis on the National Longitudinal Survey sample of American men (ages 52–64 in 1973) to show that weeks of previous unemployment were significantly related to early retirement for both Black and White males. A

plausible explanation (suggested by Bould) is that unemployed people prefer to present themselves as retired rather than to carry the stigma of unemployment. Bould reached these results after accounting for variables such as social security and pension eligibility, assets, health limitations, family responsibilities, occupation, changes in the unemployment rate and urban residence. Along the same lines, but more recently, Strandh (2000) showed that there was a positive relationship between exit from unemployment and better mental well-being. However, Strandh found that exit to early retirement pension did not significantly change the mental well-being of a sample of 3,500 unemployed Swedes.

However, it is frequently the case that the employers – or the labour legal framework of some countries – may accidentally encourage people to retire early. Fasang (2010) recently suggested that there are a number of institutional early retirement pathways which people can follow in order to retire early. Higgs et al. (2003) suggested that organizational restructuring, financial offers, opportunities for leisure and self-fulfillment are some of the factors affecting people's decision for early retirement. It seems that when people seek ways to early retirement, they will take advantage of little loopholes in the laws and regulations so that they will do so.

It is also possible that the nature of employment can encourage people to seek early retirement. For example, Blekesaune and Solem (2005) suggested that men may find it easier to obtain an early-retirement disability pension because men usually have more physically demanding jobs. Also, according to the same research, even when men and women have jobs of the same nature (e.g., low-autonomy jobs), women do not tend to retire early as frequently as men.

It has been frequently argued that people in the age group of 55-64 should be encouraged to stay in employment for longer. For example, Euwals, De Mooij and Van Vuuren (2009) explained that the goal of the Dutch government is to retain 60% of the people of this age group in employment by 2020. The EU has been investing for years on research projects, such as the "Transnational Exchange for Active Ageing" in order to devise strategies for active ageing. The aim of such projects is usually to improve the labour market situation of older workers (55+) and to enhance the capacity of, as well as the incentives for, those people to remain in the labour market (or re-enter the labour market) (Ketsetzopoulou, 2007). It is not certain how these measures may have encouraged people to remain in active employment for longer – there is not enough literature to guide on this issue.

An important report by OECD (2006) suggests that the percentage of people in employment in the age range of 50-64 varies significantly between countries and between men and women. Some countries enjoy a participation of less than 50% and others a participation of around 70%. For example, Phillipson and Smith (2005) pointed that in the UK, a quarter of men and women leave work before 58 years of age. Moreover, the percentage of women (of this age group) who decide

to remain in employment increases. According to OECD, the effective age of retirement (the age when a person withdraws from the labour force) can affect the economy considerably.

Human Resource managers do not, normally, want their most talented or experienced personnel to retire early. Experienced personnel, say at the age of 54 or 60, are still very young and able to work productively. Business needs them in order to train younger personnel and pass the organizational culture to the younger generations. For example, Brooke (2003) suggested that *"findings refute the proposition that older workers are more expensive to employ than younger employees ..."* (p. 279).

At the micro level, it is important to investigate the reasons that encourage people to escape to early retirement, so that Human Resource managers may find ways to keep the more experienced staff for longer. At the macro level, it is also important to keep people in the labor force for economic as well as political reasons. It is therefore interesting to investigate the reasons that make people to wish to retire early.

However, in real life, people who decide to retire, do not always move to full retirement immediately. The international literature has shown that many people choose to participate in various forms of "bridge employment" which means that they may choose to go to part time employment, self employment or temporary work before final retirement (Feldman, 1994). Sometimes, bridge employment is a phenomenon closely related to early retirement (not just to regular retirement). For example, Davis (2003) studied a sample of 133 early retirees from an oil and gas services firm and found that various factors like organizational tenure, certainty of retirement plans, and career-related factors affected the decision of people to move to bridge employment.

We felt that it was important to make a distinction in our study between people in full early retirement and people in bridge retirement because past research has shown that these are distinguishable groups of people. For example, Heindel, Adams, and Lepisto (1999) found that, (between non-retired workers), satisfaction from income was negatively correlated with intentions to move to bridge employment. Along similar lines, Weckerle and Schultz (1999) suggested that satisfaction with financial situation may also be a factor that affects people's decision between bridge or continued full-time employment.

Our study does not deal with people in bridge employment, although one might consider them to be in some form of retirement (or at least, they are in the path towards retirement). Including in our sample people in bridge employment would make our investigation more complex and would certainly change our research questions and findings. We only focus on people who considered themselves to be in early retirement and were not (at the time of data collection) looking for part-time employment or were not seeking any form of self-employment.

It is important to ask the question about the relationship between early retirement and fiscal austerity in a period of financial crisis and uncertainty across Europe. We aim to investigate whether the patterns of early retirement changed across different European countries in recent years. Unfortunately, exactly because of the financial problems, a number of countries did not offer a sample for our study. For example, Greece, a country deeply troubled by financial problems in the recent years, decided not to participate in the fifth round of the European Social Survey.

Mirus & Pedde (2009) discussed the issue of early retirement in the era of financial crisis and suggested that, although “the notion of working longer ... is unpalatable to many ...”, it is probably what is needed under the specific circumstances. This, however, means that people should stop retiring early; at least, it means that fewer people will feel secure enough to make the choice to retire early. It is likely that more people will stay in employment longer; is also likely that more people may choose to move to bridge employment postponing their final retirement. It is also possible that some people who have already retired may have to return to employment – even part time employment.

In agreement to the above, Helman, Copeland & VanDerhei (2011) reported that “... Americans’ confidence in their ability to afford a comfortable retirement has plunged to a new low...”. More specifically, the percentage of respondents who were not at all confident that they would have enough money for a comfortable retirement grew from 22 percent in 2010 to 27 percent. This is the highest level measured in the 21 years of the study. They also reported that the age at which the respondents expected to retire increased (the percentage of respondents who expected to retire after age 65 increased from 11% in 1991 and 1996 to 20% in 2001, 25% in 2006, and 36% in 2011). Moreover, more people intended to work during retirement.

Gelinas (2011) also suggested that many people choose to work for more years in order to shorten the years of retirement because of the crisis. Gelinas presents a historical account of initiatives at the United States that made people work longer and postpone their retirement: these include legislature initiatives as well as initiatives coming from the private sector.

Whatever the reasons may be, however, one of the aims of this study is to sketch the retirement plans of people in various European countries and to investigate whether the early retirement desire has actually declined in the recent years (probably due to the crisis). We would like to investigate if Gelinas (2011) suggestion is indeed the case: “So far, people have changed their behavior only gradually. But as those who have received the new signals during their entire working lives approach traditional retirement age, it’s probable that more and more of them will keep working”.

The aims of the study

The international literature has accumulated a vast body of knowledge about the factors that make people retire early; therefore, investigating the factors that make people retire early will be a by-product of our analysis. We mostly aim to investigate how the plans of people to retire early may have been affected by financial reasons. We will also suggest initiatives to reduce the burden of early retirement on the modern societies and on businesses.

More specifically, we aim to use data from the first release of the fifth round of the European Social Survey to

- Identify the variables that explain (predict) the retirement age at which people **would like** to retire;
- Identify the variables that explain (predict) the **discrepancy** between the wished retirement age and the actual retirement age.

Methodology

This study involves two continuous dependent variables:

(a) The first dependent variable is the age at which the respondents wish to retire (if they have already retired, this is the age at which they wished they would have retired). In order to investigate the first research question, we will use all the respondents in the dataset in the age range between 50-64 (more information on this decision is given at a later section). This is the "agertr" variable in the dataset which can be downloaded from the web page of the European Social Survey.

(b) The second dependent variable, is the discrepancy between the age people retired, and the age at which they wished they would have retired. Obviously, this variable concerns only the sub-sample of people that have already retired. We computed this variable by subtracting the desired retirement age from the actual retirement age. Therefore, positive values of the variable meant that the respondent retired later than the age he/she would like to and negative variables meant that the respondent retired earlier than the age he/she would like to.

Multilevel linear regressions were used in order to identify the factors that explained/predicted the dependent variables because the respondents were clustered in 18 countries. Using multilevel models allows us to take into account the intra-class correlation and describe the structure of the data more accurately in our models. We wanted to measure the between country variance (intra-class correlation) and we enhanced the ESS dataset with country-level information (by means of new variables) such as GDP, country size, growth as a

percentage of GDP, average unemployment for the year and inflation (all these measures referred to the year 2010).

The ESS dataset included hundreds of variables, but after studying both the literature and the list of variables at length, we decided to follow the paradigm of Davis (2003) and we selected a specific sub-sample of variables in order to build theory-driven statistical models. In addition to the country-level independent variables mentioned above, we selected the following variables from the ESS dataset (a) demographic and personal characteristics such gender, age, years spent in full-time education, the country, marital status, living with partner, living with children, satisfaction from income and subjective health condition; and (b) work and career-related variables such as if the respondent was supervising other employees, the degree to which he/she was allowed to take initiatives (an aggregate measure from 0 to 30 which was computed by adding the responses of the respondents to the variables *wkdcorga*, *iorgact* and *wkdcpcce* of the ESS dataset where larger integers indicate more freedom for initiatives), the type of organization of employment, the size of the organization and the type of employment (self-employed or employee).

There were three ordered categorical independent variables in our dataset i.e. the perceived satisfaction from the household income of the respondents (variable "*hincfel*"), the length of past unemployment (4 levels from 'Never unemployed' to '5 years of unemployment') and the subjective overall status of health (5 levels from 'Very bad' to 'Very good'). Helmert coding of the ordered variables was used to compare each level of the variable to the mean of the previous levels; e.g. for the 'satisfaction from income' variable, the first contrast compared the mean of the dependent variable for the category "*Difficult on present income*" with the mean of the previous category "*Very difficult on present income*"; the second contrast compared the mean of category "*Coping on present income*" with the mean of all of the previous categories ("*Very difficult on present income*" and "*Difficult on present income*") and the third contrast compared the mean of category "*Living comfortably on present income*" with the mean of all of the previous categories.

The unordered categorical variables with more than two categories, were entered into the linear regression models using a simple dummy coding (such as the type of the organization of the past employment with categories 'A state owned enterprise', 'Central or local government', 'Respondent is Self-employed'). The categorical variables with only two categories (e.g. whether the respondent lives with his/her children or not) were entered into the models as binary (0/1) variables.

The data

Data from 18 participating countries (all countries but Israel and Russian Federation) of the first release of the data of the 5th round of the 2010-2011 European Social Survey were used. For

this study, we investigate the early retirement status of people in the sample in the age range of 50-64, which is the age range to which OECD (2006) referred. Only the respondents in the age group 50-64 (including ages 50 and 64) were selected for the analyses. Overall, there were 8,764 respondents in this age group, approximately 500 respondents per country. Approximately half of them (around 47.4%) were males. Around three quarters of the respondents were classified as active (employment-wise), whereas 1,975 respondents were classified as early retired (an average sample size of 110 early retired persons per country). The average age of all respondents in the sample was 57 years (the median had the same value). On average, they spent 12.2 full years equivalents in education.

Results

The average retirement age for the 1805 respondents who actually gave information about their year of retirement was 54.90 years ($SD=7.07$) whereas the median age was 57.00 years. It is important to mention here that the maximum retirement age is 64, simply because we restricted our sample to respondents in the age range [50 , 64].

Overall, 8006 respondents gave information about their wished age of retirement. The average wished age of retirement was 60.45 years ($SD=4.71$) whereas the median age was 60.00 years.

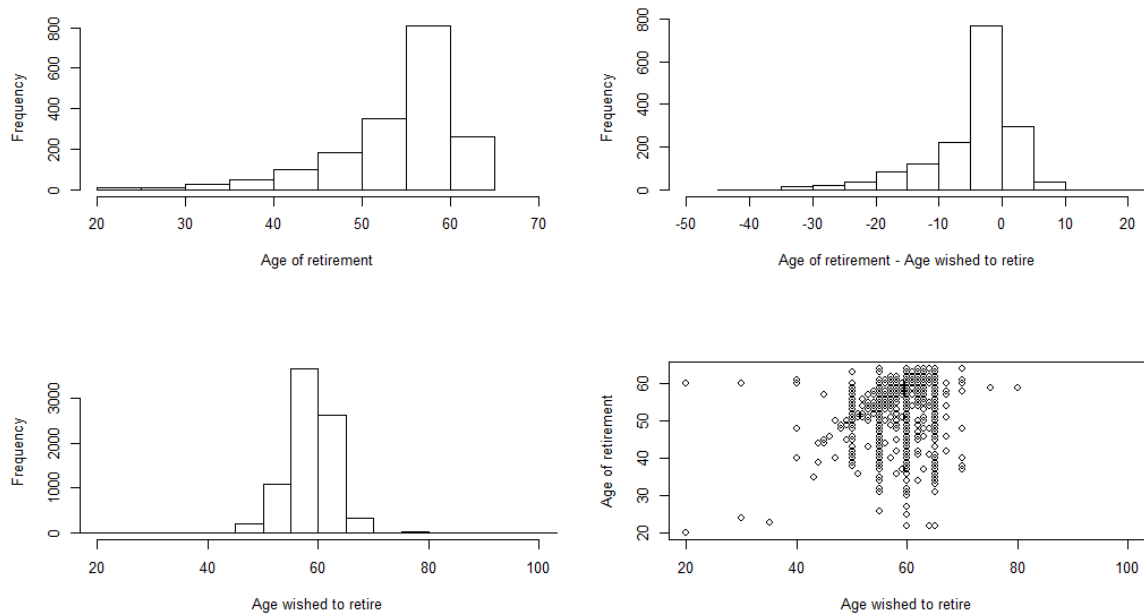

Figure 1. The distribution of the variables “age of retirement” (up left), “age wishing to retire / wishing to have retired” (low left), “actual – wished age of retirement” (up right) and the correlation between the wished and actual age of retirement.

If we compare the average age of retirement to the average wished age of retirement (for those who retired and actually responded to both questions), we may observe that the mean age of retirement is, on average, 3.7 years smaller (95% Conf. Interval of 3.3 to 4.0 years) compared to their wished age of retirement ($t(1608)=20.0$, $p<0.001$).

From Figure 1, we may also observe that the age the respondents wanted to retire was usually much larger than the age they had actually retired. On average, the 1609 respondents who gave the necessary information, wanted to retire 3.65 years later ($SD=7.49$) than their actual retirement age. The variable ranged from -43 to 40 years and the median difference was -1 year (50% of the respondents wanted to retire 1 or more years later than their actual retirement age).

The desired age of retirement

Multilevel linear regressions were used in order to identify the variables that explain the age at which the people wish to retire (or wished they had retired, if they have already retired).

Table 1 shows the results of Model 1. It is interesting to note that the variance attributed to the countries is practically negligible, indicating that we could instead use a single-level linear regression model. In addition to that, Gender (being a male) does not represent a significant amount of variance – suggesting that the effect of gender is roughly constant across the countries.

Interestingly, the desire of people to retire early is related to the size of the country as well as the GDP of the country. The larger the GDP of the country, the later the respondents would like to retire. On the other hand, the larger (in population) the country, the earlier the respondents would like to retire. It is not possible, at the moment, to speculate on why the population of the country was related to the desire to retire earlier.

Table 1: (Model 1) Regression coefficients (standard errors in parenthesis). Country and Gender (being a Male) are random effects (all other variables are fixed effects)

<u>Fixed effects</u>				<u>Type of Organization</u>				<u>GDP (2010)</u>		<u>Health</u>			
	<u>Intercept</u>	<u>Age</u>	<u>Initiative</u>	<u>State owned</u>	<u>Government</u>	<u>Self-employed</u>	<u>Education</u>	<u>(per 10.000 euros)</u>	<u>Population</u>	<u>Bad</u>	<u>Fair</u>	<u>Good</u>	<u>Very Good</u>
<i>beta</i>	-11.41*	1.06*	0.04*	-2.57*	-0.75	-0.04	0.12*	0.04*	-0.09*	0.40	0.75*	0.59*	0.43*
<i>(s.e.)</i>	(2.57)	(0.04)	(0.02)	(0.38)	(0.32)	(0.61)	(0.04)	(0.01)	(0.03)	(0.39)	(0.15)	(0.09)	(0.10)

Variance of Random effects:
Country (random intercept): 1.37
Gender (being Male) : 2.36
Residual : 29.20

* indicates a significant coefficient at least at the 0.05 level

Older respondents responded that they would like to retire later and the more initiatives a respondent was allowed to take at work, the later he/she would like to retire. More education was also related to retiring later.

Working for State owned organizations rather than working for private firms was related to a desire to retire almost three years earlier. Also, better health was related to a desire to retire later in life.

The discrepancy between the desired and the actual age of retirement

Model 2 (see Table 2) investigates the discrepancy between the desired and the actual age of retirement. The country was modeled as a random effect and the coefficients of gender (being a male) were allowed to vary between countries.

The between-country variance was significant, and the variance attributed to Country was approximately 20% of the total variance. This is strikingly different compared to the previous model. The coefficients of the gender (being Male) variable were also allowed to vary by country. The variance attributed to Gender was approximately 12% of the total variance. In other words,

in some countries, the respondents desired to retire significantly earlier than in other countries, and being a male had a different impact on the wished retirement age, depending on the country of residence. This is a result that clearly contradicts the previous model: the discrepancy between the desired and the wished retirement age is clearly affected by the country and the gender (and the gender effect is, by large, country-specific).

It is interesting to note, however, that none of the country-level variables were statistically significant. This is again in contrast to the previous model. It is possible that the inclusion of the "country" variable in the model absorbed most of the variance that could be attributed to country-specific characteristics. It is also possible that the personal variables were substantially more important than the country-level ones. For example, an individual may be more sensitive to his/her personal conditions (e.g. long unemployment) rather than the country-specific equivalent index (i.e. average country unemployment). Personal characteristics can substantially define the decision to go to early retirement.

Table 2: (Model 2) Regression coefficients (standard errors in parenthesis). Country and Gender (being a Male) are random effects (all other variables are fixed effects)

<u>Fixed effects</u>	<u>Type of Organization</u>				<u>Income Satisfaction</u>			<u>Health</u>					
	<u>Intercept</u>	<u>State owned</u>	<u>Government</u>	<u>Self-employed</u>	<u>Age</u>	<u>Difficult</u>	<u>Coping</u>	<u>Comfortable</u>	<u>Ever Unemployed</u>	<u>Bad</u>	<u>Fair</u>	<u>Good</u>	<u>Very Good</u>
<i>beta</i>	-57.55*	-1.74*	0.12	0.17	0.87*	0.18	0.31	0.45)	0.80*	0.38	1.06*	0.86*	0.69*
<i>(s.e.)</i>	(3.10)	(0.46)	(0.38)	(0.25)	(0.05)	(0.29)	(0.14)	(0.12)	(0.27)	(0.49)	(0.18)	(0.12)	(0.13)

Variance of Random effects:

Country (random intercept): 10.81

Gender (being Male) : 6.67

Residual : 37.34

* indicates a significant coefficient at least at the 0.05 level

Another interesting finding is that the years of education were not statistically significant, but this is probably because similar information is introduced in the model by the variable "satisfaction from income", in the sense that more education usually leads to more well-paid jobs and more satisfaction from income. On the other hand, age was a significant variable and every year of additional education corresponded to almost an additional year in wished retirement age.

Respondents who experienced unemployment retired, on average, almost a year later than they desired compared to those who never experienced unemployment. This probably means that they felt that they had to stay in employment in order to enhance their retirement plans. Better

health also corresponded to retiring earlier than the age they wished (probably because they felt that they still had the energy to work for longer). More satisfaction from income corresponded to retiring earlier than they wished. Finally, working for a State owned organization rather than working for a private firm corresponded to (probably been forced?) to retire earlier than wished.

Discussion

The factors that relate to early retirement have been investigated in depth. Financial, demographic and other personal reasons can explain the decision of employees to go on early retirement. However, past research has also shown that people are sometimes being pushed to early retirement because of external factors, which cannot be controlled by them, such as long unemployment. Such issues can sometimes cause anxiety among researchers because intuitively, one might expect people who are unemployed to look for a job rather than retire and forfeit any possible income from job.

For this reason, we decided that it is important to investigate the factors that relate to the age at which people **desire** to retire and then to investigate the factors that relate to the **discrepancy** between this **desired** retirement age and the **actual** retirement age. To this end, we run two models: the first investigated the variables that related to the desired age of retirement and the second investigated the variables that explained the discrepancy between the desired and the actual age of retirement.

We used the first release of the data of the fifth round of the European Social Survey, which had just been released at the time this study was being written. The dataset included around 8.000 respondents from 18 European countries (Israel and the Russian Federation were removed from the dataset).

Regarding the desired age of retirement, we found that there were differences between countries, but these differences were not substantial, compared to the effect of other variables. People working in State organizations would like to retire earlier, probably because they have a secure retirement/pension plan, so they do not have significant motives to be in active employment until late in age. Good health was also associated to a desire to stay in employment for longer. People with longer education also desired to stay in employment longer, probably because their jobs were less physically demanding, more fulfilling or provided them with other rewards (in addition to monetary capital) such as social or symbolic capital. Living in a country with a higher GDP was also related to staying into employment for longer, probably because of better health systems and because richer economies have been lately based on services which are jobs that do not demand high physical strength. One could argue that our findings are reasonable, but unfortunately there is no recent relevant literature with which we could compare our results.

However, desiring to retire early does not necessarily mean that a person has the luxury to retire at will. Retiring early usually demands a good retirement pension plan, savings or some other form of stable and secure support. This is important because retiring early means that a person will have to sustain his living for longer. Therefore, we investigated the variables that explained the discrepancy between wishing to retire early and actually retiring early. What we found was very interesting, in the sense that these results were very different from the results we found for the previous model. The most striking difference was that no country-specific variables were included in the model. The variables relating to individual characteristics and conditions were much more important than the country-specific variables. In addition to this, it was clear that there were factors that had a very strong impact on retiring earlier than wished: for example, working for a State organization, was related to retiring almost three years earlier than the wished retirement age.

These findings are in agreement with past literature, although there is no recent literature on this issue using data from Europe. For example, we know from the literature that financial and health reasons may make people decide to go on early retirement or work for longer (Bazzoli, 1985). Also, Bould (1980) found that unemployment is another factor that encourages people to proceed to early retirement and this is in agreement with our findings.

From the perspective of Human Resource managers, it is important to know which are the employees who are more likely to decide to go to early retirement. Such a knowledge can help governments as well as Human Resource managers to prepare the succession of important employees, or to give to other employees the appropriate motives to stay in employment for longer. The message from this study is that the factors that define the desire of people to retire at certain age, and the factors that actually give shape to their actual retirement age are different. To keep people in active employment for longer, they must be in good health, and they need to feel that they are still useful. There is a large number of people who seem to be forced to retire earlier than they wish. It is up to the State, the legislature and the Human Resource managers to take all necessary measures to give to the people the right to keep working for longer, if they wish.

Abstract

This paper analyses the money laundering policies in the Greek Banking Sector. It identifies and scrutinizes the causes that led to the implementation of policies against money laundering and it analyses the confrontation framework used in Greek banks. The main goal of this dissertation is to reveal the weaknesses of the national and global policies against money laundering and find perspectives related to an effective confrontation framework. Thus, there are suggestions of appropriate methods in order to strengthen the national and international financial system against money laundering phenomenon.

Keywords: Greek Banking Sector, Money Laundering, policies

Introduction

According to the daily terminology and experience, money laundering is all that actions and procedures, the practices or omissions that deliberately happen with the purpose of disguising and transforming by any means or methods the identity of the illegally acquired “dirty” money, so that it gets the desired legitimacy, in order to look like it was acquired or that it comes from a legal cause or origin (Tragakis, 1996).

The phenomenon of money laundering hasn't come up the last years, not even the last century. According to Stenimahitis C. (2002), the hiding of legal and illegal wealth has its origin even earlier, having a history of 3.000 years ago. The historian Sterling Seagrave, in his book “Lords of Rim”, describes that, even before 1000 b.C., traders in China were hiding their fortune, out of fear that the governments would bag the wealth they had gathered through trading. The techniques Seagrave describes –conversion of money into easily transportable valuable elements, export of cash out of the country, “overvaluation” for emigration of capital - are also used up to a point nowadays as well.

The term “money laundering” seems that comes from the United States during the decade of 1920s (Lilley P., 2003). Gangs of criminals at that time were trying to do the same thing they are trying to do today: to dissociate the product of their criminal actions from them same criminal actions. In order to achieve that, they were setting up businesses that had very high profits in cash, like for example laundries or launderettes or car washers and they were mixing the legal earnings with their illegal earnings. This way, they had a great alibi for the possession of great amounts of cash. According to Tragakis G. E. (1998), “cash” gives the desirable and necessary anonymity in most forms of criminal action, while it is also the most usual mean of exchange in smuggling and in retail drug trafficking, in the “markets” or “pitches” of big and small towns. So, while today the term “money laundering” is metaphorically connected with the cleaning and purification of “dirty money”, it seems that its origin has to do with the “washing” and “laundry” businesses of the United States of 1920s.

Nowadays, money laundering has taken tremendous dimensions. With the evolution of technology, millions of U.S. Dollars can go across the whole planet in less than a second (Lilley P., 2003), while more than two trillion U.S. Dollars are transferred worldwide every day. Organized crime takes the advantages of the rapid development in information technology, globalization, the almost unimpeded money transferring ability, the inexistence of the national boundaries thanks to the modern payment systems and the Internet while it has extended its “activities”, not only to drug trafficking – which initially was the main source of income – but to other sectors as well. And as a result, the rapid increase of its income which calls to be legalized somehow.

Indicatively we mention that according to Human Development Report of 1999 of the United States (Lilley P., 2003), the income of organized crime sums up to 1.5 trillion U.S.D. annually. On March of 1998, Dow Jones News reported that money laundering comes between the 2% and the 5% of the World Gross Product. At a national level, we indicatively mention the following:

- In Great Britain, Bank of England estimated in 1994 that 2.4 billion GBP were laundered every year.
- In Switzerland, the Ministry of Economics confirmed in 1998 that the country was involved in the laundering of 500 billion USD annually.
- In Greece, the former President of Money Laundering Committee, Counter Public Prosecutor Judge of a Court of Appeal Mr P. Nikoloudis, reported that in 2000 there were attached 4.3 billion drachmas (“Kathimerini”, 2001) coming from the effort to legalize income from illegal actions while in 1999 there were attached 2.5 billion drachmas (increasing tension). In 2002 there were attached about 23.5 million Euro (about 8 billion drachmas), according to the report of the Institution and Transparency Committee (“Vima”, 2003). Although we can see that there is a tremendous increasing tension in money laundering year by year, it was noticed that

the above mentioned amounts were supposed small compared to the real amount of capital that is laundered. In the meeting of the Institution and Transparency Committee in June 12th, 2003, Mr P. Nikoloudis and the President of the Committee for “money laundering”, Counter Public Prosecutor Judge of a court of appeal, Mr G. Pantelis, mentioned that “the money we do not catch is very much and the money we can not catch is even more”.

The impressive thing in the investigation of money laundering phenomenon is the inventiveness of criminals. The whole system displays a remarkable dynamic: the moment that the authorities find out an application of “money laundering”, the same moment, somewhere else by someone else, a new form of action is found out.

Determination of the problem of money laundering and the international experience

The legalization of income coming from illegal actions is an integral part of the evolution and transformation of modern societies and it expresses the effort of modern organized crime to “clean up the dirty money” their actions bring in. The level of the amounts of money and the constant character of that procedure, demonstrates the magnitude of the danger the economical systems are facing.

Many kinds of criminals followed money laundering phenomenon that came from various illegal actions, during the history. But we shouldn't ignore the fact that nowadays, the criminality levels have ejected and apart from drug traffickers, there are also many categories of criminals and crimes that face the need to find ways to legalize their incomes.

After the internationalization of economies and the abrogation of controlling of capital transfer, organized crime was tremendously facilitated to find methods for money laundering while on the other hand the efforts for finding and punishing that phenomenon were obstructed.

The realization of the complexity, the extension of the problem and its implications in the social and political stability of nations and in the solvency and security of credit institutions, has led the international community to intervene for the adoption of joint and particular proceedings and policies.

The main of these interventions are the following:

- The “**Basel Committee Principles**” since December of 1988, with the purpose of the establishment of new templates in the transaction behavior of the banks.⁶⁶

⁶⁶Basel Committee-BIS “Money laundering and terrorist financing”, www.bis.org/list/bcbs/tid_32/index.htm

- The **“United Nations Agreement”** in December 20th, 1988, that enforced the contracting nations to enact criminal penalties in cases of legalization of income from criminal actions. (United Nations, “United Nations Convention Against Illicit Traffic in Narcotic Drugs and Psychotropic Substances, 1988”).⁶⁷
- The **“Strasbourg Agreement of the member nations of the European Committee”** in November 8th, 1990, where the contracting parties have the obligation to introduce in their internal legislation stipulations for the suppression and punishment of “money laundering”.⁶⁸
- The **decision for the establishment of “Financial Action Task Force” (F.A.T.F.)** from the seven biggest industrial countries and the European Community Committee in July 15th, 1989, with the purpose of preventing the legalization of income from illegal actions.⁶⁹
- The **Guideline 308/91 of the European Commission**, that obligates the member nations to care for the prohibition in their land of the legalization of income from illegal actions.
- The **Law 2331/95** that incorporates the Guideline 308/91 for Greece.

Methodology

The methodology used in this paper for the approach of money laundering phenomenon is the presentation of its different aspects according to the current banking experience, since that is the main source not only of the suspicious transactions but of the policies applied against that problem in our country as well.

Theory comes especially from the material we gathered from different organizations and banking institutions and especially from Bank of Greece. Existing bibliography and studies on this matter are also taken into account, but the main point of the theory has to do with the policies that are used from the banks against money laundering.

The method used, concerns the quotation of the existing legislation in national and international level and the implementation from banks in the Greek society, of circulars and orders of Bank of Greece for the prevention and suppression of money laundering phenomenon.

Finally, there is an effort for recording the way of action of the different money laundering nets and the way the numerous organizations against money laundering cooperate in national and international level for the confrontation of the problem. We will also try to find any perspectives related to an effective confrontation framework.

Money Laundering Framework

Definition of money laundering.

Money laundering is the legalization of income from any criminal action through the financial system. The purpose of most of the criminal actions is to create individual or joint earnings. Money laundering is the proceedings that are used by some people, in order to hide the illegal origin of the capital they acquire and to change its identity as if it is shown that it was acquired by a legal source (Tragakis G., 1995).

The term “criminal action” by which it is possible to be acquired the ill gotten property that is wanted to be legalized, goes to the punishable acts that are determined by the Laws No 2331/1995 and No 3424/2005 of the Hellenic Republic. Some of the most important are the following:

Crimes that are anticipated by the law for combating proliferation of narcotic drugs

- Crimes that are anticipated by the law as far as weapons, ammunition etc. is concerned
- The crime of robbery

The crime of extortion

The crime of abduction

The special cases of theft

The illicit appropriation of articles of particularly high value

The illicit appropriation involving abuse of confidence

The fraud resulting in particularly large damage

The commitment of fraud as an occupation or habitually or under circumstances proving that the perpetrator is particularly dangerous

The illicit trading in antiquities

The theft of ship cargo of particularly high value

The removal and transplantation of human tissues and organs

The embezzlement against the government

The crimes out of ionizing radiation

The crimes on games of chance and other games

Money launderers, for gain or for the purpose of concealing or disguising the illicit origin of the property or assisting or abetting any person who is involved in criminal activity, purchase, conceal, receive as a pledge, acquire possession or in any way become beneficiaries, convert or

transfer to another person any property which has resulted from such activity. They can also give witness or report to any judiciary or other authorities, intentionally disguise or conceal the true nature, source, disposition, movement or location of the property, knowing that such property is derived from criminal activity. Finally, they can establish or acquire an undertaking or set up an organization for the purpose of committing one of the above mentioned offences (Laws No 2331/1995 and No 3424/2005 of the Hellenic Republic).

Most of money laundering actions pass through the banking and financial institutions, leasing companies, factoring companies, venture capital companies and exchanges. The responsible authority in Greece, that is in charge of supervising and controlling these institutions, is Bank of Greece. But we can also meet money laundering actions in insurance companies and other financial organizations for whom the responsible authority is the Hellenic Capital Market Commission (HCBC) (Laws No 2331/1995 and No 3424/2005 of the Hellenic Republic).

The implications of money laundering phenomenon

Countries with increasing and developing financial centers are especially vulnerable in money laundering phenomenon. Offenders take the advantage of differences between the confrontation methods against money laundering phenomenon from country to country. That is why they transfer their networks to countries and financial systems with deficient and ineffective countermeasures.

If the phenomenon cannot be kept under control, the social and political cost is and will be very serious. Organized crime has intervened in financial organizations, has taken the control of wild sectors of the economy, having bribed many times even functionaries, judicial authorities and political authorities as well. That has resulted in weakening social building and democratic statutes of modern society.

Money laundering phenomenon, because of its origin from criminal actions, enlarges and supplies them. A determined fight against that phenomenon has great importance on the promotion of democracy, the legal system and the human rights (Gilmore C. William, 1999). Money laundering restriction could be a fatal blow against the organized crime, since the exploitation of ill-gotten gains obtained from such actions would not be possible any more.

Money laundering stages

Money laundering takes place especially through (Tragakis G., 1990):

- Transactions in cash
- Bank accounts and safe deposit boxes
- Exchanges

- Insurance companies
- Capital markets
- Estate agencies
- Casinos
- Commercial transactions
- Foreign countries called “tax heavens”
- Offshore companies
- Bank executives involved in criminal actions
- Bank credit of loans

Cash money offers anonymity in most forms of criminal actions. That fact gives rise to the need of continuous hiding of the real origin of capital gathered from such actions, the maintenance of controlling of that capital as well as the need for transforming it.

The three stages of “money laundering” during which numerous transactions take place are the following:

Stage I: The stage of “placement”

The most usual way of legalizing “dirty” money is by depositing the packets of money, usually in small nominal value, in one or more financial institutions or by exchanging that money with objects of high value, like jewels, works of art etc. This practice consists the first stage of a complicated system of complex financial transactions, which is the most crucial and the easiest to be located in “money laundering” action and for the further surveillance of the whole procedure. The physical transportation of cash and its deposit to a bank consist the weakest point of the organized crime during the “money laundering” procedure.

Stage II: The stage of “layering”

Since the income from criminal actions is introduced in the financial system, the second stage of “layering” takes place. In that phase, money launderer makes a series of conversions or movements of amounts in order to send them away from their source. The amounts can be followed through markets and sales of depositing, investing or and insurance products or they can be netted through a series of money transfers from account to account in different banks worldwide. That use of scattered bank accounts is being used and is especially spread in countries that do not steadily cooperate against money laundering phenomenon, like the Carribean countries, small island countries of the Pacific and Indian Ocean, even also small European countries. The purpose of this stage is the misleading of inspecting authorities, the

alteration of checking evidence and the supply of anonymity of the beneficiaries of bank accounts to their advantage.

Stage III: The stage of “integration”

In this stage, the apparent legalization of the ill-gotten wealth is succeeded. Having effectively passed the ill-gotten gains through the first two phases of “money laundering” procedure and having changed their real identity, they are introduced again in the financial network, under the cloak of the normal business investments, through the investments on real estate, the establishing of new businesses, the purchase of works of art, the donations and charities, the entrance in sections with mass effect like professional athletics etc.

Money laundering sources

A few years ago, outlaws were worrying about how they would appear in front of the counter of the bank carrying whole suitcases full of banknotes, without raising suspicions to the bank employees. Nowadays things have become even more complicated and of course we don't only mean the usual and seemingly simple method of “money laundering” through purchasing real estate. Indicatively, we mention some –least- brainwave methods of “money laundering” that became widely known:

- **“Money laundering” through lottery and lottery coupons** (“Kathimerini”, 2005). In practice goes in the following way: some winning lotteries or lottery coupons are bought from the real winning owners (unambiguously against a higher price) and in continue the coupons in question are deposited by their new owners who receive the payment of the earnings and simultaneously a legal certification of the earnings (through which the capital is legalized since they are presented as earnings from lottery or lottery coupons).
- **“Money laundering” through casinos** (“Vima”, 2001). It concerns businesses that accept cash and not checks (because of the existence of the danger of bringing bad checks). This way, a supposed player can visit a casino, bringing a large amount of cash, buy chips, play, lose a short portion of his money, stop and ask the staff of the casino in charge to give him the remaining of his initiative capital in the form of a bank check (this way, the initially illegal capital that was brought is legalized).
- **“Money laundering” through the Stock Exchange** (“Vima”, 2005). The practice is simple, although the first step is considered the most difficult: the basic thing is the code to be opened and the first buy of shares to be made (usually, companies that increase their stock fund with gratis shares are preferred, with the intention, the final number of shares that will be liquidated, to be higher). In continue, the aspiring

“launderer” carries out a large number of transactions, in order to generate problems in a possible investigation of the authorities and to make it difficult for the first transaction to be found. Afterwards, he aims to “break” the capitals in many codes, in different securities companies and in continue he proceeds to liquidations (so, this way, he ensures the “origin” of his capitals).

- **“Money laundering” through the trade of antiquities and auctions** (“Kathimerini”, 2006). Antiquities – generally originating from smuggled excavations – are usually sold and bought during auctions from the same person, who mysteriously appears as an anonymous collector (as the first contributing member) and as an offshore company (as the second contributing member).

Off-shore companies and money laundering

The biggest part of “dirty money” that is gathered from illegal actions is in cash. The main three scenarios, that are recorded out of observations of the pursuing authorities and the officials against “money laundering”, as far as the procedures and the way of action of the “launderers” is concerned, for the physical transportation of the dirty money, are the following:

- The first scenario is the one where the cash stays in the country where it is gathered and people are found, that do not belong to the network, but systematically are occupied with the “laundering” on behalf of money holders and owners. Those people are “beyond” any suspicion and they are carefully chosen, taking especially into account their professional activities that from their nature should gather and transfer amounts of cash every day. Of course those people are informed about this action and they quite often deposit in one or more banks either small amounts or higher amounts of money. That money in a following phase is transferred in other countries’ banks, being presented as products of exports or loans.
- The second scenario is the one where the cash is not transferred abroad, nor is “broken” into smaller amounts, but it is deposited in big amounts without its origin being suspicious. This case refers to countries where the banking secrecy exists in its rigorous form and money laundering business hasn’t been penalized.
- Finally, the third scenario is the one where the cash is identically transferred with different methods (boats, crafts, airplanes etc.) from the country where it is gathered out of illegal actions to a destination that is usually a tax “heaven”. The money is deposited in a bank in that country and that is the way the “laundering” through the international banking system begins.

Although globalization has provided the potential of financial development, on the other hand it has also given tremendous capabilities for the expansion of organized crime without having supranational mechanisms to confront it. The whole issue is a matter of each nation separately.

Offshore companies offer a variety of services that are not normally available in other countries. These services include secret bank accounts, establishment of bogus companies and foreign trusts. That is why money launderers are very easy to exist in those companies.

The countries that are attractive to money laundering have at least one of the following characteristics (Douvis P., 2003):

- Fragile financial infrastructures with private banking systems that are in the first development stages or that are capable to be bought in such a low cost that make them just available with the possession of a small controlling proportion.
- Lack of substantial and special regulation as far as money laundering is concerned.
- Not well trained and not well equipped personnel of controlling and of banking services, on the tracing and on succeeded prosecution of offences that have to do with money laundering.

In Greece, according to the law 2238/1994, "Offshore companies are meant the companies that have their headquarters in a foreign country and according to their legislation they are exclusively activated in other countries and they are in favor of an especially favorable tax treatment".

The biggest tax heaven for capital base is Manhattan, where there is no mechanism of exchanging information for the capital that is invested in the U.S.A. International Monetary Fund estimates that 600 billion U.S.D. are annually laundered, half of which in U.S.A. It is not contingent that U.S.A. is opposed to OECD efforts to implement restrictions on "tax heavens".

Organized criminals have put on the mantle of a succeeded businessman, laundering their illegitimate child through offshore companies. This does not mean of course, that every offshore company performs an illegal action. Since that legal creature exists and it is accepted from the whole of the legal class it would be utopian if anyone tried for its whole abolition. However, it is essential the world's legal class to be legally armed in order to avoid the exploitation of that kind of companies from criminals.

In a level of prevention, European Union should introduce the obligation of reporting to local authorities (e.g. tax offices, stock exchange) the real owner of the offshore company since it takes action to a member nation, without adding him tax charges. While, in the level of suppression, the enforcement of an "embargo" on financial transactions with tax heavens, that do not follow the international rules, is a kind of pressure and punishment for those who protect crime than

improving their legislation according to the obligation of governmental, police and judicial cooperation.

The awareness for the need to take action against money laundering phenomenon

Whoever studies the many-pleated money laundering phenomenon in depth comes to the conclusion that there is a huge menace to the financial and social structure of a country. The relatively recent examples of Italy, Russia and other countries in Central and South America are indicative. According to a statistical study of the I.M.F. on the last decade, it was calculated that amounts of money on the level of 700 billion dollars are legalized through money laundering, being increased in a pace of 10% annually.

One could include in that amounts the “dirty money” that comes from sources that are directly involved with the political corruption, the illegal commissions, the great tax evasion, the illegal export of currency, the properties of the third-world dictators and the wealth that was gathered by the strong leadership of the previous political and financial form of the government of the East Europe e.t.c. (Tragakis, 1996).

During 1980s, especially in the world of banks, it was realized that institutions and rules of behavior with a long time effect and a great tradition, like the bank secrecy, come often in opposition with the social interest and that is the reason they should be newly defined taking into account the modern conditions and views. It was noticed that inactivity includes the danger that banks could be stamped as shelters of criminals and that their interests are identical with the organized crime and that is why they do not show any sensitivity on such a serious problem like the fighting against the curse of drugs, the international terrorism and other serious criminal offences.

Another important step towards the realization of the need to take particular measures was the “Manifestation of Principles” that was adopted by the Basel Committee and who officially formulated the main principles on dealing behavior that should be followed by the banks today in the whole world in order to convince everyone that they are not used as asylums for criminals and as money laundering machines (Tragakis, 1996). For all these reasons, Basel Committee concluded that the responsible authorities on supervision and controlling of the banking system owe to realize that now they have the additional general role to encourage the observance of the new templates of professional behaviour in the financial institutions.

The formulation of the professional ethics has helped enough until today, on the realization of the need to take legal measures against money laundering in national level and especially in countries where important financial institutions work.

Application of the policies against money laundering in the Greek Banking Sector

The Greek regulatory framework against money laundering.

The Greek regulatory framework on the prevention and suppression of money laundering is being consisted of regulations that are included in the Laws 1990/1991 (Sheet of the Greek Government Gazette A' 193/16.12.1991, articles 1-13), 2655/1998 (Sheet of the Greek Government Gazette A' 264/1.12.1998, articles 1-44) and 3034/2002 (Sheet of the Greek Government Gazette A' 168/19.7.2002, articles 1-28), the Law 2331/1995 (Sheet of the Greek Government Gazette A' 173/24.8.1995, articles 1-12) which was amended and complemented by the Law 3424/2005 (Sheet of the Greek Government Gazette A' 305/13.12.2005, articles 1-14), and the relative administration's circulars and instructions of Bank of Greece.

- By the Law 1990/1991 the Vienna Agreement of 1988 was confirmed.
- By the Law 2655/1998 the Strasbourg Treaty of 1990 was confirmed.
- By the Law 3034/2002 the United Nations' International Treaty of 1999, for the suppression of terrorism financing was confirmed.
- The Law 2331/1995 embodies in the Greek Law the regulations of the Guideline 308/1991 of the European Community while the Law 3424/2005 embodies in the Greek Law the Guideline 2001/1997 of the European Parliament and the Committee against the use of the financial system for money laundering.
- By the Law 2331/1995, Bank of Greece is assigned as the responsible authority for the implementation of its regulations on the financial institutions, leasing companies, factoring companies, exchanges and intermediate services companies for money transfer. They also determine the crimes included in the term of criminal activity as well as the penalties imposed on the outlaws and it was established, by the article 7 (Law 2331/1995), the constitution of a committee whose task would be gathering, evaluate and investigate the information transferred to them from the financial institutions and the other financial organizations for suspicious transactions for money laundering.
- By the Law 3424/2005 the financial system is more armed against its usage for money laundering and terrorist financing, the implementation of its regulations is also enforced to other sectors and professions, the term of basic crimes is expanded, the responsibilities of the Committee of the article 7 of the Law 2331/1995 are strengthened, penal punishment is rationalized, the Ministry of National Economy is assigned as the central coordinating authority for the prevention and suppression of money laundering

phenomenon and the obligations of the banks and the other financial organizations and their supervising authorities are marked out.

- By the Law 3691/2008, there is reinforcing and improving the legislative framework on the prevention and suppression of money laundering and terrorist financing. This new law transposes into legislation the provisions of Directive 2005/60/EC of the European Parliament and of the Council “on the prevention of the use of the financial system for the purpose of money laundering and terrorist financing” (Official Journal of the European Union L 309/15/25.11.2005) and certain provisions of Directive 2006/70/EC of the European Commission (Official Journal of the European Union L 214/29/4.8.2006) and replaces relevant provisions of Law 2331/1995 (Government Gazette 173 A).

In 18th February, 1997, Bank of Greece issued the Administration’s Circular No.2 which referred to the obligations of credit and financial institutions under the Law 2331/1995 and the obligations of credit and financial institutions arising from the Forty Recommendations of FATF, some other obligations as far as the SWIFT is concerned and the obligation for the provision of information to Bank of Greece. (Bank of Greece, “Prevention of Money Laundering”, Administration’s Circular No.2”, 1997)

In 2nd August, 2004 the Administration’s Circular No.2 stops being in effect and it was replaced by the Administration’s Circulation No.16 which is the united text that contains all the obligations of credit institutions arising from the circulation documents and guidelines until then, as well as the adjusting developments that took place under the ground of the Recommendations of FATF (Bank of Greece, “Codification of Regulation for the Prevention of Money Laundering”, Administration’s Circular No.16”, 2004).

In 9th March 2006 the Supplement No.4 of the Governor’s Order No.2577 of Bank of Greece was issued and the Administration’s Circulation No.16 stops being in effect. The purpose of Bank of Greece with this issue was to include the new regulations of Law 3424/2005 in its provisions for credit institutions as well as the regulations of the Law 2331/1995 that were still in effect. These provisions refer not only to credit institutions but to financial organizations as well and they compose the criteria for the valuation of supervised institutions from Bank of Greece.

A few general provisions for the supervised institutions are the following:

- they should demand proof for the identity of their clients
- they should inspect very carefully each transaction that could be related to money laundering or terrorist financing because of its nature or by evidences that have to do with the character or the profession of the client

- they should enact internal control and intercommunication procedures in order to prevent and deter the effect of transactions combined with the above mentioned crimes
- they should evaluate the whole portfolio the client may keep in them, in a level of Group of the bank, in order to verify the relation and convention of the transaction with that portfolio
- they should take care that these obligations are enforced in their branches and subsidiaries abroad
- they should take any other appropriate measures including not working out the transaction or the severance of their relationship with the client, since the provisions for the certification and verification of his identity according to the law for the prevention of money laundering and terrorist financing are not satisfied or his transactional behavior is not in accordance with the policy and the procedures that are enforced by the bank for the confrontation of relevant dangers.

Banks should also follow the provisions for the appropriate and consistent with the enterprising goals policies, the procedures for tracking down suspicious transactions, the precautionary measures like those that are implemented for other risks and especially the classification of transactions, clients or both according to their level of risk, the conception of the dangers, the policy and the procedures from the executives, the implementation of criteria for the acceptance of contractual relation with the clients and its surveillance and the periodical valuation of the methodologies that are in effect and the conformity of the training in the changing circumstances.

The Supervised Institutions have the responsibility to specify the policy measures and procedures for the observance of their obligations according to the above mentioned provisions. For their most possible united implementation the Supplement No.4 of the Governor's Order No.2577/9.3.2006 of Bank of Greece quotes the least procedures that should be enforced by the Supervised Institutions for the adequate performance of their obligations and a typology of suspicious transactions for money laundering and terrorist financing is also appended. (Bank of Greece, "Prevention and Suppression of Money Laundering and Terrorist Financing", Supplement No.4 of the Governor's Order No.2577, 2006).

The Decision of the Banking and Credit Affairs Committee No 242/6/4.5.2007 brought the first amendment on the Supplement No.4 of the Governor's Order No.2577/9.3.2006 of Bank of Greece with which are specified the basic principles and the valuation criteria of the organizational structure of the system of Internal Control as far as the prevention of money laundering and terrorist financing is concerned. (Bank of Greece, Decision of the Banking and Credit Affairs Committee No 242/6, 2007).

Finally, the Decision of the Banking and Credit Affairs Committee No. 257/4/22.2.2008 brought the second and final, so far, amendment on Supplement No.4 of the Governor's Order No.2577/9.3.2006 of Bank of Greece. The amendments referred to some changes and additions on the least procedures that should be enforced by the Supervised Institutions for the adequate performance of their obligations (Bank of Greece, Decision of the Banking and Credit Affairs Committee No 257/4, 2008).

Enrollment of the Greek regulatory framework against money laundering in the internal regulation of the Greek financial institutions.

In our effort to find out whether the Greek regulatory framework against money laundering is being implemented in the internal regulation of the Greek banks, we picked a major group of the Greek banking system, "Piraeus Bank" and we asked them to give us information about their compliance policy against money laundering.

From the material collected we came to the following conclusions:

- First of all they have a great organization as far as controlling, updating and applying the compliance system in the group. They have a General Director of the Corporate Governance who is above the Chief Compliance Officer who is above the Deputy Director. All of them are above two groups: the AML/CTF Group and the Compliance Group. The first group, AML/CTF Group, gives information about the records of the customers when it is needed for an investigation and generally they apply the AML/CTF policy of the bank. The second group, Compliance Group, works on the compliance of the bank with the regulatory framework against money laundering which is imposed by the responsible authorities of the country and for its implementation from the branches and subsidiaries of the Group.
- The compliance policy of the bank was in conformity with the regulations that are given from the responsible authorities of the country against money laundering. They follow the procedures in recognizing and identifying their customers, they implement the "risk – based approach" of money laundering and terrorist financing, they enforce the due diligence process for intermediaries, they keep records, they give orders as far as tracing, dealing and reporting suspicious transactions, they have a process of internal control and communication, they educate and train their personnel, they follow the essential procedures on electronic fund transfers, they give the needed information to Bank of Greece every March and they are also informed about the charges they will have if they do not comply with the regulation given by the responsible authorities.

- The bank is trying to enrich the given regulation, analyzing with many details each part and they are also stricter in some of the measures they impose, in order the bank to be more safe. For example, they do not rent safe deposit boxes but to their customers who must be well identified and they do not accept to keep any sealed envelopes or boxes (Piraeus Bank, Group Compliance Department, “Compliance Policy of the Bank of Piraeus Group”, 1st edition, May 2008)

However, taking Piraeus Bank as a model, the general conclusion we get is that banks in Greece do comply with the regulations imposed by the responsible authorities. So we come to the subsequent question: If banks do comply with the imposed regulation against money laundering then why do we have an increase in the amounts of money that are laundered?

A possible answer could be that money launderers are always finding ways to pass over the obstacles the banking system imposes by its regulation. Because of the big competition between banks, all of their employees are obliged to find ways to increase the earnings of the bank. That can easily result to not following the regulation of the same bank against money laundering. Thus, even if new and more effective regulation is being enacted against that phenomenon, we can see that they never have a satisfactory result when they are imposed.

We suggest that a more effective method against money laundering could be the more often and severe investigations on the banks for that issue and to be imposed huge fines and some tough sanctions depending on the case. Maybe this way competition between banks could be reduced and banks will use more lawful means for their development.

According to the Basel Committee on Banking Supervision, whatever the legal position in different countries, the first and most important safeguard against money-laundering is the integrity of banks’ own managements and their vigilant determination to prevent their institutions becoming associated with criminals or being used as a channel for money laundering. (BCBS, 1988).

Table 1 – Number of investigations on the spot from Bank of Greece

	2005	2006	2007
On banking institutions	240	200	201
<i>which concern:</i>			
Internal control – risk management	56	55	32
Money laundering	152	97	129
Transparency of transactions	32	48	40
On Financing Institutions	20	23	8
Other Controls	136	101	131
General Total	396	324	340
<i>from which:</i>			
On branches out of Attica	152	164	106
On branches and subsidiaries abroad	6	6	13

Source: Bank of Greece

From Table 1 it's clear that during the period between 2005 and 2006 there was a decrease in the number of investigations on the spot from Bank of Greece while from 2006 to 2007 there was an increase. According to Bank of Greece Governor's Annual Report for 2007, the number of investigations on the spot cannot be considered as the only evidence of supervisory presence of Bank of Greece. Conversations with the authorized executives of the banks and the daily supervision for the progress of the banks are some crucial factors that help Bank of Greece to form an image timely, taking into account the special risk characteristics of each bank, and making sure its compliance with each regulation that is in effect.

*Table 2 – Sanctions that were enforced from Bank of Greece
(Amounts in Euro)*

<i>Transparency in transactions</i>			
	<i>2006 (14 banks)</i>	<i>2007 (8 banks)</i>	<i>Total 2006–2007 (22 banks)</i>
<i>Interest - free deposits height</i>	<i>34,373,200</i>	<i>14,400,000</i>	<i>48,773,200</i>
<i>Total Cost (1)</i>	<i>859,330</i>	<i>360,000</i>	<i>1,219,330</i>
<i>Average Cost</i>	<i>42,603</i>	<i>45,000</i>	<i>43,801</i>
<i>Least Cost (2)</i>	<i>3,000</i>	<i>10,000</i>	<i>-</i>
<i>Greatest Cost</i>	<i>77,778</i>	<i>160,000</i>	<i>-</i>
<i>Money Laundering</i>			
	<i>2006 (14 banks)</i>	<i>2007 (12 banks)</i>	<i>Total 2006–2007 (26 banks)</i>
<i>Interest - free deposits height</i>	<i>13,413,200</i>	<i>20,200,000</i>	<i>33,613,200</i>
<i>Total Cost (1)</i>	<i>335,330</i>	<i>505,000</i>	<i>840,330</i>
<i>Average Cost</i>	<i>14,436</i>	<i>42,083</i>	<i>28,260</i>
<i>Least Cost (2)</i>	<i>6,108</i>	<i>20,000</i>	<i>-</i>
<i>Greatest Cost</i>	<i>20,804</i>	<i>75,000</i>	<i>-</i>
<i>Calculated with the interest rate of the marginal funding (5%). Calculated with a cost of capital of 7%, the total cost of sanctions for the period 2006-2007 on transparency issues comes up to Euro 1,707,062, while on money laundering issues comes up to Euro 1,176,462.</i>			
<i>Under the principle of proportionality, some categories of penalties cannot exceed the limit of the relative category of the Law 2912/2001 as far as interest rates from compound interest is concerned (e.g. on delayed answers to the clients law determines width of penalties from Euro 2,934.70 to 14,673.51)</i>			

Source: Bank of Greece

In Table 2 we can see that from 2006 to 2007 there is an increase on the amount in Euro from sanctions imposed from Bank of Greece to the banking institutions while fewer banks are found to have problems. This shows us that more banks comply with the measures against money laundering and they do enforce them, but the banks that do not enforce them in practice are accused for big irregularities with great sanctions.

Bank of Greece has cut back expansion plans for banks that were found inadequate on their internal control systems. That is a sanction which is proven for its effectiveness. It has also utilized the potential to increase the minimum capital requirements of the banks. Today, seven commercial banks ought to keep Prudential Ratio more than the least ratio of 8% (Bank of Greece, "Governor's Annual Report for 2007", 2008).

Within 2007, the valuation of Greece from F.A.T.F. on the prevention and suppression of money laundering and terrorist financing had been completed. F.A.T.F. observations were quoted on their Assessment Report. In that report the relevant weaknesses of the Greek Financial System

were marked and methods for the improvement of supervision framework were suggested (Bank of Greece, "Governor's Annual Report for 2007", 2008).

Conclusion

The erosive influence of organized crime to the society.

Money laundering reflects negatively the capability of the governments to successfully apply measures for the fiscal and monetary policy. So, it is expected when an important part of the financial values is controlled by the organized crime that the basic indexes of the financial activity lose their reliability as far as the configuration of a powerful financial policy is concerned.

The factors that lead the syndicates of the organized crime to their investing decisions are substantially different than that of the legal businesses. It is well known that these illegal companies are mainly used for facilitating money laundering, its recycling and the development of the criminal activity while the main factors that influence these decisions is their fear of leaving evidences of their identity as well as facilitating these transactions. (Tragakis G., 1996)

In developed countries, reliability of the applied financial policy is heavily damaged when a part of the financial system is under the influence and control of the organized crime. The capital that is managed from them usually has a damaging influence on the social prosperity during a period when the investing decisions of private sector of the economy and the level of crediting ability of a country for its borrowing from the international markets of money and capital are significantly influenced from the length of the penetration and undermining of that country from the organized nets of the underground. (Tragakis G., 1996) So, whatever advantages obtained by the inflow of suspicious origin capital are minimized or smashed.

However, the biggest threat from money laundering is located on the way the organized crime uses the huge amounts of capital they have in their possession for the general corruption of the political-social system and the control of the financial activity of a state. It is observed that society and economy are divided as the legal businesses are not in position to compete with the businesses that belong or are controlled by the organized crime, since they do not pay taxes, they get the best jobs, they are not supervised as they should and in addition they use criminal ways in order to destroy the dynamic and competing competitors. (Katsios S., 1998)

International Economy and Money Laundering.

The general progress of international economy has a causal link with money laundering. The biggest facility for the transfer of the ill gotten gains abroad is a problem not only to the country of origin of capital but to countries of destination of the capital as well. When the capital of organized crime enters in a country and it is used for "investments", the immediate result is

decomposition of the business environment, uncertainty and interference of many insurmountable obstacles in the development of those economies (Tragakis G., 1996).

Generally, Third-World Nations and countries have a big need for pulling in capital from abroad for the financing of development programs and they do not have legislation and mechanisms for the prevention and suppression of money laundering. For this reason and for others, fighting against that anti-social practice is linked with the promotion of financial progress and the abolition of poverty and unemployment.

As the organized crime enters all the time in different sectors of financial activity, as the universality of the financial system is given and the liberalization of the rules of its set-up, supervision and operation, as electronic fund transfer is flourishing nowadays, we are unavoidably led to the facilitation of the organized crime to legalize its ill gotten gains (Katsios S., 1998).

So, it is at least imperative to arm the financial system with any legal mean for the prevention and suppression of the above mentioned criminal activity. Today, more than ever, the function of the international financial system is threatened by the organized crime. Countries that accept the organized crime are mathematically led to financial destruction, undermining of institutions and of course to the establishment of governmental relations with corruption. This way they are immediately transformed into tax heavens dependant from organized crime gangs (Katsios S., 1998).

General conclusion-the Greek case

The new law 3691/2008 for the prevention and suppression of money laundering and terrorist financing is considered as more stringent than its earlier ones. With this law more occupational sectors are involved in the effort for confronting this damaging phenomenon. For example, lawyers, who did not have the obligation to give information to the responsible authorities about their clients, when they were involved with money laundering, because of the secrecy of their job, with the new law they will not only have that obligation but they can also be accused for aiding and abetting criminals if they do not do so.

Comments and remarks from different occupational sectors are being taken into account by the government, in order to be implemented an even more effective framework against money laundering phenomenon in Greece. But that is not enough!

We should all be in the mood of helping for the correct implementation of this framework and not sabotage it or just accept the “dirty” money in our transactions. Each one of us separately or as a team could help to confront the problem and that would be the most effective policy against the destroying phenomenon of money laundering!

The most interesting conclusion is the fact that after so many years since the enforcement in Greece of the basic law against the legalization of income that comes from criminal actions, the authorities that are occupied with this issue have realized the following:

- There are many potential dangers because of the acceptance of transactions with “dirty money”
- The damaging consequences in individual as well as in national level of this illegal action
- The provisional profitability of the acceptance and of transactions with “dirty or black money” for the whole national financial system and
- The international consequences from the exposure of such actions, since a very powerful and effective mechanism has been developed in international level for the harsh punishment of the phenomenon.

The restrictions of this paper come along with the fact that the results of this problem are not demonstrated easily to the public, under the limits of the essential discretion and the protection of the people who mention such transactions. There are also restrictions as far as the methods that are used in order to detect and trace suspicious transactions since the “specialists” in these transactions take good care in order not to be traced and neither revealed their techniques.

Abstract

This is a summary of a dissertation which focuses on the relationships between the Marketing and Sales departments, exploring specific organizational and functional factors as sources of Marketing-Sales conflict, as well as the consequences of this conflict on company performance. Based on the data collected from both Marketing and Sales managers of 132 consumer goods' companies, the dissertation identifies as sources of Marketing-Sales conflict (a) the low degree of market orientation, (b) inconsistencies in the perceptions of Marketing and Sales managers regarding their respective companies strategy, (c) the unequal level of power between the Marketing and Sales departments, (d) differences in the perceptions of Marketing and Sales managers regarding the importance of basic marketing activities, and (e) the low quality of cooperation between M&S departments for the execution of these activities, and as a consequence of this conflict the reduced company performance. The implications of the dissertation are discussed.

Introduction

Historically there has been tension between Marketing and Sales (Lorge, 1999); senior managers often describe the working relationship of Marketing and Sales (hereinafter M&S) as unsatisfactory (see Kotler, Rackham and Krishnaswamy, 2006), while some scholars report this relationship to be far from harmonious (Homburg, Jensen & Krohmer, 2008; Montgomery & Webster, 1997). Overall, the M&S relationship is characterized, mainly, by negative outcomes, e.g. a lack of cohesion, distrust, dissatisfaction and conflict (Dewsnap & Jobber 2000, 2002). The poor Marketing – Sales relationships may be the outcome of certain organizational and functional characteristics pertaining to these two departments.

Specifically, regarding the organizational characteristics, the low degree of market orientation is a barrier in the creation of effective Marketing-Sales interface (Biemans & Brencic, 2007), while Meunier-FitzHugh and Piercy (2007) argue that problematic relationships between M&S may be caused by different perspectives and poor alignment between these two departments, especially regarding company's strategy (Shapiro, 2002). Also, it has been reported that imbalances of

power are a source of problematic relationship between M&S departments (Homburg et al., 2008; Meldrum, 1996).

Regarding the functional characteristics, Krohmer, Homburg and Workman (2002) and Rouzies et al. (2005) identified a dispersion of influence on basic marketing activities such as marketing research, market segmentation, product design, pricing etc, especially between M&S departments, which could be considered as a source of conflict, while Shapiro (2002) suggested that the low level of importance assigned to marketing activities from M&S departments, is associated with poor collaboration between these two departments. Also, Homburg et al. (2008) indicated that reduced cooperation quality of M&S departments, in respect to marketing activities, is connected with poor Marketing-Sales relationships.

Although the Marketing-Sales dyad has been championed in the normative literature, it has not been subjected to any vigorous empirical analysis, despite the fact that other interdepartmental relationships have received empirical attention, e.g. Marketing and Manufacturing (see Mukhopadhyay and Gupta, 1998), Marketing and Engineering (see Weinrauch and Anderson, 1982), Marketing and R&D (see Griffin and Hauser, 1996). Moreover, extant literature in the area of interdepartmental relationships, and more specifically between the M&S departments, has not examined as yet the perceptions of the M&S managers of the same company simultaneously. As Massey and Dawes (2007) point out, researchers, ideally, need to examine M&S managers' perspectives simultaneously.

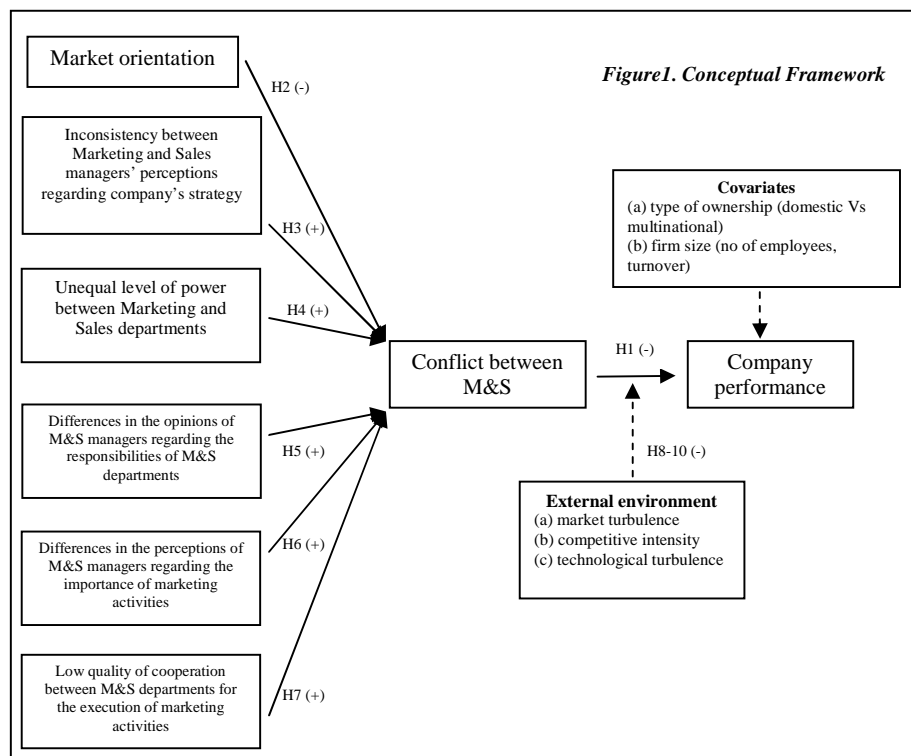

Thus, the objectives of this dissertation are to capture the perceptions of both M&S managers within the same company in order to investigate whether (a) the low degree of market orientation, (b) inconsistencies in the perceptions of M&S managers regarding their respective companies strategy, (c) unequal level of power between M&S departments, (d) differences in the decision authority of M&S departments regarding the basic marketing activities, (d) differences in the perceptions of M&S managers regarding the importance of these activities, and (e) poor cooperation quality between M&S departments for the execution of the activities in question, lead to the creation of Marketing-Sales conflict, as well as the effects of this conflict on company performance. Moreover, the dissertation investigates whether the environment within which the company operates (in terms of market turbulence, competition intensity and technological turbulence) is a moderator in the relationship between Marketing-Sales conflict and company performance, as suggested by the normative literature (Rouzies et al., 2005). It also examines company characteristics (type of ownership, size) as covariates of performance, since it is indicated in the relevant literature (e.g. Panagopoulos & Avlonitis, 2010).

This paper, therefore, is organised as follows. Firstly, the conceptual framework of this dissertation is presented and the study's hypotheses are developed, based on the theoretical

premises underlying this dissertation. Then, the research methodology is discussed and the empirical analysis and results are presented. Thereafter, the findings are interpreted and explained in light of extant theory and various conclusions are derived. Finally, the implications for researchers and managers are highlighted, and the dissertation's limitations and suggestions for future research are discussed.

Conceptual framework and hypotheses development

The core construct of this dissertation is Marketing-Sales conflict, and the conceptual framework of this research project, which is depicted in figure 1, illustrates the antecedents of Marketing-Sales conflict in terms of organisational and functional characteristics of M&S departments, as well as the consequences of this conflict on company performance. Moreover, figure 1 indicates the moderation effect of the external environment in the relationship between Marketing-Sales conflict and company performance, and the covariance between certain company characteristics and performance. The following sections focus on the rationale of these relationships.

Marketing-Sales conflict

A significant attention, mainly normative, has been devoted to the conceptualization of Marketing-Sales interface (Cespedes, 1993; Dewsnap & Jobber, 2000; Homburg et al., 2008; Rouzies et al., 2005; Kotler et al., 2006). There is evidence to suggest that while M&S are both independent and interdependent, they are not always seen as working collectively or

collaboratively (Dawes & Massey, 2005; Kotler et al., 2006; Lorge, 1999; Shapiro, 2002). In most instances, the relationship between M&S is reported as exhibiting a lack of understanding, disbelief, poor co-operation and being in conflict (Dewsnap & Jobber, 2000; Rouzies et al., 2005; Kotler et al., 2006; Meunier-FitzHugh & Piercy, 2007).

Conflict has been defined in the organisational science literature as the “collision of actors” (Katz & Kahn, 1978) and “tension between two or more social entities - individuals, groups or larger organisations - which arises from incompatibility of actual or desired responses” (Gaski, 1984). In the marketing literature, Menon et al. (1996) conceptualized conflict as dysfunctional, task-based tension between departments, which manifests in the form of “turf battles” and “destructive self-serving efforts”, which are both counter to collaboration (Morgan & Piercy, 1998).

On the other hand, collaboration between M&S departments in organisations is linked to improved business performance (Meunier-FitzHugh & Piercy, 2007). The literature concurs that the M&S interface frequently appears as lacking collaboration, and that improvements in this relationship should be beneficial to the organisation in terms of improved business performance (e.g. Cespedes, 1993; Dewsnap & Jobber, 2000; Rouzies et al., 2005; Kotler et al., 2006). Specifically, Meunier-FitzHugh and Piercy (2007) proposed that a reduction of conflict between M&S will improve their collaboration, which in turn will lead to superior company performance (Rouzies et al., 2005). In a similar vein, Chimhanzi (2004) identified a negative link between conflict and the effectiveness of strategy implementation, which is reported as an antecedent of improved company performance (Shapiro, 2002). Moreover, conflict has been found to reduce inter-functional performance (Dutton & Walton, 1996; Souder, 1981) as it results in the absence of depth of communication and infrequency of contact between functional units (Menon et al., 1997). Additionally, Kotler et al. (2006) emphasized the need for ending the war between M&S in order to create superior company performance. In general, the consequences of conflict on organisational performance are characterized as deleterious (Chimhanzi, 2004). Thus, we can hypothesize that:

H1: Marketing-Sales conflict has a negative impact on company performance.

Market orientation

A strong market-oriented culture is an effective means for the generation of superior customer value (Deshpande et al., 1993; Homburg & Pflesser, 2000), which is the base for a company's competitive advantage (Guenzi & Troilo, 2007). Market orientation has been studied extensively over the past thirty years with the general consensus that is positively related to business performance (e.g. Avlonitis & Gounaris, 1997; Jaworski & Kohli, 1993; Kirca, Jayachandra &

Bearden, 2005; Narver & Slater, 1990). Research in the area of market orientation has addressed the construct's conceptual clarification (Day, 1994; Kohli & Jaworski, 1990; Narver & Slater, 1990; Slater & Narver, 2000), measurement issues (Narver & Slater, 1990), and antecedents and performance outcomes (Avlonitis & Gounaris, 1997; Jaworski & Kohli, 1993; Slater & Narver, 1994).

Basically, two perspectives on market orientation can be distinguished (Cano, Carrillat and Jaramillo, 2004), a behavioral and a cultural perspective. The behavioral perspective describes market orientation in terms of specific behaviors related to generation and dissemination of market intelligence and responsiveness to it (Kohli & Jaworski, 1990), while the cultural perspective is related to more fundamental characteristics of the organization, such as customer orientation, competitive orientation and inter-functional coordination (Narver & Slater, 1990).

Both perspectives place cross functional relationships at the very heart of market orientation, in terms of (a) dissemination of market intelligence within the company (Kohli & Jaworski, 1990), and (b) inter-functional coordination (Narver & Slater, 1990), which are crucial matters for the entire company (Guenzi & Troilo, 2007), since a company must disseminate marketing intelligence throughout the organization and all departments must respond consistently (Kohli & Jaworski, 1990; Slater & Narver, 2000). This applies especially for the M&S departments, since they are both "outward looking", focused on the customer and the market (Shapiro, 2002), while their relationship is reported to be far from harmonious (Guenzi & Troilo, 2007).

Recent literature indicates that the strategic choice of a company to place emphasis on market orientation could contribute to the creation of smooth relationship between M&S (Biemans & Brencic, 2007; Elg, 2008). Market orientation is considered as an antecedent for the creation of esprit de corps (Kirca et al., 2005; Kohli & Jaworski, 1990), which in turn reduces interdepartmental conflict (Barclay, 1991). Moreover, Jaworski and Kohli (1993) indicated that the dissemination of market intelligence across all departments, which is an element of market orientation, aids collaboration. Thus, we can hypothesize that:

H2: A high degree of market orientation is reducing the level of Marketing-Sales conflict

Marketing and Sales perceptions regarding company's strategy

Companies can employ different strategies in order to create superior customer value (e.g. Day, 1994), which is the basis of their competitive advantage (Guenzi & Troilo, 2007). The M&S relationship is highly connected with the quality of strategy formulation and implementation (Menon et al., 1996). There is also seems to be a connection between M&S alignment and inconsistencies in the perceptions of M&S managers regarding their respective companies strategy (e.g. Viswanathan & Olson, 1992). For instance, Strahle, Spiro and Acito (1996) demonstrated inconsistencies in strategy formulation between M&S departments, suggesting that

in most cases the activities performed at the Sales department level does not reflect the strategy at the SBU level. Likewise, Colletti and Chonko (1997) showed that changes in marketing strategies do not drive to consistent modifications of sales strategies and tactics, while Evans and Schlacter (1985) found that companies hardly integrate the sales force in marketing planning processes. Moreover, Shapiro (2002) suggested that the existence of a clear, unified and explicit strategy between M&S will improve their cross functional relationships. There appears sufficient ground to hypothesize that:

H3: Inconsistencies in the perceptions of M&S managers regarding their company's strategy are enhancing the level of Marketing-Sales conflict

The relative power of M&S departments

Focusing on Marketing-Sales interface, Webster (1997) reported that the presence of power imbalance in an exchange relationship creates the potential for conflict, while Homburg et al. (2008) identified power balance between M&S as an important dimension in their interface. Scarce extant research suggests a great deal of variation among companies regarding the relative power of M&S departments. In some companies, sales units are dominant, while in others, marketing units are dominant (Piercy, 1986; Workman et al., 1998; Homburg et al., 2008). In general, these power and status differentials may lead to disharmony between the engaged departments (Souder, 1981).

The organizational theory concurs that when two engaged parts are lacking a balanced level of power, then their dyadic relationship is characterized, mainly, by a high level of conflict (Anderson & Weitz, 1989). Additionally, Bucklin and Sengupta (1993) report that the presence of power imbalance in a relationship creates disharmony and the potential for conflict. Souder (1981) indicated that power differentials between the Marketing and R&D departments may lead to disharmony and conflict, severely hindering new product successes, which seems to be connected with company performance (Menon et al., 1997). Furthermore, Homburg et al. (2008) developed a taxonomy regarding the Marketing-Sales organization, where it was shown that companies in which the Marketing department has equal power with the Sales department are characterized by (a) high quality of cooperation between these two departments, and (b) enhanced performance. On the contrary, this taxonomy revealed that when the Sales department is more powerful than the Marketing department or via-versa, then both cooperation quality of M&S departments and company performance are reduced. Thus, we can hypothesize that:

H4: Differences in the level of power between the M&S departments within the organization tend to enhance the level of Marketing-Sales conflict

Marketing and Sales departments' responsibilities

Krohmer et al., (2002) found that in certain marketing activities such as pricing and new product development there is a high cross-functional dispersion of influence, while in some other activities such as decisions concerning advertising there is a relatively low cross-functional dispersion of influence. Their results show that functional groups other than Marketing, and especially the Sales department, clearly have a great deal of influence on marketing activities. In a similar vein, Troilo, de Luca and Guenzi (2008) found that traditional marketing activities such as pricing and distribution are under Sales department responsibility. These findings concur with the Marketing Compass (2007), which shows that Marketing departments have weaker influence and control on historical "4Ps" strategies and tactics such as pricing and distribution. Beverland et al. (2006) suggested that the M&S departments have different cultural frames in relation to their respective roles regarding the activities that they carry out. Moreover, Rouzies et al. (2005) argued that if M&S are not congruent regarding their responsibilities, then conflict may arise. Thus, we can hypothesize that:

H5: Differences in the perceptions of M&S managers regarding their responsibilities for the execution of marketing activities tend to enhance the level of Marketing-Sales conflict.

Marketing and Sales managers' perceptions regarding the importance of marketing activities

Shapiro (2002) notes that it is extremely important for the "twin customer-facing functions of M&S" to work together. He also suggests that these two departments must collaborate at every level from the core central concepts of the strategy to the minute details of execution. A considerable body of the normative literature calls for both M&S departments to modify their role and practices in order to increase the coordination vis-à-vis their activities and give life to integrated processes (e.g. Cespedes, 1993; Day, 1994; Kotler et al., 2006).

A crucial matter in integrated processes is the importance that each of the engaged departments assign to their common activities (e.g. Clark & Fujimoto, 1991; Lawrence & Lorsch, 1967). Moreover, integration between M&S departments is achieved when these two departments are avoiding dissimilarities regarding the importance they assign to the activities that they carry out (Meldrum, 1996; Rouzies et al., 2005). Thus, the importance that M&S departments assign to marketing activities is essential for the creation of smooth Marketing-Sales relationship, since such relationship is reported as a benefit of integration between these two departments (Kotler et al., 2006). Moreover, a main characteristic of this smooth relationship is the reduced level of conflict (Dewsnap & Jobber, 2002). Accordingly, we can hypothesize that:

H6: Differences in the opinions of M&S managers regarding the importance of basic marketing activities tend to enhance the level of Marketing-Sales conflict

Marketing and Sales departments' cooperation for the execution of marketing activities

The dimension of harmonious inter-group relationships, according to Brown (1995), is associated with cooperation. Consistent with this suggestion, Homburg et al. (2008) define the quality of cooperation between M&S as the extent to which there is a state of collaboration between M&S that is characterized by unity of effort. They also indicate a connection between quality of cooperation for the execution of marketing activities and the harmonious relationships with respect to these two departments. A number of marketing activities require cooperation among the engaged departments, (Maltz, 1997), which are – mainly – the M&S departments (Krohmer et al., 2002). The quality of this cooperation is linked with the relationship of the engaged departments (Homburg et al. 2008). According to the literature, cooperation between M&S departments during the execution of marketing activities is one of the most important issues that practitioners are facing (Rouzies et al. 2005). A major impediment in the cooperation of activities across functional areas is that employees in the various functions have different mind-sets and different perspectives (Lorge, 1999). Accordingly, cooperation quality depends on the extent to which the M&S managers have similar perceptions regarding the level of the cooperation of their departments in the execution of marketing activities. Consequently, we can hypothesize that:

H7: Differences in the opinions of M&S managers regarding the cooperation of their departments with respect to the execution of marketing activities tend to enhance the level of Marketing-Sales conflict.

External environment

(a) Market turbulence: is defined as the degree of changes in the composition of customers and their preferences (Pine, 1993). Menon et al. (1997) reported that businesses operating in turbulent markets are likely to have a greater need for positive interdepartmental interactions (i.e., less conflict and high connectedness) than businesses in stable markets. Additionally, they indicated that high market turbulence is reducing the negative effect of interdepartmental conflict on product quality. Moreover, market turbulence has been found to strengthen the interfunctional coordination–innovativeness relationship (Han, Kim and Srivastava, 1998), and enhance the positive effect of Marketing-Sales integration on business performance (Rouzies et al., 2005). Consequently, Marketing-Sales conflict is likely to have a more significant impact on company performance in turbulent markets than in stable markets. Thus, we can hypothesize that:

H8: High market turbulence is strengthening the negative effect of Marketing-Sales conflict on company performance.

(b) Competitive intensity: refers to the degree to which a firm faces competition within its industry (Jaworski & Kohli, 1993). According to Rouzies et al. (2005) competitive intensity is expected to have a moderating influence on the relationship between Marketing-Sales integration and business performance. The same authors argue that if competitive intensity is relatively low, a firm may be able to attain good business performance even without Marketing-Sales integration because of the “slack” afforded by the marketplace. Moreover, when competitive intensity is high, it is particularly important for a firm to deliver superior value to customers (Kohli & Jaworski, 1990), and Marketing-Sales integration is crucial for meeting customer needs and requirements (Rouzies et al., 2005). Thus, we can hypothesize that:

H9: High competitive intensity is strengthening the negative effect of Marketing-Sales conflict on company performance.

(c) Technological turbulence: refers to the rate of technological change (Jaworski & Kohli, 1993). Olson, Walker and Ruekert (1995) suggested that when technology is changing rapidly, the organization must be able to share information more effectively and more quickly than when technology is more predictable. This information flow could enhance collaboration (Jaworski & Kohli, 1993). Moreover, Menon et al. (1997) indicated that the relationship between smooth interdepartmental interactions and product quality is positively moderated by technological turbulence. Thus, smooth M&S relationships are expected to play a more important role when technology is changing rapidly. Accordingly, we can hypothesize that:

H10: High technological turbulence is strengthening the negative effect of Marketing-Sales conflict on company performance.

Covariates

In this dissertation, we use firm size and type of ownership, as covariates of company performance. The literature suggests that firms with superior resources will be able to conceive and implement unique strategies that rivals will find difficult to emulate (Barney, 1991). Because large firms have more such resource advantages than do small firms, we included firm size (in terms of number of employees and turnover) as a covariate of performance. Moreover, prior studies indicate that the performance of foreign subsidiaries is superior to that of domestic firms because of firm-specific advantages associated with multinational companies (Caves, 1982). Thus, type of ownership (domestic vs. multinational) was also included as a covariate of performance.

Research methodology

Sample & data collection

Consumer goods companies with turnover of more than 5 million euro and more than 50 employees were specified as the population of this study. Consumer goods companies are reported as an ideal context for empirical investigation in the M&S interface (Dewsnap & Jobber, 2002), while in large organizations, M&S are frequently structured as separate and discrete departments (Piercy, 1986; Workman, Homburg and Gruner, 1998) performing different functions (Shapiro, 2002).

Using the ICAP (Gallop's Subsidiary) Census of Greek Companies Financial Position, 409 firms were identified as fulfilling the above criteria. The M&S managers of these companies were contacted through letters and phone calls asking their cooperation in our research. From these companies, 132 agreed to participate in our research (32.3% response rate). Personal interviews were conducted, using a structured questionnaire, with the M&S managers of these companies. Both M&S managers answered the same questionnaire in separate personal interviews (without knowing each other's answers). This method apparently is the most appropriate one in order to control common method bias, as from each sample company two key-informants provided the data (Podsakoff et al., 2003). Moreover, empirical studies in this area suggest that data should be collected from multiple respondents within the organization (e.g. Massey & Dawes, 2007; Guenzi & Troilo, 2007; Homburg et al., 2008).

Operationalization of study variables

The constructs of the dissertation were operationalized using: reflective multi-item scales, dichotomous variables and observed variables. The constructs of Marketing-Sales Conflict, Market Orientation, M&S Departments' Power, the characteristics of the companies' external environment (in terms of Market Turbulence, Competitive Intensity and Technological Turbulence), and Company Performance, were measured as reflective models, since a reflective measurement model is appropriate when observed variables are interchangeable manifestations of an underlying construct (Bagozzi & Baumgartner, 1994). Marketing-Sales consistency regarding the company's strategy, company's size and type of ownership were measured as dichotomous variables. Differences in the perceptions of M&S managers regarding (a) the responsibility of M&S departments vis-à-vis certain basic marketing activities, (b) the importance of these activities, and (c) the level of cooperation between M&S departments for the execution of these activities, were measured as observed variables. Specifically, the variables of this study were operationalized as follows.

- (a) Reflective multi-item scales

Marketing-Sales Conflict: In order to capture the level of Marketing-Sales conflict, both M&S managers were presented with the seven statements measuring interdepartmental conflict, as proposed by Jaworski and Kohli (1993). Then, using a 5-point Likert type scale, the respondents indicated their degree of agreement or disagreement (1="fully disagree" to 5="fully agree") with each of these seven statements. Later, during the analysis of the results, where necessary, the scales were reverted so that higher levels of agreement would always represent higher level of conflict. The perspective adopted in this dissertation is that of interdepartmental conflict as dysfunctional task-based tension arising from goal and action incompatibility (e.g. Jaworski & Kohli, 1993).

Market Orientation: In order to capture the degree of market orientation, both M&S managers were presented with the fifteen statements measuring this construct, as proposed by Narver and Slater (1990). Then, using a 5-point Likert type scale, the respondents indicated their degree of agreement or disagreement (1="fully disagree" to 5="fully agree") with each of the fifteen statements. The scales were formulated so that higher levels of agreement would always represent higher degree of market orientation.

Departmental Power: In order to capture the level of Marketing department's power and Sales department's power within each company, we adopt the five statements proposed by Kohli (1990) which measure departmental power. Both M&S managers were presented with these five statements and were asked to indicate their degree of agreement with each of these statements (for both M&S departments) using a 5-point Likert type scale (1="fully disagree" to 5="fully agree"). During the analysis of the results, where necessary, the scales were reverted so that higher levels of agreement would always represent higher level of departmental power. The estimation of the absolute value of the difference between the Marketing department's power and the Sales department's power provided the relative power of M&S departments, which was examined as an antecedent of Marketing-Sales conflict.

External environment: In order to measure (a) market turbulence, (b) competitive intensity, and (c) technological turbulence, we adopted the respective statements developed by Jaworski and Kohli (1993). Both managers indicated, using a 5-point Likert type scale (1="fully disagree" to 5="fully agree") with each of the statements. The scales were formulated so that higher levels of agreement would always represent higher (a) market turbulence, (b) competitive intensity, and (c) technological turbulence respectively.

Company Performance: Company performance was measured in terms of profits, sales volume, market share and ROI (e.g. Narver & Slater, 1990; Avlonitis & Gounaris, 1997). The two managers indicated, using a five point scale, the firm's performance in comparison with their main

competitor (1: much worse, 5: much better), as well as the degree of the firm's satisfaction (1: very unpleased, 5: very pleased), for each one of the four performance criteria.

We assessed reliability and validity of each reflective measure with confirmatory factor analyses (CFAs), pertaining to both Marketing and Sales managers' perceptions, as shown in table 1. Each construct manifests a composite reliability (CR) of at least 0.6 (Bagozzi & Yi, 1988). Average variance extracted (AVE) is higher than the squared phi coefficient for any pair of two latent variables, which supports the discriminant validity of the reflective measures (Fornell & Larcker, 1981). Independent samples t-tests indicated no significant differences in the opinions of M&S managers regarding the reflective measures in question, as shown in table 1. Thus, the mean value of the responses from the two managers of each company was computed and used as a composite measure for each reflective measure.

Table 1. Operationalisation of study variables

Variables		CFI	TLI	GFI	RMSE	mean	AVE	CR	Cronbach's alpha	
					A					
Marketing-Sales conflict	Marketing Manager	.943	.915	.944	.060	2.5	ns	.835	.781	.939
	Sales Manager	.962	.942	.947	.075	2.6		.849	.801	.949
Market Orientation	Marketing Manager	.922	.913	.921	.072	4.0	ns	See Table2	See Table2	See Table2
	Sales Manager	.919	.908	.920	.077	3.9		See Table2	See Table2	See Table2
Marketing dept power	Marketing Manager	.945	.925	.955	.080	3.2	ns	.635	.830	.845
	Sales Manager	.960	.919	.961	.056	3.1		.679	.812	.829
Sales dept power	Marketing Manager	.929	.915	.936	.054	3.7	ns	.612	.790	.804
	Sales Manager	.965	.930	.968	.042	3.7		.570	.729	.793
Company performance	Marketing Manager	.919	.903	.920	.078	3.2	ns	.879	.920	.958
	Sales Manager	.921	.904	.922	.080	3.2		.866	.897	.953
Market turbulence	Marketing Manager	.993	.986	.978	.065	3.3	ns	.644	.712	.734
	Sales Manager	.983	.965	.965	.074	3.5		.720	.758	.801
Competitive intensity	Marketing Manager	.993	.986	.978	.065	3.9	ns	.685	.738	.794
	Sales Manager	.983	.965	.965	.074	4.1		.682	.720	.727
Technological turbulence	Marketing Manager	.993	.986	.978	.065	3.3	ns	.785	.845	.899
	Sales Manager	.983	.965	.965	.074	3.4		.764	.815	.874

In the case of market orientation, the CFAs provided evidence in favour of the three Narver and Slater's (1990) market orientation components (Customer Orientation, Competitive Orientation, Inter-Functional Coordination), as shown in table 2. Following standard procedures

(see Narver & Slater 1990; Slater & Narver, 2000) the mean value of these three components for both M&S managers was computed, providing their perception of market orientation.

Table 2. Market Orientation components

<i>latent variable</i>	<i>Marketing Managers</i>	<i>Sales Managers</i>
<i>Customer Orientation</i>	<i>AVE=0.635 / CR= 0.737 / Cronbach's a=0.902</i>	<i>AVE=0.679 / CR = 0.721 / Cronbach's a=0.887</i>
<i>Competitive Orientation</i>	<i>AVE=0.617 / CR= 0.754 / Cronbach's a=0.816</i>	<i>AVE=0.631 / CR=0.708 / Cronbach's a=0.760</i>
<i>Inter-Functional Coordination</i>	<i>AVE=0.629 / CR=0.730 / Cronbach's a=0.826</i>	<i>AVE=0.620 / CR=0.719 / Cronbach's a=0.778</i>

(b) Dichotomous variables

Company's Strategy: McKee, Varadarajan and Pride's (1989) operationalization was adopted in order to capture the perceptions of M&S managers regarding the type of their company's strategy. Thus, both M&S manager were provided with the definition of the three strategies of Miles and Snow (1978) typology (Prospector, Analyzer, and Defender) and were asked to identify the strategy of their company. Following the approach proposed by Stathakopoulos (1998), instead of using the terms "prospector", "analyzer" and "defender", we labelled the descriptions as "Type 1", "Type 2", and "Type 3" respectively, in order to control for socially undesirable responses. Through this operationalization, the companies were classified in two groups, as shown in Table 3, whereby group 1 contains companies in which the M&S managers had similar perceptions regarding their company's strategy (79.5%), while group 2 contains companies in which the two managers had different perceptions regarding the strategy in question (20.5%). Thus, a dichotomous 0 / 1 measurement was devised whereby the value of 0 stands for companies in group 2, while the value of 1 stands for companies in group 1.

Table 3. Marketing and Sales managers perceptions regarding their company's strategy

<i>Group 1 - Consistency (N=105 – 79.5%)</i>		<i>Group 2 - Inconsistency (N=27 – 20.5%)</i>	
<i>prospector</i>	<i>68 (65%)</i>	<i>prospector-analyzer</i>	<i>18 (67%)</i>
<i>analyzer</i>	<i>24 (23%)</i>	<i>prospector-defender</i>	<i>3 (11%)</i>
<i>defender</i>	<i>13 (12%)</i>	<i>analyzer-defender</i>	<i>6 (22%)</i>

Company's characteristics: From the sample of 132 companies, 91 were domestic, while 41 were subsidiaries of multinational firms. Thus, a dichotomous (0/1) variable was devised whereby the value of 0 stands for domestic companies, while the value of 1 stands for multinational companies. Moreover, we used the number of employees as well as the company's turnover in

order to measure company size. Two groups were emerged using both number of employees and turnover. Companies in group 1 have less than 150 employees and turnover less than 5 million euros (small companies - N=95), while companies in group 2 have more than 150 employees and turnover more than 5 million euros (large companies - N=37). Thus, a dichotomous (0/1) variable was devised whereby the value of 0 stands for companies in group 1, while the value of 1 stands for companies in group 2.

(c) Observed variables

Departmental responsibility for the execution of marketing activities: We adopted Krohmer's et al. (2002) operationalization in order to measure the responsibility of M&S departments for the execution of the basic marketing activities. Specifically, both M&S managers of each company were provided with a list of 9 marketing activities (namely: marketing research, market segmentation, targeting, positioning, product design, advertising objectives, design of channels of distribution, pricing, customer relationships), and were asked to indicate the responsibility of M&S departments (or any other departments involved) for their execution, using a 100-point constant sum scale. Surprisingly, no significant differences emerged in the opinions of M&S managers regarding the responsibility of M&S departments for the execution of the activities in question as shown in table 4. Thus, the gap in the perceptions of M&S managers regarding the responsibility of M&S departments for the execution of marketing activities could not be computed, and as a consequence H5 could not be tested.

N=132	Sales department			mean	Marketing department			mean	paired samples t-test
	Marketing manager	Sales manager	Independent sample t-test		Marketing manager	Sales manager	Independent sample t-test		
Marketing research	24.0	26.6	ns	25.3	70.9	66.3	ns	68.6	p<0.05
Market segmentation	45.2	50.1	ns	47.7	50.9	43.6	ns	47.3	ns
Targeting	48.3	53.8	ns	51.0	47.8	41.9	ns	44.8	ns
Positioning	42.5	49.0	ns	46.0	52.3	45.5	ns	48.9	ns
Product design	23.1	27.0	ns	25.7	62.0	58.6	ns	60.3	p<0.05
Advertising objectives	16.4	21.1	ns	18.7	80.4	75.3	ns	77.8	p<0.05
Channels of distribution	61.9	65.1	ns	63.5	33.0	30.5	ns	31.7	p<0.05
Pricing	57.0	60.5	ns	58.7	37.3	33.8	ns	35.5	p<0.05
Customer relationships	60.8	65.3	ns	63.0	28.6	25.9	ns	27.2	p<0.05

Importance of Market Activities: The respondents were provided with the aforementioned list of marketing activities and were asked to indicate, using a 5-point scale (1: low-5: high) the importance assigned to each one of them in their respective companies. Independent samples t-test indicated differences in the perceptions of M&S managers regarding the importance of each activity as shown in table 5. Thus, the absolute value of the differences in the responses of the two managers in each company was computed. Then, the mean value of these gaps was also computed and used as a measure for the difference in the perceptions of M&S managers regarding the importance of marketing activities, as shown in table 5.

Table 5. Importance of marketing activities

N=132	Marketing Manager		Sales Manager		Independent samples t-test	Gap (mean)
	Mean	SD	Mean	SD		
Marketing research	3.39	1.14	2.70	1.29	$p<0.01$	0.69
Market segmentation	3.53	1.14	2.97	1.36	$p<0.01$	0.56
Targeting	3.68	0.95	3.05	1.16	$p<0.01$	0.63
Positioning	3.77	1.01	3.17	1.26	$p<0.01$	0.6
Product design	3.36	1.34	2.87	1.41	$p<0.01$	0.49
Advertising objectives	3.94	0.98	3.25	1.20	$p<0.01$	0.69
Channels of distribution	3.92	0.95	3.17	1.28	$p<0.01$	0.75
Pricing	3.89	1.01	3.38	1.25	$p<0.01$	0.51
Customer relationships	3.87	0.78	3.32	1.05	$p<0.01$	0.55
Mean (total)		3.7		3.1	$p<0.01$	0.60

Cooperation between Marketing and Sales: The respondents were provided with the aforementioned list of activities and were asked to indicate, using a 5-point scale (1: low-5: high) the degree of cooperation between the Marketing and Sales departments in their respective companies regarding the execution of the activities in question. Following the same procedure as above, we conducted independent samples t-test which indicated differences in the perceptions of M&S managers regarding the level of cooperation between M&S departments for the execution of each activity as shown in table 6. Thus, the absolute value of the differences in the responses of the two managers in each company was computed. Then, the mean value of these gaps was also computed and used as a measure for the difference in the perceptions of M&S managers regarding the cooperation of M&S departments for the execution of the marketing activities, as shown in table 6.

Table 6. Cooperation between M&S departments for the execution of marketing activities

N=132	Marketing Manager		Sales Manager		Independent samples t-test	Gap (mean)
	Mean	SD	Mean	SD		
Marketing research	2.48	1.26	3.29	1.10	p<0.01	0.81

Customer relationships	2.94	1.16	3.40	1.00	p<0.01	0.46
Mean (total)		2.7		3.3	p<0.01	0.60

Analyses and results

In order to test the research hypotheses advanced regression analyses were conducted estimating two models, as it has been suggested in the literature (Baron & Kenny, 1986; Guenzi & Troilo, 2007). Specifically, in the first regression model the independent variables were the antecedents of Marketing – Sales conflict, and the dependent variable was the level of Marketing-Sales conflict; while, in the second regression model the independent variables were the antecedents in question together with the Marketing-Sales conflict, and the dependent variable was company performance. The second regression model also interprets the moderation effect of the external environment (market turbulence, competitive intensity, technological turbulence) on the relationship between Marketing-Sales conflict and company performance, as well as the company characteristics (type of ownership, size) as covariates of performance, according to the suggestions of the relevant literature regarding moderated mediation (Edwards & Lambert, 2007). Although this dissertation has not developed specific hypotheses regarding the direct impact of all antecedents on company performance, these examinations are coherent with the exploratory spirit of this research project. Both regression models are significant at 0.01 levels and indicate the antecedents and the consequences of Marketing-Sales conflict, as shown in table 7.

In order to examine the potential presence of multi-collinearity the variance inflation factors (VIF) were estimated. The VIFs range from 1.072 to 1.901, well below the recommended cut-off of 10. In order to examine the potential presence of auto-correlation, Durbin-Watson test was conducted in both models, providing results which indicate no auto-correlation (values: 1.927 in regression 1 / 2.076 in regression 2). Thus, the relatively high explanatory power of the two

models (see Adj. R²) seems to be fair. Table 7 shows that all hypotheses (except H5 which could not be tested and H10) find support.

Table 7. Antecedents and Consequences of Marketing – Sales Conflict / Regression Analyses

Dependent variable	Independent Variables	Hypothesis	Std Beta (t-value)	F-value	Adj. R ²	
Marketing-Sales Conflict	Regression model 1			75.441*	.530	
	Market orientation	H2	-.511 (-8.76*)			
	Inconsistency between Marketing and Sales managers perceptions regarding company's strategy	H3	.145 (2.84**)			
	Unequal level of power between Marketing and Sales departments	H4	.441 (7.75*)			
	Differences in the opinions of M&S managers regarding the importance of marketing activities	H6	.445 (4.17*)			
	Low quality of cooperation between M&S departments for the execution of marketing activities	H7	.432 (4.24*)			
	Regression model 2				89.773*	.630
Company performance	Marketing-Sales Conflict	H1	-.623 (-8.12*)			
	Market orientation	not developed	.255 (4.06*)			
	Inconsistency between Marketing and Sales managers perceptions regarding company's strategy	not developed	-.104 (2.78**)			
	Unequal level of power between Marketing and Sales departments	not developed	ns			
	Differences in the opinions of M&S managers regarding the importance of marketing activities	not developed	-.263 (3.07*)			
	Low quality of cooperation between M&S departments for the execution of marketing activities	not developed	-.231 (2.98*)			
	moderators					
	Marketing-Sales Conflict x Market turbulence	H8	-.243 (2.11**)			
	Marketing-Sales Conflict x Competitive intensity	H9	-.209 (1.97**)			
	Marketing-Sales Conflict x Technological turbulence	H10	ns			
covariates						
Type of ownership			.362 (3.042*)			
Size			ns			

* Significant at 0.01 level / ** Significant at 0.05 level / ns: not significant

Specifically, the results identified as antecedents of Marketing-Sales conflict (a) the low degree of market orientation, (b) inconsistency in the perceptions of M&S managers regarding company's strategy, (c) unequal level of power between M&S departments, (d) the differences in the opinions of M&S managers regarding the importance of marketing activities, and (e) the differences in the opinions of M&S managers regarding the level of cooperation between M&S departments for the execution of marketing activities.

Moreover, the dissertation indicated a strong negative impact of Marketing-Sales conflict on company performance, supporting the relative normative literature (Kotler et al., 2006). Additionally, market turbulence and competitive intensity seem to reduce this negative effect, confirming the arguments of Rouzies et al. (2005). On the other hand, no moderation effect emerged regarding the technological turbulence in the relationship between Marketing-Sales conflict and company performance. This could be explained by the low rate of technological change in the external environment of the sample companies (mean=3.3, SD=.85), since according to Menon et al. (1997) only high rate of technological turbulence can act as a moderator in pertinent relationships.

Our study also indicated that differences in the perceptions of M&S managers regarding (a) the importance of basic marketing activities, and (b) the cooperation of their departments for the execution of these activities, are hurting company performance indirectly, through the creation of Marketing-Sales conflict, as well as directly. These findings highlight the necessity for alignment between M&S departments, as it has been suggested in the literature (e.g. Shapiro, 2002). Moreover, a positive direct impact of market orientation on company performance emerged, supporting the relevant literature (e.g. Cano et al., 2004; Kirca et al., 2005). Additionally, consistent with the relevant normative literature (Shapiro, 2002), our study indicated a negative direct impact of inconsistencies in the perceptions of M&S managers regarding their respective companies strategy on company performance. Finally, the analyses show that the unequal level of power between M&S departments does not have a direct significant impact on company performance, since it seems that it hurts company performance only indirectly through the creation of Marketing-Sales conflict.

Findings and Discussion

The present dissertation is one of the very few empirical investigations regarding the conflict between M&S departments, and the only one, as far as we know, which base its results on the perceptions of both M&S managers of the same organization, following the pertinent extensive calls of the relevant literature (e.g. Massey & Dawes, 2007; Guenzi & Troilo, 2007; Homburg et al., 2008). The dissertation highlights the functional and organizational characteristics which tend to

raise the level of conflict between the M&S departments, as well as the consequences of this conflict, considering also the environment within which the companies operate. Our findings contribute to the scarce existing relevant literature on several fronts.

First, Vorhies et al. (1999) indicated that the most successful companies are placing a lot of emphasis on basic marketing activities. Our study expands these findings by adding that the M&S managers have different perceptions regarding the importance of basic marketing activities, and that these differences are hurting company performance through the creation of conflict between M&S departments. Moreover, while Vorhies et al. (1999) examined only six marketing activities namely, market research, pricing, product development, channels, promotion, and marketing management, our study incorporated more crucial activities such as market segmentation, targeting and positioning, following the suggestions of the relevant literature (Rouziès et al., 2005).

Second, the dissertation confirms the findings of Homburg et al. (2008) which indicated that low quality in the cooperation of M&S departments is associated with lower company performance. Specifically, our study revealed low cooperation quality of M&S in the execution of basic marketing activities by highlighting differences in the perceptions of M&S managers regarding their departments' cooperation. These differences are reducing company performance by enhancing the level of conflict between M&S departments.

Third, the literature suggests that M&S effective relationship is one of the components of market-driven organizations (Guenzi & Troilo, 2006; Rouziès et al., 2005). Our findings concur with these results, by indicating that the adoption of market orientation can reduce the level of M&S conflict. Moreover our study provides findings which support the positive relationship between market orientation and company performance (e.g. Avlonitis & Gounaris, 1997; Cano et al., 2004), placing the M&S conflict as a mediator in this relationship. These findings are highly connected with the consideration of "inter-functional coordination" as a basic component of market orientation (Narver & Slater, 1990). Specifically, it seems that the adoption of market orientation can reduce the level of Marketing-Sales conflict by enhancing inter-functional coordination which in turn has a positive effect on company performance.

Fourth, our research empirically demonstrates that a source of conflict between M&S is inconsistency in the managers' perceptions regarding their respective companies strategy. Likewise, it seems that these inconsistencies are also directly hurting company performance regardless of their effect on the level of Marketing-Sales conflict. These findings provide support to literature suggestions emphasizing the need for the strategic alignment of M&S (e.g. Shapiro, 2002).

Fifth, our study focused on the role of the relative power of M&S departments, in the creation of effective cross functional relationships. Our findings indicate that when M&S departments have equal level of power, then the level of conflict between these two departments is decreasing, and, as a consequence, the company's performance is increasing. These findings concur with those reported by Homburg et al. (2008). In addition, our study indicated that unequal level of power between M&S is not hurting company performance directly, but only through the creation of Marketing-Sales conflict. Thus, it seems that the most successful companies are characterized by fairly strong M&S departments.

Finally, the dissertation contributes to our understanding of the effect of the Marketing-Sales conflict on company performance. Our research provides empirical data demonstrating that Marketing-Sales conflict has a strong negative impact on company performance. This finding supports the relative normative literature (e.g. Kotler et al., 2006). Moreover, the relationship between Marketing-Sales conflict and company performance seem to becoming more negative when a company's external environment is characterized by market turbulence and competitive intensity. These results are consistent with the suggestions put forward by Rouzies et al. (2005).

Managerial implications

The dissertation has several managerial implications, providing guidance for top management responsible for the M&S organization. The general implication is that top management should be aware that creating fair relationships between M&S, which are characterized by a low level of conflict, requires changes in the company's culture, as well as people's attitudes and behaviours. These changes will lead to substantial improvement in important performance metrics.

Specifically, our findings indicated that a source of Marketing-Sales conflict can be the different perceptions of M&S managers regarding the importance of basic marketing activities. Consequently, top management must make sure that the M&S managers should not only place a lot of emphasis on these activities, but should also start strive to work very closely for their execution as (a) a high level of cooperation between their departments in executing the aforementioned activities will reduce the level of conflict and enhance company performance, and (b) the decision authority for the execution of the activities in question seem to be dispersed between M&S departments. It may be wise for top management to implement in-house common training programmes in order to reduce the psychological distance between the two functional managers. Additionally, requiring each manager to spend some time working with hers/his counterpart manager could improve flows of information and expertise between them. Similarly, it may be also wise for the Marketing manager to spend a specified amount of time in the field with the Sales manager (Massey & Dawes, 2007; Rouzies et al., 2005).

Additionally, the findings of this dissertation suggest that the adoption of market orientation, positively affect both the relationship of M&S departments, and company performance. Given the performance advantages witnessed by the market-driven firms in the literature (e.g. Cano et al., 2004; Kirca et al., 2005), it is important for firms to become more market oriented by developing internal processes needed for focusing on customer desires and on competitors' strategies, and enhancing inter-functional coordination, especially between M&S.

Moreover, top management should focus on the creation of a clear and integrated strategy between M&S. Our study indicated that there are companies in which the M&S managers have different perceptions regarding the strategy that their company implements. This lack of alignment between M&S managers regarding their respective companies' strategy seems to be a source of Marketing-Sales conflict and ends up hurting company performance. Thus, M&S executives should be encouraged by the top management to meet on a regular basis in order to review and discuss strategy decisions, developing a common understanding of their respective companies strategy, and reach a consensus on the strategy which they implement (Strahle et al., 1996).

Finally, top management should attend to status differences of the two departments, by removing barriers between these two units, and providing them both with an equal strategic voice.

Limitations and future research directions

There are several limitations that deserve attention. Specifically, the selection of (a) a single geographical context as a sampling frame, and (b) a single type of companies (consumer goods' companies) might be considered major limitations of this dissertation. Future research should address the issues examined in this study in other countries and in other types of companies (such as services) in order to ensure confidence in the stability of the findings and ultimate generalizability.

In addition, the measure of the impact of Marketing-Sales conflict on performance indicators, other than those examined in this dissertation (e.g. financial, organizational), would add some value to the model.

To better interpret the model proposed in this dissertation and to provide managers with clear guidelines, future research should analyze other drivers of effective relationships between M&S, such as company culture, organization structure and personal characteristics of managers of the two departments (Guenzi & Troilo, 2007). The addition of such variables to the model would increase its explanatory power and provide evidence to the relevant role of organizational design and managerial systems.

Finally, future research should also investigate the role of “conflict resolution mechanisms” (see Cespedes, 1993), such as job rotation, information exchange, liaison unit, formulation of common training programs etc, in the reduction of the level of Marketing-Sales conflict.

**TRANSFORMING AFTER-SALES SERVICE TO THE CUSTOMER SUPPORT SYSTEM
(CSS): THE CONTINGENCY THEORY PERSPECTIVE**

Lo, Sonia M.¹

¹National Chengchi University, Taipei, Taiwan. Email: Sonia.Lo@nccu.edu.tw

Abstract

Since the concept of "supply chain management" has been raised in the 19th century, many of the related discussion mainly focus on the manufacturing-based industry. In 1988, Vandermerwe and Rada pioneered the "servitization"-related discussion. As proposed by these scholars, involving service into the product provided brings more benefits to both manufacturers and consumers.

The contingency theory is utilized in the Customer Support System (CSS) area by (Gebauer, 2007) and (Gebauer et al., 2008). For a CSS, the environment factor represents the change of customers' need to manufacturing firms. In order to response to this change, firms have to adjust their internal strategy, and include services into their business activities. Further, under this strategy, the designs of organization and process are adjusted. As such they can meet customers' requirements and improve customers' loyalty.

The discussion of how to build business processes centering on service is still limited in the literature. One of the models most commonly discussed is the service supply chain framework (**Error! Reference source not found.**) proposed by Ellram et al. (2004). In this model, Ellram et al. (2004) argue that, a service-oriented supply chain needs to be supported by the information flow. Through the comprehensive information flow, the chain members can define their own needs, share information, communicate on their service range and anticipated service level, and then receive the feedbacks after providing service. Meanwhile, through the establish of information flow, the business activities within the service supply chain can be monitored, which in turn decreases unnecessary risk and resources waste (Davis, 1993, Lee and Billington, 1995, Scott and Westbrook, 1991).

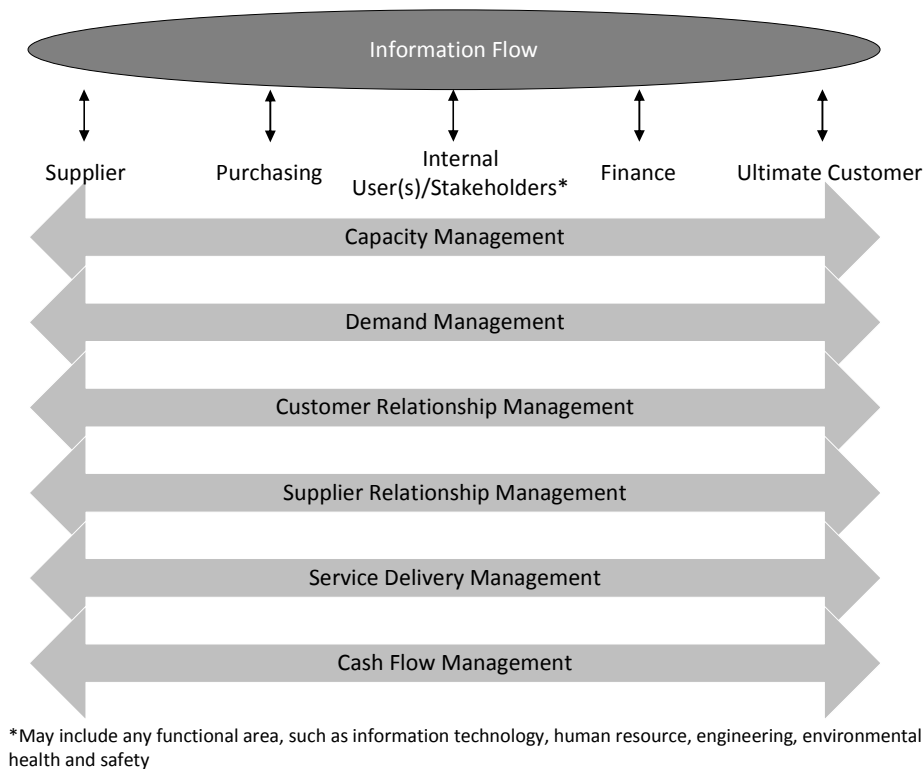

Figure 1. The Services Supply Chain Model (Ellram et al., 2004)

With the increasing importance of customer satisfaction in the competitive business activities, firms nowadays change their views of after-sales services to the weapon of creating competitive advantage, or even an important change to win customers' loyalty (Lele, 1997, Saccani et al., 2007). After-sales is further considered as one of the first steps which leads manufacturing firms to service organization (Gebauer, 2007).

In light of the importance of building a service-oriented supply chain, and the important role of after-sales in business activities, this study aims to investigate how organizations can adjust their internal business activities to face the challenges of response to customers' service-based needs, by utilizing the contingency theory as the framework.

This study uses the case study method to approach the collection and validation of qualitative data. Focusing on the selected case company, a well-known mobile phone distributor in Taiwan, we adopted the multiple data collection method as the way to collect our data. These methods include in-depth interviews, plant tours, documentation, and archival records.

With regards to the environment factors, this study figures the following five challenges facing by the case company: the close collaboration between mobile phone distributors and telecom operators, the threat of the "direct retailing" model, the losing bargaining power of branded mobile phone manufacturers, the growing bargaining power of customers, and the threat of new entrants.

In response to these external challenges, the case company has decided to solve their business problems via their organizational structure and process design. The case company aims to: attract young consumers with both tangible products and intangible service, provide consumers one-stop-shop which brings convenience to consumers, and keep their promise to consumers of fixing consumers' mobile phones within one to three days, respectively.

By using Ellram et al.'s (2004) framework of service supply chain, the detailed business process of the case company is further analyzed.

Information Management

The case company changed its traditional point-of-sales system to an enterprise resource planning (ERP) system. Via this ERP system, the case company manages its inventory, shipment, and maintenance status on a real-time basis. It also integrates the small systems distributed in different department and provides more accurate information for decision making. It also connects partners via the Internet, by building the customer and supplier relationship management systems.

Capacity Management

The case company exchanges its logistics information with third-party transporter via bar-code. This system integrates the communication between the case company and its logistics partners. It eliminates the mistakes caused by paper operations.

Demand Management

The case company uses a new forecast mechanism for the spare parts to deal with the inaccurate forecast problem. It builds up a database for its mobile phone products, analyzes the life cycle of mobile phone, and predicts how many spare parts needed based on these data. Each product has its own forecast model, which can be further utilized for the corresponding spare parts.

Customer Relationship Management

The case company wishes to add more value to their customers through the after-sales activity. To manage good customer relationships, it builds an internet-based membership database, analyzes customers' behaviors, and provides differentiated marketing strategy to each targeted customer group.

Supplier Relationship Management

The case company communicates with the brand company via a self-developed information portal, where the brand companies can check their historical transaction records and receive new

orders. The case company can also manage the percentage of purchase amount from each brand company easily on the portal.

Service Delivery Management

Because of the implementation of CRM system, the case company now transfers its marketing strategy from “push” to “pull”. They divide their products and customers into different groups, and promote suitable products to the needed customer groups.

Cash flow Management

The case company manages its cash flow mainly with its retailers. When customers come to the sales-points of retailers and make transactions, the retailers keep the record in the case company’s sales system. The system will then check the account at the night time. Compared with the traditional approach of checking the account manually, it saves much time for the case company and its retailers.

Research limitations/implications

This research chooses a well-know Taiwanese company as the case to study. An increase in the sample size could more comprehensively encapsulate the interpretation of the transformation of after-sales system.

Practical implications

This study utilized the contingency theory as the framework, to explore how after-sales service could transfer from the traditional product-oriented to service-oriented process. It can be served as the basis of a general reference for the computer-related industry.

This study collects practical evidence to investigate the transformation process of after-sales service from the traditional product-oriented perspective to the service-oriented one. By using the contingency theory as the framework, the environmental factors, strategy, and business processes of the case company are explored. It extends the knowledge body of service-oriented supply chain literature.

THE EFFECT OF DIMENSIONS OF DESTINATION IMAGE ON SATISFACTION AND PLACE IDENTITY: THE CASE OF SAOTOME AND PRINCIPE ISLANDS

Loureiro, Sandra Maria Correia¹; Kaufmann, Hans Ruediger²

¹University of Aveiro, Portugal

²University of Nicosia, Cyprus

Abstract

This paper aims to provide a contribution to the newly emerging field of place identity by studying the relationship between the dimensions of place image and satisfaction, as well as between the dimensions of place image and place identity. Based on previous literature, a model was tested using tourists who stayed in Sao Tomas and Principe as the population. The hypotheses were tested by employing factorial analysis and the PLS approach.

The main findings suggest that typicality, place quality, and pleasantness exercise a significant effect on satisfaction and place identity. The results of the study provide practical suggestions to the local authorities. Those should preserve the typicality and not mischaracterize the islands and, at the same time, they should create a better infrastructure for tourists and local habitants, such as roads. The network of water supply and electricity should also be improved. The improvement of these aspects must be conducted in conjunction with a plan to establish the identity of the islands, following by its communication in several African and European countries.

As far as the authors know, this is the first attempt to relate place image with place identity in islands such as Sao Tomas and Prince.

Keywords: destination image, satisfaction, place identity, island, typicality

Acknowledgements

The authors are grateful for the enormous help on data collection by Osvaldo Viana and Amandio Afonso.

Introduction

In a turbulent socio-economic environment, where the economic crisis is not yet completely overcome, it is worthwhile contributing to a better understanding of the image dimensions and identity of destinations. In order to apply the model proposed, this study focuses on the Sao Tome and Principe islands, which, so far, have not been the subject of significant attention by

researchers of tourism related fields. Sao Tome and Principe are two islands and several isles adjacent bathed by the Atlantic Ocean. Sao Tome and Principe, situated in the gulf of Guinea in Western Africa, have a tropical climate and an abundant vegetation. The archipelago is particularly reputed for its beaches and the production of coffee and cocoa beans.

The uninhabited islands were discovered in the reign of Alfonso V, by the Portuguese navigators João de Santarem and Pêro Escobar. Nowadays, the Sao Tome and Principe population result of miscegenation between Portuguese and natives from the coast of the Gulf of Guinea, Angola, Green Cape, and Mozambique. Concerning gastronomy, fish, crustaceans, lobster, crab, and mollusks such as conch, octopus and cuttlefish species are indispensable in the gastronomy of the islands. Plants that exist in abundance are essential ingredients in cooking of Sao Tome and Principe islands, making its cuisine one of high nutritional value in animal protein and other plant nutrients. In handicrafts raw materials such as wood, coconut husk, wicker of the palm and reeds or shells are used. The beaches are surrounded by a lush vegetation mantle and the blue sea. In light of all these natural potentialities, it is highly recommendable that the authorities of the islands create a brand identity for Sao Tomas and Prince. Hence, the main goal of this research is to analyze the impact of destination image dimensions on satisfaction and place identity.

Literature Review

Founded on the psychological theory of attraction, place attachment has been increasingly an object of interest in the field of tourism (e.g., Bricker and Kerstetter, 2000; Warzecha and Lime, 2001; Lee, 2001; Hwang, Lee, and Chen, 2005; Gross, Brien, and Brown, 2008; Ednie, Daigle, and Leahy, 2010).

Bricker and Kerstetter (2000) analyzed place attachment as to whitewater recreation. Warzecha and Lime (2001) studied the influence of place attachment, motivation, management actions, and the encounter norm on the Canyon lands National Park. Lee (2001) used attractiveness of destination, past experience, satisfaction, travel to the destination as a family tradition, familiarity with the destination, and the age of the tourist at his/her first visit, to predict the level of place attachment. Hwang, Lee, and Chen (2005) studied the relationship among tourists' involvement, place attachment, and interpretation satisfaction. Ednie, Daigle, and Leahy (2010) focused on reasons and causes associated with the way individuals become connected to a landscape. Yuksel, Yuksel, and Bilim (2010) explored the effects of destination attachment on customer satisfaction and cognitive, affective, and conative loyalty.

Place attachment is defined as an affective bond or link between people and specific places (Hidalgo and Hernandez, 2001). According to Low and Altman (1992), place attachment involves the interplay of affect and emotions, knowledge and beliefs, and behaviors and actions in

reference to a place. Moore and Graefe (1994) point out the extent to which an individual values and identifies with a particular environmental setting. The place attachment concept has been regarded as having two distinct dimensions: place identity, which refers to a symbolic or affective attachment to a place, and place dependence, which refers to a functional attachment to a place (Backlund and Williams, 2003). In addition, Bricker's and Kerstetter's (2000) study established a measurement profile for place attachment that includes place dependence, place identity, and lifestyles. Blackwell, Miniard, and Engel (2001) defined lifestyle as patterns in which people live and spend their time and money reflecting people's activities, interests, and opinions. Gross, Brien, and Brown (2008) examined the dimensions of a lifestyle tourism destination. Those dimensions include place attachment and place identity.

As this study concerns the component place identity and the effect of destination image on place identity and satisfaction, it is important to review the conceptualizations of such constructs. In this context, Proshansky (1978) alludes to the fact that place identity is related to dimensions of self that define the individual's personal identity in relation to the physical environment by means of a complex pattern of conscious and unconscious ideas, beliefs, preferences, feelings, values, goals and behavioral tendencies and skills relevant to this environment. For Proshansky, Fabian, and Kaminoff (1983) it is the connection between the self and a particular setting that consists of a collection of memories, interpretations, ideas and related feelings about physical settings as well as types of settings. Furthermore, place identity is the symbolically important connection between an individual and a setting (Stedman, 2002) and a psychological investment with a setting that has developed over time (Williams and Patterson, 1999; Yuksel, Yuksel, and Bilim, 2010). Summarizing, place identification is the connection between the tourists's self and a particular setting of a region's characteristics.

The relevance and interest of the tourist destination's image is universally acknowledged, which has led to a growing body of research on the tourism destination. However, there are several definitions of destination image. Lawson and Bond-Bovy (1977) defined it as an expression of knowledge, impressions, prejudice, imaginations and emotional thoughts an individual has of a specific object or place. Crompton (1979) mentions that an image may be defined as the sum of beliefs, ideas, and impressions that a person has of a destination. Embacher and Buttle (1989) state that image may comprise both, cognitive and evaluative components. According to Gartner (1996), destination images are developed by three hierarchically interrelated components: cognitive, affective, and conative ones. Nevertheless, the majority of researchers prioritize the cognitive dimension of image.

Echtner and Ritchie (1991, 1993) highlight the existence of a continuum from the functional to the psychological attributes of a destination. The functional component contains more tangible or measurable perceptions (such as scenery, accommodation) whereas the psychological component

emphasizes more abstract and intangible characteristics (such as atmosphere or friendliness). This study follows Echtner and Ritchie's conceptualization of destination image.

Consumer satisfaction has been the subject of much attention in the literature (e.g., Oliver, 1980; Bitner and Hubbert, 1994; Rust and Oliver, 1994; Mazanec, 2006; Han and Back, 2007; Loureiro and González, 2008). Giese and Cote (2000) conducted a thorough review of conceptual and operational definitions. After the literature review, the authors outlined three general components shared by the definitions, that is, consumer satisfaction is a response, an emotional or cognitive judgment; the response refers to a specific focus, and the response is linked to a particular moment (such as: prior to purchase, after purchase, after consumption). This research assesses the emotional and cognitive tourists' judgment of the stay in Sao Tome and Principe islands when they are leaving the islands.

On the basis of the secondary research reported above, the following hypotheses are proposed:

H1: Destination image has positive impacts on tourist satisfaction.

H2: Destination image has positive impacts on place identity.

Method

Participants and procedure

The surveys were conducted in March and May of 2010 through structured face-to-face interviews at the airport and in the port of the Sao Tome and Principe islands (when the tourists were preparing to leave the islands). The authors collected 272 completed and usable questionnaires, which, with the help of language professors, had been devised in two languages, Portuguese and English. A pilot sample was also conducted to ensure that the wording of the questionnaire was clear and that conceptual equivalence could be guaranteed. In terms of gender, the respondents split almost equally. Over fifty percent of the sample fell within the 21-40 year age group, and 43.9% of respondents were Portuguese. According to the Direction of Tourism and Hospitality of San Tome and Principe, most of the tourists are Portuguese.

Measures

Place identity was measured using 4 items based on Gross, Brien, and Brown (2008). This study used a multi-attribute approach in order to evaluate destination image (Echtner and Ritchie, 1991, 1993; Bigné, Sánchez, and Sanz, 2009). Satisfaction was assessed using 3 items adapted from previous researches (Bigné, Sanchez, and Sanchez, 2001; Loureiro and González, 2008). Each statement of the questionnaire was recorded on a 5-point Likert scale (1=strongly disagree, 5=strongly agree). The instrument was designed in English and translated into Portuguese using a dual focus method (Erkut et al. 1999).

Data analysis

For data analysis, a principal components analysis and Varimax rotation method were used to reduce the 22 destination image items into a set of simplified composite service factors. Only factors with eigenvalue equal to or greater than one were considered to be significant (Hair et al., 1992).

After that we applied the PLS (partial least squares) approach. The PLS is analyzed and interpreted in two stages. First, the adequacy of the measures is assessed by evaluating the reliability of the individual measures and the discriminant validity of the constructs (Hulland, 1999). Then, the structural model was appraised. Composite reliability was used to analyze the reliability of the constructs (Fornell and Larcker, 1981). To determine convergent validity, we used the average variance of variables extracted by constructs (AVE) that should be at least 0.5, and to assess discriminant validity we followed the rule that the square root of AVE should be greater than the correlation between the construct and other constructs in the model (Fornell and Larcker, 1981). Bootstrap is used to estimate the precision of the PLS estimates and to analyze the significance of the beta coefficients. Tenenhaus et al. (2005) proposed the geometric mean of the average communality and the average R² (ranging from 0 to 1) as overall goodness of fit (GoF) measures for PLS. The main reason for choosing PLS concerns the presence of a large number of variables and formative factors (Chin, Marcolin, and Newsted, 2003).

Results

The principal components analysis for the destination image items generated six factors that accounted for 66.9% of total variance. The results show that the loadings of reflective variables approach exceeded 0.707, except for one item of the destination image dimension named accessibility. That item was eliminated and the accessibility was analyzed with only one item.

Composite reliability was used to analyze the reliability of the constructs, since this has been considered a more exact measurement compared to Cronbach's alpha (Fornell and Larcker, 1981). Table 2 indicates that all constructs are reliable since the composite reliability values exceed the threshold of 0.7 and even the strictest one of 0.8 (Nunnally, 1978). The measures also demonstrated convergent validity as the average variance of manifest variables extracted by constructs (AVE) was at least 0.5, being indicative that more variance was explained than unexplained in the variables associated with a given construct.

Table 2 Measurement Results

<i>The distinctive lifestyle of São Tomé e Príncipe is something that attracted me here</i>	LV Index	Q ² Loading	Composite reliability	AVE*

The measures also demonstrate discriminant validity, according to the criteria defined in Methods (see Table 3).

Table 3 Discriminant Validity

Construct	Correlations							
	Accessibility	Agreeableness	Culture	Functionality	Satisfaction	Place identity	Place quality	Typicality
<i>AVE^{1/2}</i>	1.000	0.713	0.777	0.803	0.893	0.790	0.784	0.839
<i>Accessibility</i>	1.000	0.242	0.253	0.425	0.179	0.251	0.310	0.434
<i>Agreeableness</i>	0.242	1.000	0.481	0.386	0.287	0.490	0.516	0.235
<i>Culture</i>	0.253	0.481	1.000	0.535	0.285	0.392	0.388	0.419
<i>Functionality</i>	0.425	0.386	0.535	1.000	0.221	0.341	0.353	0.476
<i>Satisfaction</i>	0.179	0.287	0.285	0.221	1.000	0.235	0.446	0.311
<i>Place identity</i>	0.251	0.490	0.392	0.341	0.235	1.000	0.220	0.412
<i>Place quality</i>	0.310	0.516	0.388	0.353	0.446	0.220	1.000	0.286
<i>Typicality</i>	0.434	0.235	0.419	0.476	0.311	0.412	0.286	1.000

The structural results are presented in figure 1. In this study, a nonparametric approach, named Bootstrap, was used for estimating the precision of the PLS estimates and support the hypotheses. Four path coefficients were found to be significant at the 0.001, 0.01, and 0.5 level. All significant coefficients had the expected sign.

The Pearson's correlation value times the path coefficient value of each of the two constructs reveal that 16.3% of the satisfaction variability is explained by place quality and 21.1% of the place identity variability is explained by agreeableness.

Conclusions

This study is the first attempt to consider the effect of destination image dimensions on place identity and even on satisfaction in a destination such as the Sao Tome and Principe Islands. The results only partially support the hypotheses H1 and H2.

The typicality dimension is the most important and significant determinant of satisfaction and place identity. Typicality alludes to typical urbanization of the islands and the existence of suitable craft facilities (to see and buy).

The quality of the place is another important dimension that contributes to the tourist's satisfaction. This dimension covers the quality of the beaches, the quality of the resorts and the

availability of accommodation. On the other hand, the dimension agreeableness exercises a significant effect on place identity.

The agreeableness is one of the largest dimensions, in terms of number of items. This dimension groups items such as: there are interesting places to visit, it is a quiet place, the climate is pleasant, the gastronomy is good and the reference to the coffee and cocoa plantations.

Figure 1. Structural Results

Functionality is another dimension that combines a large number of items: high quality accommodation, night life/entertainment tourists can enjoy fairs, festivals and exhibitions, good value for money, quality services, and tourists can participate in different activities. The functional nature does not significantly impact on satisfaction and place identity. Although not significant, the beta coefficient between function and satisfaction is negative.

Finally, the dimensions culture and accessibility do not significantly influence satisfaction and place identity. The first concerns availability of open air activities, quality restaurants, and the existence of historical sites/museums. The second refers to the existence of good local transport facilities.

The tourists identify themselves with the climate, gastronomy, local visits, local urbanization, typical crafts, and calm environment. They are satisfied with the typicality but also with the quality of beaches and resorts. In this way, government and local managers should be aware of

these conclusions so as to preserve this typicality and not embark on excessive modernization and mischaracterization of Sao Tome and Principe.

In the future, the model should be improved with other variables and should be tested employing a larger sample and applying the model to different islands.

THE INFLUENCE OF BRAND IMAGE AND BRAND SATISFACTION ON WINE LOVE AND LOYALTY

Loureiro, Sandra Maria Correia¹; Kaufmann, Hans Ruediger²; Estrela, Rui³

¹University of Aveiro, Portugal.

²University of Nicosia, Cyprus.

³Lusofona University, Portugal

Abstract

The current study focuses on brand love of wine and on whether or not customer expertise influences the relationship between brand love of wine and satisfaction, brand image, worth-of-mouth, and loyalty. Derived from a review of previous literature, hypotheses were tested by employing the PLS approach and an initial model was tested with a sample of wine consumers.

The main findings suggest that wine consumers satisfied with their preferred wine brand and conscious of a good brand image are more likely to love wine, buy it and encourage others to buy and give advice. The results of the study provide some practical implications. When developing, labeling and naming a wine brand, wine producers and managers should be aware that it is possible to create not only attraction but even passion as well as feelings of love for a wine. Hence, it is important to focus on positive emotions towards the wine, planning for favorable experience with the wine, and create an image of trustworthiness. As to the knowledge of the authors, this is the first attempt to investigate satisfaction and brand image as antecedents of brand love and customer expertise as moderator. It is also the first time that the construct of brand love is applied in the wine context.

Keywords: wine, brand love, brand image, satisfaction, loyalty, word-of-mouth.

Introduction

Whether entrenched in culture over centuries in the old world or experimented with in the new world, wine inspires fascination and passion. Once regarded as a luxury good and only reserved for a few elitists, it has now become a “widespread consumer good enjoyed by a much wider socio-economic range of increasingly sophisticated consumers in many countries” (Bruwer and Wood, 2005, p.194). Consumer research could help understand what aspects of a product and its promotion these diverse consumers use to make their purchase decision. This type of research can guide wineries and distributors to highlight or even change important aspects to better suit consumer needs, which, due to the hedonistic characteristics of the wine product, have to be differentiated from those relating to other brands. Especially in the context of wine purchase,

consumers' decision-making is often an unconscious process entailing, in fact, many features or attributes entangled in complex combinations. So far, research has only provided partial understanding on how consumers really compare and then choose or recommend wines by focusing on individual facets (e.g. brand, price, region, label, color), specific consumer segments (e.g. heavy buyers), gender or cultural contexts.

A study conducted in Australia, revealed that brand was the most important factor for consumers' wine choice, closely followed by price and medals (Lockshin et al., 2009). In this study, eight different Australian brands were tested representing four different tiers of brand reputation from very well-known brands (such as Wolf Blass and Hardys) to unknown brands (such as Basalt Ridge and Duck Hollow). The total effect of difference in choice between these brands was mainly caused by one brand with a very high reputation, while they found only small differences between medium-known and unknown brands. This confirms the strong impact of a very well-known and positioned wine brand.

In Portugal, wine culture has been flourishing for centuries. Several brands from regions such as Dão, Alentejo or Bairrada are internationally known. Above them all raises wine from the Douro valley and the Port wine. The Douro valley was the first officially demarcated wine appellation in the world (18th Century) created under the guidance of Marquês do Pombal. Port got its name from the city of Oporto, which is situated at the mouth of the 560-mile long Rio Douro or River of Gold. Although many port-style wines are made around the world (Australia, South Africa and United States), the strict usage of the terms Port or Porto is reserved only to wines produced in Portugal.

The above considerations show that wine consumers have the knowledge and experience to name and identify wine brands, both national and foreign brands. Beyond these more cognitive aspects, the main aim of this paper is to propose a model explaining and interrelating antecedents and outcomes of the brand love of wine, so far neglected in literature.

Literature Review

Brand love as a complex phenomenon

The wine culture has strong ancestral roots with the Roman Empire having immensely influenced the development of viticulture and oenology. As the Roman Empire expanded, wine production in the provinces grew to the point where the provinces were competing with Roman wines. One can say that the major wine producing regions of Western Europe today were established by the Romans.

Wine is often associated with poetry, pleasure, and love. In Egypt, for example, wine played an important role in ancient ceremonial life. Similarly, ancient Greece had a god, Dionysos, dedicated to wine, pleasure, and festival.

Love is regarded as a very complex emotion, probably the most complex of all. Strongman (1996) states that love includes various emotions, some of them being positive. The following positive emotions contribute to explain this very complex phenomenon: interest, joy, pleasure, happiness, euphoria, victory, intense own satisfaction, delight, and so many others (include more sources here). This research regards brand love of wine as the central construct.

Given the complexity of the construct including aspects of branding and consumer behavior as antecedents and consequences, interpersonal love theory (Sternberg, 1986) alone does not allow for the discovery of specific dimensions of brand love.

In consumer research, Thomson *et al.* (2005) identified a higher-order emotional attachment construct consisting of three factors: affection, passion, and connection. Thus, attachment reflects an emotional bond similar to love. Ahuvia (1993; 2005a; 2005b) pioneered empirical research in the field of brand love and investigated in detail consumers' ability to love products and consumption activities using an interpretive paradigm. He found that many consumers do have intense emotional attachments to some "love objects" such as a brand, a product or a service.

According to Carroll and Ahuvia (2006), brand love is defined as the degree of passionate emotional attachment a satisfied consumer has for a particular trade name.

The interpersonal triangular theory of love (Sternberg, 1986) adapted to the consumption context is closely related to the emotional attachment construct; it considers that brand love is made up of dimensions such as: passion, intimacy, and commitment (Kamat and Parulekar 1997; Keh *et al.*, 2007). Similarly, Ahuvia (1993) suggests that consumers can have real feelings of love toward an object and conceptualizes the love as having two dimensions: real and desired integration.

Regarding models that integrate the brand love concept, three influential ones can be found: the holistic approach proposed by Fournier (1998), the causal approach of Carroll and Ahuvia (2006), and the systemic approach of Batra *et al.* (2008). Fournier (1998) suggests six strong relationships and is interested in the different relationships a consumer may have with a brand. Batra *et al.* (2008) integrate the seven dimensions of perceived functional quality, self-related cognitions, positive affect, negative affect, satisfaction, attitude strength, and loyalty into a model

of brand love relationship; however, they do not differentiate between antecedents and outcomes of the consumer's love for a brand and do not explicitly use the construct of love.

Reversely, Carrol and Ahuvia (2006) model the relationships between brand love and both its antecedents and consequences. They propose that brand love is influenced by a hedonic product and self-expressive brand and has a positive effect on brand loyalty and positive word-of-mouth.

Carroll and Ahuvia (2006) also highlight that brand love includes a willingness to declare love (as if the brand were a person) and involves integration of the brand into a consumer's identity. A consumer's love toward a brand is greater for brands that play a significant role in shaping the consumer's identity and as an image that fits somehow to the way of the consumer is, for example, transferred by a trustworthy, reliable, likeable, and attractive brand.

A concept closely affiliated with positioning which can contribute to this emotional bond between brand and consumer is brand image. Brand image refers to the set of associations linked to the brand that consumers hold in memory (Keller, 1993). In this way, the meaning of brands is constructed in two different ways: firstly, there is a primary meaning of the brand, which contains the benefits associated with it, and the physical attributes of the brand, and, secondly, an implicit meaning, made up of emotional and psychological meanings of brand attributes and other associations (Corbu, 2009).

Linking brand love to the concept of consumer satisfaction, Fournier and Mick (1999, p. 11), in their discussion of the various modes of consumer satisfaction, suggest that "satisfaction-as-love probably constitutes the most intense and profound satisfaction of all." In this way, being satisfied with a wine product can lead to the situation that the consumer loves it. Consumer satisfaction has been the subject of much attention in literature (e.g., Oliver, 1977, 1980; Rust & Oliver, 1994; Loureiro, 2010). Giese and Cote (2000) provide a thorough review of conceptual and operational definitions. Based on a literature review, the authors outline three general components shared by the definitions, that is, consumer satisfaction is a response, an emotional or cognitive judgment; the response refers to a specific focus and the response is linked to a particular moment (such as prior to purchase, after purchase, after consumption) (Giese and Cote, 2000, p.15). In this study, satisfaction is viewed as a post-consumption evaluation (e.g., Johnson et al. 2001; Loureiro, 2010).

Based on above considerations, the following hypotheses are formulated (see figure 1):

H1: Brand satisfaction impacts positively on brand love.

H2: Brand image impacts positively on brand love.

Relating to the ultimate achievement of consumer satisfaction, Oliver (1999, p. 34) defines brand loyalty as a deeply held commitment to rebuy a preferred good/service consistently in the

future, thereby causing repetitive same-brand purchasing, despite situational influences and marketing efforts having the potential to cause switching behavior. This definition emphasizes two different aspects of brand loyalty that have been described in previous work on the concept: behavioral and attitudinal. Behavioral, or purchase loyalty consists of repeated purchases of the brand, whereas attitudinal brand loyalty includes a degree of dispositional commitment in terms of some unique value associated with the brand (Chaudhuri and Holbrook, 2001; Odin et al., 2001). In this research, we will concentrate mostly in the behavioral loyalty. In this way, consumers satisfied and in love with a brand are more willing to repurchase and to recommend it to others (Carroll and Ahuvia, 2006) and the following hypotheses are proposed (see figure 1):

H3: Brand love has a positive impact on word-of-mouth.

H4: Brand love has a positive impact on loyalty.

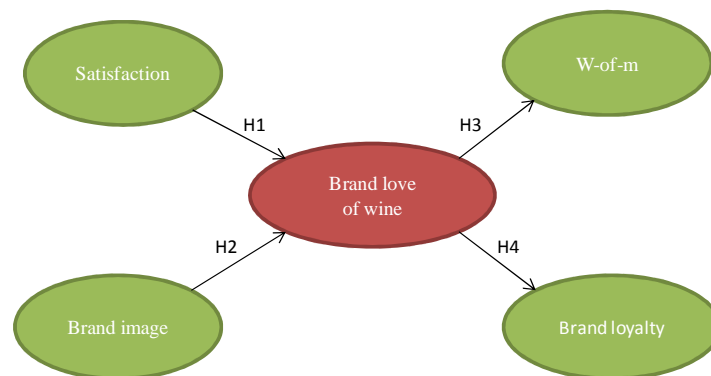

Figure1. Proposed model

Interestingly, knowledge was a factor not explicitly included yet in the discussion on conceptualization related to brand love. Consumer knowledge has been studied in western countries (Guo and Meng, 2008), and the level of knowledge partially explains consumer behavior and activities. Past research has found that experts and novices differ in the amount, content and organization of their knowledge reflected in large variances when they perform product-related tasks (Aurier and Ngobo, 1999). Two major dimensions of consumer knowledge can be distinguished, namely, familiarity or product-related consumption (Muthukrishnan and Weitz Barton, 1991) and product knowledge or subjective expertise which is the sum of product class information and rules stored in memory, that is, cues to evaluate their familiarity with the product (Bloch et al., 1989).

Referred to by a variety of authors in the previous discussion, consumer experience is conceptualized as sensations, feelings, cognitions, and behavioral responses evoked by brand-

related or product-related stimuli. In case of a brand that stimuli are part of a brand's design and identity, packaging, communications, and environments where the consumer has been exposed to the brand (Murray, 1985; Brakus et al., 2009).

Based on above considerations, in this study, the expertise of wine experts is regarded as a moderator. We define expert consumers as those who feel comfortable in the world of wine, have a great deal of experience in buying wine, and frequently shop for wine. Consumers with expert knowledge and high levels of experience in wine should be more willing to love wine. So, we postulated the following hypotheses:

H5a: The higher the level of expertise, the greater the positive relationship between customers' satisfaction and brand love of wine.

H5b: The higher the level of expertise, the greater the positive relationship between brand image and brand love of wine.

H5c: The higher the level of expertise, the greater the positive relationship between brand love of wine and word-of-mouth.

H5d: The higher the level of expertise, the greater the positive relationship between brand love of wine and loyalty.

Methodology

Sample and Data Collection

The questionnaire that captured both latent and demographic variables was pre-tested using 20 master students and wine experts which were personally interviewed. Then, an online survey was launched in Portugal during January and February of 2010. The main target population is young and mature women and men who are wine drinkers, even if they are just occasional drinkers, or even non-drinkers that purchase wine as a gift for friends, colleagues or family and, therefore, have some wine culture.

In this way, universities in the North and South of Continental Portugal, as well as, in Azores and Madeira were contacted in order to access students and staff. The Wine Commissions and wine Demarcated Regions were also contacted.

The sample of 476 respondents was split almost equal between genders. Over 50% of the respondents were under 46 years old (Table 1). Most of the respondents have a university degree and 47.4% are married or partnered with or without children.

Table 1 Demographic characteristics

Age	Gender	Qualification
18-25: 26.9%	Female: 48.6%	School – Standard level: 3.7%
26-35: 29.9%	Male: 51.4%	School – High level: 20.9%
36-45: 22.1%		University Degree: 50.3%
46-55: 13.8%		University Higher Degree (Masters, Ph.D.): 25.1%
56-65: 4.4%		
> 65: 2.9%		

Measurement

The items in the questionnaire were first written in English, translated into Portuguese, and then back translated to English. Back translation was used to ensure that the items in Portuguese communicated similar information as those in English (Brislin, 1970; Sekaran, 1983) meaning that conceptual equivalence was assured. The questionnaire was developed so that respondents could focus on their favorite wine brand: “Concerning your favourite wine brand, to which extent do you agree with the following statements”.

Brand love related to wine was measured using eight items adapted from Carroll and Ahuvia (2006). Brand image was measured with five items based on Woisetschläger (2007) and Woisetschläger, Hartleb, and Blut (2008). Satisfaction was measured using four items based on Brakus, Schmitt, and Zarantonello (2009). Word-of-mouth was assessed with three items (Zeithaml, Berry, and Parasuraman, 1996) and loyalty with two items based on Chaudhuri and Holbrook (2001).

In order to measure the experience with wine, in the questionnaire used three items: I don’t feel comfortable in the world of wine (reversed); I have a great deal of experience in buying wine; I frequently shop for wine.

Respondents rated all measures on a 5-point Likert scale ranging from 1 (Completely Disagree) to 5 (Completely Agree).

Results

First, the adequacy of the measures (see Table 2 and 3) is assessed by evaluating the reliability of the individual measures and the discriminant validity of the constructs (Hulland, 1999). All the loadings of items exceed 0.707, which indicates that over 50 percent of the variance in the observed variable is explained by the construct (Carmines and Zeller, 1979) (see Table 2).

Table 2 Measurement Results

Construct	LV Index Values	Item Loading	Composite reliability	AVE
<i>Brand Image</i>	3.8		0.942	0.764
<i>I1: This wine brand is trustworthy</i>		0.867		
<i>I2: This is reliable wine brand</i>		0.913		
<i>I3: This wine brand is likeable</i>		0.836		
<i>I4: This wine brand is a very good brand</i>		0.901		
<i>I5: This is a very attractive wine brand</i>		0.851		
<i>Satisfaction</i>	3.5		0.931	0.771
<i>S1: I am satisfied with this wine brand and its features</i>		0.819		
<i>S2: My choice to get this wine brand has been a wise one</i>		0.884		
<i>S3: I feel good about my decision to get this wine brand</i>		0.912		
<i>S4: I am happy with this wine brand</i>		0.893		
<i>Brand love of wine</i>	3.2		0.954	0.723
<i>LW1: I am passionate about this wine brand.</i>		0.823		
<i>LW2: This wine brand is totally awesome.</i>		0.875		
<i>LW3: This wine brand makes me very happy.</i>		0.862		
<i>LW4: This is a wonderful wine brand.</i>		0.886		
<i>LW5: This wine brand is a pure delight.</i>		0.863		
<i>LW6: This wine brand makes me feel good.</i>		0.850		
<i>LW7: I'm very attached to this wine brand.</i>		0.837		
<i>LW8: I love this wine brand.</i>		0.806		
<i>Word-of-mouth</i>	3.6		0.923	0.799
<i>W1: I have said positive things about this wine brand to other people.</i>		0.906		
<i>W2: I have encouraged other people to buy this wine brand.</i>		0.873		
<i>W3: I have recommended this wine brand to people who seek my advice.</i>		0.902		
<i>Loyalty</i>	3.5		0.888	0.799
<i>L1: I will buy this brand the next time I buy wine.</i>		0.878		
<i>L2: I intend to keep purchasing this wine brand.</i>		0.810		

AVE – Average Variance Extracted

Composite reliability was used to analyze the internal consistency of the constructs, since this method is considered a more exact measure than Cronbach's alpha (Fornell and Larcker, 1981). Table 2 shows that all constructs are reliable since the composite reliability values exceed the threshold of 0.7 and exceed even the stricter threshold of 0.8 (Nunnally, 1978). The measures also demonstrate that the convergent validity as the average variance of manifest variables extracted by constructs (AVE) was at least 0.5; this indicates that more variance was explained - rather than unexplained - in the variables associated with a given construct.

Finally, to assess discriminant validity, the square root of AVE should be greater than the correlation between the construct and other constructs in the model (Fornell and Larcker, 1981). Table 3 shows that this criterion has been met.

Table 3 Discriminant Validity

Construct	Correlations				
	Brand Image	Brand love of wine	Loyalty	Satisfaction	Word-of-mouth
AVE ^{1/2}	0.875	0.851	0.899	0.878	0.894
Brand Image	1.000	0.798	0.744	0.829	0.789
Brand love of wine	0.798	1.000	0.685	0.806	0.737
Loyalty	0.744	0.685	1.000	0.726	0.732
Satisfaction	0.829	0.806	0.726	1.000	0.778
Word-of-mouth	0.789	0.737	0.732	0.778	1.000

The full structural results are presented in Figure 2. In this study, a nonparametric approach called Bootstrapping was used to assess the precision of the PLS estimates and support of the hypotheses. All path coefficients were found to be significant at the 0.001 or 0.01 levels. Consequently, the first four hypotheses were supported. In addition, all the signs were in the expected direction.

The Q² statistic is used to evaluate the predictive relevance of the model. Since all Q² are positive in the model, the relations in the model have predictive relevance. The model also demonstrates predictive power (R²) since the modeled constructs explained 77.0% of the variance in brand love of wine and 46.9% of the variance in loyalty (Figure 2).

Figure 2. Structural results (full).

Then, the sample was divided into two groups, the high experience group (n=141) and the low experience group (n=135). The measurement results for each of two sub-samples reveal reliability of the individual measures, as well as, the convergent validity and the discriminant validity of

the constructs. The structural results and the multi-group analysis are presented in Table 4. In order to compare the two groups (high expertise group and low expertise group) we used the procedures described by Chin et al. (2003) and Chin (2007). The t-test results suggest that there are no significant differences (critical t-value = |1.960|) in the causal order relationships. So, the fifth hypothesis is not supported.

Table 4 Structural results and Multi-group Analysis

Structural paths	β High	β Low expertise	Standar	Standar	Sp ¹	β High – β Low	t-test
	expertise group	group	d error	d error			
			High	Low			
Satisfaction -> Brand love of wine	0.682***	0.666***	0,075	0,092	3,371	0,016	0,040 NS
Brand Image -> Brand love of wine	0.214**	0.210*	0,074	0,091	3,355	0,005	0,012 NS
Brand love of wine -> Word-of-mouth	0.683***	0.760***	0,072	0,054	2,956	-0,066	-0,187 NS
Brand love of wine -> Loyalty	0.709***	0.620***	0,050	0,076	2,900	0,089	0,255 NS
R^2 Brand love of wine	75,0%	71.1%

Conclusions

Ancestrally, wine has been identified with love and associated with several romantic songs. This study innovatively brings to the context of wine the construct of brand love proposed by Carroll and Ahuvia (2006).

The results support the first four hypotheses but not the fifth. Summarizing, wine consumers satisfied with their preferred wine brand and conscious of a good brand image are more likely to develop strong feelings of love for the wine. This strong feeling means to be attached, passionate, feel good, and regard the wine brand as wonderful and pure delight. Therefore, to be happy with the wine chosen and satisfied with the wine features influence the necessary involvement that leads to love.

Another important point is the image of the wine created in the consumer's mind. An image of attractiveness, trustworthiness, and likeability can help to create the passion for a wine label. Hence, the consumer should not be misled and a positioning created that matches the flavour and other organoleptic features to the lifestyle, and inner and social self of the consumer. The package and other symbolic representations of the wine brand should also be adjusted to the wine and the target consumer.

Brand love is a good predictor of recommendation and loyalty in the wine sector. Those who have a passion for a particular wine are the first to buy it again and suggest it to others to buy.

The higher the level of expertise does not improve significantly the effect of customer satisfaction and brand image on brand love of wine, as well as, does not lead to a greater loyalty or to encourage or recommend other people to buy the wine brand. Customers with more knowledge and experience on wine are not significantly more likely to develop feelings of love than others less knowledgeable. So, it is possible to involve consumers in order to generate wine lovers, even if they are not experts. So it could be concluded that the level of expertise can not be regarded as a moderator.

The wine should have strong flavors specific of each region that allow consumers to identify themselves with the wine, the region and the history and place related to the Portuguese wines in a unique and differentiated way.

As a suggestion for further research, it should be interesting to investigate potential other antecedents and outcomes of brand love of wine. In addition, consumers should be segmented according to different types of passion for the wine and its different features.

**VOLUNTARY ADOPTION OF INTERNATIONAL FINANCIAL REPORTING
STANDARDS BY THE ITALIAN PRIVATE FIRMS: A STUDY OF THE
DETERMINANTS**

Abstract

In our paper we explore the determinant of the voluntary adoption of Ias/Ifrs by the Italian private firms.

The Positive Accounting Theory is used as theoretical framework. We study the explanatory variables (firm size, leverage, shareholder nationality, legal form of the firm, audit and industry sector) of this accounting choices.

Keywords: Voluntary adoption; IAS/IFRS; Private firms; Financial Statements Determinant.

Introduction

The aim of the paper is to observe the determinant of voluntary adoption of the IAS/IFRS by the Italian private firms. In Italy, the Legislative Decree 28th February 2005, No. 38 (Exercise of the options provided by the Article 5 of Regulation (EC) No. 1606/2002 concerning the International Accounting Standards) allows also the private firms to adopt *voluntarily* the IAS/IFRS in both individual and consolidated financial statements if they're subsidiaries of public firms. So, firms reporting under IAS/IFRS can be divided into three distinct groups: "non-IAS/IFRS adopters" that exploit the exemptions and choose to report under domestic accounting standard; "mandatory adopters" that only adopt when they are forced to comply with; and, finally, the voluntary adopters that choose to comply with the IAS/IFRS.

Our paper focus on this third group of firms for the following reason. The IAS/IFRS is a set of accounting standards that can be used to bring about uniformity in (consolidated) financial statements of public firms on a global basis. Many studies (e.g. Ashbaugh, 2001; Leuz, 2003; Ball, Robin and Wu, 2003; Tarca, 2004; Cuijpers and Buijink, 2005; Van Tenderloo and Vanstraelen, 2005; Soderstrom and Sun, 2007) concerning these firms, highlights that the adoption of the IAS/IFRS limits the managerial discretion than the domestic accounting standards and enhances stock market efficiency (Kasznik, 1999; Leuz, 2003) in the behalf of the investors. Hence, the adoption (mandatory or voluntary) of the IAS/IFRS seems to improve the quality of the (consolidated) financial reporting of public firms and allows the investors to make informed

financial decisions and predictions of firm's future financial performance (Street, Nichols and Gray, 2000; Iatridis, 2010). However, the high quality of IAS/IFRS is linked to a process costly, complex and burdensome for the firms (Corno, 2006; Jermakowicz and Gornik-Towaszewski, 2006) because they are designed for the protection of the investors (Hope, Jin and Kang, 2005). Given that, based on previous assertion, the research question is summed up: Why the Italian private firms should adopt voluntarily the IAS/IFRS for the preparation of their separate financial statements? In other words, the aim of the paper is to investigate the determinant of the voluntary choice of the IAS/IFRS by these firms.

The main studies investigating the determinants of the voluntary adoption of the IAS/IFRS in the private firms are Francis *et al.* (2008) and, for the Italian environment, Cameran and Campa (2010).

Francis *et al.* (2008) study a sample of private firms of 56 countries and find that the voluntary adoption of IAS/IFRS is affected by both firm (e.g. foreign owners, foreign investors, foreign revenue, ownership or the legal form of the firm and the size, measured by the number of employee) and country (e.g. corruption in countries, general financing constraints, judicial functioning in countries) incentives.

Cameran and Campa (2010), instead, study a sample of Italian private firms and find that these firms have incentives to adopt voluntarily the IAS/IFRS if, among other characters, they're involved in operation of M&A, have one or more foreign shareholders, have foreign revenues (this issue measure the level of internationalization of the firm) and have a high level of leverage (debt/equity ratio).

Our paper extends prior researches on the analysis of the determinants of the voluntary adoption of IAS/IFRS and adds to our understanding of the role of the industry-type.

However, our study differs from Francis *et al.* (2008) which focalizes on the exploration of the role of the firm-specific and the country-level factors in the voluntary adoption of international accounting standards and get data from the World Business Environment Survey (WBES) which information are based on the survey.

Our study differs also from Cameran and Campa (2010) because the Scholars select a two-paired sample (firms that adopt voluntarily the IAS/IFRS; firms that adopt the domestic accounting standards, as control sample) from the AIDA database. In this case, they do not assess the determinant of the adoption of the IAS/IFRS but they compare some characters of the two samples of firms. In their paper, besides, the Scholars do not use the regression analysis to assess the significant factors that in the Italian context could influence the voluntary adoption of IAS/IFRS by private firms.

Finally, the studies before mentioned do not analyze the relationship between the voluntary adoption of the IAS/IFRS and the:

- a) appointment of an external auditor (an audit company or a single auditor) in charge of the financial audit function;
- b) industry-type of the firm.

As explaining background we use the Positive Accounting Theory (Watts and Zimmermann, 1986) because one of its main objectives is the explaining of the firms' choice (Watts and Zimmermann, 1990). A basic assumption in the Positive Accounting Theory (PAT) is that the agents are rational individuals concerned with furthering their own self-interest so the motivation for accounting policy choice studies (in this case, the voluntary adoption of the IAS/IFRS) is to gather evidence about the factors which influence managerial' behavior (Beattie *et al.*, 1994, p. 791).

The remainder of the paper is organized as follow. In section one we provide specification for the theoretical background that are the PAT (§ 1.1) and the accounting literature concerning the voluntary choice of IAS/IFRS by the private firms (§ 1.2). In section two we develop the hypothesis. In the third section we provide details about the sample of firms (descriptive statistic of the sample), the statistical method and results. In the section fourth we provide the research results and, finally we conclude summarizing the main findings and discussing the implications in according to the Positive Accounting Theory hypothesis.

Theoretical background

1.1. The Positive Accounting Theory

The PAT is considered one of the most innovative as well as controversial (Watts and Zimmerman, 1990, p. 131) theories in accounting since mid-1970s. Watts and Zimmermann (1990, p. 148) point out that the reason of the use "positive" was to "emphasize that accounting theory's role is to provide explanations and predictions for accounting practice". With regard to the financial statements, Watts (1977, p. 54) point out that "the financial accounting literature concentrates on prescriptions: on what should be the content of financial statements. Very little attention is given to developing a theory to explain many interesting observed phenomena; in particular to explain why financial statements take their current form". Jensen (1976, p. 7) arguments that the development of the PAT is linked to "explain why accounting is what it is, why accountants do what they do and what effects these phenomena have on people and resources utilization". In other words, the PAT attempts to explain observed phenomena indicating how things should be without indicating how they should be (Schroeder, Clark and Cathey, 2005, p. 113). Finally, Watts and Zimmerman (1978, p. 113) assert that a "... precondition

of a positive theory of standard setting is understanding management's incentives" in choosing among accountant alternatives. As Watts and Zimmerman (1986, p. 7) state, PAT "... is concerned with explaining accounting practice. It is designed to explain and predict which firms will and which firms will not use a particular method ... but it says nothing as to which method a firm should use". Hence, PAT could be produce prescriptions for government accounting policy and/or for the international standard setter, for example, for accounting standards (Watts and Zimmerman, 1986), but the normative aspect is based on positive (i.e. empirical) evidence.

Belkaoui (1992) highlights that "the central ideal of the positive approach is to develop hypotheses about factors that influence the world of accounting practices and to test empirically the validity of these hypotheses".

However, as Watts and Zimmermann (1986, p. 2) bring to light that PAT is based "on the intention to explain and predict accounting practices..." in this study we integrate the PAT background with other variables (compatibles with the Italian environment) to explain the determinants of the voluntary adoption of the IAS/IFRS by the Italian private firms.

The PAT and its hypotheses were originated in the American context and the studies are devoted mainly to the public firms. We extend this approach to the Italian private firms because we believe that it could help us to explain the determinants of accounting policy choices (IAS/IFRS vs. Italian accounting standards) made by preparers of financial accounting.

1.2. Literature review and the research question

In order to understand the market and firm's features behind the internationalization of financial statements, several previous papers concerning the public firms (Dumontier and Raffournier, 1998; El Gazzar *et al.*, 1999; Murphy, 1999; Ashbaugh, 2001; García and Zorio, 2002; Cuijpers and Buijink, 2005; Ortiz, 2005; Francis *et al.*, 2008; Nicolliello, 2009) have analyzed why these firms aim to adopt voluntarily the IAS/IFRS instead of their domestic accounting standards. These studies found that there are some market's and firm's features that influence the voluntary choice of the IAS/IFRS by these companies: e.g. the firm's size, the foreign activities or foreign revenues, the presence of foreign shareholders, the degree of the firm's leverage, and the type of their capital providers.

As concern the private firms, we found only few studies on the matter. Here follow we summarize their main findings and methodology.

Francis *et al.* (2008) investigate the reasons of IAS/IFRS adoption by small and medium-sized private firms from 56 countries. They build their study on prior researches, which posit that higher quality of the financial statements can reduce information asymmetry, and facilitate contracting with external parties. The Scholars, in fact, argue the existence of the agency problem

also in the private firms (see also Eirle and Halle, 2009) and firms that rely more on equity are characterized with higher levels of information asymmetry between managers and stakeholders. This asymmetry could increase the demand for high quality accounting standards. Francis *et al.* (2008) conclude that the voluntary adoption of the IAS/IFRS by these firms is motivated by firm-specific as well as by country-specific factors. Finally, the Scholars point out that larger firms, firmer with more external financing, growth firms, firms with foreign shareholders and firms with foreign revenues (firm-incentives) are more likely to apply IAS/IFRS. Among the firm-specific factors, Francis *et al.* (2008) supposed that the determinant (the independent variables) of the voluntary adoption of IAS/IFRS (a dichotomous dependent variable that assumes the value 1 if the firm adopt the IAS/IFRS) was: the expected growth rate in investment, the proportion of firm's financing in the previous year from external sources; the nationality of the owners, the export sales, the size (measured by the number of employees) and, finally, the ownership (Limited liability corporation, partnership or sole proprietorship).

The study of Cameran and Campa (2010), instead, using the archival data (extracts by AIDA database), explores the determinant of the voluntary adoption of the IAS/IFRS by the Italian private firms. They select two-paired sample of firms that adopt voluntarily/non adopt these accounting standards. Unlike Francis *et al.* (2008), Cameran and Campa (2010) do not utilize the regression analysis to determine the statistical importance of the factors influencing the voluntary adoption of IAS/IFRS by private firms; instead they adopt the univariate analysis methodology as the "Two sample paired T-test" and the "Two proportions T-Test". Here follow, we summarize the two studies cited (Table 1).

Table 1: Summary of studies on voluntary adoption of IAS in private firms.

Authors	Research Question	Dependent Variable	Independent variables	Methodology	Results
Fields <i>et al.</i> (2008)	1) The influence of the firms and countries incentives on the decision to adopt voluntarily the IAS 2) The role of the firm and countries incentives in explaining IAS adoption	Adoption of IAS: 0 = no 1 = yes	1) Firms specific factors: - External financing - Investment growth; - Foreign owners; - Export sales. 2) Country Level variables: - Power-adjusted gross domestic product per capita; - Legal development in countries; - General financing constraints;	Logit Regression analysis	We cannot summarize all the results (see Fields <i>et al.</i> , 2008, p. 345-353) but the Scholars find that the voluntary adoption of IAS by private firms of the 56 countries in the world is affected (in different measure) by both the firm specific and country level factors.

			<ul style="list-style-type: none"> - Corruption in countries; - Judicial functioning in countries; - Financial development in countries; - Common law or civil law variable. 		
Cameran and Campa (2010)	The determinant of the voluntary adoption of IAS/IFRS by Italian private firms	-	<ul style="list-style-type: none"> 1) Organizational and governance variables: <ul style="list-style-type: none"> - Link to a public firm; - Institutional investors; - Strong ownership by one shareholder; - Italian and foreign shareholders; - Export revenues; - M&A operations. 2) Economic and Financial variables <ul style="list-style-type: none"> - Total assets; - Leverage; - Financial position. 	<ul style="list-style-type: none"> - Two sample paired T-test; - 2 proportions T-Test 	<ul style="list-style-type: none"> 1) 74% of the firms of the sample adopt the IAS/IFRS if they are subsidiaries of public firms; The decision to adopt voluntarily the IAS/IFRS is influenced by the presence of: <ul style="list-style-type: none"> - Institutional investors (e.g. pension funds; SIM) influence the decision to adopt voluntarily the IAS/IFRS; - One majority shareholder; - Foreign sales; - M&A operations; - High level of leverage.

Consistent with this argument and considering that the adoption of the IAS/IFRS is a process costly, complex and burdensome for all the firms, the Research Question is:

Why the Italian private firms should adopt voluntarily the IAS/IFRS for the preparation of their separate financial statements instead of the Italian accounting standards?

Our study, extending prior researches (Fields *et al.*, 2008 and Cameran and Campa, 2010), investigates the explanatory variables regarding the determinants of the voluntary adoption of IAS/IFRS by the Italian private firms that are allowed by the law (Decree Legislative 38/2005) to this voluntary choice.

Hypothesis development

Watts and Zimmermann (1990, p. 132) state “it is clear that there is a relation between firm’s accounting choice and other firm variables”. In our study we retain the classical variables issued from the PAT as the firm’ size and its degree of leverage because they are compatible with the aim of our work. However, to these explanatory variables we also add other variables as: the presence of foreign shareholders, the export sales (foreign revenues), the legal form of the firm, the body that the firm can put in charge of the Financial audit function (voluntary or mandatory)⁷⁰ of the financial statements and, finally, the industry sector. These indicators are proxies for firms’ incentives that may drive their decision to adopt voluntarily the IAS/IFRS. In the analysis we do not consider as independent variable the membership of the firm in a group: the Italian law allows only to the subsidiaries to adopt voluntarily the IAS/IFRS for the preparation of the firm’s separate financial statements (see the article 2 of the Decree Legislative n. 38/2005).

Size

Watts and Zimmerman (1986) pointed out that political costs are positively related to firm’ size, hence, larger firms should be more likely to apply IAS/IFRS than smaller firms. Higher political costs (Watts and Zimmerman, 1986) and agency costs of large firms caused by more widely dispersed ownership, may drive these firms to the voluntary adoption of IAS/IFRS and make more disclosure (Meek, Roberts and Gray, 1995) increasing the confidence in their financial statements (Dumontier and Raffournier, 1998). Given that, the compliance of the financial statements with IAS/IFRS improves its quality in behalf of firm’s stakeholders. If, as generally admitted, political costs are positively related to size (Watts and Zimmerman, 1986), large firms should be more likely to apply IAS than small firms (Dumontier and Raffournier, 1998, p. 221). However, Murphy (1999) states that public Swiss companies that adopt IAS/IFRS do not differ in terms of size.

Moreover, compliance with IAS/IFRS implies an increase of disclosure. The literature agrees on the positive relationship between the firm’s size and its information disclosure level. Chavent *et al.* (2006) highlight that there are many reasons according which is possible explain this link. Large firms have more incentives to disclose information to reduce their political costs, since their higher visibility can easily lead to more litigation (Watts and Zimmerman, 1978; Bujaki and Richardson, 1997). Besides, thanks to their more developed internal reporting system, the costs associated with a higher disclosure level are lower for large firms. Finally, because their annual report is the main source of information for their competitors, smaller firms may be reluctant to make additional disclosures which might place them at a competitive disadvantage (Firth, 1979).

⁷⁰ The Italian law allows the private firms to have their financial statements audited by the Board of Statutory Audit (BSA), an inside body appointed by the shareholders, by a single auditor (external) and, finally, by an Audit company (BIG 4 or non BIG 4).

Besides, the compliance process with IAS/IFRS has quite different for large and small firms because large firms have better access to resources and being more able to cope with this adoption (ICAEW, 2007). Kvaal and Nobes (2010) find that size is a key determinant of accounting choice when it comes to deviation from the domestic accounting standards.

As proxy of the SIZE we use the natural logarithm of the net sales (in euros) although it can be measured in numerous different ways (e.g. the number of the employees or the Total of the Assets). We choice the net sales because the number of employees is not always shown in the Notes while in Italy the total of assets could reflect some accounting policy and earnings manipulation (for example, the capitalization of the deferred costs).

Based on these arguments, we state the following null hypothesis:

H0₁: The voluntary adoption of IAS/IFRS is positively associated with firm size

The coefficient of SIZE is expected to be *positively* associated with the voluntary adoption of IAS/IFRS.

Leverage

External financing gives to the shareholders the opportunity to transfer wealth to the prejudice of firm's creditors. As affirmed by Dumontier and Raffournier (1998, p. 223), borrowing costs are based on a firm's current risk. So, the shareholders have an incentive to invest borrowed finance in projects riskier than current assets in order to improve their expected return on the investment without supporting additional costs. In this case, finance providers (especially the banks and the other capital providers) are penalized considering that they are not compensated for the resulting increase of default risk (Jensen and Meckling, 1976). For this reason, firms have incentives to enhance their transparency (for example by preparing high quality accounting information) and to improve the quality of their financial statements (by using a set of General Accepted Accounting Standards as the IAS/IFRS) in order to attract external financing at lower costs (Durnev and Kim, 2005).

Given that, as the leverage is positively associated with the need for monitoring between shareholders and creditors, it can be argued that high leveraged firms are more wishful to adopt IAS/IFRS in order to reduce borrowing costs compared to firms with a low level of leverage.

Based on these arguments, we state the following null hypothesis:

H0₂: The voluntary adoption of IAS/IFRS is positively associated with the degree of firm's leverage

The coefficient of LEV is expected to be *positively* associated with the voluntary adoption of IAS/IFRS.

Foreign shareholder

Foreign shareholders are less familiar with subsidiaries' national accounting standard: this situation could create an information gap between the firm and their foreign shareholders. The adoption of IAS/IFRS allows foreign shareholders to better monitor the performance and the financial position of the firm (Khanna, Palepu, and Srinivasan, 2004). Since IAS/IFRS are generally of high quality accounting standards (Barth, Landsman and Lang, 2008) and prevent distortion in financial statements by managers, the adoption of IAS/IFRS facilitates the monitoring task of shareholders. The adoption of IAS/IFRS increase the transparency and credibility of the firm (Francis *et al.*, 2008), this in turn increases the attractiveness of the firm for foreign investors (Covrig *et al.*, 2009). Private companies with one or more foreign shareholders, thus, have an incentive to publish their financial statements according to IAS/IFRS in order to reduce the level of information asymmetry.

Based on these arguments, we state the following null hypothesis:

H0₃: The voluntary adoption of IAS/IFRS is positively associated with the presence of a foreign shareholder

The coefficient of FSHAR is expected to be *positively* associated with the voluntary adoption of IAS/IFRS.

Export sales (or Foreign revenues)

Francis *et al.* (2008, p. 339), highlight that adoption of IAS/IFRS can also be affected by export sales. The argument is the same to that for foreign shareholders. Frankel and Romer (1999) show that foreign trade enhances economic growth. Therefore, firms engaging in exports normally experience increase in sales. Moreover, exporters are typically larger and more capital intensive than non-exporters, which creates a need for external financing. Exporters also have contracts with foreign firms so that IAS/IFRS-based financial statements can be relevant in facilitating contracting with these parties. Unlike to Francis *et al.* (2008) we do not detect the existence or the absence of the export sales (by a dichotomous variable). We argue that a firm with a lower level of export revenues than the total amount of the annual revenue, couldn't be regarded as an exporting firm. So, as proxy of the variable Export sales, we consider the weight of the export sales on the total of the sales of the year 2009. We get the information about the export revenues from the mandatory firms' Notes.

Based on these arguments, we state the following null hypothesis:

H0₄: The voluntary adoption of IAS/IFRS is positively associated with the ratio of export sales

The coefficient of FREV is expected to be *positively* associated with the voluntary adoption of IAS/IFRS.

Legal form

Francis *et al.* (2008, p. 339) point out that the legal form of a firm can influence its ability to meet its financing needs. Many private firms are not entirely run by owner-managers, and are organized as limited liability corporations (rather than proprietorships and partnerships) in which agency conflicts create the need for monitoring of management (Ang, Cole and Lin 2000). To limit information risk and agency cost, the limited liability corporations are more likely to adopt IAS/IFRS as a signal of accounting quality and financial transparency (Francis *et al.*, 2008, p. 340).

The Italian civil law requires the preparation and the publication of the financial statements only for the companies and not for the sole proprietorships and partnerships. Also, the companies can be divided mainly in two groups: the Stock company or corporation (in Italian, "Società per azioni" or Spa) and the Limited liability company (in Italian "Società a responsabilità limitata" or Srl). Moreover, in this group are included a little number of Cooperatives and of Consortium. We use a dichotomous variable that takes the value of 1 if the legal form of the firm is the Stock company (Spa) and the value 0 if the legal form of the firm is the Limited liability company, the Cooperative or the Consortium.

Based on these arguments, we state the following null hypothesis:

H0s: The voluntary adoption of IAS/IFRS is positively associated with the legal form of the firm

The coefficient of LFORM is expected to be *positively* associated with the voluntary adoption of IAS/IFRS.

Use of external audit and auditor's reputation

The audit verification improves the credibility and the reliability of the financial statements toward the stakeholders (investors and capital providers). In recent years, many researchers argue that the enforcement of accounting standards is as important as the accounting standards (e.g. Sunder, 1997). Strong IAS/IFRS enforcement puts great pressure on management and auditors to act faithfully and truthfully to comply with the accounting standards, and they contributes to comparability of financial statements across countries (FEE, 2002, 29).

DeAngelo (1981) indicated that audit quality is influenced by the size of the external auditing company. The Scholar argued that the value of an external audit depends on how users perceive the report of auditors in the corporate annual report. The perception is formed on the basis of the understanding of users of both the ability of the auditor to discover a material error (auditors' technical capabilities) and the willingness of the auditor to properly report the error (auditors'

independence). Nowadays, the plan of the Big 4 is to force all countries, all companies and all auditors to use IAS/IFRS.

Moreover, it has been argued that Big Audit companies (now the Big Four are: the PriceWaterHouseCoopers, the KPMG, the Ernst & Young and the Deloitte) may incite their customers to disclose more information (Firth, 1979) because an audit failure could damage their reputation and their brand name (Francis, Maydew and Sparks, 1999; Piot and Janin, 2007; Mariani *et al.*, 2010). Finally, the Audit company has higher competences in IAS/IFRS (Corno *et al.*, 2007) and they create schemes and model for apply the IAS/IFRS worldwide. So, the adoption of the IAS/IFRS by their customers helps them to execute the work of auditing.

Hence, we argue that the firms audited by an Audit company are more likely to adopt voluntarily IAS/IFRS than the firms non audited by these companies. In this way, the firms audited by a Big 4 Audit company seem to improve the quality and the credibility of their financial statements and this credibility toward the capital providers and the other stakeholders.

We expect also that the firms that do not submit their financial statements to the financial auditing adopt the Italian accounting standard.

Based on these arguments, we state the following null hypotheses:

H0₆: The voluntary adoption of IAS/IFRS is positively associated with the presence of the Financial Audit function and the likelihood to adopt them increases if the firm is audited by a BIG 4 Audit Company.

The coefficient of AUDIT is expected to be *positively* associated with the voluntary adoption of IAS/IFRS.

Industry

As concern public firms, Cuijpers, Buijink, and Maijoor (2003) obtain results regarding the association between voluntary adoption of IAS/IFRS in the European Union and the industry type. The Scholars found that firms in transportation, communications, electric, gas and sanitary services (SIC code 4; two-digit codes 40-49) are more likely to use IAS/IFRS (non-local GAAP). This evidence was found also by Ortiz (2005). However, while Ortiz (2005) found that firms engaged in services operations (SIC code 7; two-digit codes 70–89) are more likely to adopt IAS/IFRS, Cuijpers, Buijink, and Maijoor (2003) found that these firms are less likely to use IAS/IFRS.

Based on these arguments, we want analyze if also in Italy the industry-type influence the voluntary adoption of the IAS/IFRS. The level of voluntary disclosure may differ between industries because of industry-specific accounting regulation, competitive pressures (Cooke, 1992) or proprietary costs (Meek *et al.*, 1995).

We use Industry as control variable to check if a particular industry sector could affect the voluntary adoption of the IAS/IFRS than the others

In summary, we have:

Table 2: Summary of the independent variables (IV) used in the paper

Hypotheses and Label	Name of the independent variable	Expected sign of the coefficient	Source of data	Nature of the IV	Explanatory variable
H1: SIZE	Size	+	AIDA	Continue	Natural logarithm of the annual revenue
H2: LEV	Leverage	+	AIDA	Continue	Financial debt/Net Equity ⁷¹
H3: FSHAR	Foreign shareholder	+	AIDA	Dichotomous	1= Yes; 0=No;
H4: FREV	Foreign Revenue	+	AIDA (Notes or Management report)	Continue	Export sales/Total sales of the 2009
H5: LEGFORM	Legal Form of the firm	+	AIDA	Dichotomous	1=Stock company or Corporation; 0= Otherwise.
H6: AUDIT	Audit	+	AIDA (Report of the Board of Statutory Audit or Report of external auditor)	Categorical	0 = firm not audited 1= Board of Statutory audit; 2= External independent auditor; 3= Non BIG FOUR Audit company; 4= BIG FOUR Audit company.
H7 IND ⁷²	Industry (Sic classification)	none	AIDA	Categorical	SIC1= sectors up to 10 SIC2= sectors 11 to 17 SIC3= sectors 20 to 40 SIC4= sectors 41 to 50 SIC5= sectors 51 to 69 SIC6= sectors 70 to 90

⁷¹ The Financial Debt is the sum of Debt to shareholders for loans, Debt to banks and Debt to other capital providers (for each item, the AIDA Database considers the debt within 12 months and over).

⁷² From the SIC Code, we exclude the sectors: 60 (Depository Institutions); 61 (Non depository credit institutions); 62 (Security and commodity brokers, dealers, exchangers and services); 63 (Insurance carriers); 64 (Insurance agent, brokers and services) because in this sector there are special law that require to comply with IAS/IFRS. So, the choice does not voluntary.

Research design and methodology

This section describes the method used to select the sample of the firms used in the analysis (§ 3.1) and the procedure followed to test the predicted associations (§ 3.2).

Sample and Data

The population consists of all Italian private firms that are allowed by law (the Decree Legislative n. 38/2005) to adopt voluntarily the IAS/IFRS in preparing their separate financial statements. For the analysis we consider the year 2009. We choose this year because the Decree Legislative n. 38/2005 allows the Italian private firms to adopt voluntarily the IAS/IFRS only from the 2006. We note that most of the firms of our sample comply with the IAS/IFRS only in the 2007. Some other, instead, adopt these standards in 2008 (we do not include the year of adoption of IAS/IFRS in our study). We remember also that the Italian private firms could adopt voluntarily the IAS/IFRS if they're subsidiaries. So, choosing the 2009 we believe to capture a high number of firms that adopted voluntarily the IAS/IFRS (please note that we do not consider the year of the First Time Adoption of the IAS/IFRS).

For the analysis we extract financial data from the AIDA Database (Bureau Van Dijk) in date 24th April 2011. At this date, the population of Italian private firms that meet the legal requirements for the voluntary adoption of IAS/IFRS for their separate financial statements are 46.184: only 479 ($479/46.184 = 1,04\%$ of the population) of them prepare the separate financial statements compliant with the IAS/IFRS (voluntary adoption).

We decide to extract a sample from the population because we find that the AIDA Database do not publish the Notes of many firms. To extract the sample from this large population, we use the method suggested by Kreicic and Morgan (1970, p. 608). The Scholars suggest that for a population in the range 20.000-50.000 the sample should be of 381 firms:

Table 3: Extraction of a sample from a given population

Population	Dimension of the sample
10	10
100	80
200	132
300	169
...	...
10.000	370
20.000	377
50.000	381
75.000	382
≥ 1.000.000	384

Source: Adapted by Kreicie e Morgan (1970, p. 608).

However, considering the proportion between the firms IAS/IFRS compliant and the firms that comply with the domestic accounting standards (479/46.184), in the sample of 381 firms we fear to find a low number of firms which financial statements comply with IAS/IFRS. Such, to improve the sample and to increase the likelihood to find that adopt voluntarily the IAS/IFRS we decide to extract 500 firms (instead of 381)⁷³.

⁷³ The choice of the particular firms to be subjected to empirical analysis was conducted using the random procedure suggested by literature (Collis and Hussey, 2009, pp. 210-212) that we described below. We:

a) Divide the population (46.184) by the sample size (391): $46.184/450 = 103$ (rounded);

b) Using the software Excel 2011 for Mac®, we get a random number between 1 and 103: the result is 12;

c) The numbers thus selected (12) represent the starting point of an iterative procedure to select randomly sample units from the population (when we export the AIDA result in EXCEL, each firm is identified by a progressive identification number, from 1 to 46.184); the numbers are added to that identified in the previous sub phase a). The procedure is then repeated until when we reach the desired numerosity of the sample. In our case, the first firm selected from the population of 46.184 firms, is in place n. 12 (the random number). The second firm selected is that is in position n. 115 (12+103). The third firm selected in the population is in position n. 218 (115+103) and so on.

Between the 450 firms, we have to eliminate 22 firms that do not adopt voluntarily the IAS/IFRS because the notes do not provide clear information about the nationality of the shareholders (we find the information "do not available"). So our sample is of 428 firms. Between them we find only 37 firms that adopt voluntarily the IAS/IFRS for their separate financial statements. To improve the analysis we decide to select other firms that prepare their separate financial statements compliant by IAS/IFRS. We analyze the information of all the 479 firms in the population that adopt voluntarily the IAS/IFRS at 2009. From this population (of 479) we exclude the 37 already selected in the first step of the sampling and other 65 firms whose notes do not present clear information about the export revenue or the nationality of the shareholders (in many cases, in fact, we find "information not available"). So, we have to extract a sample from 377 firms that adopt voluntarily the IAS/IFRS (479-37-65). From this population (377), we try to draw other 100 firms (the total should be $37 + 100 = 137$).

The choice of the other 100 firms that adopt voluntarily the IAS/IFRS was conducted using the procedure random, described below. We:

d) Divide the sub-population (377) by the sample size (100): $377/53 = 7$ (rounded);

e) Using the software Excel 2011 for Mac®, we get a random number between 1 and 7: the result is 5;

Following the sample' procedure selection shown in note 4, our final sample is composed by 514 firms: N° 123 (37+86) firms that adopt voluntarily the IAS/IFRS; N° 391 firms that do not adopt the IAS/IFRS (but they would be able to adopt it).

However, after a first analysis of the firms, we canceled two firms belonging to the SIC sectors of agriculture (Category 1). Finally, the sample analyzed is composed of 512 firms (both firms belong to the firms that not adopt the IAS/IFRS). Table 4 report the firms after the elimination of the two firms.

Table 4: Final sample: Firms that adopt/non adopt voluntarily the IAS/IFRS (512 obs.)

Variable	Frequency	%
NON IAS/IFRS (0)	389	76.00
IAS/IFRS (1)	123	24.00
Total of the sample	512	100.00

Methodology

We estimate the Binary Logistic Regression model (BLR) because the dependent variable is a dichotomous variable. The model classifies the firms into two groups: IAS/IFRS (1) and NON IAS/IFRS (0) adopters.

The dependent variables is now placed in relationship with the independent variables:

- Firm's size (SIZE): the natural logarithm of the net sales in 2009 (the turnover);
- Leverage (LEV): as stated above, for this measure we considered the amount of debt financing (the sum of the debts to shareholders, the debt to banks and the debts to other capital providers) at the end of 2009 scaled by owner-equity at the same period;
- Foreign shareholder (FSHAR): the variable is dichotomous and it assumes value of 1 if the firm has also foreign shareholder, the value of 0 otherwise;

f) The numbers thus selected (5) represent the starting point of an iterative procedure to select randomly sample units; the numbers are added to those identified in the previous sub phase d). The procedure is then repeated until when we reach the desired numerosity of the sample. In our case, the first firm selected from the sample of 377 firms, is that is in position n. 5 (the random number). The second firm selected is that is in position n. 12 (5+7). The third firm selected is that in position n. 19 (12+7) and so on.

Between these 100 firms we have to eliminate 14 of them because their financial statements refer to a period that not coincide with the calendar year. So, we find only 86 firms.

Finally, our final sample is of 514 firms: N° 123 (37+86) firms that adopt voluntarily the IAS/IFRS; N° 391 firms that do not adopt the IAS/IFRS (but they would be able to adopt it).

- Export sales (FREVE): we consider the amount of foreign (or export) sales of 2009 scaled by the total of the turnaround at the same period.;

- Legal form (LEGFORM): the variable is dichotomous and it assume value of 1 if the legal form of the firm is the Stock company (Spa) and the value 0 if the legal form of the firm is the Limited liability company or a cooperative;

- External audit (AUDIT): the variable is categorical and assume the following values: 0 if the company is not audited; 1 if the company is audited by the Board of the Statutory Audit; 2 if the firm is audited by and external independent single auditor; 3 if the firm is audited by a NON BIG FOUR Audit Company; 4 if the firm is audited by a BIG FOUR Audit Company.

- Industry (IND): this variable is categorical and we refer to the SIC code as stated above in Figure N° 2.

In analytical terms, the statistical model used in the Binary Logit Regression (BLR) analysis can be defined as:

$$\text{Prob (IAS/IFRS} = 1) = \alpha_i + \beta_{1i} \text{ SIZE} + \beta_{2i} \text{ LEV} + \beta_{3i} \text{ FSHAR} + \beta_{4i} \text{ FREVE} + \beta_{5i} \text{ LEGFORM} + \beta_{6i} \text{ AUDIT} + \beta_{7i} \text{ IND} + \varepsilon_{ni} \quad (1)$$

Where:

α_i = is the intercept of the model (constant)

β_{ni} = are the coefficients of the “n” independent variables (n= 1 to 6) and of the “i” firms (i= 1 to 512)

ε_n = is the error of the regression (unobserved variables)

For the BLR analysis we use the software IBM SPSS[®].

Research results

The results section of the research discusses the empirical results on the determinants of the voluntary adoption of the IAS/IFRSs by the Italian private firms (allowed by the Italian law to adopt voluntarily these accounting principles for the preparation of their separate financial statements).

Section 4.1 presents the descriptive and univariate statistics. Section 4.2 reports multivariate regression on the hypothesized associations between the dependent variable and the independent variables.

Descriptive statistics

Table 5 reports the descriptive statistics of our sample (Confidence Interval = 95%).

Table 5: Descriptive statistics of all the sample (NON IAS/IFRS and IAS/IFRS adopters)

	IAS/IFRS	SIZE	LEVERAGE	FSHAR	FREV	LEGFORM	AUDIT	INDUSTRY
N= 512								
Mean	.24	10.466	1.025	.74	.191	.521	1.982	4.11
S.E. Mean	.019	.0728	.313	.019	.0137	.022	.060	.054
Median	.00	10.207	0.100	1	.000	1	1	4
Mode	0	8.655	.00	1	.00	1	1	3
Std. Deviation	.428	1.648	7.093	.438	.311	.500	1.364	1.219
Variance	.183	2.715	50.310	.193	.097	.250	1.861	1.487
Minimum	0	3.69	-37.51	0	.00	0	0	2
Maximum	1	16.51	127.69	1	1.00	1	4	6

Table 6, 7, 8 and 9 report the frequency of the independent variables LEGFORM, FSHAR, AUDIT and INDUSTRY for all the firms in the sample (N=512). The frequency of the independent variables SIZE, FREV and LEVERAGE are reported in Appendix A because they require a lot of pages.

Table 6: Frequency of the independent variable LEGFORM

	Frequency all sample	Percentage
0 = Otherwise	245	47.9
1 = Company	267	52.1
Total	512	100.0

Table 7: Frequency of the independent variable FSHAR

	Frequency all sample	Percentage
0 = No	132	25.8
1 = Yes	380	74.2
Total	512	100.0

Table 8: Frequency of the independent variable AUDIT

	Frequency all sample	Percentage
0 = Non Audited	12	2.3
1 = Board of Statutory Audit	306	59.8
2 = Single independent auditor	11	2.1
3 = Non Big Four	45	8.8
4 = Big Four	138	27.0
Total	512	100.0

Table 9: Frequency of the independent variable INDUSTRY

	Frequency all sample	Percentage
1 = 0 to 10	--	--
2 = from 11 to 17	14	2.7
3 = from 21 to 40	222	43.4
4 = from 41 to 50	61	11.9
5 = from 51 to 59	124	24.2
6 = from 69 to 90	91	17.8
Total	512	100,0

The descriptive statistics show that the firms have the legal form of company (47.9% of IAS/IFRS) and the 74.2% of them have at least a foreign shareholder. Besides, only the 27% of the firms have their financial statements audited by a BIG 4 Audit company. Finally, the 43.4% of the firms of the sample belongs to the SIC code (two digit) from 21 to 40 (Manufacturer) and the 24.2% to the SIC code from 51 to 59 (Wholesale and retail trading).

Regression results (Full sample BLR)

Before starting with the regression analysis, we provide finding of the inexistence of multicollinearity (MC) among the independent variables of the model. To intercept cases of MC we perform the analysis for Tolerance and VIF (Variance Inflation Factor). Since these values do not exceed 2 for any independent variable, we conclude that multicollinearity does not present a problem in our analysis.

Table 10: Tolerance' and VIF' results

<i>Variables</i>	<i>Tolerance</i>	<i>VIF</i>
<i>Constant</i>	-	-
<i>LEGFORM</i>	.921	1.086
<i>SIZE</i>	.543	1.841
<i>FSHAR</i>	.978	1.022
<i>FREV</i>	.878	1.138
<i>AUDIT</i>	.562	1.781
<i>LEVERAGE</i>	.988	1.012
<i>INDUSTRY</i>	.885	1.130

The VIF and Tolerance findings show that among the independent variables (Table 11) there is not Multicollinearity and all them could explain the model (voluntary adoption of the IAS/IFRS by the private firms). The finding is support by the consideration that four out of seven independent variables are categorical.

In table 11 the Spearman Correlation Matrix.

Table 11: (Rho) Spearman Correlation Matrix (2-Tailed)

This table provides the Spearman (Rho) correlation matrix for the explanatory variables. Values indicated in bold show statistically significant relationship between variables. ** indicates statistical significance at less than 1% levels (two-tailed).

LEGALFORM = legal form of the firms; SIZE = the natural logarithm of the annual turnover; FOREIGNSHA = foreign shareholder; FOREIGNREV = foreign revenue; AUDIT = the form of audit choice by the firm (0 = not audited; 1 = audited by Board of Statutory Audit; 2 = audited by an independent external single auditor; 3 = audited by NON BIG FOUR Audit company; 4 = Audited by a BIG FOR Audit company); LEVERAGE = financial debts/Equity; INDUSTRY = dummy variable.

Tables 12 and 13 reports the result of the first regression analysis that include only the constant.

Table 12: Binary Logistic Regression analysis including only the constant

Classification Table ^{1,2}					
		Predicted			
		IFRS			Percentage Correct
	Observed	NON IAS/IFRS	IAS/IFRS	IAS/IFRS	
Step 0	IFRS	NON IAS/IFRS	389	0	100.0
		IAS/IFRS	123	0	.0
Overall Percentage					76.0
1. Constant is included in the model.					
2. The cut value is ,500					

Table 12 reports that the 76.0% (overall percentage) of the observations are correctly classified with a single model with the intercept (hence, a model that considers all the firms as non adopters of IAS/IFRS). Table 13 reports the results of estimating equation including only the constant. We find a negative coefficient of the constant (p-value .000).

Table 13: Binary Logistic Regression analysis: variables in the equation (only the constant)

		Variables in the Equation					
		B	S.E.	Wald	df	Sig.	Exp(B)
Step 0	Constant	-1.151	.103	123.889	1	.000	.316

Then, we include in the Binary Logit Regression model all the independent variables (tables 14 and 15).

Table 14 shows that the 88.1% (overall percentage) of the observations are correctly classified with a model including all the independent variables (covariates). In this circumstance, the model including all the independent variables (table 14) improve the predictability of the model used in the analysis.

Table 15 reports the results of estimating equation with which we test the seven null hypotheses. This model assesses the importance of the explanatory variables we isolate in according to previous studies in explaining the voluntary choice of IAS/IFRS. In table 16 we report: the -2 Log likelihood; the Cox & Snell R², the Nagelkerke R² and the statistical significance of the binary LOGIT model. Finally, we report the Hosmer and Lemershow Test for the model.

In the analysis, we consider the variable Audit and the variable Industry as categorical variables. The Confidence Interval we choice for the regression analysis is the 95%.

Table 14: The Binary Logistic Regression analysis including all the independent variables

Classification Table ^a					
		Predicted			Percentage Correct
		IFRS			
Observed		NON IAS/IFRS	IAS/IFRS

Discussion and analysis

The object of the paper is the analysis of the determinant of the voluntary adoption of IAS/IFRS by Italian private firms in the preparation of their separate financial statements.

For the analysis we collect financial data from the AIDA Database. Italian private firms that meet the legal requirements for the voluntary adoption of IAS/IFRS for their separate financial statements are 52.444 (the population). From this population we extract a random sample of 2.827 firms.

The review of the extant literature, highlight that only few studies deal with the analysis of the determinant of the voluntary adoption of IAS/IFRS by private firms. Using a survey data, Francis

et al. (2008) investigate the reasons of IAS/IFRS adoption by small and medium-sized private firms from 56 countries.

Conversely, Cameran and Campa (2010), using archival data, explore the determinant of the voluntary adoption of the IAS/IFRS by the Italian private firms. They select two-paired sample of firms that adopt voluntarily/non adopt the IAS/IFRS. Unlike Francis *et al.* (2008) the Scholars do not utilize the regression analysis to determine the statistical importance of the factors influencing the voluntary adoption of IAS/IFRS by private firms.

The studies mentioned above stated that size, leverage, foreign shareholder can explain the voluntary adoption of the IAS/IFRS by the private firms (the dependent variable – adoption/non adoption of IAS/IFRS – is associated with the independent variable – the determinants).

In this work we have extended the studies of Francis *et al.* (2008) and Cameran and Campa (2010).

In according with the Positive Accounting Theory and prior literature (concerning public firms in the preparation of the consolidate financial statements) we also argue that explanatory variables like size (measured, however, by the turnover), leverage, foreign shareholder, the character of the financial audit body and industry-type could explain and predict the voluntary adoption of the IAS/IFRS also by the Italian private firms.

Our work differs from prior studies (Francis *et al.*, 2008 and Cameran and Campa, 2010) because we hypothesize that the voluntary adoption of IAS/IFRS is influenced by the presence of a BIG 4 Audit Company in charge of the financial audit function.

The adaptability of the model does not appear very high (Cox and Snell R²: 37.4%; Nagelkerke R²: 55.9%) but it seems statistically significant.

We performed the regression analysis for each group of firms (adopt/non adopt IAS/IFRS) and the results, partially consistent with prior literature (Francis *et al.* 2008; Cameran and Campa, 2010), confirm only partially our hypotheses (Confidence Level of the analysis: .05) as stated below:

H0₁: The voluntary adoption of IAS/IFRS is positively associated with firm' **size** (*p-value*: .178). As the *p-value* > .05 the null hypothesis should not be rejected. This means that the firm's size could influence the voluntary adoption of IAS/IFRS.

H0₂: The voluntary adoption of IAS/IFRS is positively associated with firm **leverage** (*p-value*: .701). As the *p-value* > .05 the null hypothesis should not be rejected. This means that the degree of the leverage could influence the voluntary adoption of IAS/IFRS. Probably, this still means that firms with a high level of leverage improve the quality of their financial statements to facilitate the bank' loan;

H0₃: The voluntary adoption of IAS/IFRS is positively associated with the presence of a **foreign shareholder** (*p-value*: .000). As the *p-value* < .05 the null hypothesis may be rejected. This means that the presence of the foreign shareholder couldn't influence the voluntary adoption of IAS/IFRS;

H0₄: The voluntary adoption of IAS/IFRS, in contrast with our hypothesis, is *negatively* associated with the presence of **export sales** (*p-value*: .408). As the *p-value* > .05 the null hypothesis should not be rejected. This means that the export sales could influence the voluntary adoption of IAS/IFRS but with opposite effect;

H0₅: The voluntary adoption of IAS/IFRS is *negatively* associated with the **legal form** of the firms (*p-value*: .065). As the *p-value* > .05 the null hypothesis couldn't be rejected. This means that the legal form of the firm could influence the voluntary adoption of IAS/IFRS but with opposite effect;

H0₆: The voluntary adoption of IAS/IFRS is positively associated with the presence of a **BIG 4 Audit Company** (and negatively associated with the presence of the other auditor or in absence of the financial audit function). AUDIT is a categorical variable that assume value 0 if the firm is not audited; value 1 if the firm is audited by the Board of Statutory Audit; the value 2 if the firm is audited by an external independent single auditor; the value 3 if the firm is audited by a NON BIG 4 Audit Company and, finally, the value 4 if the firm is audited by a BIG 4 Audit company. So, in SPSS the last value (4) is fixed as a reference variable and its constant conventionally assumes value 1 (SPSS do not report this value in the table 16) and *p-value* = .041. The constant and the *p-value* of the other forms of auditing are compared with this audit type. So these individual coefficients and *p-values* are meaningful only when they are compared with the reference variable (AUDIT = 4) and not with the regression model. Given that, the table 16 shows that the sub-hypothesis HP_{6.1} (AUDIT = 0), HP_{6.2} (AUDIT = 1), HP_{6.3} (AUDIT =2), HP_{6.4} (AUDIT = 3) have negative coefficient (compared to the reference variable, AUDIT = 4). This means that in contrast with our hypothesis, the presence of the financial audit function is negatively associated to the voluntary adoption of IAS/IFRS. The *p-value* is statistically significant (*p-value* < .05) in AUDIT = 0 (.037) and statistically not significant in AUDIT 1 (.096), in AUDIT 2 (.273) and in AUDIT 3 (.244). These findings could be interpreted as a moderate evidence to reject the hypothesis HP₆ (*p-value* .041). Probably, this means that the presence of an auditor do not influences the voluntary adoption of IAS/IFRS by private firms.

The table 16 reports the association by the accounting choice of the firms (IAS/IFRS versus. NON IAS/IFRS) and the appointment of the body of financial audit.

Table 16: Association by firm' accounting choice and audit body

Type of audit	Accounting choice			
	IAS/IFRS=0	%	IAS/IFRS=1	%
0	5	41,67%	7	58,33%
1	251	82,03%	55	17,97%
2	10	90,91%	1	9,09%
3	30	65,22%	16	34,78%
4	93	67,88%	44	32,12%
Total	389		123	

As concern the influence of the industry-type, we consider the association between the accounting choice (IAS/IFRS-NON IAS/IFRS) with the industry sector to which the firms belong. Industry-type (IND) is a categorical variable that assume value 2, 3, 4, 5 and 6 corresponding to the different sector identified by the SIC code. So, in SPSS the last value (6) is fixed as a reference variable and its constant conventionally assumes value 1 and p -value = .011. The constant and the p -value of the other form of auditing are compared with this reference value. So these individual coefficients and the p -value are meaningful only when they are compared with the reference variable (IND = 6, SIC Code from 69 to 90) and not with the regression model. We note a relative direct association by the accounting choice of the IAS/IFRS and the IND 2 (SIC Code from 11 to 17) and a p -value statistically not significant (0.200). IND code 3 (SIC from 21 to 40), 4 (SIC code from 41 to 50) and 5 (SIC Code from 51 to 59) have negative coefficient (compared to the reference variable, IND = 6). The p -value is statistically not significant in IND = 3 (.406) and in IND = 4 (p -value .355) and statistically significant in IND = 5 (p -value .002). This result could be interpreted as a confirmation of the hypothesis HP₇ (p -value .011). Table 17 reports the association by the accounting choice of the firms (IAS/IFRS vs. NON IAS/IFRS) and the SIC sector to which the firm belong.

Table 17: Association by firm' accounting choice and SIC sector

SIC sector	Accounting choice			
	IAS/IFRS=0	%	IAS/IFRS=1	%
2	8	57,14%	6	42,86%
3	174	77,68%	50	22,32%
4	37	60,66%	24	39,34%
5	110	90,16%	12	9,84%
6	60	65,93%	31	34,07%
Total	389		123	

Given that, in conclusion we find that our hypotheses are partially confirmed by the analysis (BLR). The firm's size, the degree of the financial debt (scaled to the net equity), the legal form, the export sales (even if the sign of the regression is negative) are more important and influence the voluntary adoption of the IAS/IFRS by the Italian private firms. Conversely, it seems that the presence of the foreign shareholders (at least one) and the presence of an auditor (Board of Statutory Audit, BIG 4, Non BIG 4, single auditor) seem do not influence significantly IAS/IFRS by the Italian private firms. Finally, the firms of the sample are distributed between the different industry-type as shown in Table 17. The table shows that the firms belonging to the SIC sector code 5 are less likely to adopt voluntarily IAS/IFRS than the firms belonging to other industry sectors. At the same time, we can note also that there are no significant differences for firms in the other sectors.

Limits of the analysis

The model we use in this first analysis does not seem to explain very well the voluntary adoption of the IAS/IFRS by the Italian private firms. Probably, one of the reasons is that, in 2009, Italian private firms have not yet chosen to adopt voluntarily the IAS/IFRS (the law that gives the option to adopt voluntarily the IAS/IFRS is dated 2005). So, in next step of the research, we think to improve the model considering the year 2010 as soon as it is available on AIDA Database.

Finally, our study could be improved considering the years beyond the 2009 for monitoring if all firms continue to use IAS/IFRS also in the future or they downgrade to the domestic accounting standard.

Abstract

Interactive broadcasting elaborates on the study and realization of novel television networks, able to provide multiple interactive multimedia and Internet based services, utilizing Digital Video Broadcasting advances. On the other hand, IP Multimedia Subsystem (IMS) is a promising solution, that may be adopted in next generation networks and broadcasting systems, providing advanced capabilities and added value data services. In this context, this paper investigates interactive broadcasting systems and IMS convergence and proposes a novel research approach, which could be adopted in interactive marketing, enabling for a more efficient process of collecting and analyzing feedback data from users/viewers. This process may be vital for optimum marketing and advertising purposes. This potential information data may be used to target customers in more efficient and effective ways, i.e. geographical segmentation, increasing the possibility of impulse sells through t-commerce or allow audience to require more information for a company, brand or product, enhancing the experience a customer have with specific brands.

Keywords: Interactive Marketing, Interactive Broadcasting, IP Multimedia Subsystem

Introduction

Interactive communication is vital in marketing, enabling the real needs of customers/users to be successfully met. Traditionally, enterprises try to maintain contact with customers/users via phone, emails and Internet based networks. Nowadays, sophisticated advances may be the mean, enabling for a vital interactive contact between the enterprise and its customers. In order for a

more efficient cooperation and relationship to occur between these two parties, a first part of an IT strategy in an enterprise, is to integrate business systems using a common interface, so that customers can interact and report back directly their needs. The second component of this strategy is a database analysis. The results may define the basis for models aimed at understanding the real customers' needs. In this context, advances in interactive broadcasting systems (Crinon et al., 2006), IP Multimedia Subsystem (IMS) (Camarillo et al., 2007), web technologies and their convergence could contribute efficiently towards optimizing the process of collecting and analyzing data, useful in interactive marketing (Barwise and Farley, 2005).

Interactive marketing enables customers' collaboration utilizing a digital media and allows a company to use direct response communication in order to build a relationship with them. In a general context, long-term communication strategies should be planned carefully, otherwise the client can develop a negative view of the company. For instance, if a company has come into contact very often with the clients with no real purpose, the customers will likely ignore the notices in the future, when the company needs to communicate with them. In order to avoid this, potential customers are asked for feedback regularly. Despite the promotion of risks taken by companies, they wish to have great opportunities to promote their products to individual customers. Some companies' websites utilize already «call back» images giving the opportunity for customers to contact them. Such information can be delivered directly to the company through fast and easy to complete research or through an independent third party.

Moreover, interactive broadcasting elaborates on the realization of novel television networks, able to provide multiple interactive multimedia and Internet services utilizing Digital Video Broadcasting (DVB) advances (Reimers, 2006). The first existing networking architectures based on interactive broadcasting enabled the provision of IP datacasting offering offline interactivity (Linder et al., 2000; Kellerer et al., 2000). According to these infrastructures, a large volume of data is pushed with constant bit rate to the end user's terminals through DVB channels (Reimers, 2006) with a repeated process (data carousel). Data is then received offline by the end user via a graphic interface. There is no real interactivity in such systems, since the end user is not able to request for real time services (e.g. Internet based services) and to provide his own services due to lack of an interaction channel. The utilization of an interaction channel according to the generic interactivity model (ETSI, 1997), was essential in order to transfer end user's requests to the service provider, enabling for the provision of real interactive services (Gardikis, 2004).

Furthermore, the IP Multimedia Subsystem (IMS) (Poikselka and Mayer, 2009) is considered as a promising solution to fulfill a number of requirements in next generation networks and broadcasting systems. IMS refers to a functional architecture for providing multimedia services based on Internet Protocols (Bertrand, 2007). The goal is to merge Internet technologies and wireless networks, to enable rich multimedia communications as well as a number of other

functionalities. The first version of IMS was focused on facilitating the development and deployment of new services in mobile networks. It was later extended by the European Telecommunications Standards Institute (ETSI) (Sultan, 2009), including utilization in Next Generation Networks (i.e. NGN). A standardization body of ETSI, namely the Telecommunications and Internet converged Services and Protocols for Advanced Networking (i.e. TISPAN) standardized a subsystem of IMS, regarding NGN.

In this context, this paper studies the convergence of interactive broadcasting systems with IMS and proposes a novel research rationale, which could be utilized in interactive marketing, towards a more efficient process of collecting and analyzing feedback results from potential users/viewers of an interactive television enterprise. Following this introductory section the rest of the paper is as follows: Next section analyzes interactive marketing and investigates interactive broadcasting advances. Also, last two sections elaborate on IMS and finally conclude this paper respectively, by indicating research contributions.

Interactive Marketing and Digital Video Broadcasting

The overall target of interactive marketing is to enable advertisers to target customers' needs more successfully. Towards this scope, a number of advances/developments have been achieved, that may change the role of advertising on television in the future. Currently, viewers are invited to move to a more interactive world of television or are invited to visit a Web address or call a phone number. This means that the signals from the enterprises may become more personalized and interactive with their customers. The most of the features of the media are not able to achieve this personalization. However, they encourage viewers to participate in more reactive, interactive or personalized channels. They are able to ensure, that such disclosures would be consumed by interested customers.

Other communications with customers are dynamic including, that digital or physical location of a person is enough to achieve communication. Digital communication can be identified when a person has visited a page and this information is able to be used in order to find out what viewers are now interested. In a general context, interactive marketing systems were developed to such an extent, that allow large companies to achieve the best possible relationship with their customers, offering numerous choices to meet their needs (Chaffey and Smith, 2008).

More familiar with the TV concept and without the need of being an IT expert, the audience has the ability to interact easily with the concept and content of iDTV (Lee and Lee, 1995). This interaction is mostly concerned with shopping, browsing through VOD and advertising concepts, banking, gambling, playing games sponsored by brands, participating instantly to broadcasting programmes like voting or expressing their opinions as members of a community, completing questionnaire and chatting. Text information services, e-mail (with IPTV) and offline contact

options are available to users /viewers to communicate with other viewers (i.e. dating) or companies, and they also present a good way to advertisers to count the impact of their campaign as they get the permission “contact me” from the user.

It is very important to create an interactive community and target this niche market with new forms of advertisements like microsites, logos / banners or websites’ illustration on screen or Dedicated Advertising Location (DAL, mini-DAL) formats that enable impulse response to direct marketing promotional material like coupons, samples or brochures. Furthermore, the old forms of advertising like product placements in programmes, sponsoring, virtual advertising, on-screen banner advertisement during programs (with the option to bookmark and expose to them with a lag), and advertainment (a program totally made by an advertiser) or long commercials on demand are also essential to increase brand awareness of a product and improve costumers’ experience with a brand (Boddy, 2004; Deighton and Blattberg, 1991; Deighton and Barwise, 2000; Smilansky, 2009; McDonald and Wilson 2002;).

People using the TV box-set as a mean to calm and relax which is usually arouse their emotions. For them its interaction aspect is not only a convenient and instant way of buying or responding to a promotional or informational content, it lets them to have the sense of control in marketers’ “beleaguerment” which take place in traditional media (Stewart, 2004). On the other hand, the emerged data of personal and household interests gives to marketers a significant amount of advantages to turn in account such as direct response to mass market advertising, highly accuracy to targeted audiences according to the ad – hoc strategy of the company, access to those who adopt an impulse decision making process to complete instantly their buying, increase the engagement of viewers, building positive brand image and enhance the brand’s world of mouth impact in the formed community, reformulate an ineffective advertising strategy by measuring the achieved goals, offer better promotional and customer service in a “walled-garden” platform (as TV is perceived) in contrast to websites and finally they are allowing to manage the primary objective of better money allocation avoiding the waste of money on disinterest viewers or improper contents (Chaffey and Smith, 2008). Nevertheless, advertisers seem to be mistrustful against these opportunities mainly due to audience unfamiliarity with them, the luck of their technology experience and the high cost these new advertising forms are presented (Cauberge and De Pelsmacker, 2006).

Additionally, interactive DVB systems may enable end users to interact with service provider by utilizing interactivity channels established between customers’ premises and the broadcasting system. More specifically, interactive DVB-T (i.e. terrestrial systems) networking architectures (Xilouris *et al.*, 2002) have been realized based on a generic interactivity model, enabling for the provision of asymmetric data transfer among the service provider and the end users. In such cases, DVB-T channel provides forward data traffic, while reverse data traffic is transferred

through several interaction channels (e.g. PSTN, ISDN, DECT, GSM, GPRS, UMTS, xDSL, LMDS, MMDS) (Gardikis *et al.*, 2002; Gardikis *et al.*, 2003). According to these configurations, the service provider's side may incorporate both an interactive service provider and a broadcast one. The former may enable access to interactive multimedia services such as video and audio on demand or may provide Internet facilities such as WWW access, e-mail services etc. The latter is responsible for the distribution of broadcast services, such as TV programmes, that utilize digital transmission formats (i.e. MPEG-2). Both interactive and broadcast services are multiplexed into one transmission stream and distributed to the users via the broadcasting delivery media according to the DVB-T standard. Each user receives the multiplexed broadcasts via a broadcast interface module (e.g. antenna, front-end amplifier etc.) that passes the appropriate data to an end user module (TV receiver, PC screen, PC station etc.) via a Set Top Unit (de-multiplexer, decoder etc.). The user's requests for interactive services are forwarded by the Set Top Unit to an interactive interface module that may utilize wired or wireless access technology depending on the interaction media's specifications. The interaction media, in turn, passes the user's requests to the integrated service provider via the interactive network adapter that forwards them to the interactive service provider.

An interactive DVB-T system may be also utilized to provide interactive services to mobile users. UMTS Forum and DVB-UMTS Ad-Hoc Groups define proposals and reports studying interactivity among DVB-T and UMTS for the provision of broadband interactive multimedia and networking services (Cosmas *et al.*, 2002). Alternative solutions for the return channel in an interactive DVB system may utilize LMDS or DVB-RCT (Faria and Scalise, 2001) in order to support interactivity to fixed users. Further GPRS has also been proposed to be utilized together with broadcasting networks (Rauch *et al.*, 2001).

IP Multimedia Subsystem (IMS)

While the first generation of the Internet was mainly devoted to the transfer of data to non-real time services, sophisticated systems and new services now require interactivity and strict Quality of Service (QoS). Moreover, the requirements for the provision of multimedia services are expected to increase in coming years. The move towards an all IP architecture for services and applications appears to be a strong trend. In this context, customers seem to wish access to personalized interactive multimedia services on any device, anywhere. This trend introduces new requirements for a network infrastructure.

Towards fulfilling this requirement, the IP Multimedia Subsystem (IMS) was originally defined by the 3GPP and 3GPP2 wireless operators working bodies. The main focus was to provide a new mobile network architecture that enables convergence of data, voice and technology in a mobile network over an IP-based network infrastructure (Kinder, 2006). The IMS was designed to bridge

the gap between existing traditional telecommunications technologies and Internet technology and support operators to offer new and innovative services that will attract new subscribers and maintain its existing base.

IMS is a core network architecture that enables communication between servers and clients using open standards that support IP network interfaces and fixed-mobile convergence. IMS consists of a layered and integrated architecture that manages the media as it moves through the network and provides the systems integration required to provide any IP multimedia services for and between any combination of wired and wireless end users. The core network contains reusable functions that manage media services in application servers. Application servers host the services and IMS defines monitoring services, routing, protocols, and the loading processes across the network. The development of the IMS framework defines how services connect and communicate with the underlying telecommunications network. IMS also defines how services are integrated with the provider of systems back-end (IP Unity, 2005).

One aim of IMS is to make the network management easier. Therefore, it separates control and bearer functions. This means that IMS features an overlay service delivery network on top of a packet switched infrastructure. Moreover, IMS should allow the migration of Circuit Switched services like voice telephony to the Packet Switched domain. As a result, IMS should lead to network administration savings, because an all-IP integrated network is easier to manage. IMS is an end-to-end architecture that must support several kinds of equipment. In addition, IMS is intended to be "access agnostic", which means that service delivery should be independent of the underlying access technology. Thus, the use of open Internet Protocols is specified in IMS for better interoperability. The level of QoS that can be provided in IMS networks determines the services that can be deployed in such networks. QoS delivery is therefore critical in IMS networks. As a result, QoS management functionalities are integrated in the IMS architecture (Bertrand, 2007).

Today's telecom users are increasingly demanding. They are more individualistic, independent, informed and involved than ever before, and they welcome services that appeal to their emotions as well as their practical needs. New, exciting services and enhancements to existing services have a key role to play in making the communications experience much more like interacting face-to-face. New advanced terminals and communication mechanisms adapted for user needs will enable this and hide technical complexity (Ericsson, 2004). Users are now used to access information, entertainment and other content-rich services through a variety of channels. Telecom operators have a great opportunity to integrate and extend the multimedia experience through new highly personalized person-to-person, person-to-content and group services. The widespread adoption of mobile telephony, SMS and Instant Messaging shows how readily users adopt services that fulfill an emotional need to communicate in a variety of ways.

Commercially available IMS services are still in their infancy and providers are working on the implementation of IMS in both network's and user's side. As usually, implementations may face interoperability issues since the IMS specification is flexible to allow differentiation, as stated in. In particular, QoS solutions are not enforced by the specification, although QoS requirements are well defined. Other non technical challenges include defining the business model. As IMS enables the provision of commercial services by the operator and third parties, another challenge is defining billing schemes for charging services, as the value chain and impact on final services' price have to be determined. Operators are likely to create an "IMS broker", interconnecting operators and third-party service providers via SLAs (Service Level Agreements), so agreements would only take part between the IMS broker and each operator and service provider, simplifying the commercial scenario.

However, the success of IMS or any other convergence enabler technology depends on the provision of value-added services that take advantage of all the core services it provides (presence information, session transfer, QoS, etc.). Currently, all the IMS services planned are ports of existent services like the voice service, walkie-talkie ("Push To Talk"), presence and instant messaging, etc. thus not showing the advantages of the convergence yet. Maybe new highly interactive multiuser multimedia applications like online gaming and collaborative work will unleash the power of IMS.

Conclusion

This paper investigates novel interactive broadcasting systems, able to provide multiple interactive multimedia and Internet based services utilizing Digital Video Broadcasting advances. Additionally, it elaborates on the study of IP Multimedia Subsystem (IMS) as a promising solution, that may be adopted in next generation networks and broadcasting systems, providing advanced capabilities and added value data services. Taking into account the advances in both research fields, it proposes the convergence of interactive broadcasting systems with IMS, which may result to a novel research paradigm, able to be adopted in interactive marketing field. The proposed concept may enable for a more efficient process of collecting and analyzing feedback data from users/viewers, which is vital for optimum marketing purposes. It might be the answer to the one of the top priorities in the marketers' wishing list; to move forward to one to one marketing communication with the desired audience, gain their attention and interest, create their desire and end in the covetable impulse or well thought-out action of buying.

UKRAINIAN ENTREPRENEURSHIP IN CASERTA: AN EMPIRICAL INVESTIGATION

Matricano, Diego¹

¹I.R.A.T. – Istituto di Ricerche sulle Attività Terziarie, Via M. Schipa n. 91, 81022, Napoli (NA), Italy.
Email: e-mail: d.matricano@irat.cnr.it; diego.matricano@gmail.com

Abstract

The main aim of the present work is to investigate which approach is made by Ukrainians entrepreneurs to launch ethnic ventures in Caserta city.

Four factors are relevant in reference to ethnic ventures: sources of funding, nationality of employees, of suppliers and of consumers. They can be affected by the socio-cultural aspects of the origin country or by the socio-economic context in the destination country. According to the influence exercised on the four factors, it is possible to derive and frame four main approaches to ethnic entrepreneurship: supply-based, demand-based, mix-based and vacancy-chain.

A sample of forty-two Ukrainian entrepreneurs in the Caserta Region was asked to fill in a questionnaire and the results are presented and discussed in the last part of the work.

Introduction

According to data provided by Unioncamere (Infocamere) and referred to 2008, ethnic entrepreneurship in Italy involves nearly 300.000 immigrants: 165.114 are entrepreneurs; the remaining ones are partners with different roles.

According to estimations included in the *Sedicesimo Rapporto sulle Migrazioni 2010* provided by Fondazione ISMU, this phenomenon is growing up constantly. Despite political and normative reasons at the basis of the phenomenon, there is still so much to inquire about origins of ethnic entrepreneurship. This is the reason why the main goal of the present work is to propose different approaches made by ethnic entrepreneurs in order to launch a new venture and, then, to analyze some cases. Actually, the present work is just a part of a bigger research project aiming to compare Ukrainians, Brazilians and Senegalese entrepreneurs in the Caserta city. Surveys are still ongoing, so by now the results just deal with Ukrainians entrepreneurs in Caserta.

In the next section, attention is focused on the factors determining the launch of a new venture: sources of funding, nationality of employees, of suppliers and of consumers. By considering that these factors can be affected by the socio-cultural aspects of the origin country or by the socio-economic context in the destination country, four different approaches to entrepreneurship are going to be explained and framed (the supply-based, the demand-based, the mix-based and the

vacancy-chain approach). In the last part of the paper, the results of an empirical research, about the Ukrainians in the Caserta Region, will be presented and discussed.

Factors to inquire

Ethnic entrepreneurship in Italy seems to be more similar to self-employment than to entrepreneurial activity properly meant (Codagnone, 2003). It derives that some factors, which are usually considered when talking of new ventures (R&D, innovation, and strategic management), are excluded. Consequently, attention moves towards other factors that are at the basis of ethnic ventures:

- Financiers;
- Employees;
- Suppliers;
- Consumers.

Financiers. Sources of capital to invest can be divided into two main groups. If capital consists of savings (by the entrepreneurs themselves or by their relatives) or loans by members of the ethnic group, ethnic aspects are determinant for the new entrepreneurship. On the contrary, if local banks or special projects to foster immigrants' involvement in entrepreneurship (for example European projects) can guarantee loans to ethnic entrepreneurs, then the entrepreneurial aspects are determinant.

Employees. The choice to assume employees of the same ethnic group, sharing the same culture and value, underlines that ethnic aspects are determinant for ethnic entrepreneurship. By the choice to assume employees of the local group or even of another ethnic group, instead, entrepreneurial aspects become more relevant for the new venture.

Suppliers. By referring to suppliers of the same ethnic group, loyalty and trust are at the basis of economic exchange and, moreover, acquired resources are well known to the entrepreneur. On the contrary, by referring to suppliers out of the ethnic group, relationship is ruled by contractual aspects and ethnic entrepreneurs try to sell different products to consumers.

Consumers. The choice to sell products only to the ethnic group or even to the mainstream market is not arbitrary. In the first case, the ethnic aspects identify a niche market in which ethnic products can be easily sold since there is no or scarce competition. In the second, instead, competition is stronger and some risks are due to the competition with big players of the mainstream market.

Ethnic Entrepreneurship

Interest about ethnic entrepreneurship can be dated back to the end of Eighties and the beginning of Nineties (Aldrich and Waldinger, 1990; Aldrich *et al.*, 1990; Waldinger *et al.*, 1990; Waldinger, 1989; Light and Bonacich, 1988).

Since then, some difficulties have emerged in order to define ethnic entrepreneurship (Drori *et al.*, 2009; Stiles and Galbraith, 2003; Ambrosini, 1999, 2001; Light and Gold, 2000; Teixeira, 1998). These difficulties are mainly due to the trial to mix entrepreneurial and ethnic aspects.

Some authors assume that ethnic aspects are more relevant than entrepreneurial ones. Volery (2007), for example, supports the idea that ethnic entrepreneurship strongly depends on the immigrants and on the ethnic group they belong to. According to Aldrich and Waldinger (1990) and Pécoud (2004) it is the ethnic origins of entrepreneurs to determine ethnic entrepreneurship; according to Waldinger (1995) and Cobas and DeOllos (1989) it is the ethnic network to be more relevant. Pécoud (2004), Razim and Langlois (1996), Aldrich *et al.* (1989), Sanders and Nee (1987) support the idea that localization gives an ethnic connotation to the ventures created by immigrants.

As an alternative, there are some authors who consider entrepreneurial aspects as determinant for ethnic entrepreneurship, more than ethnic aspects are. Masurel *et al.* (2002), for example, consider that ventures created by immigrants embody an ordinary example of the entrepreneurial phenomenon. Ethnic aspects, even if not questionable, are not so relevant to differentiate ethnic entrepreneurship.

Ethnic and entrepreneurial aspects, whether combined or excluding each other, stress the idea that ethnic entrepreneurship cannot focus on some aspects and exclude others.

The theoretical framework

Choices about financiers, employees, suppliers and consumers can be “scarcely” or “strongly” affected by:

- Ethnic aspects: the socio-cultural aspects of the origin country;
- Entrepreneurial aspects: the socio-economic context in the destination country.

Beyond the classification between “opportunity” and “necessity” entrepreneurs (Chrysostome, 2010), four possible approaches to ethnic entrepreneurship are shown in Table N.1.

	<i>Strong influence of socio-economic context in the destination country</i>	<i>Scarce influence of socio-economic context in the destination country</i>
<i>Strong influence of socio-cultural aspects of the origin country</i>	<i>The mix-based approach</i> 1	<i>The supply-based approach</i> 2
<i>Scarce influence of socio-cultural aspects of the origin country</i>	4 <i>The demand-based approach</i>	3 <i>Vacancy Chain</i>

Table N. 1 - Four different approaches to ethnic entrepreneurship. Personal Elaboration.

The supply-based approach. Ethnic entrepreneurship can be the result of socio-cultural aspects typical of the origin country. By “socio-cultural aspects” it is generally meant the whole background (cultural, social, psychological and religious) that can foster the individual involvement in entrepreneurship.

This approach has been largely investigated in entrepreneurial literature and it has been developed according to different perspectives. A trend of studies focused on the economic capital to invest. To have some savings (Kim and Hurh, 1985) or to obtain credit by other members of the same ethnic group (Deakins, 1999; Lee, 1999; Lee et al., 1997; Deakins et al., 1997) strongly affect the creation of new ethnic ventures. Another trend of studies, instead, focused on human capital (Lee et al., 1997; Waldinger et al., 1990). Level of education, ability to speak other languages (Johnson, 2000), previous working or migration experiences to other countries (Basu, 1998) can affect immigrants’ choice to launch a new venture. Eventually, a different trend of studies focused on social capital (Perreault et al., 2007). Solidarity (Zhou, 2004; Portes and Zhou, 1992), trust (Van Delf et al., 2000; Kloosterman et al., 1998; Ram, 1994; Johannisson, 1993) and informal linkages (Guarnizo et al., 2003; Gold, 2001; Yoon, 1995) between members of the same ethnic group can determine new ethnic entrepreneurship.

The demand-based approach. The supply-based approach, based on the socio-cultural aspects of the origin country, has been strongly criticized since it seems to be a deterministic approach. The main critique, in fact, deals with the limited importance given to the external context in which immigrants live and, consequently, entrepreneurship takes place. According to Razin (2002), to study origins of ethnic entrepreneurship both constraints and opportunities typical of the socio-economic context in the destination country need to be considered.

Attention has always been paid on constraints but the possibility to obtain credit by local banks, the availability of local employees, and the chance to establish contacts with local suppliers are opportunities, offered by the local context, which cannot be ignored. Very

interesting studies have tried to point out the missing links with local socio-economic context (Daniels and Lever, 1996; Daniels, 1993, Sassen, 1991).

The mix-based approach. If both the socio-cultural aspects of the origin country and the socio-economic context in the destination country affect ethnic entrepreneurship, then it is possible to refer to the mix-based approach (Palidda, 2000; Waldinger *et al.*, 1990). A very interesting way to explain this approach is the reference to the theory of the *enclave economy* (Portes, 1995). *Enclaves* are sub-systems of the mainstream economy, referring to limited geographical parts, in which there is a very high density of ethnic ventures that are managed by immigrant entrepreneurs, employ immigrants and offer goods to consumers of the same ethnic group (Wang, 1999; Nee and Nee, 1986).

According to Zhou (2004), *enclave economy* is a peculiar case of ethnic entrepreneurship characterized by the co-ethnicity of members and by geographically limited space.

The mix-based approach has caused a noticeable approach in economic literature (Volery, 2007; Zhou, 2004; Kloosterman, 2003; Kloosterman and Rath, 2003, 2001; Kloosterman *et al.*, 1999; Basu, 1998; Peterson and Roquebert, 1993).

The vacancy-chain approach. The last approach, namely the vacancy chain approach, is due to a scarce influence exercised by the socio-cultural aspects of the origin country and by the socio-economic context in the destination country. It can be referred to the theory proposed by Bonacich (1972) about *middleman minorities*. They are groups of immigrants who are not oriented to a definitive settlement in the destination country but only to a temporary one. It derives that:

- *Middleman minorities* do not consider and evaluate all the opportunities offered by the socio-economic context in the destination country. They are only interested in some kinds of entrepreneurial activities like the ones exploiting manual tasks or basic technical competences (Zenner, 1991).
- *Middleman minorities* (Bonacich, 1972) do not aim to develop their own community in the destination country or to integrate with local people.

In sum, choices by *middleman minorities* depend neither on the socio-cultural aspects of the origin country nor on the socio-economic context in the destination country.

Research Methodology

Surveys about Ukrainians in the Caserta Region were conducted through a questionnaire divided into five sections dealing with:

- The entrepreneur: generic information about origin country, time spent in Italy, reason to leave the origin country and involvement in ethnic or local organizations;

- The venture: the core activity, year of foundation, the main language used at work, previous working experiences if any;
- The start-up phase: the main reason and the main difficulties affecting the choice to launch the new venture;
- The business practices: nationality of financiers, employees, suppliers and consumers;
- The social practices: where immigrants live, how they move in city, which are the places they attend or they miss in the city.

A pilot test was conducted by submitting the questionnaire to a few Ukrainian entrepreneurs not included in the final sample. Some criticalities emerged in reference to section five (social practices). After improvements, the questionnaire was sent out to all the Ukrainian entrepreneurs working in the Caserta Region and 42 of them decided to join the research. The questionnaire is mainly based on descriptive answers and, wherever possible, on yes/no answers that make the analysis of results much easier.

Findings

As a part of a bigger research project, involving Ukrainians, Brazilians and Senegalese entrepreneurs, the results of the empirical research will be shortly discussed.

For a start, attention is focused on the socio-cultural aspects of the origin country. Ukrainians live in the city-center of Caserta, or in the very close neighborhoods, and all the entrepreneurial activities are established there as well. The choice is not casual: all the entrepreneurial activities, in fact, are easily reachable by all the Ukrainians. The ethnic community is very strong in fact when entrepreneurs were asked to show the main reasons why they started the entrepreneurial activity, nearly 60% of them answered: "to satisfy the already existing demand of products/services". Another important signal of the strength of ethnic group is that business partners and employees, if any, belong to the same ethnic group.

According to these results, Ukrainians approach to entrepreneurship can lay in the first or second quadrant of the framework. According to the strong influence of the socio-cultural aspects of the origin country, in fact, the possible approaches to entrepreneurship are the supply-based or the mix-based one.

As for the socio-economic context in the destination country, instead, some reflections are necessary. Ukrainians entrepreneurs do not leverage on opportunities offered by the context they live in: for example they do not get loans by Italian banks, close contracts with Italian suppliers nor assume Italian employees. However, it is interesting to point out that Ukrainians do not refer only to Italian consumers but to Romanians, Russian, Bulgarian, Estonian, Polish,

Czechoslovakian as well. Despite apparent similarities, these ethnic groups do not share the same culture as Ukrainians' and there are many differences intra them (some of these ethnic groups have an Asian culture, use a Slavonic alphabet and embrace the Orthodox religion; other groups have an European culture, use a Latin alphabet and embrace the Catholic religion). The ability to keep relationships with ethnic communities of the first group and, at the same time, to implement new relationships with the communities of the second group represents a signal of opening to different ethnic groups who live in the same external context.

In conclusion, it seems that the Ukrainians in Caserta city decide to launch new ventures according to the supply-based approach but, because of their opening to other ethnic groups, they could be driven toward the mix-based one (as shown in Table N.2).

Table N. 2 – Ukrainian approach to entrepreneurship

Conclusions

The findings related to Ukrainian entrepreneurship in the Caserta Region suggest that the supply-based approach is the one followed. However, by referring to other ethnic groups (with different culture but living in the same context) a kind of influence by the socio-economic context can be hypothesized.

The reference to the supply-based approach could be already expected but the integration with different ethnic groups was not. It would be interesting to know whether it is due to the context (the survey was conducted in Caserta) or to a social inclination by the ethnic group.

To reach this goal, it is useful to compare Ukrainian, Brazilian and Senegalese approaches to entrepreneurship (in order to understand whether the inclination toward other ethnic groups is forced by a small context, like Caserta is, or is typical of a certain ethnic group) that, as already anticipated, is the final aim of a whole research project.

STATISTICAL ARBITRAGE STRATEGIES ON GREEK BANKS' EQUITY SHARES**Mavrakis, Emmanouil¹; Alexakis, Christos²**

Abstract

Compared with previous research, the present work extends existing literature by considering pair-wise long-run relations between banks' shares trading in the Greek stock market, under different market conditions, and the implications of these relations on the implementation of pairs trading strategies. The examined data contain one bust phase followed by a mild bullish period. Employing cointegration analysis, reported results initially indicate that changes in market performance affect stability of long-run relations, therefore suggesting that arbitrageurs should perform rebalancing between the examined stocks, in each pair, when a change in market trend is evident. Furthermore, extreme market performance harms the mean-reverting properties of the long-run relations while moderate market performance points to one cointegrating vector which retains the characteristics implied in full-sample analysis. The applicability of our results may be of importance to market participants since the cointegration approach has recently received considerable attention from hedge funds adopting pairs trading strategies.

Keywords: Cointegration, Pairs Trading Strategies

Introduction and Literature Review

Present study pertains to the examination of a market efficiency issue, considering pair-wise long-run relations between banks' shares trading in the Greek stock market, under different market conditions, and the implications of these relations on the implementation of pairs trading strategies. There is considerable literature in financial economics concerning the validity of various forms of the Efficient Market Hypothesis (EMH), Cuthbertson (1996) provides a thorough review. EMH implies that in liquid markets, where asset prices will be the result of unconstrained demand and supply equilibria, the current price should accurately reflect all the information that is available to the players in the market. In other words, the price of an asset at time t is equal to the price of the asset at time $t-1$ plus a random term which reflects the impact of new unpredictable information. This is why the model that is most commonly assumed for stock price movement is a log-normal process; that is, the logarithm of the stock price is assumed to exhibit a random walk. However, because the random walk is a martingale, the mean value of the predicted increment is zero. Therefore, knowing the past history of a random walk is not much help in predicting the forward-looking increments. The condition is very different for stationary processes. Armed with the knowledge that stationary

processes are mean reverting, one can predict the increment to be greater than or equal to the difference between the current value and the mean. The prediction is guaranteed to hold true at some point in the future realizations of the time series.

Given that stock price predictability may lead to abnormal returns, testing mean reversion has been the objective of many researchers since 1960. While initial studies (Fama, 1965; Samuelson, 1965; Working, 1960) could not reject the random walk hypothesis, later findings are mixed. Some studies suggest stock prices are either mean reverting (Chaudhuri and Wu, 2004, 2003; Balvers et al., 2000; Grieb and Reyes, 1999; Urrutia, 1995; Fama and French, 1988; Lo and MacKinlay, 1988; Poterba and Summers, 1988) or random walk (unit root) processes (Narayan and Narayan, 2007; Narayan and Smyth 2007, 2004; Kawakatsu and Morey, 1999; Zhu, 1998; Choudhry, 1997; Huber, 1997; Liu et al., 1997).

Since there is no consensus as to whether stock prices are mean reverting or unit root processes, assuming that the joint hypothesis of risk neutrality and market efficiency holds (and thus lack of stock price mean-reversion property), we cannot apply trading strategies that rely upon unconditional variance in order to realize excess returns. However, previous research suggests the existence of stationary linear relations among log data of share prices. Based on this result, prior literature suggests the construction of Statistical Arbitrage (SA) strategies exploiting the mean-reverting properties of linear relations among financial data (Jacobsen, 2008; Canjels et al., 2004; Hogan et al., 2004; Bondarenko, 2003; Laopodis and Sawhney, 2002; Tatom, 2002; Harasty and Roulet, 2000; Forbes et al., 1999; Wang and Yau, 1994).

Reviewing relevant literature, Gori (2009), Gatev et al. (2006) and Vidyamurthy (2004) mention that SA is attributed to Nunzio Tartaglia, a Wall Street quant who was at Morgan Stanley in the mid 1980s. Tartaglia's group of former academics used statistical methods to develop trading programs, executable through automated trading systems, which replaced traders' intuitions and skills with disciplined, consistent filter rules. SA techniques are widely used by hedge funds, Wall Street companies, and even sophisticated independent investors trying to profit from temporary deviations of equity prices from their fundamental value. In academic literature, SA is opposed to arbitrage (deterministic). In deterministic arbitrage a sure profit can be obtained from being long in some securities and short in others. In SA there is a statistical mispricing of one or more assets based on the expected value of these assets. In other words, SA conjectures statistical mispricings or price relationships that are true in expectation, in the long run, when repeating a trading strategy. One of the most popular trading strategies is Pairs Trading (PT). PT is a very simple technique: "find two stocks whose prices have historically moved together, when the spread between the two widens, short the winner and buy the loser; if history repeats itself, prices will converge and the arbitrageur will profit" (Pole, 2007). PT is a trading strategy that aims to exploit temporal deviations from an equilibrium price relationship between two securities. This is given by a long position in one

security and a short position in another security in such a way that the resulting portfolio is market neutral (which typically translates in having a beta equal to zero). This portfolio is often called a spread. According to Gori (2009), in the framework of spread modelling, among the more recent techniques we find that cointegration is probably the most popular approach in quantitative trading strategies adopted by hedge funds and a reasonable amount of literature has been published on it.

The main objective of this study is to examine pair-wise cointegrating relations between banks' shares, trading in the Greek stock market, with the implementation of PT strategies exploiting the mean-reversion property of the implied long-run relations. Bondarenko (2003) and Hogan et al. (2004) defined SA as an attempt to exploit the long-horizon trading opportunities revealed by cointegration relationships. Furthermore, according to Alexander and Dimitriu (2005), compared with other conventional methods, cointegration performs better as a way of applying SA strategies. Overall, cointegration methodology is a powerful tool for long-term investment analysis. A number of asset management firms now base allocations on cointegration analysis. In addition, when portfolios are constructed on the basis of returns analysis, frequent rebalancing will be necessary.

As suggested by Alexander (2001), the power of cointegration analysis is that optimal portfolios may be constructed on the basis of common long-run trends among asset prices, and they will not require extensive rebalancing. On the contrary, according to Lin et al. (2006), arbitrage trading of the "convergence trade" type is rarely riskless. Market events or structural price changes may invalidate statistical pricing models, confound future price expectations or require parameter re-estimation. Price spreads, after position opening, may escalate rather than revert, or the equilibrium position may shift.

So far, in the relevant literature, there are rather conjectures (Lin et al., 2006; Alexander and Dimitriu, 2002) than evidences supporting the argument that changes in market performance alternate the mean-reverting properties of long-run relations between financial assets and, as a result affect implementation of SA strategies on the variables under consideration. That is, there is small empirical evidence suggesting that arbitrageurs should perform rebalancing among the traded assets when a change in market performance is evident. Main objective of the present study is to contribute in the relevant literature shedding more light on the effects of changes in market performance on the implementation of SA strategies which rely on the cointegration approach.

Compared with previous research, the present work aims to extend existing literature by considering if changes in market performance alternate the mean-reverting properties of long-run relations between equities and, as a result, affect implementation of PT strategies on the variables under consideration. In order to evaluate the validity of our main hypothesis we examine stock prices data of six banks quoted in the Athens Stock Exchange. The examined data contain a bust phase followed by a mild bullish period. Employing cointegration analysis,

reported results initially indicate that changes in market performance affect stability of long-run relations, therefore suggesting that arbitrageurs should perform rebalancing among the examined shares when a change in market trend is evident. Furthermore, “extreme” market performance harms the mean-reverting properties of the long-run relations, which have been identified in our full-sample analysis, while “moderate” market performance points to cointegration between the examined stocks in each pair. Moreover, considering the second sub-period of “moderate” market performance, the presence of a stationary spread suggests the potential of abnormal returns realization, in the short-run, through exploitation of deviations from its mean value. Since the cointegration approach is widely used by hedge funds adopting SA or PT strategies, we believe our results are of significant importance, suggesting that when a change in market performance is evident then fund managers should keep in mind the necessity of rebalancing.

The remainder of this paper includes a description of the examined data, in Section II, and research organization along with the employed methodology, in Section III, followed by model specification and results on cointegration rank tests as well as tested hypotheses, in Section IV. Finally, Section V provides a summary and conclusions.

Data Description

Data employed in this paper include weekly closing prices of six banks’ equity shares quoted in the Greek stock market. In order to leave out any structural effects arising from the introduction of Euro, we choose to examine a seven-year period: 2001:01:05-2007:12:28. The examined Greek stocks are the equities of the National Bank, the Alpha Bank, the Cyprus Bank, the EFG Eurobank Ergasias, the Piraeus Bank, and the Marfin Bank. Our choice of stock prices variables relies on our objective to examine all shares constituting the banks’ sector index in the Greek market as well as on the availability of data for the examined seven-year period. Apart from the banks’ sector index, the examined shares are also constituents of one popular market performance index namely, the FTSE/ASE 20 for the Greek market.

In order to examine pair-wise cointegrating relations between the examined equity shares under different market conditions, we have split the sample into two sub-samples. We can visually examine, in Fig. 1, the performance of the FTSE/ASE 20 index for the examined seven-year period. Although structural change is obvious from visual inspection of data in Fig. 1, in order to further justify our choice to split the sample, we apply a breakpoint test suggested by Chow (1960). The breakpoint test is applied on a linear regression of the relationship between log price data of those pairs of stocks that appear to be cointegrated in the first part of our econometric analysis where we have employed full-sample data.¹ According to the results of the Chow test in Table 1, with a zero p-value, we reject the null of no breaks at the starting

¹ Our choice to apply Chow breakpoint test on two bivariate linear regressions between log data of the examined shares is justified by the results of our analysis in Section III where, employing full-sample data, Tables 2a-e indicate two existing pair-wise cointegrating relations among the examined variables.

point of the second sub-sample, in all cases. In addition to the latter documentation of the two sub-samples, in order to reveal market performance, we define positive (negative) weekly index returns as Up (Down) market returns. Furthermore, following Fabozzi and Francis (1977), we redefine Up (Down) market returns as Substantially Up (Substantially Down) market returns when the weekly return of an index is larger (lower) than the sum (difference) between average market return and half of one standard deviation measured over the full sample.

Examining market performance of the Greek FTSE/ASE 20 index, in the first sub-sample there are 47 Up and 68 Down market returns while 73.53% of the Down returns are also Substantially Down market returns. In the second sub-sample there are 149 Up and 101 Down market returns while 53.69% of the Up returns are also Substantially Up market returns.

While there is no commonly agreed-upon definition for a “bear” market, broadly defined, a “bear” market represents a substantial decline of at least 20% in stock prices over a period of several months. This characteristic is met in market performance of the FTSE/ASE 20 index in the first sub-sample. Furthermore, in the first sub-period, we find that the number of Down returns characterized as Substantially Down returns is sufficiently higher than 50%. In this way we identify the first sub-sample as an “extreme” period.

According to market analysts, a “bull” market is a prolonged period in which share prices raise faster than their historical average. Considering market performance of the Greek FTSE/ASE 20 index, in the second sub-period we find that the number of Up returns characterized as Substantially Up returns is 53.69%. That is, the number of Up returns characterized as Substantially Up returns is slightly higher than 50%. In this way, we identify the second sub-sample as a “moderate” period.

Overall, the sample under consideration contains a period of “extreme” market performance followed by a period of “moderate” market performance. The “extreme” period falls within the sub-sample of *2001:01:05-2003:03:14* and the data include 115 observations. The “moderate” period falls within the sub-sample of *2003:03:21-2007:12:28* and the data consist of 250 observations.

Methodology and Research Organization

Our research schedule is comprised of three parts. First, employing full-sample data we investigate if there are bivariate cointegrating relations among all the possible pairs of the examined shares. In the second part of our analysis, splitting the sample in two sub-periods, we examine if market performance affects the statistical evidence of possible cointegrating relations, indicated by the results of the first empirical part. Finally, as indicated by the results of the second part, in the third empirical part we shed more light on the second sub-sample, characterized as “moderate” period, in order to reveal differences between cointegrating relations from full-sample and second sub-sample data.

We apply the Johansen (1988, 1996) and Johansen and Juselius (1990) methodology of the Cointegrated VAR Model. As noted by Gonzalo (1994) and Kremers et al. (1992), the Johansen and Juselius approach performs better, or at least as well as, the Dickey-Fuller cointegration test of Engle and Granger (1987). In addition, the selected procedure is invariant to different normalizations (Hamilton, 1994) and thus the test outcome does not depend on the chosen normalization. Our results were obtained using CATS in RATS version 2 (Dennis et al., 2005). We choose to restrict the constant term, μ_0 , to lie in the cointegrating space and in addition, when proper, we include dummy variables, D_t , as unrestricted to the cointegrating space.

The error correction form of the examined unrestricted VAR model is described here:

$$\Delta x_t = \Pi x_{t-1} + \sum_{i=1}^{k-1} \Gamma_i \Delta x_{t-i} + \mu_0 + \phi D_t + \varepsilon_t, \quad \varepsilon_t \sim N_p(0, \Sigma), \quad t = 1, \dots, T \quad (1)$$

where: x_t is a vector of two variables: $[l_{it}, l_{jt}] \sim I(1)$, (2)

- l_{it} : weakly closing prices (in logs) of bank i,
- l_{jt} : weakly closing prices (in logs) of bank j,

and D_t is a vector of deterministic variables such as intervention dummies.

Notation of the examined banks' shares is: lgr_{1t} for National Bank, lgr_{2t} for Alpha Bank, lgr_{3t} for Cyprus Bank, lgr_{4t} for EFG Eurobank Ergasias, lgr_{5t} for Piraeus Bank, and lgr_{6t} for Marfin Bank.

Our choice to employ a model with a constant term and exclude the presence of a trend, in the examined log-run relations, is implied by the nature of PT as a SA strategy. That is, implementing a PT strategy, an arbitrageur forms a long/short portfolio of two assets, where the weights in each asset depend on the coefficients of the implied long-run relation between them. However, his initial decision to set up as well as the follow up of such a portfolio relies on the statistical properties of the spread between the prices of these assets. Therefore, in order to set up such a strategy the trader should initially verify the existence of a long-run relation as the one described in Equation (3).

$$l_{it} = \beta \cdot l_{jt} + Spread + stat.error. \quad (3)$$

In other words, what an arbitrageur looks for is a stationary spread $(l_{it} - \beta \cdot l_{jt})$. As stated by Pole (2007), relying on the stationarity of the spread between two assets, when detecting a divergence from its mean value then, the arbitrageur shorts the winner and buys the loser: if history repeats itself, prices will converge and the arbitrageur will profit. Alternatively, let us assume that, instead of employing the model described in Eq. (1), we choose to include a trend in the cointegrating relation. Although we could have found a stationary long-run relation,

however in that case the arbitrageur could not set up a strategy based on the stationarity of the spread ($l_{i-r} - \beta l_{j-i}$).

Implementing PT strategies and assuming that we have already choose the pairs of stocks then; we should identify the weights of the two assets, the so called pair's ratio. According to Gori (2009), this ratio should meet two requirements. First, it should make the strategy zero cost, and second it needs to make the strategy market neutral (which typically translates in having a beta equal to zero). Consequently, in an estimate of a long-run relation as the one described in Eq. (3), the presence of a slope coefficient significantly different from unity is justified and can be interpreted by the pair ratio.

Performing model specification, we choose the optimal number of lags using Schwarz, Hannan-Quinn and Akaike Information Criteria along with a Likelihood Ratio (LR) test. Following Juselius and MacDonald (2003), in order to secure valid statistical inference we need to control for the largest of observations by dummy variables or omit the most volatile periods from our sample. Since the volatile periods could potentially be highly revelatory, we followed the Juselius and MacDonald approach. The dummy variables used in our models are permanent impulse dummies $D_{yyyy.mm.dd}$ (equal to one at $yyyy:mm:dd$, and equal to zero otherwise).

Performing cointegration tests, our main objective is to investigate if there is a long-run relation, with a non-zero intercept, between the examined banks' shares in each pair. Applying Johansen (1988, 1996) and Johansen and Juselius (1990) methodology of the cointegrated VAR model, we examine the existence of a long-run relation with a non-zero intercept based upon the estimated eigenvalues, $\hat{\lambda}_i$, and the trace test, τ_{p-r} .

In addition, we perform hypotheses testing regarding multivariate stationarity, univariate normality, and variable exclusion. In the presence of I(1) series, Johansen and Juselius (1990) developed a multivariate stationarity test which has become the standard tool for determining the order of integration of the series within a multivariate context. The multivariate stationarity test is a LR test distributed as chi-square with (p-r) degrees of freedom, [$\chi^2(1)_{95\%}=3.841$]. Testing univariate normality, we apply the Doornik and Hansen (2008) test, distributed as $\chi^2(2)$, [$\chi^2(2)_{95\%}=5.991$]. In order to test variable exclusion, we apply a LR test distributed as chi-square with r degrees of freedom.

Furthermore, focusing on the cointegrated pairs of banks' shares, we perform long-run identification of the existent cointegrating relations through testing the validity of over-identifying restrictions. First, we test the null hypothesis of long-run weak exogeneity for each stock constituting the examined pair. According to Juselius (2006), the hypothesis that a variable has influenced the long-run stochastic path of the other variables of the system, while at the same time has not been influenced by them, is called the hypothesis of "no levels feedback" or long-run weak exogeneity. The long-run weak exogeneity test is a LR test

distributed as chi-square with r degrees of freedom. Second, testing if cumulating shocks driving the system have exactly the same influence on both variables (li_t and lj_t), we examine if the hypothesis of long-run homogeneity holds. That is, we examine if the cointegrating vector is $(1, -1)$. Third, in cases where results, of long-run weak exogeneity test, point to the identification of the common stochastic trend, we apply a joint test of long-run weak exogeneity and long-run homogeneity hypotheses. Finally, in order to further justify our suggestions, we apply the Augmented Dickey-Fuller (ADF) technique (Dickey and Fuller, 1981) to test the null hypothesis that the spread has a unit root.

Model Specification and Results on Cointegration Rank and Tested Hypotheses

As mentioned, performing model specification, we choose the optimal number of lags using Schwarz, Hannan-Quinn and Akaike Information Criteria along with a LR test while, in order to secure valid statistical inference, we choose to control for the largest of observations with the use of dummy variables.

In the first part of our analysis, examining full-sample data, for fifteen pairs of banks' shares, we have employed a model with either one or two lags, described in Equation (4).

$$\Delta x_t = \alpha(\beta', \rho') \begin{pmatrix} x_{t-1} \\ 1 \end{pmatrix} + \sum_{i=1}^{k-1} \Gamma_i \Delta x_{t-i} + \mu_0 + \phi D_t + \varepsilon_t \quad (4)$$

where: k equals the number of lags minus 1.

Being sufficiently confident about the specification of our model, we shall try to determine the rank. Reported results, in Tables 2a-e, suggest in two cases rejection of the null hypothesis of $r=0$ while a cointegration rank equal to one is accepted, with 95% significance. Overall, for the pairs of (i) $lgr_{3t}-lgr_{4t}$, and (ii) $lgr_{3t}-lgr_{5t}$, we have evidence that our system contains one cointegrating relation and, as a result, one common trend.

Considering results reported in Tables 2a-e, further analyzing the two cointegrated pairs [(i) $lgr_{3t}-lgr_{4t}$, and (ii) $lgr_{3t}-lgr_{5t}$], with rank=1, we cannot accept the exclusion of any of the variables of the system. Overall, in both cases, we have a system where the employed variables are non-stationary and significant, therefore they cannot be excluded. Univariate normality test outcomes suggest that residual properties are within acceptable levels. The rest of our analysis, in this part, is focused on the two cointegrated pairs. That is, as described below, performing detailed long-run identification we shall test the validity of over-identifying restrictions on the implied cointegrated vectors.

Examining the dynamics of each system, we perform hypotheses testing. We begin our analysis, in Tables 3a-b, with the unrestricted model H_1 . We choose to normalize the β vector to lgr_{4t} in the first case (Table 3a), and to lgr_{5t} in the second case (Table 3b). Although

normalization of these cointegrated vectors leads to two identified cointegrating relations, we choose to impose over-identifying restrictions.

First, employing models H_2 and H_3 , given the importance of a zero error correction term, we test the validity of long-run weak exogeneity hypothesis for both shares constituting each pair. Estimated coefficients of the error correction terms represent the short-run speed of adjustment; their magnitude and significance are of great importance regarding the results of our study. If the coefficient of a term is zero, then the error correction does not come from that variable. Considering results reported in Tables 3a-b, we cannot reject the hypothesis of long-run weak exogeneity for lgr_{4t} (EFG Eurobank Ergasias) in pair (i), as well as for lgr_{5t} (Marfin Bank) in pair (ii). Overall, Cyprus Bank is identified as the adjusting variable in both cases, where we identify EFG Eurobank Ergasias and Piraeus Bank as the pushing forces in pairs (i) and (ii), respectively.

Regarding the second over-identifying restriction, employing model H_4 , we test the null hypothesis of long-run homogeneity between share prices in each pair. Reported results, considering model H_4 (in Tables 3a-b), indicate rejection of long-run homogeneity hypothesis in both pairs [(i) $lgr_{3t}-lgr_{4t}$, and (ii) $lgr_{3t}-lgr_{5t}$]. Moreover, examining model H_5 , we reject as well the null joint hypothesis of long-run weak exogeneity and long-run homogeneity.

Summing up, we detect two well established cointegrating relations. The cointegrating relations β_1 , and β_2 , implied by model H_3 (in Tables 3a and 3b, respectively), are:

$$\beta_1 : lgr_{3t} = -5.088 + 2.471 \times lgr_{4t} + \text{stat.error.} \quad (5)$$

(-6.383) (8.149)

$$\beta_2 : lgr_{3t} = -1.518 + 1.249 \times lgr_{5t} + \text{stat.error.} \quad (6)$$

(-6.039) (11.803)

The above described cointegrating relations (β_1 , and β_2) seem to be stable in the short run as well, as we can infer from the negative sign and significance of the coefficient corresponding to Δlgr_{3t} , (model H_3 , in Tables 3a and 3b, respectively) reported in α matrix. In other words, the share prices of the bank identified as the adjusting process seems to adjust very well to the long-run relations.

In the second empirical part, our analysis is focused on the two pairs [(i) $lgr_{3t}-lgr_{4t}$, and (ii) $lgr_{3t}-lgr_{5t}$], where well established cointegrating relations have been detected. Splitting the examined sample into two sub-periods, we perform cointegration tests and hypotheses testing in each sub-sample. We have employed a model with one lag in the first sub-period, and a model with one or two lags in the second sub-period. In order to secure valid statistical inference, we choose to control for the largest of observations by dummy variables. Equation four (4) describes the model employed in the two sub-periods.

The results, in Table 4, suggest the acceptance of a cointegration rank equal to zero regarding both examined pairs, in the first sub-period. On the other hand, as indicated by the results in Table 5, considering the second sub-period, with 95% significance, the null hypothesis of $r=0$ is rejected while, a cointegration rank equal to one is accepted, in both cases.

Given the previously mentioned results of cointegration tests, in the third part of our analysis, we focus in the second sub-period in order to perform long-run identification of the two cointegrated pairs. Proceeding in the same line as in the first empirical part, we examine the dynamics of each system, performing hypotheses testing. In Tables 6a-b, we begin our analysis with the unrestricted model H_1 , normalizing the β vector to lgr_{4t} , in the first case (Table 6a), and to lgr_{5t} , in the second case (Table 6b). Although, normalization of each cointegrated vector leads to identified cointegrating relations, we choose to impose over-identifying restrictions.

First, given the importance of a zero error correction term, employing models H_2 and H_3 , we test the validity of long-run weak exogeneity hypothesis, on both shares constituting each pair. Reported results, in Table 6a, indicate rejection of the hypothesis of long-run weak exogeneity for each of the shares of Cyprus Bank or EFG Eurobank Ergasias. That is, in the case of the first pair ($lgr_{3t}-lgr_{4t}$), we cannot distinguish between the stochastic trend and the adjusting process of the system. However, in the second pair ($lgr_{3t}-lgr_{5t}$), reported results, in Table 6b, indicate that we cannot reject the hypothesis of long-run weak exogeneity for Piraeus Bank. Overall, only in the cointegrated relation between Cyprus Bank and Piraeus Bank we have evidence of a well established system, where Piraeus Bank is the pushing variable, while Cyprus Bank is purely adjusting.

Regarding the second over-identifying restriction, employing model H_4 , we test the null hypothesis of long-run homogeneity between the share prices in each pair. Reported results, considering model H_4 (in Tables 6a-b), indicate rejection of long-run homogeneity hypothesis in all the examined pairs. Therefore, there is no evidence of a cointegrated vector (1, -1) in any case. Moreover, employing model H_5 , in the last case (Table 6b) and examining models H_5 and H_6 in the first case (Table 6a) we reject the null joint hypothesis of long-run weak exogeneity and long-run homogeneity, in all the examined pairs.

Summing up, considering data from the second sub-sample, we detect just one well established cointegrating relation. The cointegrating relation β'_2 , implied by model H_3 (Tables 6b) is described in Equation (7).

$$\beta'_2 : lgr_{3t} = -1.733 + 1.329 \times lgr_{5t} + \text{stat.error.} \quad (7)$$

(-6.367)
(12.493)

The above described cointegrating relation, β'_2 , seems to be stable in the short-run as well, as we can infer from the negative sign and significance of the coefficient corresponding to Δlgr_{3t}

(model H_3 , in Table 6b), reported in α matrix. In other words, the share prices of Cyprus Bank, identified as the adjusting processes, seem to adjust very well to the long-run relation between Cyprus Bank and Piraeus Bank.

Moreover, the outcome from the Augmented Dickey-Fuller (Dickey and Fuller, 1981) unit root test (in Table 7) indicates, with 99% significance, acceptance of the null hypothesis, while points to a stationary spread, with 95% significance.

Summary and Conclusions

Compared with previous research, we extend existing literature by considering pair-wise long-run relations between log-prices of stocks, under different market conditions. Also, we investigate the implications of these relations on the implementation of SA strategies. Our empirical results may be valuable to market participants since the cointegration approach has recently received considerable attention from hedge funds adopting SA or PT strategies.

According to Alexander (2008), the prices (and log prices) of stocks are integrated, and integrated processes have infinite unconditional variance, thus there is little point in attempting to use past prices to forecast future prices in a univariate time series model. However, when the prices of two or more equity shares are cointegrated, there is a multivariate model revealing information about the long-run equilibrium in the system.

In investigating pair-wise long-run relations between banks' equity shares, quoted in the Greek stock market, we have found two well established cointegrating relations. Based on that finding, one could set up SA strategies in order to exploit the mean reverting properties of these two spreads. However, taking into account a structural change due to alternation in market performance, our results indicate that one should be cautious about applying such strategies. That is, further investigating the long-run relations among the examined stocks, we have divided the sample into two sub-periods in order to re-examine the suggested linear relations under different market conditions. The examined sub-samples contain a bust phase followed by a mild bullish period.

Employing cointegration analysis, reported results initially indicate that changes in market performance affect the stability of long-run relations, suggesting that arbitrageurs should perform rebalancing among the examined equity shares when a change in market trend is evident. Furthermore, "extreme" market performance harms the mean-reverting properties of the three long-run relations while "moderate" market performance points to cointegration between the examined stocks in each pair. However, under "moderate" market performance, we have found that there is one well established cointegrating relation that retains the same characteristics shown in the analysis of the examined full-sample data. In addition, the presence of a stationary spread, with 95% significance, suggests the potential of abnormal returns realization, in the short-run, through exploitation of deviations from its mean value.

RECONTEXTUALISING AND RECONCEPTUALISING PERSPECTIVES AND TYPOLOGIES OF ELITE INTERVIEWING: CASES FROM THE FOOTBALL INDUSTRY

Moore, Neil¹; Stokes, Peter²

¹Chester Business School, University of Chester, UK

²Chester Business School, University of Chester, UK.

Abstract

Elite individuals and groups constitute a distinctive, upper echelon social grouping and in various shapes and forms, elites have been an enduring feature of many societies. In the contemporary era, the concept of elites and the related notion of celebrity have seen fresh developments. The paper considers the literature on elite interviewing both generally and, more specifically, in an organization and management disciplinary context. Furthermore, in relation to the processes involved in elite interviewing, the paper focuses on the notion of role of context in relation to elite interviewing. For the purposes of illustration, the paper engages with the organizational and management context of the English football industry. The intention is that this will offer fresh insights into the function of context in elite interviewing.

The paper's examination of the literature feeds into the fieldwork stage which employs an inductive and interpretivistic methodology. The key method employed within the methodology is semi-structured interviews that are tailored for elites conjoined with participant observation. The approach is applied to an elite interviewing process mindful of its overall organization and management context and its specific focus on the football industry.

The paper concludes that there is some scope for recontextualising elites and elite interviewing through the development of novel conceptual and theoretical underpinnings and models. By engaging with social constructionism, lived experience and narrative informed frameworks the paper draws heightened attention to the potent role of sector and context in elite interviewing. In relation to the task of interviewing elites in the English football industry context the paper identifies that there is scope to recontextualise this specific context with, for example, issues of arrogance, amateurism, power, and the phenomenon of insider/outsider.

Elites and celebrity constitute phenomena that have risen unabated in the 21st Century and therefore they merit on-going close attention. Equally replete in contemporary life are organizational and managerial domains and the elites that reside within them. For many

people, football is one particular domain that plays a central role in their lives and therefore constitutes a significant field worthy of research.

The work is an original study of the issues surrounding interviewing elites in the organizational and management context of the English football industry. In a more general sense, elite interviewing is generally an under-commented subject in the business and management arena and this study seeks to contribute to redressing this.

Keywords: Celebrity, Context, Elite, Interview, Football

Introduction

Elite interviewing is a field of research methods and methodology that has come to increasing prominence in recent years. When the term 'elite' is applied to a person or group they are generally considered to be people who are well-known, famous, distinctive or important. Elite also implies use of qualitative judgements regarding some people being seen as perhaps better than others. Moreover, elite involves the formation of identities in relation to ideas of professionals and professionalism and implies notions of power bound up and associated with them. And, the idea of elites broaches and intertwines with the phenomenon of celebrity. While elite groups may have common themes, they are also likely to have differing identities that emerge in distinctive contexts and environments.

Access to, and interviews with, elites can be challenging and the extant literature is right to dedicate energies to considering the issues involved in planning and conducting approaches. A good degree of progress has been made in relation to elite interviewing by the existing literature however this has been generated primarily in the fields of applied social sciences, sociology and politics (see by way of illustration: Rivera, Kozyreva and Sarovskii, 2002; Leech, 2002; Lilleker, 2003; McEvoy, 2006, Tansey, 2007, Neal and McLaughlin, 2009, Slote Morris, 2009).

This paper argues that there is further potential to explore the phenomenon of elite interviewing with a view to reconceptualising certain marginalised and underexplored aspects of academic disciplines and research settings or sectors. In order to progress this, the paper examines the current state of the literature on elite interviewing within research methods for business management and organization and identifies a number of issues in relation to the writing. It contextualises this by conducting interviews in the context of the 'business' of football in the United Kingdom. The overall effect of this discussion allows the paper to offer a degree of recontextualisation on elite interviewing and to generate lessons for interviewing individuals in business and management contexts.

A Consideration of the Literature on Elites and the Processes of Interviewing Elites

This paper focuses on elite interviewing in the management and organizational context of English football. Therefore, in order to progress an analysis and argument in relation to this phenomenon it will be necessary to elaborate a number of pertinent key terms and dimensions. The review commences by examining some initial and general ideas on the notion and nature of elites. The discussion then turns towards making some preliminary comments on the kindred experience of celebrity. Integrally, the paper considers interviewing as a research method and this is gradually focused on to the area of elite interviewing. This cumulative analysis is then considered in relation to the specific business context of English football.

A Consideration of 'Elite'

The Concise Oxford English Dictionary defines elites as 'a group of people considered to be superior in a particular society or organisation' (Concise Oxford English Dictionary, 2011). An elite is constituted of individuals and collectives that form a separate and distinct echelon or grouping in a given society or section of society. Although, by their very nature, elites are often in a minority, typically they can be seen to have knowledge, influence, control and power in a setting or situation. Human history has shown that there is a longstanding propensity for elites to emerge and develop. Indeed, in demonstrating this longevity, it is worthy of note that the very term 'elite' is derived from the Latin term 'eligere' meaning 'to elect'.

Drawing upon these initial definitions, it is possible to identify a number of elite groups, such as, for example, scientific, political, educational and bureaucratic elites, (see: Zuckerman, 1972; Rivera et al, 2002; McEvoy, 2006, Rice, 2010). By way of illustration of elitism in action within a specific domain it is possible to consider, for example, linguistic elites. In a UK context this might, for instance, point at speaking with a received-pronunciation accent associated with 'the Queen's English' and signal (aspirant) membership of a posh or middle-upper social class. Equally, there may also be educational elites. These could include people who have attended educational establishments with world famous reputations, for example, Eton, Oxford, Cambridge, Harvard or the Sorbonne. Given the connection with power and control it is of little surprise that the examination of elites has taken place to a large extent in relation to the discipline of politics, political thought and its linkage to cultural and organizational life (Parenti, 2010; Richardson, Kakabadse and Kakabadse, 2011; Seidl, 2010). It is also worthy of note that many of the characteristics of different forms of elite groupings, for example, educational and linguistic, converge in the world of politics where a large number of politicians come from well-educated, 'well-spoken' middle class origins.

In corporate terms definitions of elites range from simply those who occupy the higher echelons of an organisation through to more specifically the ‘...owners, directors and senior executives of the largest and most important of a nation’s business corporations. They can be variously defined according to criteria of corporate size and type of enterprise’ (The Online Dictionary of the Social Sciences, 2011). Welch et al (2011: 6) also acknowledge the importance of an organisation’s size and type when determining its status but develop this further by suggesting that ‘Elite status is also affected by the company’s standing in relation to other firms in the industry and more broadly by its public image.’ From this perspective elite status is regarded as being fragile, unstable and dependent upon time and place (Harvey, 2010: 195; Aberbach and Rockman, 2002: 675). These observations highlight that the elite status of an organisation, group or individual is not fixed; rather it is fluid and highly dependent upon the context in which it is situated. Burt (1992) also emphasised the importance of contextualisation and went on to note that social factors were also important. He observed that although some individuals within organisations have relatively little role or job-title power they are regarded as being elites because they are strategically positioned within social structures.

The argument hitherto has underlined that the term ‘elite’ does not refer to a homogenous group and rather there is a great diversity of what constitutes elite. For this reason it is inappropriate to treat elites uniformly. This is congruent with the observations of Delaney (2007: 210) who emphasises that not all elite interviewing is alike (he cites, for example, philanthropic elites, political elites, organisational elites and ultra-elites). In the present paper, it therefore follows that although interviewing ‘football elites’ has similarities to interviewing other types of elite it also has significant differences. One of these key dimensions is that many of these elites are, to some greater or lesser extent, also celebrities which is an issue considered in greater depth below.

In this paper we acknowledge the need to be aware of contextual issues and we also recognise the need to move beyond merely defining elites in terms of traditional role criteria. Consequently we use the term elite to describe, not only the highly placed, but also those who are afforded elite status because of their accumulated experience, knowledge, respect and/or notoriety. In addition, given this transient nature of elite status, we were also careful to identify ‘former’ elites as part of the study. This correlates with work by Davies (2001) who mentions interviewing people who were elites but have now retired and he makes the point that the interviews were best described as ‘guided reminiscences’ rather than semi-structured interviews. In short, within the context of this paper, the term elite describes a broad range of individuals some of whom derive their elite status from their current positions within a hierarchy and others who are, or have been, regarded as being elite at some other point in time. For example, elite interviewees involved in the study included media personalities, acting and former football club Chairmen, managers and

administrators of football clubs, governing bodies and football related organisations (e.g. the Professional Footballers' Association) and high profile coaches/managers.

Justification for gathering interview data from elites is provided by a number of scholars. For instance, Tansey (2007) explains that because elites are often key informants their first-hand accounts are valuable when corroboration of facts and additional information are required. In addition he explains that contributions from elites may be helpful in developing inferences about larger populations and reconstructing accounts of past events. Likewise Delaney (2007: 208) emphasises the value of interviewing elites and comments 'You gain a unique opportunity to understand the worldview of those with significant influence.' Lilleker (2003: 208) elaborates further by highlighting that elites '...provide insight into events about which we know little: the activities that take place out of the public or media gaze, behind closed doors.' This observation is of particular relevance to the UK football industry where intense media scrutiny has resulted in clubs becoming closed institutions that are wary of 'outsiders'. Gaining access to football industry elites provides a rare and valuable opportunity to explore unique accounts and insights which have been previously considered in only limited contexts.

A Consideration of Celebrity

The current paper proposes that, in certain domains and situations, notions of elite and celebrity are often closely aligned or overlap. The social dimension of elite status is particularly pertinent when exploring the conjoined area of celebrity. The term celebrity derives from the Latin word 'celeber' which means 'much frequented' or 'thronged'. However, although we can accurately trace the origin of the term, according to Cashmore and Parker (2003: 215) celebrity remains a 'slippery concept' with 'seemingly amorphous boundaries'. Despite this a number of scholars have attempted to provide definitions. According to Alberoni (1972: 76) celebrities are '...a powerless elite - a group that occupy a privileged social position but derive status not from institutionally based social power, but from the fact of public attention.' Similarly, Meyer (1995: 184) argues that 'Other elites command attention because of their power to influence; celebrities derive any influence they may have from attention.' In essence celebrity status is derived from notoriety and 'well knownness' and as a consequence is inherently ambiguous and insecure (Boorstin, 1961; Dyer, 1991; Gamson, 1994).

Although the phenomenon of celebrity is in no way unique to the twentieth and twenty-first centuries (Crawford, 2004; Whannel, 2002), the accelerating ascendancy of it during contemporary époques potentially adds a further dimension to ideas of elites (Rojek, 2001; Turner, 2004, Inglis, 2010). Indeed, according to Bainbridge and Bestwick (2010: 215) celebrity is a pervasive phenomenon which can be observed in many settings they suggest: 'Many person-types are somehow associated with celebrity-hood: heroes, leaders, legends, idols, stars,

superstars and icon.' Goodman (2010:510) reminds us of Warhol's famous saying that 'One day everyone will be world famous for fifteen minutes'. In drawing on Warhol, the consequence of Goodman is to underline the fleeting and fickle nature of celebrity and to mark a contrast with certain more solid and permanent aspects of 'elite'.

Following in the vein of Goodman's analysis, Lawler (2010:419) suggests that celebrity is in fact a poor aspect of the genre of fame. He indicates that it is ephemeral and prone to disappearing as quickly as it has been conferred by a changeable and capricious public opinion. Likewise Crawford (2004: 133) discusses the shallowness of contemporary celebrity and comments '...[it] often lacks depth of character, as figures are frequently painted in one dimensional terms.' Therefore, unlike elite status it would seem that celebrity is more difficult to control. Nevertheless, while considering power and control, Lawler (2010) continues by making the point that celebrity, in a similar manner to belonging to an elite, is an opportunity to both gain and lose a range of other things. These could simultaneously include, for example: wealth and privacy.

As was noted above, elites can be identified in a range of societal arenas. Politics, and political life, were identified as one of these and Lawler (2010: 422), with reference to politics, draws an important distinction between elites and celebrity. He suggests that 'political greatness' is different from a notion of 'celebrity greatness':

'Celebrity greatness, being self-absorbed or irresponsible, is still easily distinguished from political greatness. Politicians (or, better, political leaders) either aren't or are more than celebrities. President Obama is quite the celebrity, but he's more than that. (Before he ran for president, it wasn't so clear he was more than that.) Bill Clinton, Al Gore, and Mike Huckabee are now merely celebrities. Sarah Palin, because the shameless media imposed the burdens of celebrity on her, was stuck with (and really enjoyed) skilfully making the transition from politician to celebrity. Being governor of Alaska was boring and paid poorly; becoming president was and will continue to be a most improbable long shot, but now she's rich and famous and commands the media's attention in all its dimensions. Palin, like Lady Di, is amazingly adept at linking her celebrity status to causes beyond herself, but increasingly the content of the cause seems secondary.'

Lawler's comments have powerful resonance for this paper's focus on the football industry and those who operate within it. Many of these individuals are, it would seem, very much involved in 'celebrity greatness' rather than any alternative form of greatness that exudes a more powerful form of gravitas perhaps. This could have implications for the processes of interviewing and the structures and principles that play out in their course. This is a point that has been long identified as indicated by Meyer (1995:184):

'There is much to this insight that celebrity is deliberately manufactured and that the famous are therefore not necessarily the "deserving." Additionally, and importantly, the celebrity's social influence is not based on formal, institutional power (Alberoni 1972). We turn our attention to those public figures whose *lives* are watched with great interest, but whose claims to attention are not tied to the *consequences* their actions have for those watching. Celebrities are, in Alberoni's (1972) play on Mills, a "powerless 'elite/ "a group that occupy a privileged social position but derive status not from institutionally based social power, but from the fact of public attention. Their notoriety has less to do with what they do, or with how they can directly affect lives, than with what and who they are. Other elites command attention because of their power to influence; celebrities derive any influence they may have from attention.' (Emphasis added].

Meyer's comments provoke an interesting reflection when applied to football. Football elites/celebrities are arguably somewhat different to the notion expressed by Meyer above. A football player's notoriety can partly stem from who they are but their notoriety will also have something to do with *what they do* i.e. whether or not they are a skilful player, a good or bad player, a successful (or not so successful) coach. From this perspective football elites/celebrities are different to the celebrities emerging from popular television programmes such as, for example, 'Big Brother' who, it might be said, have nothing to offer other than *who* they are. Rather football elites/celebrities are known for what they do and also their institutional/organisational affiliation –which club they've played for /which organisation they've worked for, for example the Football association etc. and their role within a club/organisation etc.

Elite Interviewing: Acts, Processes and Atmospheres – A Consideration of the Literature

The paper has now considered the realms of elites, celebrity and undertaken an initial consideration of these phenomena in relation to the United Kingdom football context. This stage of the argument considers the processes and issues involved in interviewing elites and involves the need to provide an appreciation of interviews as a genre of research method.

There is a considerable body of literature on the various forms and processes of interviews within the research methodology arena. The paper undertook a scan of the terms 'elite' both as a standalone index entry and also within sub-categories of the index entry for interviews and, furthermore, identified some thirty key texts on research methodology for business management and organization students. It was highly significant that this search of seminal textbooks provided only one reference to elites and this was an incidental reference to the term in the context of a particular case rather than seeking to focus on the sphere of elite interviewing. In a more general sense, a decade earlier, Welch et al (2001:1) pointed up the weakness in the overall research methodology literature noting that, for example, sociology and geography had gone

some way to addressing this lacunae (see Useem 1995; Yeager & Kram 1995). In some regards, this has been addressed in some disciplinary spheres however this is not the case in organization and management.

Neal & McLaughlin (2009: 689-690) in citing the work of Liazos make the very valid point that a good deal of social science work has tended to concentrate on marginalised populations, what Liazos controversially termed 'nuts, sluts and perverts' (1972: 103). Neal & McLaughlin go on to align themselves with Punch who noted that 'it is still painfully obvious . . . that researchers have rarely penetrated to the territory of the powerful and many field studies still focus on lowly, marginal groups' (1986: 25). They duly observe that across a span of subject areas it is possible to find studies on powerful, autonomous elites:

'...not only does a multi-disciplinary body of work concerned with the study of elite populations exist (Palmer, 2000; Cook et al., 2002; Pimlott, 2002; Simon, 2002; Welch et al., 2002; Davies, 2004; Ball, 2005; Glees et al., 2006, for example), but alongside this is an expanding set of methodological accounts of the experiences of researching 'upwards' and engaging the seemingly powerful in the research process.'

Neal and McLaughlin's comments provide a useful insight and overview to the research on the elite, nevertheless, importantly, the paucity of commentary in business and management research methods textbooks in relation to elite interviewing is contrasted with the engagement with elite interviewing by wider social science and humanities journals (Rice, 2010: 70). In this regard the sphere of politics and political literature has been important in the writing on elite interviewing. An analysis of the more extended literature (book, journal and web-based) suggests that a number of recurrent themes can be identified. These incorporate, process, power and positionality:

- Process Issues – This includes discussions and commentaries making points regarding preparation, question design (open v closed), semi-structured approach, and the need to:
 - adopt a conversational style and be flexible,
 - need to highlight credentials and affiliation in order to gain access;
 - overcome pre-prepared monologues\talk tracks by 'probing' (i.e. elites are often 'professional' communicators);
 - recognise the tendency of elites to claim undue credit and exaggerate their contributions;
 - provide elites with feedback;

- use snowballing techniques to gain referrals
- Power – A recognition of the frequent imbalance between interviewer and interviewee; the reversal of the ‘usual’ non-elite interviewing situation where the interviewer is deemed to have the power; and degree of openness
- Positionality – The question of whether the interviewer is an insider/outsider and the impact on the data? Does an outsider gradually become an insider as more and more interviews are conducted? Issues related to being an insider or an outsider?

In certain disciplinary realms, the research on elite interviewing has a relatively longstanding history. With regard to the process aspects of elite interviewing, Zuckerman (1972:163) in her work *Interviewing an Ultra-Elite* considered Nobel laureates in science. She makes a range of comments on the preparation for accessing the elite and conducting the interview. She notes the need to have brief but clear and polite initial written communication as elites are ‘time poor’ and will not dedicate a large amount of time to considering a request. In keeping with the approach advocated by Ostrander (1993), Welch et al. 2002, and Rice (2010) Zuckerman also notes the need to establish legitimate credentials with the interviewee. Goldstein (2002) supports much of this stating that being clear about intentions from the outset is centrally important. In addition Delaney (2007: 212) emphasises the need for a succinct introductory letter which emphasises ‘the value of the elite’s particular experience.’

Zuckermann (1972:163) also states that with well-known and famous elite interviewees it is imperative to have thoroughly researched their biography. Moreover, when dealing with elites she proposes that ‘standard’ questions will not suffice and the conversation must be tailored. She also goes on to make a range of normative comments pertaining to tape recorders, interviewing techniques and an ability to be fluent in jargon and technical language (167–170). A number of scholars emphasise that elite audiences tend to prefer open-ended questions because they do not like to be strait-jacketed and cornered; rather they often wish to be diplomatic or measured in their responses (Schoenberger, 1991; Clark, 1998; Aberbach and Rockman, 2002; Rice, 2010). McEvoy (2006:185) provides insights and lessons from interviewing politicians in Northern Ireland. She shows how she used semi-structured interviews to allow and show parity and equity in the way she approached politicians of the different factions. This nevertheless, allowed space for them to expand.

In relation to gaining access, Hunter (1995) explains that elites have the ability to protect themselves from intrusion and criticism and Laurila (1997) observes that although elites are often visible they are not necessarily accessible. Elites often erect barriers which separate them from the wider community and as a result researchers may have to invest significant financial and time resources to gain access (Shenton and Hayter; 2004 and Welch et al. 2002). In order to increase

their chances of gaining access Peabody et al. (1990) advocate that researchers should draft an interview schedule that can be shown, and verified, in advance to respondents. This 'advance warning' dimension is also subscribed to by Goldstein (2002) and Lilleker (2003). In line with the usual interview technique of 'starting with the easy questions' then moving on to more difficult ones Leech (2002) suggests the interview schedule should move from 'non-threatening' to 'threatening' questions and Pridham (1987) indicates that a 'funnel' method with general questions at the beginning before the more significant aspects of the interview.

The ability to restrict or grant interviews is a source of power for elites and this contributes to the divide that exists between interviewer and interviewee. Indeed Delaney (2007: 215) suggests that restricted access to elites is yet another marker which indicates that the interviewer is a 'status subordinate'. Welch et al (2001:1) goes to the crux of the issue of power in elite interviewing:

'The power of an elite interviewee stems from organizational hierarchy, corporate values and history, personal assets and degree of international exposure. However, handbooks on qualitative methodology do not address the 'double trouble' that most of us face: namely, the task of conducting an in-depth interview, while simultaneously balancing the power of an influential elite.'

Welch et al go on to make the point that the nature and structure of an elite is far more complex than an organizational chart would prima facie suggest. This clearly has major implications for addressing and dealing with the power inherent therein. Despite Welch et al's early observation that very little work has explored power issues in elite interviewing more recently a small number of scholars have begun to consider this area. For instance, Delaney (2007: 215), suggests that interviewers can use power and status differences to their advantage by making it clear to the elite interviewee that they are being interviewed because they are able to provide a valuable contribution. In this way the encounter is not regarded as being a battle for control, rather it is seen as a contest more akin to jiu-jitsu in which the interviewee's 'momentum' provides the interviewer with an advantage. For instance, using this approach the interviewer may be able to incorporate non-threatening questions such as 'I am unsure about this area, would you mind explaining further?' This strategy is an illustration of how the 'gap' between the interviewer and the elite interviewee can be manipulated (Moss, 1995 and Rice 2010). Slote Morris (2009: 213) also discusses power issues but shifts the focus away from the interview and argues that although an interviewer may feel powerless they are not entirely so because they have control over how the interview data is contextualised and interpreted. This observation is supported by Neal and McLaughlin (2009: 695) who go on to suggest that power relationships in elite interviewing can be ambiguous, multi-directional, transient, untidy and messy. Smith (2006: 645) elaborates on this when he explains that

'...the idea that elites can be neatly defined and treated as consistently powerful is a view which relies on a rather simplistic idea that there is a dichotomy between powerful elites and powerless others. . .such an outlook ignores the proposition that power exists in a variety of modalities . . .that these modalities of power can be negotiated and are not inscribed and consequently that elites may change over time (even during the course of one research project).'

In the present study this observation that status as a given elite status/power can be transient was pointedly remarked. By the time the study had been concluded many of the people interviewed during the study had vacated their positions. The football industry is dynamic - people move around and status and power can shift quickly. Aberbach & Rockman (2002) make the valid point that where elite interviewing is part of a longitudinal study this may experience specific issues in relation to elites. They note that elites have a tendency to be dynamic and experience high turnover of role which can mean that it is challenging to keep some stability and consistency in the sample.

McEvoy (2006: 185) makes a number of interesting comments in relation to the management of identity issues. She notes the evident power 'differential' between interviewer and interviewee. This might be derived from not just position but also age, gender, ethnicity and other status dimensions. She notes in the context of Northern Irish political milieu:

'The respondents are all experienced politicians, former ministers in the power-sharing government and/or senior members of their respective parties while I am a young researcher at the point of embarking on an academic career. As a young female I was aware of the 'male space' of politics (Mackay, 2004, p. 112) and that my gender would probably have an effect on the attitude of the respondent, given that the majority of respondents are male and middle-aged'.

Equally, McEvoy (2006:186) raises the interesting notion of 'affiliation' in relation to interviewing elites. She ponders whether the perception of her kindred (or not) ethnic identity had led her data to be distorted. In a related vein, she notes Arthur (1987) success with interviewing Dublin politicians because they had trust in him linked to his background and notes that Nationalist politicians tended to accord her the same trust-based access. In the football focus and context of the current paper, this raises an interesting point in relation to the interviews conducted. The researcher has often gained access through 'snowballing' telephone calls from interviewee in a given quarter of the footballing community to another. Nevertheless, it is interesting to reflect on what drives this trust and warmth dimension of the elite interview positioning and access.

Rivera et al (2002: 683) indicate that there are gaps in the literature of various varieties in relation to differing national context and the social structures therein. It is suggested that much of the literature hitherto generated is aimed at accessing and interviewing elites in advanced

industrial democracies (see, for example, Aberbach, Chesney, and Rockman 1975; Dexter 1970; Peabody et al. 1990). However, the pointers under which the issues are addressed would seem to be similar to those faced in many diverse contexts, namely: have an institutional affiliation; reassure the respondent that there are no right answers; establish an appropriate identity for the interviewer; request interviews in person when possible; develop an appropriate questionnaire.

Language and communication is an evident medium of positioning and positionality. The manner in which an elite talks, the lingua franca employed, is an integral aspect of any community and an elite is no different. Goffman (1959) describes the elite interviewing interaction as a performance which is manufactured to generate particular impressions and is shaped by audience and environment. From this perspective elites are regarded as having a 'front stage' and a 'back stage' persona. Research by Puwar (1997: 11) identifies that when they are interviewed politicians tend to adopt monologues which are akin to pre-scripted official speeches and they also tend to engage in highly, defensive off-hand behaviour. Equally Ball (1994: 97-98) highlights the challenge of overcoming attempts of elites who try to present themselves in the best light, convey a particular interpretation of events and dismiss the interpretations of others. Delaney (2007: 211) highlights an issue that is particularly pertinent to the realm of football whereby senior figures become a spokesperson for their organisations when they are interviewed and Thomas (1993: 85) develops this further to suggest that such elites '...even to speak as if they were the organization.' As a consequence the researcher may feel that they are being treated in a formulaic manner with the 'same old line' being 'trotted out' and offering little more than might be available in the general press and media. However, the opposite may sometimes be the case with elite figures feeling that they have the right or the capacity or protection to be able to speak their minds.

Within all of this is the interesting role of the interviewer progressively conducting their interviews. They must reconcile the gradual transforming role of insider/ outsider and the complexity of being 'friend' and 'critic' simultaneously (Becker, 1995; Herod, 1999; Sabot, 1999, Desmond, 2004). Herod (1999:314-324) explores the insider/outside issue within elite interviewing at some length by focusing on trade unions. He makes the point that assuming the role of a 'cultural insider' will not necessarily deliver better quality data than a relative 'outsider' (ibid, p321). Moreover, he is wary of the over-simplistic dualism that 'insider/outside' infers:

'I have come to realize that what I had initially taken to be a simple and unproblematic dichotomy "insider" or "outsider" with regard to positionality was not quite so analytically simple, but that the issue of positionality was, in fact, quite messy on the ground. Specifically, it is apparent that the positionality of the researcher can shift depending upon a number of considerations, in the process disrupting the supposedly stable dualism of "insider"/"outsider" and the privileged positionality of the "insider" that much literature on interview methodologies

has assumed exists....As a consequence of thisthe researcher can adjust shift her/his positionality in a self-conscious way 'on some occasions playing up social distances between researcher and interviewee, on others playing down such distances i.e. they can manipulate what Moss (1995) has called "the gap". This is to say, the researcher's positionality is not necessarily fixed in some absolute sense, 100% "outsider" or 100% "insider", but it may translocate through categories and identities, such that at some times and places the researcher may emphasize certain positionalities and identities and not others' (ibid, p.321).

As the 'insider/outsider' a researcher conducting interviews is also conducting participant observation of some form or another. This may be deliberate or inadvertently consequential. Therefore, interviewing of any form can be implicitly argued to involve participant observation and it is a methodological choice by the researcher how this is addressed and employed (Waddington, 2004). Desmond (2004) continues his analysis of insider/outsider by introducing the idea of transition or 'grey zones':

I have increasingly come to think, however, that it might be more appropriate to consider instead the notion of "degrees of outsidersness" in which there is a continuum of "outsidersness" along which researchers operate. Such a perspective would enable us to recognize that even an erstwhile "insider" becomes, in a sense, at least a partial "outsider" the moment they put on their researcher's hat in that they no longer hold the same positionality they did before, having created a space of critical distance between themselves and the elite to which they may belong objectively but with which they now have a different relationship ± whereas an "outsider" may change her/his positionality to become closer or more distant from their sources depending upon the situation.' (ibid, p.321).

Allied to the issues of positionality, and the extent to which an interviewer is an insider or an outsider in relation to elites, is the 'dilemma of seduction' (n.b. this is also germane to the issue of celebrity also). According to Delaney (2007: 217) a common problem for those interviewing elites is that:

'There is something seductive about interviewing those with great wealth, power and success. It is tempting by the end of an interview to 'envision' yourself in the particular career path or life circumstance of your interview subject. You enter someone's life for an hour or two, you may speak as 'relative equals'...and it is easy to come out of an interview thinking either 'that was amazing to interview someone like that' or 'that could be me' – both of which reflect the process of seduction..... I have watched inexperienced interviewers go through this process, returning starry eyed from an interview, identifying with, or defending, the elite person well beyond what would typically be seen after an interview.'

Delaney further describes this phenomenon as being akin to Stockholm Syndrome whereby captives begin empathise with their captors and are even prepared join them in their cause.

Having defined elite and examined this through the predominant politically and sociologically orientated literature it is clear that it shows and characterises elites in a specific manner. This is a valuable contribution to the debate on elite interviewing, however, equally there is scope to identify, develop and explore additional facets. Firstly, the degree to which these can be examined in a more in-depth and rich manner with regard to theoretical possibilities. Secondly, there is scope to consider these issues in different contexts in recognition of the possibility and need to contextualise and problematise the concept of elites in a more complex manner than may currently be the case. The study engages this task by examining the English Professional Football industry as a case study. This provides a fresh and novel context in which to some of the questions and issues raised by the literature discussion.

Football – Background Context, Elites and Celebrity

Within the football focal of interest of the paper, it can be readily recognised that elites and celebrity play a major role in this particular organizational and managerial sphere. This is inextricably linked to the presence of a range of different elites across the sector. Here, the research is not necessarily addressing the likes of the English Premiership footballers, such as, by way simply of example, the stellar footballers, Rooney, Suarez or Lampard. Rather, it is keen to show and explore the world of ‘elites within elites and elites alongside elites’. The rise of the phenomenon of celebrity has coincided with radical transformations in the structure of what can be termed the English ‘football industry’ especially in the latter part of that epoch and it is useful to examine a number of background contextual issues in relation to this.

As part of the process of considering elite interviewing in the organizational context of the English football industry it will be useful to provide a brief background. The scale of the transformation is staggering; in their Annual Review of Football Finance: Lost in Translation The Football Money League Deloitte (2009: 30) observed that

‘In 1991/92, the last season before the formation of the Premier League, the former Division One clubs had a collective turnover of £170m. By contrast the revenue of the top 20 Premier League clubs in 2007/08 is projected at over ten times this amount at £1.9billion.’

Indeed, even clubs in the lower divisions became ‘multifaceted leisure businesses with a range of income streams’ (Matusiewicz, 2000: 166). Consequently, for many success ‘on the pitch’ is no longer the sole concern; issues such as survival, liquidity, revenue maximisation and profitability loom large (Szymanski and Kuypers, 2000: 16; Guillianotti and Richardson, 2004: 554; Milanovic, 2005:883, Buraimo et al. 2006: 34; Gilmore and Gilson, 2007: 410).

Despite this transformation a number of scholars have argued that business management practices remain ill-suited to the challenges which have emerged. For instance, Cannon and Hamil (2000: 36) suggested that the 'amateur tradition' prevails in the boardrooms and the back offices of most clubs. They argued that clubs are still run predominantly by non-executive directors with little experience of the type of business issues facing contemporary football. Likewise, Banks (2002: 139) explored the financial aspects of the sport and observed that 'amateur practices' were instrumental in the difficulties faced by clubs. Similarly, Syzmanski and Kuypers (2000: 79) commented that clubs have hardly advanced beyond Victorian business practices. Typically, Boards of Directors were composed of '...the butchers, bakers, candlestick-makers of local industry', who had part time involvement in their clubs. Their motivation to become involved was driven by a number of factors. For instance, the pursuit of local prestige was important. One manager respondent (2005) commented that in some instances individuals chose to own their local clubs because '[their]...dads took them to watch the team from the terraces when they were twelve'. These individuals acted as benefactors to their clubs and in return gained local prestige; prominent examples include Jack Walker of Blackburn Rovers and Jack Hayward of Wolves. Similarly, a senior football executive respondent (2005) commented 'It certainly seemed to be a matter of local pride to get selected to join [the Board of] the local football club in those days.' An ex-football player respondent (2006) reinforced this view and suggested that for some, football clubs were '...a little bit of a plaything' and that association with a successful club could provide '...an awful lot of personal kudos'.

These observations highlight an apparent paradox: on one hand the football industry has experienced an unprecedented period of growth and commercial success and celebrity in its own right, but on the other business management practices are regarded by many as being unsophisticated and out-dated. In essence a successful, dynamic twenty-first century industry appears to be dominated by commercial practices and modes of operation that would not look out of place in the late nineteenth century. This has consequences for the production of the various 'elites' within the industry and the processes required in order to access them.

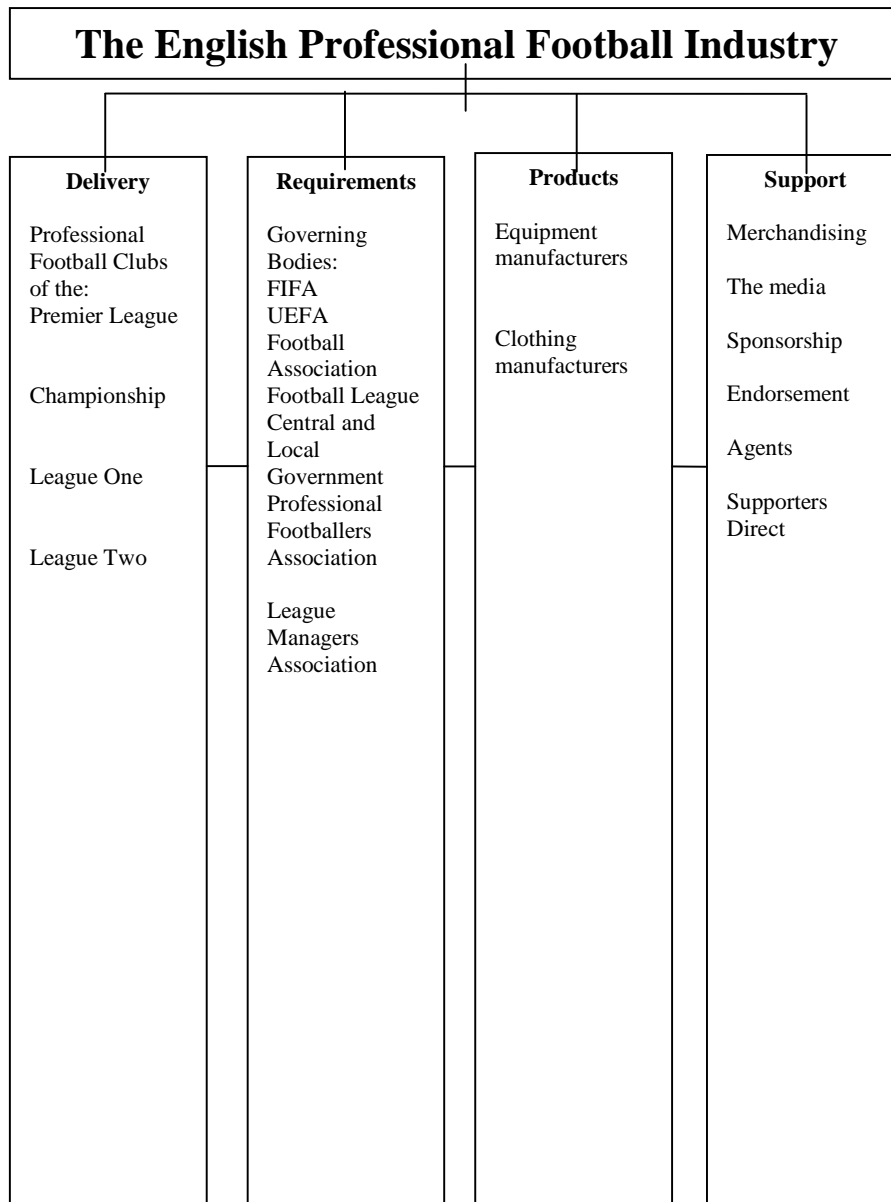

The English Professional Football Industry

Although many scholars accept that English football has become an industry in its own right a comprehensive definition of the term 'English professional football industry' does not exist (see Haynes, 2007: 362; Breitbarth and Harris, 2008: 180; Edensor and Millington, 2008: 18). In order to address this lacuna, and define the scope of this paper is, it is helpful to begin by briefly considering the works of those who have focused upon defining the wider sport industry. Overwhelmingly, scholars working this area have concentrated upon identifying and categorising the component parts of the industry (Robinson, 2003: 171; De Schriver and Mahon, 2007: 267; Humphreys and Howard, 2008: 27).

For instance, Chelladurai (1994: 8) suggested that the sport industry could be divided into two fundamental elements: participatory activities and spectator activities. The former is categorised in terms of the motives of participants, for instance health and fitness or the pursuit of pleasure, excellence or skill, and the latter is divided in terms of whether the sport offers commercial entertainment (i.e. professional sport) or non-commercial entertainment (i.e. amateur sport). Similarly, Pitts et al. (1994: 17) investigated the component parts of the sport industry and identified three segments: sport performance (i.e. the spectators and participants who consume the sport); sport production (i.e. the training, sportswear and equipment utilised in playing the sport); and sport promotion (i.e. individuals, organisations and products used to market and promote the sport). Building on these works, Robinson (2003: 172) suggested that the sport industry comprised four inter-linked elements: sport delivery, sport requirements, sport products and sport support services. The first segment, sport delivery, is the means by which sport is offered to the spectator, participant or customer and comprises amateur and professional sport. The second component, sport requirements, consists of the products and services needed to produce or enhance the quality of the sport. Key elements in this category include governing bodies and officials. The third area, sport products, incorporates the enterprises which produce goods for the sport industry (for example equipment and clothing manufacturers). The final category, sport support services, consists of those products or services that support and promote sport. For instance, this segment consists of the media, merchandising organisations and those engaged in endorsements and sponsorship.

In attempting to define the English professional football industry Robinson's work is of particular interest because, unlike other works, it emphasises the inter-connectedness of the industry's components and in so doing goes beyond merely identifying and labelling them. In essence, by considering the relationship between the segments which constitute the industry as a whole this approach more clearly captures its complexity and multifaceted nature. For the purpose of explaining the scope of the sector under consideration here Figure 1 shows an adapted version of Robinson's framework which has been applied to English professional football.

Figure 1 The Components of the English Professional Football Industry

*

(Source: Adapted from Robinson, 2003: 172)

Figure 1 shows the principal actors involved in the English professional football industry and locates these within the components identified by Robinson. The figure effectively illustrates the breadth and depth of the industry and in so doing emphasises the obligatory limits to the scope of an investigation of this type. Indeed, a study which attempted to explore all constituencies of the industry would be either need to be extraordinarily extensive or ill-conceived, unmanageable and lacking in focus.

In parallel with the growth of the 'business of football' the cult of footballer celebrity has grown hand-in-hand with the growing wealth that is associated with the game. Commensurately, many of the people involved in the support or off-field game have also grown to receive celebrity status. They have also emerged as elites displaying many of the traits of elite bodies in that they are a minority, they exercise control and power of a larger section of a sphere, and they have professional bodies and affiliations. However, unlike many professional elite organizations (for example, accountants, solicitors, judges and so on and so forth) footballers cannot be said to be drawn predominantly from a middle-class context. This was a significant observation in the data. Many professional elites are drawn from well-educated, middle-class contexts. Illustrations might include, for example, senior judges, top architects, senior public officials and so on and so forth. Traditionally, it is not uncommon for English contingents of footballers to be drawn from lower or less privileged socio-economic groupings and classes (although the overall team may well be made up of international players for whom the same may, to some greater or lesser extent, hold true or not). In this regard, they perhaps have much in kind with other sports personalities and indeed the world of entertainment wherein people rise to elite status and celebrity from humble or disadvantaged origins. Moreover these domains, including football, bring celebrity and elite readily together and perhaps more easily than professional fields such as, for instance, medical doctors, architects or a majority of politicians. Equally, the aforementioned professional groupings typically exhibit celebrity less readily than football or entertainment. They are often unknown to the wider public and they do not have their identity or influence conferred on them by public opinion.

Methodology – Interviewing Elites

The research into elite interviewing took place in an English Professional Football organizational context. The intention was to examine and experience elite interviewing in a novel context in contrast to much of the extant research conducted in the elite interviewing literature hitherto. The research undertook an inductive and interpretivistic approach that involved the use of semi-structured and unstructured interviews with people working in the football industry (Van Maanan, 1988, 2010; Maylor and Blackmon, 2005; Eriksson and Kovalainen, 2008). The questions concerned the nature of living and working in the 'business' of the football industry and provided insight into the celebrity, personality and notion of elites in relation to this context.

The study took place over three years with the interviewing taking place between June 2005 – June 2009. A total of thirty-four participants were interviewed. The interviews lasted between thirty and ninety minutes. These were tape recorded and later transcribed and the tapes were subsequently returned to the interviews. The interviews were supplemented and complemented by non-participant observation at two non-Premiership clubs. This included shadowing of senior managers during the course of match days. The building of the interviewee databank was

achieved through a snowballing technique based on personal recommendation of one interviewee to another (Collis and Hussey, 2009:158).

Semi-structured interviews were deemed to be the most appropriate data collection method because they are congruent with the interpretive approach in that they enable contributors to 'tell their own story', thereby enabling the interviewer to gain a more comprehensive understanding of the participants' 'world' (Bryman and Bell, 2003: 477; Barbour and Schostak, 2005: 42-44; Polonsky and Waller, 2005: 131; Easterby-Smith *et al.* 2008, 88; Gray, 2009: 373). To this end, only a small number of pre-prepared questions were used during this interview phase. Here the aim was to encourage participants to provide a rich picture and consequently it was important to adopt a highly flexible approach which allowed interviewees to digress if necessary. The need for this type of flexibility was emphasised by Polonsky and Waller (2005: 106). They commented that 'The method chosen should match the degree of flexibility you require in terms of informational needs' and went on to explain that in '...exploratory research, you may need a method that provides room for respondents to give answers that the researcher may not have anticipated.' The data were analysed through intensive reading and rereading in order to allow prevalent themes, issues and phraseology to crystallise. This process, combined with the overall approach to the research, acknowledged and embraced issues of reflexivity in the research recognising the relation and impact of the researcher on the researched and vice-versa.

In relation to necessary issues of validity and reliability, the research followed normative protocols for interview processes. This involved use of the same questions for the semi-structured questions and use of the same introductory questions and passages for the interviews which took on a more unstructured nature. Given that interpretivism is the espoused methodological approach of the research it was reasonable to state that the findings carried resonance for many people working in a United Kingdom football context. It could not automatically be suggested that the research, so constructed, would be applicable to other contexts however it is possible that relevance might be found for other settings.

Findings and Discussion - Recontextualising Elites in English Football?

The convergence of the review of relevant literatures with the field data provided a range of interesting insights and questions. At the core of these was the re-emergence of the questions concerning the challenge of defining elites and celebrity in differing sector and organizational contexts.

Based on our research, we would suggest that the precise dimensions of celebrity and elite may well vary in relation to the sector or context under examination by the research. This develops, but is kindred with, Delaney's (2007) work. For example, certain high ranking administrators are celebrities *within* the 'world' of football but are largely unknown as public figures. In the model

below, we could characterise this as 'public background figure'. In addition, we need to be careful how far we argue the presence of elites in football because many of the people interviewed were indeed elites but were could not be consider celebrities as such. The paper recognizes that this phenomenon is present and able to be observed in other organizational contexts beyond football. In the football context examined it was seen that this provided a particularly interesting context where the two entities seemingly overlap. It is possible to identify a number of factors that drive the convergence of this interaction, however, issues of power and familiarity to the public possibly constituted some of the more important ones. Power and the factors of power are starkly evident in the football context, as one administrator noted:

'If you are not a player you are treated abysmally. For instance, our players arrive at the training ground, they park their Porsche, and their first stop is the kit room where they meet Elaine and Lesley, on £7k a year. They will have washed the kit overnight and will have it ready for when they come in. So you've got a player on £1.5 million, £2 million a year taking kit and exchanging good mornings with a girl on £7k. The dichotomy for football clubs is that the investment in certain groups of people is absolutely massive, sometimes unimaginable, and yet the rest of the people surrounding them are on the basic wage. I would suspect that in many clubs they don't even bother to address this issue but we have tried to deal with it. Players can be very generous when directed in the right fashion. But it's harder to get a wage increase for a basic employee than it is for a £2 million a year player.' (Administrator – Manager – A, 2008)

This issue in combination with the literature and filed data analysis provide the opportunity for the evolution of a proposed model indicated below:

<i>High Power</i>	
<i>Macro-Elite/Celebrity</i> <i>Players: Messi, Ronaldo</i> <i>Former Players: Pele, Cantona</i> <i>Certain Managers: Alex Ferguson. (Akin to</i> <i>Cashmere's 'Global Celebrity'.)</i>	<i>Micro-Local Elite/ Public 'Background'</i> <i>Figure</i> <i>Certain Managers – the majority</i> <i>Team coaches and staff</i> <i>Administrative staff</i>
<i>Eclipsed-Faded -Fallen Elite/ Celebrity</i> <i>Personality/'Character'</i> <i>Players: Gazza (Paul Gascoigne)</i> <i>Some managers and team staff – high profile</i> <i>newly promoted but vulnerable teams for</i> <i>example.</i>	<i>Member of the Public – Man or Woman</i> <i>in the Street</i> <i>Warhol's 15 minutes of fame</i>
<i>Low Power</i>	
<i>Profile - Well Known</i>	<i>Profile - Unknown</i>

Figure 2: A Recontextualisation of the Celebrity-Elite Interface in a English Professional Football Context.

Figure 2 works to illustrate, drawing on the data, a number of aspects of elites in a United Kingdom football context. Power and the extent to which people are in a particular public consciousness (here termed 'knownness') emerged as important aspects of the data. Herein the data analysis is infused with a spirit drawn from the tradition of Critical Management Studies (see Stokes, 2011) which is centrally concerned with discussions on the subjectivities of issues such as power, discourse, identity, sexuality).

The model embraces these elements and points up the manner in which, in relation to continua of 'power' and 'knownness' (i.e. known or unknown) the Macro-Elite Celebrity operates in different spaces to the Micro-Local Elite/ Public 'Background' Figure of the game. In this way the upper two boxes share a similar temporal space or moment – in other words they are both elites and celebrity but in the case of the 'Local' elite the extent and coverage ('knownness' is limited to a micro or very localised context).

On the other hand, where the power is low we see a different form of celebrity. We see forms of Eclipsed-Faded -Fallen Elite/ Celebrity. These may well have once belong to the upper boxes of Macro or Micro Elite/Celebrities but now have slipped into some marginalised domain. In this manner, in many instances they are a close step away from reintegrating into the role of a member of the public. The table presents a range of environments and 'worlds' in which elite and

celebrity identities play out with varying degree of power and profile. They also model the dynamic and changeability of these identities over relatively short periods of time. Indeed, in relation to the grid in Figure 1, it is possible to introduce the term and notion of 'elite/celebrity eco-systems'. The metaphor of elite/celebrity eco-system is a useful one in that it provides a model that attempts to integrate and show the relationship between a range of dynamic facets: power, profile, the temporal and the spatial intertwined with identity within global or localised realms. This notion of the lack of homogeneity in elites was alluded to by Aberbach and Rockman (2002) in the literature above however the analysis of the particular organizational context of football both illustrates and develops understanding of the phenomenon.

As a consequence, it can be seen how the model and its variable/typologies might equally be adapted for realms beyond football. For example, the world of entertainment may offer a kindred field and indeed, although football is suggested as a business or industry it is equally part of the worlds of leisure and entertainment. A range of data moments underpinned the building of the model. In most instances interviewees requested that they met in a location of their choice – often a prestigious location (e.g. A famous ex-manager and TV pundit at the All England Club Wimbledon; A football entrepreneur owner-director at Arsenal's Highbury Stadium; A former player at Liverpool's Anfield Stadium; a football executive at Football League HQ Preston; An old ex-player at PFA HQ Manchester). Location and 'space'/place could have had an influence on the process i.e. 'in awe of the surroundings' – difficult to maintain objectivity – danger of 'seduction' (Delaney, 2007). Meeting and interviewing somebody who you feel that you know because you've grown up watching them on the TV or because you see them regularly in the media (read about them in the papers/ seen them interviewed elsewhere etc.) challenges objectivity and may increase bias, prejudice etc. It could be argued that this isn't such a big problem for those who just interview mainstream elites – but when you are interviewing elites who are also celebrities this may be an issue.

On some occasions interviews were interrupted by phone calls etc – clearly my interviewees were busy people – on a number of occasions the interruptions were made by other celebrities (i.e. when interviewing Phil Thompson he received 2 phone calls – Stephen Gerrard and Gerrard Houllier; when interviewing Dave Basset we were interrupted by Denise Wise – in person; Bill Beswick took a call from Steve McClaren). From an interviewer's perspective these were 'surreal' experiences – they emphasised the status and power of the interviewee [degrees of separation?]. Indeed interviewees were keen to point out who they'd been speaking to – an effort to impress/name dropping!!

One feature that was particularly striking in the interviews conducted was the tendency of many individuals to go through the motions of 'trotting out the patter' often from their autobiography – so in fact producing 'an account from an account' so to speak. This offered

almost a self-caricatured portrayal and representation of the respondent by the respondent. As one friendly club colleague intimated - If we could devise a way of 'cutting through the c**p' that would be great'

One issue that is strongly evident in the data is the phenomenon of insider/outsider in the football 'world' (akin to the work of Becker, 1995; Herod, 1999; Sabot, 1999, Desmond, 2004). Herod (1999:314-324 in wider contexts). Football is, and remains, a protected world and this presents a major challenge for the elite interviewer. In many regards, perhaps this is little different from many celebrity elite contexts (see for example, Shenton and Hayter (2004)). However, as a contextual factor it is worthy of note as it repeatedly resurfaced in the data:

'In general in clubs there is no big picture feel. In other industries you get coordinating groups. But in football there is no formal exchange, there is no sharing of competitive strategies. Football sees itself as a competitive industry, whereas, in fact it should be a cooperative industry.' (Former Manager and Football Celebrity - H, 2007).

'Football clubs remain isolated and suspicious of outside influences. This has led to a 'sclerosis' that has severely limited their ability to modernise and develop.' (Former Manager and Industry Commentator - L, 2009)

It might be argued that this engenders a power-centric arrogance in some individuals. And, indeed, this might well be identified as a potential trait in the identity of elites and celebrity. In the case of the football industry this appeared to be compounded with issues of amateurism in the back room/ administrative operations. This seemed a heady and dangerous cocktail with potentially serious consequences. In the data this manifested itself in a number of ways:

'A highly placed football administrator recounted how the fan approached the Chairman and berated him about recent incidents at the club. The Chairman responded and said 'My man, how do you expect to have any say in these matters if you are not a shareholder?' A few months later the fan approached the Chairman again and informed him that he was now the proud owner of a single share. He went on to enquire as to whether this now meant that he could have more access to the club. The Chairman replied 'No, becoming a shareholder means that you will still know bugger all, but quicker!'

(Administrator - B, 2007)

'Whether it was girls who cleaned the floors, to any people who worked in the offices, the club felt they should have been working for nothing because it was a real delight and it was an honour - when people asked for pay rises club officials would say "What are you asking for a pay rise for? What an opportunity you have to work for this club!'"

(Football club Employee - G, 2008)

'Surprisingly, the outgoing accountant thought that the post of Financial Controller was a part-time role. But I learned fairly early on that it clearly wasn't!...Things were very lax - I had to spend literally three or four months getting everything bang up to date, it was a complete baptism of fire!'

(Senior Administrator – M, 2008)

The notion of amateurism, or perhaps alternatively expressed unprofessionalism, is an interesting finding and situation in the data with which the elite interviewer had to contend in this particular context. There is often an assumption, perhaps, that elites will be organised, well-aware and generally coherent given the journey they have undertaken to arrive at their 'eliteness'. In the particular context of football this was not at all uniformly the case. This further provides evidence of a variable aspect in the assumptions sometimes made regarding the variability of elites.

The redefinition of elites needs to take account of 'new elites' phenomenon in the 21st century and this may be particularly relevant in the changed and changing world of football. One particular aspect of this has been the tendency for rich local people to buy clubs. Of course, in more recent times this has escalated into Russian, American and Arab Oligarchs and business people taking a business interest in clubs. It might be argued that this is driven by celebrity issues as much as business aspects:

'...a little bit of a plaything that could provide an awful lot of personal kudos' (Manager C, 2009)

For employees – administrators and managers at clubs, the celebrity or glamour can seem significantly more ephemeral and transient:

'Football doesn't mind if you work 60 hours every week. The problem is if you aren't prepared to work hard and you want a family life - you're going to get kicked out. If you say, "I can't come on Saturday because I'm taking the kids to the funfair". You might get away with that once, but if you start doing that a couple of times you're going to be gone. A lot of people come in and survive six months and then say "Right I'm off". There are some glamorous times but suddenly they realise they're in a job and unless you're fully committed you aren't going to survive.' [Emphasis added] (Senior Administrator F, 2007)

In reference to the proposed box diagram it is possible to identify processes of creation and re-creation, or social construction of identity, fame, celebrity and eliteness:

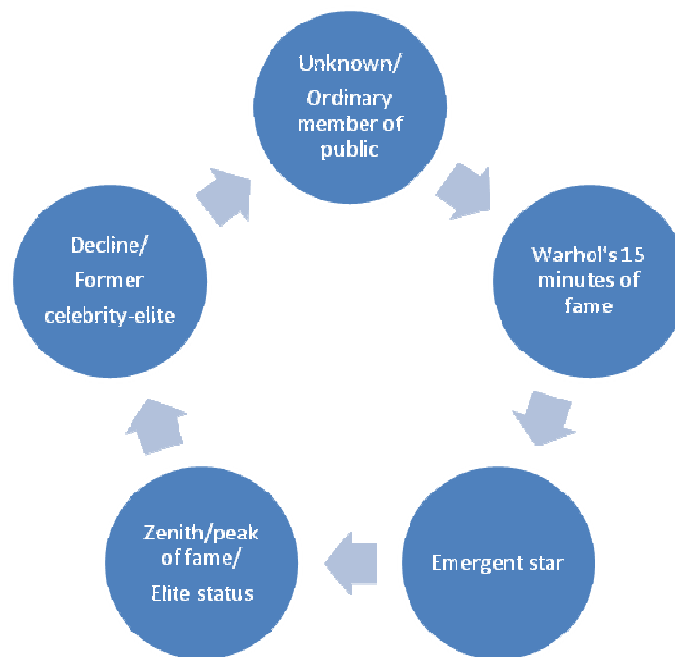

Figure 3: A Tentative Model of the Processes of Celebrity

The construction of a research methodology approach allows interviewing and elite interviewing to be seen a process rather than seeing elite interviewing as a tool or device – i.e. an end in itself. Rather, an examination of elite interviewing allows us to see the experience more as a process or narrative. This in turn invokes a consideration of the role of narrative methodologies in elite interviewing.

It is valid to see football as a number of things in its modern context. On the one hand it is a business and an industry in which markets, careers and profits are pursued. At the same time it is a leisure and entertainment domain that offers drama and show-business. In all of these regards, football is little different to many other organizations in that they have celebrity and personality that occasionally reaches the press and media. There is scope to use inter-disciplinary sources, such as for example, journalism, media or social studies. This might contrast with existing approaches which tend to see football examined through sport, leisure, tourism and management frames of references

At the outset of the paper, it was noted that the field of politics and political studies has played an important, indeed rather dominant role, in relation to the interviewing of elites. This work has therefore primarily resided in the area of the liberal arts and wider humanities. However, there is no doubt that other literatures, for example – media studies, social studies and journalism have also played a role in this regard. All of this laudable effort is to be strongly commended,

however, in the fields of business, management and organization it can be seen that elite interviewing has been largely overlooked and marginalised. This is strange given that the world of business and commerce is not alien to the notion and practice of elites and celebrity.

We have conducted our study and investigation of the concept of 'elite' as an a priori point of departure for a consideration of how to undertake research in relation to them. There may well be a 'world' of the elite that needs to be understood as a separate world and the dividing act of creating elites and de-facto non-elites.

In reflecting on the analysis of the data thus far, and considering the future directions in which to develop the working of the data and the evolution of the study, there is scope to introduce and consider a number of frameworks to elite interviewing. For instance, social construction processes around elite identity (Berger and Luckmann, 1966; Watson and Harris, 1999) can be seen to offer a useful elaboration for why variation in identity and behaviour occurs across elite groupings. This shows us the emergence and formation of notions of elite and celebrity rather than, as is so often the case taking them as a homogenous fait accompli. By better understanding these it may provide insight to the research method of elite interviewing and contribute to what seems to be something of a theoretical void around the area. Overall, this underscores a need to consider processes of representation for elites and how these might be scrutinised through various research methods. Moreover it points up a role for approaches which can challenge orthodoxy and reveal some of the marginalised areas. Critical perspectives /Critical Management has been an underlying influence in the data analysis of the present paper and there is scope to consider that the subjecting of elite interviewing in a range of different organizational contexts to CMS (and its concern for issues such as power, discourse, sexuality, identity and so on and so forth) may yet reveal further insights.

Overall, there is scope to consider and debate elite interviewing to a greater extent in the field of business organization and management. This paper has worked to carry forward this process in relation to a football business organization and management context.

Conclusion

The paper from reflection on the literature has offered novel insights and contributions in a number of regards. We have identified the paucity of literature on elite interviewing in the management and organization field. This is especially the case in relation to textbooks. As was indicated above, custom and practice indicates that textbooks are the primary source of information for students in relation to research methodology. Yet the search of thirty of the most widely used texts showed virtually no references to the specific field of elite interviewing. It was noted that a journal literature is available but regrettably many students show a reluctance to access journals especially in relation to research methodology (Stokes and Martin, 2006, 2008).

We have revisited and challenged the very nature and character of the concept of 'elite' in relation to elite interviewing. In relation to this we have highlighted and re-profiled the role and importance of developing alternative frameworks and schema for elite interviewing. By examining elite interviewing in the setting of United Kingdom football, we have illustrated the role of specific contexts both at national level and also at the micro and meso-community levels.

The elected case of football was shown to provide a clear illustration of how elites operate in differing ways in various contexts. In the case of the English football industry the relative informality and amateur legacy that operates in what are essentially multi-million pound corporate businesses produced interesting insights into accessing, even becoming assimilated to, elites during the course of the research. It appears to the authors that the way that different manners and cultures impact on issues of access, reflexivity and assimilation a particular aspect of elite interviewing worthy of further research across different sectors and contexts.

These processes have been contextualised against an analysis of background literatures that has sought to show the act of interviewing elites in the richest and fullest light possible. The impression is all too often given that elite interviewing draws on a particular literature base whereas there is scope to draw on a wide inter-disciplinary base.

The research was able to develop a form of typology of elites, generated by the interview data, in relation to an English football organizational setting. This provides a useful template to be employed in future research in approaching football elites. Equally, the research was able to identify and consider the language and patterns of communication used by elites in English football during the interview processes. In undertaking the above processes we have attempted translations of the data secured into working conceptual frameworks. It is for future research to test and extend these models.

Furthermore, we have worked to profile issues of identity and power in elite interviewing together with processes of autobiography, narrative, reflexivity and social constructionism and this is work that needs to be developed further within a critical frame of reference. In conducting all of the above stated work we have initiated a debate to recontextualise elite interviewing in relation to business, organization and management and believe that there is scope for a range of work to pursue this further in the future.

EGYPT'S RANKING ON THE KNOWLEDGE ECONOMY INDEX: BARRIERS TO TRANSFORMATION IN REVOLUTIONARY TIMES

Nafie, Rania Mohy El Din¹

¹Maastricht school of Management (MsM). Email address: ranianafie@gmail.com

Abstract

This article seeks to bridge the gap in literature between Knowledge Management as a prerequisite to innovation and transformation of developing countries such as Egypt. Several articles and research studies have been conducted on this relationship, yet none has been extended to North Africa. Egypt is currently walking a thin line between revolutionary change that can aid the country in regaining its former glory and long-lasting chaos. The authors have conducted interviews with 50 junior and senior level managers in the ICT and FMCG sector in Egypt according to a structured questionnaire that seeks to identify Egypt's position on Knowledge Management and innovation. The results of the individual companies provide us with an aggregate picture of the economy, enabling us to assemble the first SWOT analysis for Egypt's current position.

The Egyptian economy possesses high potential given the existence of the enabling tools that allow Knowledge Transfer. Yet, the enduring weaknesses of a deeply rooted culture that defies Knowledge Transfer, corruption and an outdated educational system pose a threat to the economy's ability to innovate and advance. These findings justify the World Bank's ranking of Egypt on both the Knowledge Index (KI) and Knowledge Economy Index (KEI) for 2009. The value of this research resides in compiling a SWOT analysis that would be of value for practitioners and policy makers in Egypt and allow them to fathom the justification behind the World Bank's ranking of Egypt. This information should formulate a solid base for Egypt's transformation path.

Keywords: Knowledge Management, innovation, SWOT Analysis, Egypt, Knowledge Index (KI), Knowledge Economy Index (KEI)

Introduction

The management of knowledge is frequently identified as an important antecedent of innovation (Darroch and McNaughton, 2002). The Knowledge Assessment Methodology (KAM) is an internet-based benchmarking tool developed by the Knowledge for Development Program of the World Bank. The tool provides a basic assessment for the knowledge economy readiness for 128 countries in 9 regional groupings (Chen and Dahlman, 2005). The World Bank has identified four pillars to gauge whether or not a country is conducive for the development of a

knowledge economy; namely economic incentive and institutional regime, education, innovation and ICT. This signifies a correlation between both Knowledge Management and innovation that is worthy of research.

Accordingly, this article aims to discuss the marketplace trends in Knowledge Management and innovation in Egypt through constructing a SWOT analysis for the Egyptian economy. This aims to demonstrate that Knowledge Management and innovation are inter-related, and that the management of knowledge and human capital should be an essential element of running any type of business (Gloet and Terziovski, 2004).

Literature Review

Definition of Knowledge Management

Knowledge is a broad and abstract notion that has defined epistemological debate in western philosophy since the classical Greek era. In the past few years, however, there has been a growing interest in treating knowledge as a significant organizational resource (Alavi and Leidner, 2001). Accordingly, researchers and practitioners have realized the importance of the concept and transformed it into the efficient and effective management and classification of knowledge, which if properly administered might bring about fruitful returns. Literature is satiated with definitions of the term including that of Frappaolo (2006), Hansen et al. (1999), Malhorta (1998), O'Dell and Grayson (1998) and Groff and Jones (2003), to name but a few.

In 1998 Malhorta proposed a definition, which he suggested found a general consensus amongst scholars and practitioners across the world. He states that 'Knowledge Management refers to the critical issues of organizational adaptation, survival and competence against discontinuous environmental change. Essentially, it embodies organizational processes that seek synergistic combination of data and information processing capacity of information technologies, and the creative and innovative capacity of human beings'. Although some definitions are a mere recitation of the stages or processes of Knowledge Management and may seem outdated, others take into account the dynamic nature of knowledge and, through their definitions, have been able to demonstrate the impact of this concept on key outcomes such as organizational performance, innovation, organizational adaptation and responsiveness (Nafie and Jones, 2011, forthcoming).

Simply stated, Knowledge Management includes making knowledge available in organizations whereby employees that need information have immediate access to it. Making this knowledge available poses a challenge since there are two types of knowledge tacit and explicit and there are several knowledge enablers that have been identified by researchers that need to be present for knowledge to be transferred within the organization.

Unfortunately, until now implementing Knowledge Management (KM) has been like nailing jelly to the wall (Tiwana, 2000), as such Cortada and Woods (1999) proposed eight major categories of knowledge-focused activities that could be managed within an organization to provide the broad and complex concept with clear and identifiable dimensions that one could specifically refer to when discussing / measuring Knowledge Management.

- Generating new knowledge
- Accessing valuable knowledge from outside sources
- Using accessible knowledge in decision making
- Embedding knowledge in processes, products and/or services
- Representing knowledge in documents, databases and software
- Facilitating knowledge growth through culture and incentives
- Transferring existing knowledge into other parts of the organization

Measuring the value of knowledge assets and/or impact of Knowledge Management

Types of Knowledge

There seems to be a clear accord in much of the Knowledge Management literature that there are two main types of knowledge – tacit and explicit. Authors such as Groff and Jones (2003), O'Dell and Grayson (1998), Ikujiro Nonaka (1991), Frappaolo (2006), and Tiwana (2000) among others have proposed similar definitions. Nonaka (1991) simply states that *explicit knowledge* is “formal and systematic and for this reason can be easily communicated and shared” while *tacit knowledge* is “highly personal and hard to formalize and, therefore, difficult to communicate to others”. Frappaolo adds to this by explaining that *explicit* knowledge is articulated in formal language while *tacit* knowledge is embedded in individual experience and involving such intangible factors as personal belief, perspective, instinct and value (2006, p.10)' (Nafie and Jones, 2009).

Knowledge Management Enablers and barriers

To ensure effective implementation of Knowledge Management, several authors have identified various factors that need to be present if the endeavor is to succeed. Heeseok and Byounggu (2003) proposed a model of seven enablers including: collaboration, trust, learning, centralization, formalization, T-shaped skills, and information technology support, while O'Dell and Grayson (1998) proposed only culture, technology, infrastructure and measure. Apparently, there seems to be a consensus among researchers that technological support and culture are essential to building a successful Knowledge Management base. This includes basic IT hardware

and software as well as appropriate IT solutions that will facilitate the process of knowledge dissemination.

Research results in Egypt have shown that the IT tools are available in all companies. Organizations invest heavily in upgrading their technology with internet access available to all employees and knowledge repositories created to promote sharing. Borghoff and Pareschi (1998) call this repository a corporate memory and state that a corporate memory is an explicit, disembodied, persistent representation of knowledge and information in an organization. Yet, interviews show that although repositories are available, access is granted via a username and password on a need to know basis. Knowledge remains highly guarded and closely held to top management. It remains a symbol of status and wisdom. Moreover, local companies and government institutions inaugurate sophisticated systems in place through tenders, but do not walk the extra mile by training employees to use the system and give them sufficient time for the transformation phase. As such, IT systems are not used to their full potential with frequent setbacks occurring. Helpless employees are asked to contact the solutions provider and work the problem over the phone, which rarely proves effective. Finally, employees lose hope in the new system and either revert back to their old ways or try to endure the problems of a perfectly functional system that was not designed for them!

Culture, the second Knowledge Management enabler, can present itself in two ways; on the outer circle is the national culture defined as '...patterned ways of thinking, feeling and reacting, acquired and transmitted mainly by symbols, constituting the distinctive achievements of human groups, including their embodiments on artifacts; the essential core of culture consists of traditional ideas and especially their attached values' (Hofstede, 2001). While in the inner circle, organizational culture is defined by Trompenaars and Hampden-Turner (1998) as the way in which a group of people solves problems and reconciles dilemmas (1998). Organizations with a culture based on trust and mutual cooperation represent a formula for success and a fertile ground for innovation since employees build on each others' experiences and don't squander time reinventing the wheel. Accordingly, researches have shown the importance of culture to knowledge sharing and transfer (Hill et al., 1998, Jones, 2007), where both authors give examples of instilling new technologies and training employees in the Arab world; nevertheless, they confront the barrier of both the corporate and national cultures.

Interview results in both local and multinational companies in Egypt show that the situation is no different with a majority stating that national culture is not conducive to Knowledge Transfer given deeply rooted cultural heritage that dates to the Pharaohs, which does not promote the sharing of knowledge with subordinates further down the hierarchy. The authors found exceptions in two multinational ICT companies, whereby the existence of a strong corporate culture outweighed the effect of the national culture, compelling employees to follow the

companies' way of doing things. The ICT sector is characterized by innovation and rapid change, justifying why the results are different from the FMCG sector, where corporate cultures were weak and strategies dictated by headquarters. From the above we can deduce that culture can act as both an enabler and an impediment to success. It seems that change is sluggishly taking place, following the Spring Revolution where results have shown a sharp shift in the national culture, but have not yet permeated the intricate workings of the economy (Nafie, 2011).

Interpersonal trust has been stated as an imperative pillar in allowing effective and amplified exchange of knowledge between employees and silos of an organization (Levin et al., 2002). According to Nahapiet & Ghoshal (1998) trust lubricates cooperation, and cooperation itself breeds trust. This shows a mutual synergistic relationship between both factors that has been afororganizationed by many researchers to have a colossal bearing on Knowledge Management activities within organizations (Park, 2006, Levin et al., 2002). Although important, research results shows that this enabler is in fact an impediment to Knowledge Management activities in Egypt. Interview results showed that more than 90% of interviewees explicitly stated that most people cannot be trusted. This has several drawbacks: the obvious is a lack of cooperation between employees and silos of an organization, hindering efforts to collaborate and innovate to bring new products to the market. This might be an important reason for Egypt's loss of its global competitive position and inability to compete internationally.

Knowledge Assessment Methodology

In order to facilitate countries trying to make the transition to the knowledge economy, the *Knowledge Assessment Methodology* (KAM) was developed by the World Bank Institute. The user-friendly, interactive, internet-based tool was designed to provide a basic assessment of countries' readiness for the knowledge economy, and identifies sectors or specific areas where policymakers may need to focus more attention or future investments (Chen and Dahlamn, 2005). The authors have utilized the results of this interesting assessment as an input into the SWOT analysis, which will illustrate Egypt's situation to date. KAM has been developed for 128 countries within 9 regions with results ranked on an ordinal scale from 0 (weakest) to 10 (strongest). The four pillars that constitute the basis of this methodology are important determinants of long-term economic growth (Ibid, 2005).

Prior research results have shown the importance of education on per capita GDP (Barro, 1991) and economic growth (Cohen and Soto, 2001). Educated individuals have increased capacity to learn and contribute to an economy's skilled labor force. This labor force is the basis for economic development and productivity within a nation and it is their contribution to R&D and innovation that is of value. An effective innovation system is one that provides an environment that nurtures research and development (R&D), which results in new goods, new processes and new knowledge, and hence is a major source of technical progress (Chen and Dahlman, 2005). Adams conducted a research that shows a significant correlation between the number of scientific

papers contributed and growth in productivity in manufacturing industries based in the United States in the 1953 – 1980 period.

An adequate information infrastructure, commonly referred to as ICT, includes a country's usage of technology. This includes telephone lines, computer availability and usage as well as internet usage within a country. Technology has transformed economies around the world leading some of them to leapfrog (such as the South East Asian countries). A study by Oliner and Sichel (2000) shows how the usage of ICT has led to increased economic growth during the past decade. Finally, the previous three pillars cannot function effectively without an economic incentive and institutional regime where well-grounded and transparent macroeconomic, competition and regulatory policies exist (Chen and Dahlman, 2005).

Table 1: Egypt's rating on the Knowledge Economy Pillars - 2000

Index	Egypt, Arab Rep.
1. Knowledge Economy Index (Average of 3,4,5,6)	4.31
2. Knowledge Index (Average of 4,5,6)	4.50
3. Economic Incentive and Institutional Regime	3.73
4. Education	4.70
5. Innovation	5.03
6. ICT	3.78

Figure 2: Egypt's ranking on variables representing the different pillars
http://info.worldbank.org/etools/kam2/scorecard_bs_separate.asp?chart=1

Findings

Empirical evidence supports the view that organizations with a Knowledge Management capability will use resources more efficiently and so will be more innovative and perform better (Darroch, 2005). Interviews with 50 junior and senior level managers at local and multinational companies in the ICT and FMCG sector since the Spring Revolution has determined the following marketplace development and trends that are worthy of discussion:

- Almost all of the companies visited are directed by functions and not business units, which implies that centralization in decision making persists. This has serious implications on Knowledge Management efforts within corporations since knowledge dissemination and sharing within such organizations tends to be sluggish and complex.
- All interviewees have indicated that a relationship outside the office exists with colleagues. This informal, one-on-one rapport acts as a lubricant in all companies. Most interviewees indicated that without it, they would not exchange knowledge or trust peers easily.
- Organizations in Egypt do not highly rate Knowledge Management efforts within their priorities. As such, no formal endeavors are taken by company management to raise

awareness on the importance of the subject and its implications on future competitiveness.

- Organizations do not free up employees' time for socialization or dedicate specific time for formal coffee breaks where employees can engage in work-related discussions.
- All organizations have state-of-the-art software ICT software and hardware including knowledge repositories where all the company's information is stored for future retrieval and reference. Nevertheless, access is granted on an individual basis depending on their 'need to know' and its degree of confidentiality. Usernames and passwords which expire once used, have been created to guard the repository with only general knowledge such as seminars and manuals available to all.
- Following the above points, all organizations possess intranet systems, but no active efforts are taken to encourage employees to access the system and discover material that might be of use for innovation such as novel ideas and processes.
- Employee handover efforts as part of Knowledge Transfer and Knowledge Management at large are a mere formality in most organizations. Interviewees stated that employees are usually in a hurry to leave and hence time is of the essence. New employees are left to navigate the system and search for the required knowledge at their own pace. This causes more harm than good, since productivity slumps for a period and other dependant personnel / departments are obliged to wait until the employee is properly aligned to the new system and ready to function.
- Companies usually do not assign a mentor / coach to new employees since the workload is high and demanding. Accordingly, new employees only receive a formal orientation, leaving them to discover the intricacies of their new job.
- Employees are not encouraged to innovate or think out of the box. Only a few multinational companies from those interviewed stated that this is the norm at the workplace. The reasons attributed by interviewed managers include a desire to maintain the status quo, and a solemn adherence to the motto 'knowledge is power'. Ideas and innovations have to pass through management, who either are apathetic to employee efforts or discredit employees in favor of themselves. Over time, this has created a de-moralizing atmosphere which has not only nipped innovation attempts in the bud, but also diminished Knowledge Management significantly across organizations.

The above key findings show that Egypt's rating on the KAM is well-grounded. ICT scores 3.78, which may be related to lack of employee training on technology and thus their inability to use it

effectively as well as the inexistent management support to utilize the organization's intranet. As for economic incentive and institutional regime, a rating of 3.73 is justified by Egypt's recent unstable economic and political situation in addition to its historical corrupt regime that has been overthrown leaving the nation with poor economic indicators of inflation and unemployment. Regulatory quality and rule of law are minimal given the regime's desire for personal gains instead of the nation's welfare. The interconnected pillars of education and innovation scoring 4.70 and 5.03 respectively are attributed to low adult literacy rates as seen in figure 2 above. A nation with high illiteracy is challenging to advance. Nevertheless, innovation is mediocre given the large amount of scientists engaging in R&D as evidenced by the decent amount of journal articles published per million (in figure 2 above).

Carneiro (2000) examines the relationships between organizations' competitiveness, innovation advancements, and Knowledge Management and presents a set of considerations regarding how these relationships affect strategic management and the formulation of competitive strategies. In Egypt, the relationship between these factors is imperative especially in light of the current situation where expectations are high and hopes of ameliorating the political and economic situation are eminent. Knowledge needs to be managed, with the assistance and continuous support of higher management. A commitment to sharing information with the aim of creating a change is the goal of the coming era. Not only will this encourage innovation, but also create an atmosphere of trust and collaboration, which is a requirement for both innovation and Knowledge Management. A nation with the said determinants will be able to increase its productivity and hence global competitiveness. Egypt, formerly the largest exporter of cotton during the 1950s is currently a net importer.

Discussion

Egypt ranks 89 out of 128 countries in the results of the Knowledge Economy Index (KEI) published by the World Bank in 2009 rating the country at 4.31 / 10. The KEI takes into account whether the environment is conducive for knowledge to be used effectively for economic development based on the four pillars. This depicts a below-average rating especially when compared with neighboring Middle Eastern countries such as Qatar and the UAE scoring 6.06 and 5.96 respectively and ranking 49 and 50 respectively. Changing economic policies and a corrupt political regime have left Egypt burdened by debt, a problem which has been exacerbated following the Spring Revolution with the flight of investor capital from the country and the halt of production in almost all economic sectors, demanding their long-forgotten rights of workplace equality, raises and yearly bonuses. This might explain Egypt's score of 3.73 on the economic incentive pillar as opposed to 6.63 and 7.71 by Qatar and the UAE respectively as an example of economies that strive to furnish investors with an environment conducive to production by instating abiding rules of law.

As stated above, education and innovation are closely related with Egypt scoring 4.70 and 5.03 respectively. This is quite shocking for a nation with a strong cultural heritage such as Egypt especially with Egypt having a significant number of scientists working in R&D (Zeng, 2006). Although Nobel Laureates Dr. Ahmed Zuwail, novelist Naguib Mahfouz, renowned cardiologist Magdy Yacoub and Dr. Mohamed El Baradei, previous Director General of the International Atomic Energy Agency, are all Egyptians, the problem still persists. Almost all TV programs following the Spring Revolution have been calling for an overhaul of the educational system, which was once able to produce such scientists, but has now become outdated and graduates are not employable. Nour (2005) tries to explain the lack of innovation in Egypt through looking at a failure to build human capital. She states that public expenditure on education was highest in the case of the 26.1% spent by Morocco. On the contrary, Egypt's % is in single digits, despite recording the appointment of 493 senior scientists during 1996-2000, the highest in the Arab world (Nafie and Jones, 2011, forthcoming).

Although ICT tools are available in Egypt, they have not been properly put to use as a result of a lack of training on the new systems as well as a work force that is resistant to change. The educational system has produced a laborious workforce that is incapable of thinking out of the box and embracing new technologies. As a result Egypt has scored 3.78 on this pillar compared to 7.06 and 7.91 by Qatar and UAE respectively. Although these countries are heavily dependant on expatriate labor, it is this qualified, well-educated and flexible labor force that is equipped to adapt to new and changing ICT systems in order to produce high quality output in response to lucrative incentive systems set by organizations.

From the above information, the authors have compiled the following SWOT analysis to demonstrate the nation's strengths and weaknesses providing policy makers and investors with a viewpoint at the situation.

Strengths:

- Egypt has a prime geographical and logistical location on both the Red and Mediterranean Sea, in addition to the presence of the Suez Canal.
- Substantial water supply from the Nile River allowing for the irrigation of the country's fertile land.
- Large population size approaching 83 million. Egypt ranks 27th in domestic and foreign market size, rating it as a lucrative market for Foreign Direct Investment (FDI).
- Hub for investment in the Middle East that has attracted more than 880 multinational companies in 37 different sectors (Foreign Companies Yearbook, 2008).
- Sizeable skilled and semi-skilled labor force.

- Strong political power in the Middle East and North Africa with influential decision making capabilities within the region.
- Egypt has recorded the appointment of 493 senior scientists within the last decade (Nour, 2005).
- Egypt has the largest army within the Arab world allowing for protection of its boundaries and providing it with the required stability.
- One of the world's largest markets for tourism.

Weaknesses:

- Egypt is currently in a state of upheaval given the Spring Revolution.
- Egypt's public expenditure on education is only 12% (UNICEF statistics).
- An outdated and underdeveloped educational system that produces a labor force that is possibly unemployable.
- Changing economic policies.
- High levels of poverty: 13.7 million Egyptians were recorded to live below the poverty line in 1996 (Hassanin, 1999).
- High unemployment rates reaching 11.3% in 1996 (Hassanin, 1999).
- Egypt lacks innovation capabilities attributed to the educational sector and high illiteracy rates reaching 66% in 2005-2008 (UNICEF statistics).
- Egypt ranks 81 out of 139 participating countries on global competitiveness and 109 and 74 on innovation and company spending in R&D respectively according to the results of the World Economic Forum – Global Competitiveness Report.
- According to the Knowledge Assessment Methodology, regulatory quality in Egypt is weak, which might imply a lack of trust for foreign investors.
- Strong national culture characteristics which act as an obstacle to Knowledge Transfer in both local and multinational companies (Nafie and Jones, 2011, forthcoming).

Opportunities:

- The abundance of undeveloped and urban land presents an opportunity for the development of large-scale urbanization projects.
- The large population poses a diverse market for a multitude of investors providing different products at varying prices to cater for the demand of a diverse base where the distribution of income is different.

- Unemployment represents opportunities for companies to recruit labor at low cost.
- International organizations such as UNICEF have the chance to intervene to bestow grants and establish projects to alleviate poverty and raise literacy levels. Not only will this will raise the economic standard of living, but also create a ripple of organizations that are willing to aid the organizations, thus driving the economy forward.
- The Spring Revolution has overthrown the corrupt regime. A new political system which aims to alleviate corruption and promote equity is in the pipeline. This will act as an incentive for foreign investors that wish to penetrate the Egyptian market.
- Egypt's senior scientists, including Nobel Laureate Dr. Ahmed Zuwail, are promoting various efforts to overhaul the educational sector.

Threats:

- Reform might take time rendering the economy in a state of chaos for some time.
- Egypt is highly indebted and thus funds for development of the economy in the short-term are unavailable. This has forced the economy to turn to the International Monetary Fund (IMF) for loans, which might overburden the economy if reform does not take place fast.
- The internal security situation in Egypt is volatile given several demonstrations, which might jeopardize tourism efforts that provide a base for Egypt's GDP.

Conclusion

The relationship between Knowledge Management and innovation is an important one. Not only does it impact productivity and competitiveness, but also a country's ability to leapfrog and advance into a different dimension. Egypt has been reborn following the Spring Revolution and stands a high chance of success if the current problems are addressed. According to the interviews, problems persist with management support and ICT implementation within organizations. Suppressed innovation efforts and inability to cause change are a hindrance to competitiveness. The lack of trust felt by most interviewees results in diminished cooperation between employees, again impacting innovation. An underlying problem to all challenges is the outdated educational system, which needs immediate attention in order to produce a qualified and employable labor force. Such a transformed labor force will revolutionize industries, increase productivity and produce novel products, services and processes to cater for a growing and diverse market. The situation within Egyptian organizations needs to be transformed to keep up with the pace of globalization. Additional chances may not come by again!

**EMERGENCE AND INTRODUCTION OF THE NEW OCCUPATIONS AND
QUALIFICATIONS IN THE NATIONAL SYSTEMS OF OCCUPATIONS AND
QUALIFICATIONS – THEORETICAL AND PRACTICAL ISSUES**

Nazelskis, Eugenijus¹; Vidmantas, Tūtlys²

¹International Management School Vilnius University

²Vytautas, Magnus University Centre for Vocational Education and Research

Abstract

Considering the growing influence of the emergence and introduction of new occupations and qualifications in the national systems of occupations and qualifications to the development of economy, human resource management, employment and lifelong learning and the lack of systemic and in-depth research of these processes, the purpose of research is to disclose the features and factors of the processes of emergence and introduction of the new occupations and qualifications to the national systems of occupations and qualifications.

Approach of research is based on the systemic analysis of the factors and processes of the emergence and introduction of new occupations and qualifications. Methodology of research consists of the analysis of scientific literature and interviews with the human resource managers and developers of enterprises.

The paper provides systemic approach for research of the emergence and introduction of the new occupations and qualifications, discloses the specificities of these processes in the transitional economy and proposes theoretical framework for their analysis, monitoring and forecasting.

Keywords: New occupations, new qualifications, emergence of occupations, introduction of qualifications, national system of occupations, national system of qualifications.

Introduction

Emergence of new occupations and qualifications today is very common feature of the changing labour markets, economies and systems of qualifications. Changes in the national and global economies, labour market, technological development and dynamically changing business competition strategies and work organization forms, mobility of workforce and workplaces create conditions for fast development of new occupations and qualifications. Despite of that, the process of emergence and development of new occupations and qualifications lacks systemic theoretical and empirical research. Current attempts to research this process are too much concentrated on quantitative research and forecasting of the development trends, very often

ignoring important qualitative aspects of the process of emergence and introduction of new occupations and qualifications in the national systems of occupations and qualifications. Besides, there is a lack of research of these processes in the countries of transitional economies, where the emergence and introduction of new occupations and qualifications has specific character and plays specific role in the socioeconomic change.

Therefore the **aim** of this paper is to disclose the features and factors of the processes of emergence and introduction of the new occupations and qualifications to the national systems of occupations and qualifications referring to the cases of emergence and introduction of new occupations and qualifications in Lithuania.

This aim is achieved by:

- Disclosing and describing the factors of emergence and /or introduction of new occupations and qualifications in the national systems of occupations and qualifications, by considering commonalities and differences of these factors.
- Defining and characterising the processes of emergence and introduction of new occupations and qualifications in the national systems of occupations and qualifications by disclosing the structure and contents of these processes.
- Empirically researching the features of emergence and introduction of new occupations and qualifications in the national system of occupations and qualifications in Lithuania.

There are discerned the following *questions of research*:

What factors influence and shape processes of emergence and introduction of new occupations and qualifications in the national systems of occupations and qualifications?

What are the main pathways of the processes of emergence and introduction of new occupations and qualifications? What are the typical features of these pathways in Lithuania?

Theoretical and empirical research in this paper is based on the following concepts:

Occupation – professional activity, economically purposeful work and employment.

Qualification – a formal outcome of an assessment and validation process which is obtained when a competent body determines that an individual has achieved learning outcomes to given standards (European Commission, 2008)

National system of occupations – totality of occupations and professions in the country, systemically interrelated with different functional, processual, socioeconomic and cultural links and relations. System of occupations is also often referred as the world of work, but this concept is more generic and does not refer to the national level.

National system of qualifications – systemically interrelated and structured qualifications, developed in the national-level processes of their design, provision (training and learning), assessment of learning outcomes and awarding. National system of qualifications comprises qualifications, instruments of their structuring and regulation (National Qualifications Frameworks, legal basis), the processes of their design, provision (training and learning), assessment of learning outcomes and awarding.

There were applied the following research methods:

- analysis of scientific literature and documents (desktop research);
- semi-structured interviews with the representatives of the enterprises responsible for human resource management seeking to disclose the features of the cases of emergence of new occupations and qualifications.

The system of factors influencing emergence and introduction of new occupations and qualifications

New occupations and qualifications emerge or are being introduced in the rich context of different factors. In order to grasp this complex variety of factors influencing emergence of new occupations and introduction of new qualifications in the national systems of occupations and qualifications we will refer to the scope of origin and action of factors (local, global) and to the relationships with the labour market and human resource management (demand and supply of human resources). Following this logics we can discern the following main categories of factors: local factors, global factors, factors related to demand of human resources in the labour market and factors related to supply of human resources ensured by the systems of education and training and lifelong learning.

Local factors – factors, which enhance or suppress emergence or introduction of new occupations and qualifications in the country or region originating from local social, economical, cultural conditions and context.

Global factors – factors, which enhance or suppress emergence or introduction of new occupations and qualifications in many countries and regions originating from the global (international) social, economical, cultural conditions and context.

Factors related to human resource demand in the labour market – features and processes of human resource demand and it's change, which enhance or suppress emergence or introduction of new occupations and qualifications.

Factors related to supply of human resources - features and processes of human resource supply and its change, which enhance or suppress emergence or introduction of new occupations and qualifications. .

By analyzing the relationships of these categories of factors there can be derived the following four categories:

- local factors related to human resource demand in the labour market;
- global factors related to human resource demand in the labour market;
- local factors related to supply human resources;
- global factors related to supply human resources.

We will briefly overview some typical factors belonging to these categories and will estimate their influence to the emergence and introduction of new occupations and qualifications.

Local factors related to human resource demand in the labour market

There can be discerned the following factors belonging to this category:

Economical development of the country or region and its influence to the labour market, occupations and demand of qualifications. Economic growth and development of production can create favourable conditions for emergence and development of new occupations and qualifications, because these processes enhance investments of enterprises to the new technologies, as well as foster introduction and development of new products and services, search of the new markets etc., leading to the emergence of the new functions and tasks of work. Economic decline has adversary effect on the emergence of new occupations and qualifications, because it reduces the number of workplaces and makes enterprises and business actors to concentrate on the challenges of survival in the market often forcing them to follow more restrictive pathways of human resource management and development.

Specificities of the structure of regional or national economy, such as features of dominating sectors, size of enterprises, level of economical and technological development of enterprises, etc. The features of the development of economical sectors, such as level of technological development, dominating approaches and strategies of competition, innovativeness, level of openness to international competition and others can either enhance or suppress the emergence, transfer and introduction of new occupations and qualifications. For example, sectors dominated by the big enterprises internationally competing by quality and innovations tend to create much more opportunities for emergence of new occupations and qualifications or their 'advent' from other countries, than those sectors, which are dominated by the small and medium enterprises competing locally by price.

Specificities of the national or regional labour market, such as socioeconomic pattern of local labour market defined by the division of roles and responsibilities of state and social stakeholders, the ratio between the supply and demand of workforce in the local labour market, etc. State regulated labour markets with

well developed social dialogue in the fields of employment and training supports establishment of favourable institutional conditions for effective and proactive introduction of new qualifications in responding or preceding the emergence of new occupations.

Specificities and changes of the national public regulation of occupations and professions, such as introduction of national regulations based on qualifications. For example, very rigid and highly bureaucratic regulations of qualifications can impede introduction of the new qualifications in responding to the needs of labour market or to make this process more complicated and time-consuming.

Global factors related to human resource demand in the labour market

There can be discerned the following factors belonging to this category:

Intensifying international competition and economic globalization, changes of the competition patterns. These processes enhance the shifts and changes of the international division of labour, facilitate migration of workforce and workplaces caused by subcontracting and outsourcing (Brown, Lauder, Ashton, 2011). In turn, such situation facilitates the 'migration' of occupations and qualifications between countries, especially in those countries, which attract foreign investments and relocated workplaces and jobs.

'Global auction' in the international labour market together with the wars for talents amongst enterprises and positional competition for the attractive employment positions amongst learners and job seekers influence the changes in the contents of occupations and qualifications by changing requirements of employability, increasing the weight of social skills and personal attitudes, creating the pressure to seek for higher standards of education and qualifications (Brown, Lauder, Ashton, 2011). These authors also forecast that increasing international competition for skilled work could enhance the emergence of the new fields of paid employment and new occupations in such fields as social services and services to persons, voluntary work in the postindustrial societies. From the other side, global auction in the labour market widens the possibilities for the migration of 'new' occupations to the developing countries through the processes of outsourcing, relocation of production, etc.

Global trends in the technological development and changes of work organization. For example, the process of 'digital taylorism' through standardization of intellectual and knowledge based work processes change the contents and requirements of some former high skilled jobs and qualifications (Brown, Lauder, Ashton, 2011).

Local factors related to supply human resources

There can be discerned the following factors belonging to this category:

Features and specificities of national systems of education and training - for example, specificities of the institutional model of education system, relationships between the system of education and training and labour market, features of contents and structure of competences and qualifications provided by the institutions and VET and higher education. These features influence *development of the national systems of qualifications, emergence and development of the new pathways and possibilities for the acquisition of skills and qualifications*, for example, by assessment and recognition of skills and competences acquired through informal and non-formal learning. Some systems and models of education and training are more open and flexible to the different ways and patterns of learning and acquisition of skills and knowledge and tend to 'produce' qualifications with flexible structure and contents, thus creating favourable conditions for their change and emergence of new qualifications, while other systems and models of education systems emphasize the school based ways of training and 'produce' solid qualifications, which are more resistant to change (Cedefop, 2010). Other important factor here is the patterns of social dialogue in the field of education and training. Qualifications and their related processes play different roles and attain different attention in the agendas of the social partnerships depending on the model of social partnership (Winterton, 2007). For example, the model of deregulated, disorganized approach with decentralized collective bargaining on the enterprise level (UK) facilitates more active involvement of trade unions in the operative matters related to provision and upgrading of qualifications. Trade unions in this model tend to care for the better access to qualifications for the low-skilled and unskilled workforce by raising the demand for training and learning and enhancing of the involvement of these employees in learning and training opportunities (Stuart, 2007). Here the social dialogue focuses on the operative and local applications and benefits of qualifications to the employability and job status of employees, especially in the conditions of the restructuring of work organisation or technological changes. Therefore here social dialogue can facilitate and enhance the changes in the contents of qualifications. In the model of concerted social dialogue on the sectoral and national levels (Germany) the qualifications represent an important topic in the agenda of strategic discussions and negotiations between the social stakeholders. Here social stakeholders and partners share the strategic responsibilities and obligations related to their involvement in the design, provision and awarding of qualifications. Such social dialogue is favourable for setting and implementation of the national strategies of skills formation and qualifications. In the model of concerted social dialogue with the strong influence of the state (France, Sweden, Denmark) qualifications and their related measures usually become very important part of the national policy agenda.. Such model of social dialogue facilitates the development of a rather complex understanding of qualification, which encompasses the functions of human resource development and social cohesion, stressing that acquisition of qualifications is one of the basic citizen rights. For example, the introduction of the recognition of experiential learning (*validation des acquis de l'expérience*,

VAE) in France together with other corresponding instruments (individual right to continuing training - le Droit Individuel à la Formation (DIF), individual training leave - Le congé individuel de formation (CIF) opening wider and more equal opportunities for citizens to acquire the qualification can illustrate this case.

Competition patterns of the providers of training, as well as marketing of provided training services. Active and intensive competition of training providers and appliance of competition strategies based on the new and innovative training services can enhance the initiatives of training providers in offering new qualifications to the local market.

Local features of the provision of continuing vocational training and human resource development in the enterprises. Continuing vocational training and human resource development in the enterprises influence the emergence and development of the enterprise based qualifications.

Changes of the curriculum design and provision of vocational education and training and higher education, influencing the changes of volume and contents of provided qualifications. For example, introduction of modular training and competence-based qualifications imply more flexible approach in design and provision of qualifications, thus facilitating emergence and development of new qualifications.

Global factors related to supply human resources

There can be discerned the following factors belonging to this category:

International competition of the providers of vocational training and higher education and it's intensification. Intensive competition of training providers and appliance of competition strategies based on the new and innovative training services can enhance the initiatives of training providers in offering new qualifications to the international market.

Mobility of learners, job seekers and workforce, migration processes. Mobility and migration create necessary medium for the transfer and exchange of qualifications between the countries.

Changing attitudes of people to education, qualifications and career, emphasising market needs and adaptation of personal profile of human capital to these needs seeking to gain the better positions in highly competitive labour market (Brown, Lauder, Ashton, 2011).

Structure and contents of processes of emergence and introduction of new occupations and qualifications in the national systems of occupations and qualifications

Processes of emergence and introduction of new occupations and qualifications in the national systems of occupations and qualifications are complex and multidimensional. These features enable to analyse these processes by using very different methodological approaches. The

authors of this paper will analyse the different features of the processes of emergence and introduction of new occupations and qualifications paying special attention on how the changes in the system of occupations (emergence of the new occupations, changes in the contents of occupations) influence the changes in the national systems of qualifications (introduction of the new qualifications or changes in the contents of existing qualifications).

At the beginning we will examine some approaches in analyzing the processes of change of occupations and work. One of such approaches is based on distinguishing different hierarchically structured and interrelated dimensions of change in occupations. For example, P. Zarifian (2004, 2009) distinguishes the following dimensions of the change of occupations (Fig. No.1):

1. Socioeconomic and cultural changes of contemporary society (for example, growing consumerism) and their influence to the changes of business strategies and professional activities.

2. Change of the business strategies enhancing integration of the work tasks and their increasing complexity, for example:

- orientation to the specialized market niches by sustaining and enhancing the differentiation and variety of the needs of consumers,
- competition, which is based on the constant and continuous innovations of products, services and technologies.

3. Changes of the features of contemporary professional activities:

- increasing changeability of the contents of activities and it's unpredictability, demanding more and more initiatives from the performers of activities;
- increasing importance of the interpersonal communication in the performance of activities leading to the fast expansion of the contents of activities and it's enrichment with the tasks related to communication with customers, consumers, providers, colleagues, community and increasing requirements of communication and cooperation skills;
- growing importance of the processes of creation and implementation of innovations requiring from the performers more creativity and initiatives.

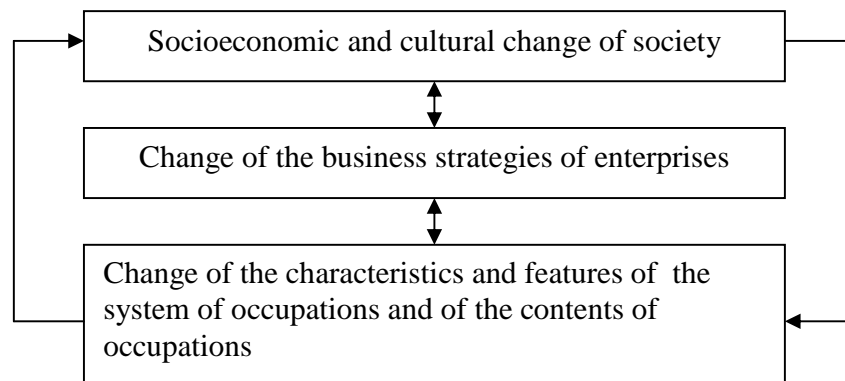

Fig. No.1 Structure of the process of change of occupations (prepared according to P. Zarifian)

Other methodological approach which can help to distinguish and evaluate the features of change process and outcomes of change is the methodology of institutional change. Thelen and Streeck (2009) suggest to analyse and classify the processes of institutional change by evaluating the inter-relations between the character of change process (incremental change, abrupt change) and results of change (continuity and discontinuity of development pathway). Using this methodological approach, there can be discerned the following types of the process of emergence and introduction of the occupations and qualifications in the national systems of occupations and qualifications:

		<i>Result of change in the systems of occupations and qualifications</i>	
		<i>Continuity – changes in the structure and contents of occupations and qualifications do not change the existing pathway of development of the existing structure and practices in the systems of occupations and qualifications.</i>	<i>Discontinuity – changes in the structure and contents of occupations and qualifications are driven by the purposeful policy measures which change the existing structures and practices in the systems of occupations and qualifications.</i>
<i>Process of change in the system of occupations and qualifications</i>	<i>Incremental change: changes in the contents and structure of occupations and qualifications are slow, gradual, developing and can be foreseen in advance.</i>	<i>Reproduction of the existing structure and contents of the system of occupations and qualifications by adaptation. Occurring changes in the system of occupations and labour market do not result in significant rise and development of new occupations and qualifications, but slowly change the contents of existing occupations and qualifications by changing the work tasks and related competences.</i>	<i>Gradual transformation of the existing system of occupations and qualifications. The changes of the structure and contents of occupations and qualifications, as well as of the socioeconomic and technological context of work are incremental and gradually lead to the development of the new occupations and qualifications.</i>
	<i>Abrupt change: changes in the contents and structure of occupations and qualifications are sudden, revolutionary and caused by unpredictable events and shifts in the system of occupations and qualifications, as well as in the external socioeconomic environment.</i>	<i>Survival and return of the occupations and qualifications in the context of changes of the system of occupations and qualifications. This change is often caused by certain return or regeneration of institutional and socioeconomic order which was abrupt in the pathway of it's development.</i>	<i>Change of the contents of existing occupations and generation and rise of new occupations caused by the different factors (sometimes of revolutionary character): technological innovations, shifts and upturns in the work organization.</i>

Table No. 1. Institutional change approaches in analyzing the development of new occupations and qualifications: processes and results. Adapted from Thelen, Streeck, 2009.

Looking from the perspective of the impact of the new emerging occupations and qualifications to the existing system of occupations and qualifications the processes of emergence of new occupations and qualifications can be analysed by discerning the following types:

- Emergence of new occupations and qualifications as the substitution of the existing ones, when newly emerged occupations and qualifications eliminate and replace some of the existing occupations and qualifications (Tessaring, 1997).
- Emergence of new occupations and qualifications as the complementing to the existing system of occupations, when newly emerged occupations and qualifications add to the existing ones without changing or replacing them (Tessaring, 1997).
- Emergence of new occupations and qualifications as reproduction and development of the existing system of occupations and qualifications, when the newly emerged occupations and qualifications enhance the emergence of another new qualifications.
- These impacts can occur and act on two levels:
 - level of the structure of the system of occupations and qualifications (macro level), where occur the changes related to emergence, transfer or introduction of new occupations and qualifications,
 - level of the contents of occupations and qualifications (micro level), where occur the changes of work tasks, specifications, requirements and corresponding competences.

We will examine the possible interrelations of these types and levels of impacts:

<i>Level of impact</i>	<i>Emergence by substituting</i>	<i>Emergence by complementing</i>	<i>Emergence with reproduction and development</i>
<i>Contents of occupations and qualifications (micro level)</i>	<p>There emerge new work tasks and objectives, which replace certain existing tasks and objectives. This process also creates the new needs of competences in the same time reducing or making obsolete certain competences which were applied before. The most typical factors influencing this process are gradual technological change and development of work organization, when new technologies and work organization replace the existing ones.</p> <p>In the most cases it leads to the gradual transformation of existing occupations and qualifications and this transformation can be of the different extent: partial transformation, when emerged new tasks and corresponding competences does not change essential features of the objective of occupation or qualification, or total transformation when the occurred changes of tasks and competences imply change the objective of occupation or qualification and lead to development of new occupation and qualification.</p>	<p>Emerging and developing new work tasks and competences enrich the existing occupations and qualifications in the same time sustaining the existing work tasks and competences. The contents of work and qualification are enriched and expanded. This process can be caused by the processes of gradual technological and organizational development when new technologies and instruments of work organization complement the existing ones.</p>	<p>The process of complementary enrichment of work tasks and competences can become cumulative and self-enhancing process, when newly introduced work tasks and competences enhance the emergence on the new ones. Such situation can reach the point, when the accumulation of new work tasks and competences can no longer be sustained in one occupation and qualification because of the resulted complexities in the processes of human resource management, human resource development and provision of training. This situation leads to the split of enriched occupations and qualifications into smaller separate ones. In this way there can emerge new occupations and qualifications.</p>
<i>Level of impact</i>	<i>Emergence by substituting</i>	<i>Emergence by complementing</i>	<i>Emergence with reproduction and development</i>
<i>Structure of the system of occupations and qualifications (macro level)</i>	<p>Emerged new occupations and qualifications replace the existing ones. These changes occur due to the radical technological development, introduction of new work organization forms, exporting and importing of the new workplaces through the outsourcing processes and other factors</p>	<p>Emerged new occupations and qualifications complement the existing ones without further change of the systems of occupations and qualifications. The factors causing this change do not replace the existing work requirements, technologies, tasks of specifications but enhance the emergence of additional</p>	<p>Emergence of new occupations enhances development and expansion of new sectors and sub-sectors of activities and opening new employment possibilities. This is very typical for the innovative and emerging sectors of economy (IT, communications, high-tech sectors). Emergence of new occupations can also</p>

	<p><i>which replace previously applied technologies, work organization practices or other important features of work. New occupations and qualifications in this case usually emerge and develop with rather different speed. Very often at the initial stage of emergence of new occupation needed knowledge and skills are provided by continuing learning and training at the workplaces. Formal provision of knowledge and skills of new occupations in the initial training institutions often depends on the workforce needs in these occupations, or on the rate of dissemination and development of new occupations in the labour market.</i></p>	<p><i>ones.</i></p>	<p><i>enhance the dynamic expansion in the design and provision of new qualifications.</i></p>
--	---	---------------------	--

Table No.2: The types of processes of emergence of new occupations and qualifications from the perspective of the impact of the new emerging occupations and qualifications to the existing system of occupations and qualifications

Current changes of the work features provide a lot of examples of these complex interactions between the changes **in the contents** of occupations (and qualifications) and the changes in the structures of the system of occupations (and qualifications). For example, the modularization of work and professional activities brings the new types of control of work, which are based on the control of engagement (Zarifian, 2009). Zarifian (2009) notices, that the control of engagement in the work is based on the accountability for the outcomes of work or the outcomes of performance. According to this sociologist, the responsibility for performance and for the proof of performance is delegated to the performers and the focus of control is shifted from the work productivity to profitability and cost-effectiveness of the human capital. Subsequently, qualifications can retain their importance and role only to the extent on how they contribute to or indicate the increase of the value of the engaged individual human capital.

Shift to the control of individual engagement in work significantly reduces the applicability and instrumentality of the formal qualifications, which have been traditionally used as measures to establish the correspondence between the workplace (or job status) and the real human capital of employees (knowledge, skills and competences) in this way ensuring certain balance and stability. The changes (and increasing changeability) of work organisation and contents exert the pressure on individuals to distinguish themselves from the others and outperform them to win the positional competition in the enterprise or on the labour market. In this context the traditional formal qualifications are being increasingly 'replaced' or dominated by the competence approach (Lallement, Zarifian).

Labour relations, employment status, wage setting and other elements of the world of work become increasingly dependent on the competences and assessment of competences. This individualised assessment starts to dominate over the collectively negotiated rules and regulations of the labour relations (of the industrial period) which are traditionally based on the formal qualifications (Winterton, 2007). This shift to the competences in the practices of human resource management and development in the enterprises, however has not endangered or challenged the strong positions of qualifications and their related measures in the agendas of the education systems and national skill formation policies. On the contrary, the expansive development of the national and international qualifications frameworks evidences, that qualifications are being increasingly used as policy devices in the field of education and national skills formation.

What are the implications of this shift of paradigms (from the paradigm of qualifications to the paradigm of competences) to the changes in the national systems of qualifications? There is noticed decrease of the role of qualifications-based approaches and increasing proliferation of competence-based approaches in the corporate management of human resources and in the relationships of socio-professional groups. Regarding the developments in the corporate management we can already evidence the increasing influence of competences in the

management of organizations and human resources development (for example, the rise of 'gestion par compétences' in France). The behaviour and attitude of socioprofessional groups towards the formal qualifications is increasingly influenced by the 'flexibilisation' of the career pathways, introduction of competence-based approaches in continuing vocational training and practices of the validation of non-formal and informal (experiential) learning. There area also noticed attempts to increase the flexibility of approaches towards qualifications in the dimensions of the education systems and national skills development policies by integrating competences in these approaches and seeking to establish a kind of 'mixed' or 'hybrid' approach oriented both to competences, as the outcomes of learning process applied in the activity and to qualifications, as the results of the legitimisation of these outcomes. The examples of such attempts can be the designing and development of the competence-based curricula in VET and the introduction of the competence or learning outcomes based national qualifications frameworks.

Features and scenarios of the emergence and introduction of new qualifications in the national systems of qualifications

Cedefop study 'Changing Qualifications: a Review of Qualifications Policies and Practices' distinguishes four scenarios for the development of qualifications which are based on the extent of flexibility and solidity of qualifications and the governance of the national systems of qualifications (2010). We will analyse the implications of these scenarios to the introduction of the new qualifications in the national systems of qualifications.

Features of the scenario 1:

- Flexible qualifications, supply-driven.
- Learners can navigate qualifications flexibly, which leaves space for learners to choose how they qualify.
- Education and training providers are in control, emphasising traditional goals and values, efficiency, cost-effectiveness and making sure that large numbers can qualify.

In this scenario the flexibility of qualifications (for example, modular structure, wide choice of the pathways of acquisition and awarding) increases the possibilities of choice for learners in acquiring knowledge and skills leading to qualifications and facilitates wider access to qualifications. It can lead to certain limited increase of diversity in the contents of acquired qualifications and to development of the different new qualifications (in terms of their contents, volume and structure).

However, strong control of education and training providers in the field of designing and provision of qualifications limits the sensitivity of the system of qualifications to the changing needs of labour market and the system of activities. Designing of qualifications and curriculum design in this scenario is still based on the reactive approach to the labour market

and workplace needs. Therefore introduction of new qualifications in the national system of qualifications can be rather slow although certain applied approaches (modular curricula, modular design of qualifications) provide remedies to solve this problem. Comparatively low involvement of employees in the process of designing and provision of qualifications in combination with the increasing possibilities of choice to learners in acquisition of qualifications can lead to rather important incompatibilities between the acquired qualifications and labour market needs.

Features of the scenario 2:

- Flexible qualifications, demand-led.
- Learners can navigate qualifications flexibly, which leaves space for learners to choose how they qualify.
- Governance systems ensure that the social partners and community interests are strong partners in qualifications development, emphasising labour market signals, as well national and community values.

In this scenario the flexibility of contents and provision of qualifications combined with the strong involvement of social partners in the designing and provision of qualifications create the most favourable conditions for effective and timely introduction of the new qualifications.

However, the approach in the introduction of the new qualifications to the national system of qualifications can be still more reactive, because flexibility of qualifications permits operative modifications of the contents and structure of qualifications according to the changed labour market needs, while proactive (anticipative) change of qualifications require more holistic approach and consideration of the essential shifts and changes in the whole structure of the work process and qualification (such as introduction of completely new qualifications responding to the forecasted changes in the needs of sector and / or economy).

Features of the scenario 3:

- Solid, dependable qualifications, supply-driven.
- Learners face large, benchmark national qualifications and systems that govern access, participation and progression. This limits flexibility.
- Education and training providers are in control, emphasising traditional goals and values, efficiency, cost-effectiveness and making sure that large numbers can qualify.

In case of this scenario the introduction of the new qualifications in the national system of qualifications can be rather long and complicated process, because employers and other stakeholders from business and labour market are comparatively weakly involved in the designing and provision of qualifications. Besides, large national qualifications and solid processes of the designing and provision of qualifications imply big inertia in reacting to the

changing needs of labour market and workplaces. Orientation to the proactive approach in design and provision of qualifications would be very important for ensuring and sustaining long-term compatibility between the contents of qualifications and labour market needs in this scenario, but the big obstacle to achieve it can be the domination of education and training providers and lack of involvement of social partners in the design of qualifications.

Features of the scenario 4:

- Solid, dependable qualifications, demand-led.
- Learners face large, benchmark national qualifications and systems that govern access, participation and progression. This limits flexibility.
- Social partners and important groups in civil society have a lot of influence over how qualifications are structured, mainly at the national level.

In this scenario active role and important contribution of social partners in the designing, provision and awarding of qualifications together with the nationally regulated solid national qualifications and systems permit and facilitate effective and systemic processes of the introduction of new qualifications. This scenario is also favourable for the development of anticipative approach in the designing of qualifications and introduction of new qualifications, because it enhances and supports active participation of employers and other social partners in establishing and maintaining of the solid qualifications based on the holistic attitude to work process, skills and knowledge.

Processes of emergence and introduction of new occupations and qualifications in the national system of occupations and qualifications in Lithuania: empirical study

Empirical research of the processes of emergence and introduction of new occupations and qualifications in the national system of occupations and qualifications in Lithuania was focused on the six different cases of these processes. There were interviewed human resource managers and developers of six enterprises working in the different sectors of activities:

<i>Field of activity</i>	<i>Occupation</i>
<i>ship loading</i>	<i>sales manager of towage shipping</i>
<i>production and installation of reed roofing</i>	<i>roofer of reed roofing</i>
<i>installation of lifting equipment and elevators</i>	<i>technician of assembling and maintenance of lifts and elevators</i>
<i>installation of wind power stations</i>	<i>technician of servicing and maintenance of wind power stations</i>
<i>production of equipment for food and chemical industry</i>	<i>operator of automatic welding equipment</i>
<i>production of biochemical products</i>	<i>researchers-engineers in biotechnologies</i>

Table No.3 : Cases of empirical research

Here we will present cases of the emergence of new occupations and qualifications by analysing:

the factors which influenced these processes;

the features of the contents and structure of the emergence and development of new occupations;

the features of contents and structure of the introduction of related new qualifications.

Sales manager of towage shipping. New occupation in the ship loading company: unification and integration of the existing occupations.

<i>Factors influencing emergence and introduction of new occupation and qualification:</i>	
<i>Intensifying competition in provision of ship loading services amongst the ship loading companies in the Baltic region forcing to look for the new services and market niches. Expansion of the activities of port and fuel terminal increasing demand of towing - ship loading company bought towboats in order to satisfy the needs of towing services for the ships in the port and fuel terminal. The integration of the services of loading and towing and combination of the activities of several fields – sales of services, shipping navigation, shipbuilding and repair of ships.</i>	
<i>Features of the contents and structure of the emergence and development of new occupations:</i>	<i>The features of contents and structure of the introduction of related new qualifications:</i>
<i>The new occupation emerged or developed on the basis of unification and integration of the existing occupations caused by the shift to production of new products or services. The emergence of this occupation has the features of the abrupt change sustaining the continuity in the system of occupations, because the new occupation emerged quite suddenly but this process did not changed the existing pathway of development of the field of activity. Emerged new occupation complement the existing ones without further change of the systems of occupations and qualifications.</i>	<i>As far as qualifications corresponding to these activities were being provided by the several initial VET and higher education institutions, the new qualification was provided by concluding the agreement between enterprise and training provider. New qualification was established by integrating of the competences and units of existing qualifications in the fields of sales of services, shipping navigation, shipbuilding and repair of ships. The process of the introduction of this new qualification is more close to above mentioned scenario No. 4 leading to establishment of solid, dependable and demand-led qualifications.</i>

Roofer of reed roofing. Revival of occupation: the case of production and installation of reed roofing

<i>Factors influencing emergence and introduction of new occupation and qualification</i>	
<i>Demand of previously vanished and replaced products or services in the market. The occupation of the roofer of reed roofing returned in the system of occupations of Lithuania after more than half of age of oblivion. The reed roofs were popular in the period between the two world wars and later, but in the Soviet period they were displaced by the standardized roofing technologies with the appliance of slate, tin or bitumen. Enterprising initiative of business to find the new niche of business in producing and installing reed roofing. There were no know-how and skills in the local labour market needed for this reintroduced occupation.</i>	
<i>Features of the contents and structure of the emergence and development of new occupations</i>	<i>The features of contents and structure of the introduction of related new qualifications</i>
<i>The occupation re-emerged after the period of it's oblivion. The emergence of the occupation of reed roofer has the features of the abrupt return of the occupation due to the changed external context (market conditions). Emerged new occupation complements the existing ones and enhanced the 'adoption' of other occupations related to reed roofing.</i>	<i>Due to the absence of know-how and skills in the new occupation, these were transferred from the foreign partners - the businessman went for training and acquisition of know-how to the company in the Netherlands. Now the needed knowledge and skills are provided to reed roofers by the on the job training in the company, because the need of skilled specialists in this field is comparatively small. The process of the introduction of the corresponding qualification is quite uncertain and undefined on the institutional level and is more close to above mentioned scenario No. 2 leading to establishment of flexible and demand-led qualifications.</i>

Technician of assembling and maintenance of lifts and elevators. The change of structure and contents of activity due to the expanded profile of activities of enterprise and enlargement of the range of provided products and services

<i>Factors influencing emergence and introduction of new occupation and qualification</i>	
<p><i>Enrichment and expansion of work tasks due to the expansion and development of the activities of enterprise. The enterprise working in the field of assembling and installation of lifts and elevators have expanded the profile of its activities and enlarged the range of offered products and services. In the Soviet period the enterprise was installing the lifts produced by one producer. The transition to market economy required to expand the range of offered services and to find new markets. This enterprise now installs and equips lifts, escalators and elevators, special lifting equipment for handicapped persons and other equipment. Besides these services it designs and produces certain units and elements of lifting equipment (benchboards of dispatching equipment and peripheral devices of lifts).</i></p> <p><i>Significant change of the profile of activities: from the narrow specialization in the field of installation of lifting equipment produced by other producer it became the original supplier of lifting equipment (started to assemble original equipment from the parts and elements purchased abroad and produced by themselves). Other new activity is the representation of the commercial interests of foreign producers and suppliers of lifting equipment in the local market.</i></p>	
<i>Features of the contents and structure of the emergence and development of new occupations</i>	<i>The features of contents and structure of the introduction of related new qualifications</i>
<p><i>Expansion of the range of activities had significant impact on the contents of the occupation of technician of assembling and maintenance of lifting equipment: there emerged the new tasks related to technological and technical activities, commercial activities and relationships with customers. This is a typical case of reproduction of the existing structure and contents of the system of occupations by adaptation to the new conditions and requirements, as well as the case when emerging and developing new work tasks enrich the existing occupations in the same time sustaining most of the previously existed tasks or reshaping them.</i></p>	<p><i>The biggest part of the new know-how and skills has been transferred from the foreign partners – producers of the lifting equipment in the Western Europe. Most of the technicians and other employees acquired needed know how and skills through the continuing training measures, provided by these foreign partners.</i></p> <p><i>Most of the new competences needed for this activity are closely related to specific technological know-how, what limits the possibilities to provide this know-how and skills in the initial vocational training.</i></p> <p><i>The process of the introduction of the corresponding qualification is quite uncertain and undefined on the institutional level and is more close to above mentioned scenario No. 2 leading to establishment of flexible and demand-led qualifications.</i></p>

Technician of servicing and maintenance of wind power stations. The case of not yet emerged, but expected occupation and qualification in the context of the rise of new sub-sectors of economy and market niches.

<i>Factors influencing emergence and introduction of new occupation and qualification</i>	
<p><i>Initial stage of the introduction of the new sub-sector of activity and new market niche due to the "import" of the new technology. Wind power station is a new technology in the energy sector of Lithuania. All wind power stations were installed and equipped by the foreign companies. The maintenance and servicing in the warranty period is provided by the producers of equipment. As far as this sub-sector of energy production is on the very initial stage of development and the number of installed wind power stations is quite modest, foreign suppliers can cost-effectively ensure maintenance and services by using their own technicians (currently there is no need to have local skilled technicians in the field).</i></p> <p><i>However, with the development of the sub-sector and increase of the number of wind power stations local operators of these stations and foreign suppliers of equipment see the need to have local skilled technicians and other specialists.</i></p>	
<i>Features of the contents and structure of the emergence and development of new occupations</i>	<i>The features of contents and structure of the introduction of related new qualifications</i>
<p><i>Emergence and initial stage of development of the new sub-sector of activities do not necessarily 'bring' new occupations to the system of activities. At the initial stage of formation of the new fields of activities new occupations can be economically inexpedient, until the development of these new fields of activities creates the needs for local workforce.</i></p> <p><i>This is a case of gradual transformation of the existing system of occupations and qualifications. Introduction of the new technology is incremental and gradually leads to the introduction and development of the new occupations. This is also the case when emerged new occupation will complement the existing ones in the sector.</i></p>	<p><i>The new know-how and skills will inevitably have to be transferred from the suppliers of the technology of wind power stations from abroad.</i></p> <p><i>At the initial stage the new qualifications will be provided only through continuing training measures, mainly by training courses and on the job training (provided by the suppliers of technologies).</i></p> <p><i>Most of the new competences needed for this activity are closely related to specific technological know-how, what limits the possibilities to provide this know-how and skills in the initial vocational training.</i></p>

Operator of automatic welding equipment. Emergence of new occupation and qualification due to the technological development of production enterprise.

<i>Factors influencing emergence and introduction of new occupation and qualification</i>	
<i>Development of applied production technologies by introducing the innovative production technologies. Enterprise producing equipment for food and chemical industries invested in the new production technologies (including automatic welding equipment) seeking to increase productivity and to achieve the highest quality standards, necessary for the development in the very competitive market. Presence of the skilled and experienced workforce in the field of welding.</i>	
<i>Features of the contents and structure of the emergence and development of new occupations</i>	<i>The features of contents and structure of the introduction of related new qualifications</i>
<i>Introduction of new production technologies (automatic welding) led to the introduction of the new occupation - operator of automatic welding. This is a case of abrupt change leading to the discontinuity in the occupational structure of the field of activities. Introduction of new production technology led to sudden emergence of new occupation. This is also the case when the introduced new occupation partially replaced the existing ones. Introduction of automatic welding permitted to execute all main welding operations (which were previously performed in the manual way) with automatic equipment. The need of manual welding operations has been very significantly reduced.</i>	<i>Introduction of new technologies, sudden introduction of the new occupation and absence of the automatic welding specialists in the labour market predefined the character of provision of required knowledge and skills by using on the job training. The training is provided by the suppliers of technologies and the acquired know-how and skills are “multiplied” by the internal apprenticeship. The common practice of training is when the representatives of supplier of equipment arrive to the company and train one operator and several representatives of technical staff – production technician, welding technologist or designer. The later do not work directly with the new equipment but serve as accumulators of competence and intermediaries of communication between operator and supplier of equipment. They help to operator to acquire new knowledge and skills after the training (for example, to learn to work with new additional functions of equipment) or communicate with supplier of equipment in case of technical problems. In case of the most sophisticated equipment the provider was sending for training not only the engineer, but also the experienced operator from the other enterprise in order to use the advantages of apprenticeship training. New know-how and skills were provided on the basis of existing human capital - new operators of automated welding equipment were prepared by training (re-qualifying) of the best skilled welders. The process of the introduction of the corresponding qualification is quite uncertain and undefined on the institutional level and is more close to above mentioned scenario No. 2 leading to establishment of flexible and demand-led qualifications.</i>

Researchers - engineers in biotechnology. The case of new occupations emerged in the activities of creation and implementation of innovations.

<i>Factors influencing emergence and introduction of new occupation and qualification</i>	
<p style="text-align: center;"><i>The basis of activity is creation of the innovative and research based products</i></p> <p><i>Activities in the enterprise comprise scientific research and it's application in design and development of innovative products. Some biotechnological enterprises have their own departments or centres of scientific research and experimental development. These centres execute fundamental research and on the basis of this research develop new biotechnological products. Enterprises themselves create the forefront know-how in the field in parallel with other research institutions and universities.</i></p> <p style="text-align: center;"><i>Company is part of international business structure.</i></p> <p><i>Sector of biotechnology in Lithuania was established on the basis of the executed scientific fundamental research.</i></p> <p style="text-align: center;"><i>There is developed strong cooperation of the biotechnological enterprises with the universities in the field of organization of studies, practical training of students, even funding of studies.</i></p>	
<i>Features of the contents and structure of the emergence and development of new occupations</i>	<i>The features of contents and structure of the introduction of related new qualifications</i>
<p><i>Occupation of researchers-engineers in biotechnology developed from the symbiosis of scientific and engineering activities.</i></p> <p><i>High changeability of the contents of activities influences changes of work tasks and duties and development of new occupations. For example, recently there emerged the position of quality assurance and control engineer. It corresponds to the typical case when emergence of new occupations enhances the development of new work fields and open new employment possibilities.</i></p>	<p><i>The qualification is provided through the formal studies in higher education in combination with further continuing training.</i></p> <p><i>Skills development plays very important role in maintenance of the quality of human resources. Specialists are being sent for training foreign countries or foreign experts are invited to the enterprise for the purpose of training.</i></p> <p><i>The outcomes of continuing training (acquired know-how) is disseminated and shared through the reports of former trainees.</i></p> <p><i>The process of the introduction of this new qualification is more close to above mentioned scenario No. 4 leading to establishment of solid, dependable and demand-led qualifications.</i></p>

Comparing the analysed cases there can be drawn the following conclusions:

- In the all analysed cases new occupations and qualifications emerged due to the different dynamic changes in the system of occupations and the labour market. There can be noticed influences of the local (internal restructurings in the organization, changes of the profile of activity etc.) and global changes (international competition, international transfer of technologies) to the emergence or introduction of the new occupations.
- There can also be noticed certain typical features of the emergence and introduction of new occupations in the transitional economies:
 - Predominantly “borrowing” or “import-based” and adaptive character of the emerging of the new occupations. It can be explained by the essential restructuring of the system of occupations and qualifications in the transition

from planned economy to the market economy. Opening to the international competition inevitably required the adoption of the technologies, best practices of work organization, as well as adoption of certain occupations, their related work objectives and tasks.

- Domination of the continuing training forms in the provision and acquisition of know-how and skills needed for the new occupations. The main reason of this situation is absence of the related know-how, expertise and skills sources, importing of new technologies and know-how. The weak involvement of initial vocational training and higher education institutions in provision of training for new occupations can create important obstacles for the development of new qualifications in the new activities, because continuing vocational training often does not lead to the formal acquisition of qualifications.

Conclusions

There can be discerned the following factors influencing the emergence and introduction of new occupations and qualifications in the national systems of occupations and qualifications:

- local factors related to human resource demand in the labour market (economical development of the country of region and it's influence to the labour market; occupations and demand of qualifications, specificities of the structure of regional or national economy, such as features of dominating sectors, size of enterprises, level of economical and technological development of enterprises ; specificities of the national or regional labour market, such as socioeconomic pattern of local labour market defined by the division of roles and responsibilities of state and social stakeholders, the ratio between the supply and demand of workforce in the local labour market; specificities and changes of the national public regulation of occupations and professions, such as introduction of national regulations based on qualifications);
- global factors related to human resource demand in the labour market (intensifying international competition and economic globalization, changes of the competition patterns, 'global auction' of skills in the labour market) ;
- local factors related to supply human resources (features and specificities of national systems of education and training; development of the national systems of qualifications, emergence and development of the new pathways and possibilities for the acquisition of skills and qualifications, local competition patterns of the providers of training, as well as marketing of provided training services; local features and specificities of provision of continuing vocational training and human resource development in the enterprises; changes of the curriculum design and

provision of vocational education and training and higher education, influencing the changes of volume and contents of provided qualifications);

- global factors related to supply human resources (international competition of the providers of vocational training and higher education and its intensification; mobility of learners, job seekers and workforce, migration processes).

Complexity and multidimensionality of the processes of emergence and introduction of the new occupations and qualifications in the national systems of occupations and qualifications requires to develop and use certain theoretical or methodological frameworks and schemes, which provides certain structure and logics for the analysis. This paper suggests to categorise these processes referring to methodological approaches of institutional change and from the perspective of the impact of the new emerging occupations and qualifications to the existing system of occupations and qualifications. The first approach in analyzing the emergence and introduction of the new occupations and qualifications permits to understand the dynamics and extent of incurred changes. The second approach discloses the impact of these changes (emergence and introduction of new occupations, qualifications and their elements) to the contents of existing occupations and to the existing system of occupations and qualifications.

All analysed cases new occupations and qualifications in Lithuania emerged due to the different dynamic changes in the system of occupations and the labour market. There can be noticed influences of the local (internal restructurings in the organization, changes of the profile of activity etc.) and global changes (international competition, international transfer of technologies) to the emergence or introduction of the new occupations. The analysed cases of emergence and introduction of new occupations in Lithuania have predominantly “borrowing based” or “import-based” and adaptive character. Regarding the provision of qualifications in the newly emerged or introduced occupations there can be noticed the domination of the continuing training forms in the provision and acquisition of know-how and skills needed for the new occupations.

ENHANCING INTERNATIONAL TOURISM TO THE DITSONG (SOUTH AFRICAN): NATIONAL MUSEUM OF MILITARY HISTORY

Nicolaides, Angelo¹

¹Vaal University of Technology, Department of Hospitality, Tourism and PR Management, Human Sciences Faculty

Abstract

Attractions such as military history museums which exhibit a wide range of important historical artefacts are fundamental sub-elements in any tourism systems, and yet their study suffers from lack of theoretical depth. Military history is an integral element of the history of any nation and countless varieties of tourists both local and international, visit military museums whenever the opportunity presents itself because museums are generally stimulating places of interest. This article focuses predominantly on international tourists visiting the Ditsong National Museum of Military History. In addition to the interest that such museums generate, they play a key role as the organizational foundation stones of modernity. It is via their many interesting exhibits that museums enlighten us about the past that intrinsically highlights its distance from the present era. Museums also selectively reconstitute aspects of history and in so doing alienate many artefacts from their original context and yet manage to impart deep understanding of events that shaped the modern world.

Museums of all types thus impart knowledge and have a wide range of tales to tell concerning the many and diverse assortments of objects they hold. National pride is an obvious reason for having a military museum where the comprehensive display of military equipment is exceptionally unique while exhibition halls also offer an educational narrative of a nation's history. What is also of interest to many visitors is the type of research that is carried out in a multiplicity of ways. The huge global growth in tourism in recent years has contributed to many museums radically altering their exhibits in both content and manner of exhibition. This is significant given the reciprocal impact that museums and tourism have on one another. The attractions in museums are regarded by many to be central to the tourism process and these are very often the main reason for many tourists visiting a particular destination. The particular focus of this article is the role of Ditsong (South African) National Museum of Military History in promoting tourism and it suggests possible areas of development for the museum which would enhance its offerings and increase the number of tourist visits.

Introduction

There is a wide range of cultural attractions that tourists can visit including museums, heritage sites, parks and botanical gardens (Graham and Lennon, 2002).The Cambridge

Dictionary Online defines museums as "places of study, buildings where objects of historical, scientific or artistic interest are kept, preserved and exhibited". Rojek states that human beings, irrespective of cultural background, have an innate urge to travel to witness for themselves the 'extraordinary' and often 'wonderful' objects they have read about or been taught about at school (Rojek, 1997).

According to Bennett (1995), museums have always been tourist destinations and they have been created to educate the uneducated masses. Museums, viewed as attractions are precise permanent resources that are managed for the education, pleasure, enjoyment, leisure time of their visitors (Middelton & Clarke, 2001). Consequently, the exhibits in a museum and the manner in which they are set out, allow tourists to essentially rise above and beyond the exhibition halls of the museum, as they recreate the past, and shape individuals perceptions of the present.

The Ditsong National Museum of Military History in Johannesburg has always been a fascinating place to visit. Like similar museums abroad, it offers a very unique context for learning which is termed in literature as a "free-choice" learning environment (Falk & Dierking, 2000). The items on display in the museum are also distant enough to allow us to view the past and also look at ourselves in a different light. Visits to the museum are strongly related to the motivation and the characteristics of certain tourist typologies. The exhibits are special and very unique in an African context and yet more could be done to increase the number of tourist visits. The challenge for the museum is to better understand the needs of its diverse audience and provide experiences that meet and satisfy these needs in an environment of increasing global competition for tourists and huge scale socio-economic global change. It is said that 'museums are gatekeepers of modernity', if this is true then they have a great influence in affecting our perceptions.

Background to the museum

The South African Prime Minister in 1947, Field Marshal JC Smuts, at the opening of the museum referred to World War II and stated:

"...We are gathered here today to open what may not unfairly be looked upon as a memorial to the greatest united effort our country has ever been called upon to produce. Memorials, of course, have more than one use. They serve to remind us of what is past, of great deeds of heroism and sacrifice; they also serve as a pointer, and sometimes as a warning to the future. It is in these senses that the South African War Museum may be regarded as a Memorial. It will remind us, I hope, not only of the part we played in the recent great struggle to save civilization, but also of the horrors, the loss of life and the devastation, and serve as a warning to us to create a world in which we shall never have to use again the weapons of death and destruction we see here today, or those dreadful weapons to follow them..."

After South Africa's participation in World War I (1914-1918), on the side of the allied forces, and her subsequent involvement in World War II (1939-1945), the official historian of the Union Defence Force, Captain J Agar-Hamilton came to the realization in 1940, that South Africa's involvement in World War I was not documented at all. Consequently, countless valuable artefacts and material heritage were lost, never again to be seen. As this was an unsatisfactory state of affairs, Captain J Agar-Hamilton began to put in place the fledgling South African War Museum. Due to his efforts, a very wide range of historical documents and military related materials were conserved. In addition to his efforts, the government of the day hired seven artists to document the war and set up a unique collection of roughly 850 works of art. In 1975, the name of the museum changed to the South African National Museum of Military History. The museum complex honours our nation's military and its many dedicated and exceptional soldiers, sailors and airmen. The complex spotlights the service and sacrifice of all South Africa's military through a variety of museum galleries dedicated to South Africa's military, both prior to and post the South African Democratic Revolution of 1994, and including inter-alia, the Anglo-Zulu War of 1879, Anglo-Boer War of 1899-1902, World War I, World War II, Korea (1950-1953) and the South African Liberation Struggle.

The museum's comprehensive collection of information, artefacts and images thus covers a wide range of events that shaped South Africa's history and keeps the nation's history alive. Although the scope and exhibitions have altered and new buildings had been constructed, every conflict that South Africa has ever been a part of is depicted in the Museum. The various sections in the exhibition halls follow an innovative progression that is generally chronological but they also reveal, within the various exhibits and assemblages, an almost thematic coherence. The museum also has a very important conservation and restoration role and it is this department which attracts a great many visitors due to the high standard of restoration projects. These are so well researched that they are known and appreciated internationally.

The Director of the Museum, Major John Keene, is doing a sterling job and has an able staff complement, amongst whom, are the curator Allan Sinclair, who also serves as a Communication Science/PR officer and art and aviation specialist and Hamish Paterson, an education coordinator who clearly loves his role of imparting knowledge to visitors to the museum. Despite having able staff, the Museum is clearly short-staffed and should employ more able-bodied staff if it is to become a truly great and globally recognised heritage site.

The primary function of the Museum is to make authentic information, collections and research available to a wide range of visitors. The Museum thus documents, monitors, collects, inspects, stores, examines and exhibits a wide range of historical artefacts of a military nature, which give evidence of and provide information about historic events, everyday life and the many achievements of South African soldiers and armed forces throughout

history. The research activities of the museum play an important role in its operation as well over 2 000 emails are received per annum and approximately 1 000 detailed answers are provided to information seekers by the curators. This is an important part of the educational activities where the museum is able to inform especially researchers, on specific items held at the museum.

A future short-term project of the Museum is to create a Transformation Display emphasizing the Liberation Struggle which should also prove to be of great interest to tourists. Tourists both local and international, military experts as well as military historians are afforded opportunities to gain valuable insight into the different historical periods which have contributed to the creation of present-day South Africa. Andreas Huyssen identified what he termed the “transnational movement of memory discourses”, and this plays a very important role in what and how museums exhibit artefacts (Huyssen, 2003). By attention to the legacy of South African involvement in wars, the museum should also play an important role in trying to show what the ‘enemy’ at any one time felt, and it should also to an extent focus on the importance of all war’s within the South African domestic culture. It has done this to an extent but more could be done.

Many South African and indeed foreign veterans and reserve soldiers view the Ditsong National Museum of Military History, as a sort of headquarters. They reminisce about their sacrifices in times of conflict, as well as their many fallen comrades as well as their victories. The museum is unique on the African continent in its coverage of conflicts involving especially the South African military apparatus and it provides for, and promotes, the study and appreciation of the history of modern war and war-time experiences. The Director of the Museum, Major John Keene and Susanne Blendulf who heads the Curatorial Department are clearly experts at what they do and having such employees is critical to the museum’s success.

The Museum, currently houses a collection of 44,000 items which are as wide-ranging as military aircraft, a single-man submarine, tanks, cannons, armoured vehicles, medals, uniforms, many weapon types, photographs and documentation, as well as memorials. The library possesses a unique collection of journals, archival materials and historical books covering over 150 years of South African and global history. The development of warfare weaponry is also exhibited, such as combat uniforms and medicines. It is important to mention some of the ‘one of a kind in the world’ exhibits that are on display and to note that they lure many military enthusiasts from across the globe. These include, for example, the Messerschmitt 262 night fighter which was a very powerful piston-engined plane and a deadly aerial combat opponent of the Allies during World War II, and the Italian Armoured Vehicle Autoblinda. The Ditsong National Museum of Military History has roughly 50,000-60,000 visitors per year which includes local and international tourists, students, scholars and groups that are sent by the South African National Defence Force. In addition to playing an

important role in the military history of South Africa, the Museum also caters for functions and presentations with a choice of conference rooms. There is also a museum shop for the purchase of memorabilia and a refreshment kiosk (<http://www.defenceweb.co.za>).

Why are military museums Important?

Traditionally, museums secure for us a living legacy of the past by holding in trust for society many important artefacts and their primary role is to advance and disseminate knowledge about the history of a nation. They generally gather documentation, interpret material evidence and preserve exhibits for the public benefit. Today, however, museums allow tourists and the general public to explore their many and varied collections for learning and enjoyment. They serve as vital sources of "living history" and provide visitors with insight into the upcoming fragile world we inhabit. Tourism is also a means to a better understanding of the dynamics of globalization and museums thus empower them in this regard. Military museums are especially important as they provide lessons from conflict around the globe which resonate with people from all walks of life. Decisions made in our history shaped how we view ourselves as a young nation today and many lessons may be learned in military museums. The Ditsong National Military History Museum has a huge opportunity to forge human identity as it allow visitors to access many and varied objects, sources of knowledge and invaluable information in very pleasant settings situated adjacent to the exceptional Johannesburg Zoological gardens.

The events they portray and memorialize are part and parcel of the global dialogue, promoted by the United Nations Organization, about justice and freedom for all. The museum can transform memory into action as it inspires and engages its visitors on the core lessons of war but has to an extent an unrealized potential. Gunn (1988) argues that attractions such as military museums exercise a magnetic "pulling power" over tourists since even classical times. This fascination consists of not only the interests and preferences of the tourist, but especially on the quality of the museum's design, its development, and the manner in which it operates. By learning about wars that have shaped the current world we are better able to provide for ourselves a clearer ethical and moral compass. Museums thus provide an ideal learning environment, for both formal and informal learning, active hands-on participation, or passive observation (Hein, 1998) and they raise the intellectual bar so to speak.

Tourists who visit museums see themselves and their culture reflected in such a way that they are encouraged to gain fresher perspectives, make new connections, understand in different ways and also learn more (Falk, 2004). Museums have moved on from being merely storehouses of knowledge and many and varied objects and now have a multifaceted and indeed outward looking role as hosts who invite tourists inside to be amazed, encounter and learn (Schauble, Leinhardt & Martin, 1997). Museums are perpetual participants in the shaping of modernity, and their role is dynamic in a global context as they expand into the

contemporary universal consciousness. Cities such as Johannesburg have a wide range of attractions such as Freedom Park, Gold Reef City and the Ditsong National Museum of Military History, the purpose of which is to promote tourism which has both a complex and multifaceted character. The support of local residents for these attractions is also critical for their sustainability, and also serves to boost the cultural liveliness of the city.

What does the term 'leisure' mean?

Museums are closely associated with the leisure sector, principally in a number of research studies linked to the marketing of museums (Burton & Scott, 2003; Packer & Ballantyne, 2002; Witcomb, 2003). The prime motivations for tourists to visit museums are for leisure and entertainment (Packer, 2004). In an Australian Museum study on visitors, it was found that 71% of adults visited museums in the main for the entertainment value (Kelly, 2001).

Moore, Cushman and Simmons (1995), state that free time appears to be fundamental to the notion of leisure and that those who engage in a leisure activity are aware that they have both free time and opportunity available to do something different which they generally perceive to be mentally stimulating and rewarding.

Stebbins (2001) differentiated between what he terms 'casual' and 'serious' types of leisure with most leisure, including museum visits being of the former type and being conducted by your average tourist. This type is generally a short-lived but pleasurable experience. Historians or military analysts for example, who visit a military history museum do so due to as it conforms with their careers, knowledge and skills and challenges them, and these are the 'serious' type of leisure seekers, who comprise a much smaller group of visitors. Leiper (1990) on the other hand, maintains that tourists are not somehow "attracted" or "pulled" towards visiting a museum, but "are pushed ... by their own motivation towards the places and/or events where they expect their needs will be satisfied". Either way, museums want more visitors.

Challenges facing museums

There are numerous challenges facing museums today, including inter-alia, greater competition from a wider range of leisure options for tourists who are now more refined through the use of the internet (Lynch et al, 2000).

How museums maintain an ability to draw lessons of value to what is generally an extensive array of disciplinary interests for tourists is highly thought provoking. This is especially important as museums are now in global contention in the marketplace with many other leisure, learning and educational providers (Lynch et al., 2000). Museums clearly have limited resources and this requires them to operate with a greater commercial emphasis than was previously the case. Museums should not simply be suppliers of information but rather strive to provide utilizable knowledge and for tourists to investigate their own ideas and arrive at their own conclusions (Bradburne, 1998). Many museums are now of necessity

seeking greater stakeholder collaboration in their operations and seek to gain the support of corporations (Garnett, 2002). Apart from their heritage factor importance, for museums to remain relevant in 21st century society, they must be receptive to burning social and environmental issues such as societal justice, population growth and sustainability (Goulding, 2000).

It is increasingly important for museums to adapt their role and provide greater access to tourists for accurate and authoritative information (Cameron, 2006). Tourists visiting museums detest artificial exhibits and settings and value authenticity above all else. This poses a significant test to museums since it is not only important to tourists but they have come to expect authenticity. If museums fail to satisfy the needs and wants of their visitors, then they will simply visit other places in their leisure time. Most tourists and indeed the majority of all visitors to museums wish to know that any information they are given on exhibits is in fact based on careful research. They seek a true interpretation of the 'facts' that they are presented with. If tourists feel that what they are told or shown in a museum is in any way inaccurate, they will forever regard the museum as unauthentic. It is thus critical that tourists be imbued with a sense of trust by what is reflected in a museum as museums are the focal points of convergence for thinking, reflection, pleasure and knowledge (Arpin, 1992).

In the context of expansion of Johannesburg's portfolio of tourist attractions, it is imperative to attract miscellaneous, but nonetheless well-matched, markets and submarkets of visitors. As far as international tourists are concerned, the museum should be regarded as one of the essential sights to visit on a trip to Johannesburg. These are not the only important market however. The problem of accessibility and the relationship of conservation and heritage to the poor and marginalized constituencies of South Africa is an issue that the museum will have to try to address as a matter of urgency. Consequently this group is a potential market of importance and essentially comprises local visitors who have not yet visited the museum. Globally, there is an increasingly growing perception that admission to museums should be very cheap if not entirely free in order to encourage local visitors to attend (Rentschler et al. 2004). While this thinking should be encouraged, tourists from abroad could pay a higher foreign visitor fee as is the case in many countries. In addition there should be free admission for senior citizens, students and disabled people (Rentschler et al, 2007). A important question to consider is the status of 'leisure' tourism to the Museum.

An Effective Marketing Plan for the Museum

Museum marketing is distinctive as the roles of Museums are to educate their visitors and become self-sustaining institutions by increasing their revenue through increased numbers of visitors. As a result of these roles careful planning is required in merging the mission and vision with the available market. An effective marketing plan is imperative to success as it is via this plan that a museum can increase its visitor base and boost revenues which will enable

it to realize its vision and mission. Planning is thus critical to a museum's marketing strategy. If a museum is marketed in a haphazard manner which is devoid of a considered plan, ideally based on a feasibility study, resources will simply be squandered. The annual marketing plan should target the primary tourist segments while it prioritizes its resources.

A primary concern of the marketing plan developers for the Ditsong National Museum of Military History, should be analyzing the type of experience the museum offers tourists. This should include a detailed description of the activities the tourists can enjoy while visiting the museum. There was a noticeable lack of any booklets, DVDs, and other vital marketing material at the front-desk of the museum. An effective marketing plan for the Ditsong (South African) National Military History Museum is lacking. Such a plan should encompass five main steps including:

1. A Situation Analysis the initial step in the strategic marketing plan. The context in which the museum finds itself in the marketplace is important to the future orientation.

2. Establishing Market Opportunities

3. Setting Marketing Objectives

4. Strategy and Programme Development

5. Implementation, Monitoring, Evaluation of the Marketing Plan

If there is a marketing plan why is it apparently not operational or functional as it should be? Has the museum conducted any analysis that attempts to answer questions such as: Why do visitors come to this museum? Who makes the decision to come to the museum? Do visitors decide to visit the museum spontaneously or is it a planned carefully worked out visit? There also needs to be an analysis of how societal values influence visitor attendance. For example, do certain population groups not visit the museum as it is regarded as an apartheid era glorifying institution? Why do school groups not visit as much as they should? How does the museum promote itself? Does funding or lack thereof hamper the growth of the museum? Is the state making enough tourism grants available to the museum which is part of the Ditsong museums?

Although the museum welcomes all visitors and looks forward to an increase in numbers, the vital fact of having sufficient amenities and the requisite number of staff to provide the necessary security and cleanliness, must be considered before any meaningful marketing drive is undertaken. There is the question of working within capacity. The museum could do with far more funding which appears to be a major challenge and is does not reside under the appropriate 'umbrella' organisation as such.

Does the museum have any competition and which other attractions are targeting potential visitors? Is it possible to collaborate with other tourism draw-card institutions? Once the museum knows the answers to such questions, it will be in a position to make important

marketing decisions and promote itself in a meaningful way. Technology and especially the internet now plays a vital role in increasing attendance to any museum. The Website of the museum is now under the Ditsong umbrella, but in order for it to be effective, it should be a stand-alone Website which will encourage thousands of 'hits' per week. These 'hits' can be translated into increasing real visitor numbers to the actual museum? Current marketing objectives clearly need to be analyzed. To what extent is the museum attempting to understand the motivations of its diverse visitors' and how does its marketing strategy reflect this? (Lepkowska-White & Powell, 2007).

Research study

As international tourists are an important market for the Museum, increasing the number of these visitors should be a strategic objective. Consequently, a study of tourist origins and viewpoints on the Museum was undertaken to provide market information that the Museum could use in its future marketing strategy. The primary objective is to increase the number of tourists visiting the Museum.

There are currently two scales that have been developed which help the tourism industry to identify the motivational domains of the leisure tourist. These are the Leisure Motivation Scale (Beard & Ragheb, 1983) and the Subjective Leisure Scale (SLS) of Linger & Keman, (1983). The former includes four motivational domains that direct involvement in leisure. These include the intellectual domain, the social domain, the domain of challenge to achieve something and an escapism domain.

The Subjective Leisure Scale (SLS) on the other hand, comprises 26 items which differentiate between six main domains, namely, intrinsic satisfaction, perceived freedom, arousal, mastery, involvement and spontaneity. In preceding studies the SLS has established outstanding levels of reliability and validity. In this research 30 questions were posed.

Cronbach's alpha is a measure of internal consistency and a coefficient of reliability that was used in assessing how closely related the set of items (questions posed) were as a group. It is generally considered to be a conservative and safe estimate of the reliability of a test or survey. Cronbach's alpha may be written as a function of the number of test items and the average inter-correlation among the items used. However, it is important to remember that reliability is in itself not a characteristic inherent in the test, but it is rather an estimate of the consistency of the set of items which were administered to the international tourists at specific times under particular conditions for the specific purpose of this research. The Cronbach's alphas for the constructs of SLS as used in this research, ranged between .87 and .93. The average Cronbach alpha for a

set of scores thus turned out to be .90, and may be interpreted as meaning that the test was 90% reliable, and by extension, that was only 10% unreliable.

Research Design

A quantitative data collection method was integrated into the case study of the Ditsong National Museum of Military History. Yin (2002) has explained that this type of approach is appropriate when the research conducted focuses on current situations and does not need control over behavioural events, and especially where the structure of the research question is based on how or why something occurs.

The research involved three threads of data collection techniques:

- Desk research to draw together existing information on tourism profiles to Gauteng, patterns of tourist behaviour and trends.
- An onsite exit survey/questionnaire of 580 visitors to the museum, of which 227 were international tourists visiting the Museum was conducted in order to gather information on visitor profiles, reasons for their visit, visitor experience and responses to what else they would have liked to have seen or experienced at the Museum.
- Discussion with three tour operators on their knowledge of the Museum and their marketing thereof.

This study reports on a number of areas of the questionnaire, namely:

- What are the trends in military history tourism?
- What is the profile of international tourists who visit the Museum?
- What motivates international tourists to visit the Museum?
- Which other sites were visited by them in Johannesburg?
- What visitor experiences do they seek?
- What are their sources of information?
- What trends are likely to occur in tourism to Gauteng Province over the next 5 years?

Additionally, three tour operators were asked:

- What levels of awareness of the Museum exist amongst them and their intermediaries?

The exit survey was conducted from November to December 2010 revealed that around 42% of all visitors' to the Ditsong National Museum of Military History were international tourists, with the following general characteristics:

- Country of residence:
 - 25% UK

- 17% Germany
- 11 % France
- 4% Holland
- 4% Italy
- 8% other Europe
- 7% Asia
- 5% North America
- 21% other
- Visited due to proximity to hotel
- Visited due to proximity to the Johannesburg Zoological Gardens
- Visited as a result of tourist guidebook
- Visited due to interest in military history and heritage studies
- Visited due to local family/business partner driven initiative
- Visited due to tour guide recommendation
- Other sites visited by these tourists in or in close proximity to Johannesburg:
 - 29% Freedom Park and Soweto
 - 11% Johannesburg Art Gallery
 - 17% Walter Sisulu Botanical Garden
 - 34% Gold Reef City
 - 26% Johannesburg Zoological gardens
 - 5% The Constitutional Court
 - 4% The Sharpeville Museum in Vanderbijlpark
 - 23% The Lion Park
 - 14% The Crocodile Farm

Questionnaire Development

Data was collected using a questionnaire administered in face-to-face interviews over the period of two weeks during November and December 2010, as randomly selected tourists left the Museum. It had to be ascertained on contact, if they were local or international tourists. Once this was established, the questionnaire was administered. Respondents were given standardised instructions on how to complete the questionnaire and an explanation was given on what was expected of them. The content validity of the questionnaire, or its

appropriateness of questions, were tested for correctness, lucidity and relevance in a preliminary investigation. The 30 questions that were included were considered to be relevant to the research problem and the survey was quite simple in design. Clear instructions were provided and simple, clear and unambiguous language was used. A rationale was given for any item whose purpose was not immediately clear and there were consistency checks and some items were designed to assess the same or similar characteristics. The specific characteristics of the respondents was measured and not the individuals themselves.

Questions on the relevant areas as well as leisure motivations with regard to tourists visiting the Ditsong National Museum of Military History were included in the interview using the Subjective Leisure Scale of Unger and Kernan (1983).

The 30 questions included in the SLS were:

- The main criterion for me visiting the museum is the intrinsic satisfaction I obtain when I learn something new.
- I was invited to visit the museum by a local family member/friend.
- I was taken to the museum by a business associate.
- I visited due to my curiosity of how good an African museum could be.
- I escape a mundane existence by experiencing something different.
- I made a spontaneous decision to visit the museum.
- I visited as I had nothing else planned for the day.
- I have visited/will visit other tourist sites in and around Johannesburg.
- I am a professional in whose field of work history/military studies/heritage plays a large part.
- I visit museums for the thrill of the experience.
- I visited the museum to see how different cultures articulate their understanding of global events.
- I visited due to what I have read about the museum in a travel guide/guidebook.
- I visited due to the tour operator's/tour guide recommendations or advice.
- I visited due to the proximity of my hotel to the museum.
- I visited due to the proximity of the museum to the Johannesburg Zoological Gardens
- I visited due to my interest in military history and heritage studies
- I visited due to local family/business partner driven initiative

- I visited the museum because of specific rare exhibits such as the Messerschmitt 262 or the one-man German submarine.
- I visited the museum because other museums/art galleries were inaccessible at the time.
- I investigated what the museum had to offer on the internet before I arrived in South Africa?
- I investigated what the museum had to offer after I arrived in South Africa?
- I would say the museum has a good marketing strategy in place.
- I would say that the museum has a welcoming atmosphere.
- I would say the food stall is adequate for refreshments.
- The staff including guides seemed to be well trained, friendly and knowledgeable.
- My visit to the museum was an authentic experience that had an emotional impact on me as I 'relived' important moments in history.
- What I have read about crime in South Africa made me wary about visiting the museum.
- Would you visit the museum again?
- Would you recommend the museum to others in your country of origin?
- I have visited or will visit other attractions in Johannesburg and surrounds? (they were asked to list which attractions alongside on the rating scale)

A 5-point Likert scale was used to measure the extent to which respondents disagreed/agreed with the SLS statements (Unger & Kernan, 1983). These statements included in the rating scale were used so as to simplify and more easily quantify the attitudes and behaviour of the international tourists surveyed. Statements included 'strongly agree, agree, neutral, disagree, strongly disagree'. A value of 1 represented 'strongly disagree' and 5 represented 'strongly agree'. Since the respondents each selected an appropriate response on the scale of 1 to 5 points, the scores were added up for each individual based on their reaction and assessed and their attitude on the issues could thus be determined as stated by Huysamen (1994).

Generally, studies which used the SLS displayed high levels of validity and reliability and it was expected that the same instrument would be able to produce the same data at a later stage under similar conditions such as for example by means of a test-retest procedure. Respondents could also write comments alongside each point on the rating scale if they so wished.

Based on Aizen's Theory of Planned Behaviour (1985) and Fishbein's Theory of Reasoned Action (1980), it was considered suitable to use behavioural intentions as a 'ballpark' figure of visitation to the museum. Ajzen stated that all intentions are merely indicators of how hard people are willing to try, and of how much of an effort they are planning to exert, in order to perform a certain behaviour' (Ajzen & Driver, 1992). In leisure activities such as visits to museums, intentions are strongly correlated with reported behaviour. Consequently, ones attitude towards leisure activities can be differentiated on the basis of whether they are emotional, or descriptive or instrumental (Ajzen & Driver, 1992). In this study then, behavioural intentions were used to measure respondents' likelihood of visiting the museum again.

Sample

A convenience sampling (accidental sampling) methodology was operationalized through a sampling approach from tourists who had just visited the museum. The data was collected between November and December 2010. The resulting sample size of people approached was 580 of which only 227 were international tourists, which was considered to be appropriate given the aim of the study. This sampling typology is suitable for less demanding research problems as it provides the researcher with the information needed for the purpose of the study.

Data Analysis

The sample (n = 227) was initially segmented, based on respondents' behavioural intentions in relation to their visit to the museum. Such a sample size is considered to be representative of the population, and the results achieved give a true reflection of the characteristics of the international tourist population. Data filtering took place in which only the data critical to the research remained. The role of the data towards the elucidation of the research problem as well as the relationship of the data towards the research topic, were carefully considered. The target population was only international tourists visiting the museum. Filtering of data continued until only critical data remained which was analysed in depth. During this process, the interpretation and integration of viewpoints of the respondents came to the fore and thus new knowledge was created by the researcher.

Results

This research provides insights for the Ditsong National Museum of Military History with regard to what international tourists are seeking when they visit local tourist attractions and what motivates them to visit. The information can thus be used to develop more constructive experiences for international tourists for this important sector of the tourism market. Like other destinations such as Durban and Cape Town, Johannesburg is gradually experiencing some cumulative effects of increased levels of global tourism since the successful hosting of the FIFA 2010 World Cup. The Museum has a great deal of competition in Johannesburg and

surrounds. International visitors who are interested in history and military heritage sites visited the Museum. The majority of international tourists visiting the Museum were either business or short-stay tourists. Most of them also visited other venues of interest with nature and wild-life related sites absorbing most of their attention.

By drawing conclusions from the collection of data, the researcher was able to extrapolate about tourist motivations and expectations. The Subjective Leisure Scale (SLS) was used to explore whether there were any differences across the age groups in terms of their leisure motivations. It was clear that intrinsic satisfaction was the main motivator for tourism visits but the marketing of the museum was very poor. Local government needs to support the future development of the museum. In this study, it is argued that international tourists are a very important market to pursue for the museum and so marketing initiatives must be revamped as a matter of urgency if the museum is to attract more visitors from abroad. Service quality excellence is non-negotiable and word of mouth is important in developing goodwill and business for the museum (White & Schneider, 2000). To take full advantage of this market, it is important to understand why international tourists visit the museum. By gathering information on this theme, it is likely that new marketing and management strategies for the museum will be developed to better accommodate the needs of international tourists.

British, German and French international tourists were the main visitors from abroad. They represented 53% of the sample, and 38% of these were most likely to revisit the museum in the future. Only 17% of those surveyed had been advised to visit the museum by tour operators or guides. Approximately 89% of the sample indicated that had no prior knowledge of the museum before arriving in Johannesburg. The sample indicated that they would or had already visited other attractions including mainly Gold Reef City, Freedom Park and Soweto, the Zoological Gardens and the Lion Park. Results indicated a higher propensity to visit some heritage sites (34% Gold Reef City), while other heritage sites had minimal intended or actual visits (5% The Constitutional Court and a paltry 4%, the Sharpeville Museum in Vanderbijlpark- the latter is in critical need of extensive marketing given that it is a very historic site in the history of South Africa). Nature based attractions', in particular the Johannesburg Zoological Gardens (26%), the Lion Park (23%), the Walter Sisulu Botanical Garden (17%) and the Crocodile Farm (14%) also attracted international tourists. The Johannesburg Art Gallery attracted on 11% of the respondents in the sample. The survey indicated a strong propensity of international tourists to visit at least 2 sites in Johannesburg and surrounds. Most visitors in the sample visited due to spontaneity and interest in heritage studies/history. 98% of the respondents indicated that they had enjoyed their experience which was immersive and authentic. 95% found staff to be friendly and guides to be knowledgeable. 87 % of respondents found the food stall to be inadequate for a museum of such standing and one respondent wrote the word 'pathetic' alongside the relevant item on the rating scale (number 24).

Surprisingly, given its central position in Johannesburg, the results indicated that the museum appears to be a rather difficult attraction to access. Approximately 90% the respondents wanted to experience the unique South Africa, and were seeking mainly satisfying experiences from which they could learn. Only 12% had read any general descriptions on the museum in tourist guide books and 7% had the museum recommended to them by friends and family, or 'heard it was interesting' and should visit by business associates. Certain exhibits, amongst which was the ME 262 World War II, aircraft developed by Germany, was advanced as the main reason for 4% of the visits.

Three tour operators' perspectives

Face to face open-ended semi-structured interviews were conducted with representatives of three Johannesburg tourism operators in order to get clarification on their knowledge of the museum and their promotion thereof if any at all. Two expressed the opinion that although they are aware of the museum and what it offers, South Africa is not the first country most tourists have visited. Consequently, the museum is essentially competing with many similar overseas attractions, especially in North America and Europe, for example the Smithsonian in the United States and the Imperial war Museum in England. Knowledgeable tourists thus believe they have 'seen it all'.

Most tourists do not plan in advance what they will see at their destination and thus rely on information they receive for example at the airport or referrals from friends and business associates. Most visitors to South Africa Tourism also want to spend limited time seeing nature-linked tourism sites. Tourists are also increasingly looking for authentic experiences that impact on them emotionally and so they prefer live safari-type encounters, but this does not necessarily mean that heritage sites are less important to them. The tourists also rely on tour guide advice. Tour operators admitted that they could do more to promote the museum and one stated that he would be happy to support initiatives to encourage more international tourist visits if only they (the museum) approach him to discuss such an initiative. Most tourists seek a unique nature visit and so visit the Lion Park etc to fulfill this desire. Many also seek an opportunity to visit cultural sites although these are limited in number in Gauteng. For most international tourists on a travel itinerary, Johannesburg is seen as a transit point or a shopping destination rather than as a place with meaningful tourism sites. Generally, the tourism operators interviewed had relatively low knowledge of what was on offer at the Ditsong National Museum of Military History. It was not surprising therefore that international tourist visits were when low compared to similar museums abroad.

Limitations of the study

The descriptions of the attitudes and opinions of the respondents (international tourists) visiting the museum were constructed on the spot and they did not have enough time to carefully consider the questions posed. In addition, some of them may have intentionally

misrepresented the facts so as not to 'offend' the researcher. The researcher thus could have obtained limited and possibly distorted information (Dowson & McNerney, 2001).

Recommendations for further research

Given the case study nature of this research, the results are only applicable to the Ditsong National Museum of Military History with its excellent range of exhibits. The results are useful for the museum and the marketers of tourist destinations and attractions in Johannesburg to consider when developing their strategies which are generally aimed at meeting the needs of international travellers with regard to their leisure motivations.

Research with a greater quantitative focus to ascertain diverse market segments' preferences for certain amenities as well as a drive to further determine the reaction of international tourists to dissimilar fundamentals of the marketing strategy is also advocated for future studies. Further research could also be conducted on how competing attractions may choose to market their 'type' of attraction collaboratively. The nature-based attractions could intensify collaboration with the museum for a multi-venue pass for international tourists sold by tour operators in their country of origin or at the airports in Gauteng. From a marketing perspective, however, it is evident that the museum considers expanding its marketing initiatives. Research could also be conducted in this area.

Recommendations for enhanced experiences and increased visits

Although the exhibits and related information are presented to visitors, it should be done in a more imaginative way. The museum should consider installing interactive video gallery which will allow visitors to search databases and learn about the many sacrifices of all nations affected by war. Chronological timelines for wards could be placed on wall charts to assist visitors to contextualize the exhibits they are seeing. Although there are a few television screens showing DVDs of various military campaigns from World War I onwards, these should be made viewer friendly with some simple benches placed at strategic positions to make viewing easier.

The museum should essentially become more of a learning laboratory where visitors both local and international, students and researchers can use the exhibits to assess the role of South Africa in global conflict. Museums must build relationships and strive to become 'communities of practice' (Kelly et al, 2006)

The average visitor spends approximately two hours at the museum. What should be encouraged is that the museum should present questionnaires to visitors which encourage them to consider the consequences of war and its many negative impacts on our fragile planet. The museum could also, where possible, hire veterans from armed conflict to serve as guides as this will allow visitors to become au fait with experiences of war from those who were actually involved. Guest lecturers on military themes could be held once a month and vigorously advertised in the local press. Globally, museums with a military history slant

favour marketing strategies involving dedicated websites (Schuler & Janell, 2002). They also utilize newspapers, magazines as well as a number of community activities to increase attendance. Coach operators could be handed freely available leaflets to promote visits by international tourists and tour operators could help a great deal in this regard. Tourists who book their holidays through a tour operators are far more likely than independent travellers to make the decision to the museum before leaving home and so tour brochures would be important for those on package tours. Tour buses could also, for example, be met by Zulu dancers in traditional impi (warrior) garb. This in itself would set a warm and inviting tone for the rest of the visit.

The museum receives welcome additional income from its Conference and Function Centres and these centres supply in excess of R500 000 to the income portion of the annual budget, and also serve as an excellent tool for marketing the museum to individuals who visit the museum for work - related functions or seminars and are able to take time to tour the premises. However more advertising in the media of such premises and their availability would be advisable as not many people are aware of these facilities in really special surrounds. Additionally, special events such as the launching of a new exhibit, which may be advertised in the media, may draw those who may not otherwise visit. Special offers could also be made for cheaper entry at specific times. The media should be fed with press releases on all issues of interest. This is the most cost effective element in marketing the museum. It is after all free media coverage and in this regard the museum should pursue the building up of good relationships with news editors, feature editors, journalists, photographers and cameramen employed by the local media including those who are employed on a freelance basis. The website of the museum should be a unique one, while still maintaining a separate Ditsong website. This is probably the most important marketing tool to employ.

The reception area of any museum sets the tone for the rest of the museum and generally is an indication of things to come, so to speak. At the museum, the front desk is stark and uninviting. Apart from charging admission fees it should be selling guide books and providing useful information on the museum for tourists. In terms of food and drink provision, the current set-up is sub standard and it would be worthwhile to tender for reputable coffee shops or restaurant chains to establish an operation on the museum site at reasonable rentals. The same applies to reputable bookshops that could offer and sell a wide range of militaria and historically oriented publications. The existing shop is a good initiative but this concept must be expanded.

The Offerings on entry could also be improved by the provision and sale of a carefully compiled tourist guidebook which elaborates on the major exhibits on view. Vigorous marketing initiatives using tour operators and even airline companies publications, are

critical to increased international tourist visits. If a museum is not marketable it cannot survive (Colton, 2000). It is recommended that far more work be undertaken in this regard as there is a market just waiting to be informed of what is on offer.

Many museums abroad find that television advertising is very effective, but a very expensive way of reaching a large target market. Piggybacking with multinational corporations that appreciate the value of corporate social responsibility and such initiatives, such as MTN for example, could alleviate such a deficiency. There may also be local radio stations with an international audience such as 702 that could be useful in raising awareness and who would also be seen to be 'leading South Africa'.

Conclusion

Historically, Museums have been and continue to be, leisure and tourist destinations but the contemporary challenge is for them to remain relevant and be regarded as a must-view tourist destination in an environment in which there are many competing tourism sites (Scott & Burton, 2000). There is no doubt that international tourists value museums' as places for active personal learning through the observation of interesting and educational exhibits and also as outlets for physical relaxation and escapism (Slater, 2007).

Museums despite the fact that they are needed in society (Carr, 1999), are recognizing that they are competing for the international tourists share of leisure time and entertainment with many other tourism related operations and new avenues must be sought to make them more interesting (Freedman, 2000). The challenge for the Ditsong National Museum of Military History is to connect with potential visitors from abroad. To do this it should realize that a profitable future lies in its urgent implementation of effective marketing and vigorous public relations efforts, which begin with ascertaining what visitors want. This should be followed by promoting what the museum has to offer and exhibiting its many and unique attractions in new and exciting ways so as to satisfy international tourist needs and wants for meaningful leisure experiences.

The findings of this research have a number of practical implications for those involved in the management and marketing of the Ditsong National Museum of Military History. The international tourists visiting the museum, who responded to the survey, were not only guided by the potential attractiveness of the museum, but while looking to spend their valued leisure time in a free environment, simultaneously challenged the operators of the museum through what were generally sincere and useful responses which should hopefully benefit the museum and all its stakeholders and enhance the offering so as to be world-class.

As stated earlier, the museum resides under the umbrella of an organisation called – Ditsong: Museums of South Africa. This organisation is under the 'ownership' and control of the Department of Arts and Culture – and there is no doubt that this is indeed a strange place for a military museum to reside. The museum consequently competes continually with other

cultural museums for funding. There has been a drastic cut in core function personnel over the last ten years and, as a result, many of the curators are of necessity multi – tasked. Advertising the museum is in a sense, thus unwise, if there is insufficient staff to handle the current workload. It is recommended that the museum not reside under the current umbrella organisation, but rather under another, and that additional funding and staff be made available as soon as possible.

ENTREPRENEURSHIP AND HIGHER EDUCATION IN SOUTH AFRICA

Nicolaides, Angelo¹

¹Vaal University of Technology, Department of Hospitality, Tourism and PR Management, Human Sciences Faculty

Abstract

In the last ten years, entrepreneurship has assumed an increasingly important role in the South African economy as well as around the globe. The creation of new business activities has become a major driver in the economy and these greatly affect economic growth, job creation and general prosperity and, to an extent, enhance the national competitiveness of the nation in the global business arena.

This paper strives to answer some important questions relating to entrepreneurship. First and foremost, why is entrepreneurship necessary and who, precisely, are entrepreneurs and where may they be found? What can government do to promote entrepreneurship and what is it that Higher Education can do to develop a greater entrepreneurial awareness in South Africa given that there is ambivalence as to the degree to which entrepreneurship can be taught? Are South African universities able to develop cross-functional thinkers who are innovative and have entrepreneurial skills that are needed in the local economy? To what extent do the local universities encourage entrepreneurship by making use of innovative programme designs and are there specialist post-graduate programmes in entrepreneurship or is it simply regarded as an area business students must be aware of with no explicit academic entrepreneurship bias? The answers to these questions and their implications for the nation are discussed in this paper.

Why is entrepreneurship necessary?

In a world where people live in fear of being made redundant and where corporations “right-size”, “downsize” or “retrench” employees, whichever term you prefer to use, entrepreneurship is seen as a viable option, albeit with risks attached. Entrepreneurship is thus regarded as a “dynamic process of vision, change, and creation. It requires an application of energy and passion towards the implementation of new ideas and creative solutions. Essential ingredients include the willingness to take calculated risks...” (Kuratko : 2003).

South Africa is faced with a multitude of challenges including the great need for a higher economic growth-rate. There is a growing need to transform innovations and new creations or products or services into something more meaningful. This transformation will create employment. Many employees are forced into becoming more flexible functionally and opt to become self-employed in areas where they feel they have relevant skills and /or training and

education. The promotion of entrepreneurial thinking and action will in essence, to very large extent create employment, which is much sought after and desired for masses of unemployed South Africans. Generally speaking, entrepreneurship will be a driver for economic growth and its benefits in the South African scenario will be huge, particularly when there is a negative business climate as in a recession. It also facilitates global economic development and increases the skills of employees. Human capital and personal development are able to grow. This is very important given that large businesses cannot conceivably hope to even absorb 5% of the surplus of unemployed people. Entrepreneurship will also create a fresh competitiveness in markets as entrepreneurs are individuals who identify opportunities and use these to their own benefit (Maas & Fox : 1997). The country is obliged by external economic forces to become far more competitive whilst the changing face of the workforce and types of work, means that the skills necessary for socio-economic growth need to be re-assessed (King & McGrath : 2002).

Who are entrepreneurs?

Schumpeter (1934) regarded entrepreneurs as individuals who are radical market innovators. He saw them as instigators of “creative destruction” through the process of innovation. He believed that all industries are at some point in time appropriately replaced by others. This replacement process he termed as “destruction” making way for “creation”. Hence the term “creative destruction”. This process is ongoing and new entrepreneurial enterprises are being founded daily in the United States of America (Census : 2000). South Africa as a growing economy is also subject to this phenomenon. Who are these entrepreneurs?

Entrepreneurs are generally confident individuals who show promise in creativity and innovation and have the know-how obtained from either Higher Education institutions, from family networks or have simply gone out there and researched for themselves, often learning by a painful trial-and-error approach. The education of an entrepreneur will greatly influence his/her perception of entrepreneurship. They have the ability to transform a simple idea into a workable reality. They tend to network very well and think conceptually. They basically see an opportunity in the market and exploit that opportunity by gathering resources and taking measured and carefully managed risks. Entrepreneurs are always results orientated and seek to add value by satisfying the needs of their market. Many of them are challenged by their education. The growing interest in entrepreneurship is leading to more and more universities offering entrepreneurship as a course of study.

Where do we find entrepreneurs?

Many entrepreneurs have been driven by necessity into entrepreneurial ventures. A large number of businesses in various sectors of the economy, such as marginal mining enterprises, have over the last few years tended to layoff middle-management and workers and this has led to unemployment figures escalating. People have thus been forced in a sense, to start other

ventures such as small businesses. Others have been more fortunate and have been employed by companies where there is a need for people who are able to think cross-functionally.

Many South Africa high school students have now begun to see entrepreneurship as a potential career choice and this is also the case in the United States of America (Bardach : 1997). In fact, the demand has been so great that many American Universities have established entrepreneurship centres (Katz : 2000). In South Africa, entrepreneurs are found in the business world and the community at large, in both the public and private sectors as well as in the formal and informal sectors. There are also many entrepreneurs in the Arts and Science.

What can government do to promote entrepreneurship?

The government must begin to vigorously develop a spirit of enterprise in which entrepreneurial ventures are acceptable and worthy of support. In this regard, individuals should be helped more to take calculated risks. Creativity, learning and innovative thought through education should also be vigorously promoted. Schumpeterian entrepreneurs (individuals who learn to become entrepreneurs) should be nurtured whilst Kirznerian entrepreneurs (those who are naturally entrepreneurially orientated), should be supported more. The “network paradigm” as it has been defined by Cooke and Morgan (1993), is a major way in which innovation possibilities can be capitalized on. The necessary resources such as finance and infrastructure should to an extent be made available by the government. Organs should exist at Universities in which “selection panels” have a greater vision in identifying people with a natural aptitude for creative and innovative business development. The individual entrepreneur should be able to make use of his/her family networks as well as governmentally assisted social networks.

What can Higher Education do to help?

Higher Education institutions are regarded as the custodians of knowledge in society and play a very significant role in developing a nation. This is why entrepreneurship education should not merely be a niche activity. This realization has dawned on Higher Education institutions and has resulted in a noticeable increase in entrepreneurship programmes since about 1998. The process is ongoing and it is a matter of time before there is a relatively fixed entrepreneurship culture in South Africa, which will challenge academics and students alike. Many new challenges are facing universities as they seek to develop and establish growing entrepreneurship programmes. First and foremost will be the promotion of the very great potential for innovative start-up business ideas. An effective investment in national higher education initiatives concerning entrepreneurship, which will to an extent meet the needs of the population, will underpin the international standing of South Africa’s higher education institutions. Only by recognizing the great value and importance of entrepreneurship, and by expanding education about it, can South Africa hope to obtain a pre-eminent position in the

world of education and become truly competitive economically. In many societies in Africa, education has always played a very important role alongside culture in forming an individual (Micere : 1999). The cultural mindset concerning entrepreneurship in any region needs to be taken into account and the aspects which may either promote or go against entrepreneurship as a career option should be carefully analyzed. In this regard, the “spatial and cultural proximity” between those that produce knowledge and those who use knowledge is particularly salient (Koschatzky : 2001). The South African education curriculum at school level as well as in Higher Education system needs to be transformed so as to make entrepreneurship one of the most important subjects that should be taught. A difficulty could be that to achieve a measure of parity for students from disadvantaged backgrounds, access may become limited to other students. This implies that higher education would have to be further expanded. There is a problem however, in that there are no acceptable paradigms or suitable theories as to what entrepreneurship education should encompass (Norton, Kaplan & Hofer : 1999). This is a major challenge for South African universities to overcome by meaningful research initiatives on their part. By this I mean that Higher Education institutes should link research more closely to the market.

Entrepreneurs should be in a position to identify national and international trends and be able to isolate and identify entrepreneurial opportunities that have potential growth and should then be able to take advantage of these opportunities. Entrepreneurship courses should carefully separate business skills from entrepreneurial skills. Business strategies and business plans whilst important elements do not really improve a person’s entrepreneurial skills. Dana (1993) expresses the opinion, that entrepreneurship education should train students in knowledge and skill acquisition that would enable them to bring an idea, process or invention from conception to full business potential. Whilst practical experience is essential there must be harmony in education. By this I mean that the practical components requiring innovation and creativity, new idea-generation and practical action, and the academic knowledge components, need to be carefully counter-balanced so as to make the study meaningful.

A strong knowledge base for entrepreneurship should be created via research and the findings of such research must be disseminated. Students must be in an educational environment in which entrepreneurial ideas are generated and tested. The results should then be made known. The personal growth of students should be facilitated and their critical faculties should be developed as far as possible. Given the very wide range of personalities, the characters of students should be built so as to make their learning more significant. Ideally, students should be inspired to learn for themselves in an environment which promotes the idea of lifelong learning and an ethos of personal research should pervade every higher education institution and be part of the mindset of each and every student. Entrepreneurship courses at Universities can make a very significant contribution in promoting meaningful

entrepreneurship, as they could allay the fears of failure of potential entrepreneurs by educating the students about pitfalls and risks to avoid when embarking on a new business venture. Students will thus have a fuller understanding of entrepreneurship as a phenomenon and surely become more competent stakeholders in entrepreneurship at whatever level; investor or employee, manager or entrepreneur (Maranville : 1992). Young adults should be made capable and be taught to become self-reliant rather than expect to be fended for in an economy which is limited in capability and which has approximately a 24% unemployment rate. In a nutshell, as entrepreneurship is a philosophy which can help the South African economy to grow, it should be supported as a total system (Timmons : 1999).

Another major challenge facing entrepreneurship education in Higher Education institutions, is an academic faculty body, which has entrepreneurial ability and the necessary qualifications to make the subject intelligible and meaningful to students. There are clearly shortages in suitably qualified academic staff to teach entrepreneurship. While some faculties have a glut of PhD academics who cannot find suitable employment, entrepreneurship has too few suitable academics (Pfannestial ; 1998).

In many parts of the world, South Africa being no exception, entrepreneurship is battling to find academic legitimacy. Entrepreneurship should be a separate stand-alone subject and not be viewed as simply part of Business Management or part of an interdisciplinary field. It is also good and well to have guest speakers and guest lecturers, as these tend to offer a measure of interaction with entrepreneurial business people, but this is not really enough. Academic staff able to alter the mindsets of students and who do have the ability to effectively teach basic business skills and develop creative thinking in their students by giving them practical assignments, whether individual or group, should be the priority. Course content should focus on the skills and knowledge an entrepreneur would need to be successful (Benson : 1989). What is paramount is that potential entrepreneurs see themselves as self-reliant, aware, creative, analytical and knowledgeable individuals who are able to successfully become self-employed and make a meaningful contribution to the society in which they live. They require an entrepreneurial perspective (Kuratko : 2003). This perspective should ideally be developed at high school levels where more business related subjects should be added to existing curricula, perhaps being made compulsory to an extent.

Higher Education institutions create an environmental awareness of entrepreneurship and its many facets. This learning should be life-long learning and is necessary to sustain individuals in society in this new century where business is changing (Drucker : 1995). It is also invaluable to the promotion of the philosophy. Higher Education institutions need to ask the question as to what the appropriate relationship between education and the ever-changing workplace is and what it is precisely that employers are seeking in terms of skills and capabilities in young people entering the world of work?

Universities could be more supportive of entrepreneurs, as is the case at the University of Johannesburg, which involves students in gaining practical experience in direct selling and practical sales management. Students completing the National Diplomas in Marketing, Retail Business, Sport Management, Small Business Management and the Certificates in Marketing and Sales as well as the Foundation Programme, have the opportunity to gain two years of practical sales and one year of practical sales management experience. Once they complete their studies some students may find it difficult to obtain full-time employment. By participating in the above project in which they do practical sales for any of the Direct Selling Association (DSA) companies, they are able to generate income for themselves and have opportunities for personal and entrepreneurial development. This opportunity granted through the partnership with the DSA gives students a competitive advantage. Students who successfully complete the respective modules could reflect on their CVs that they have two years sales experience as well as one year experience in managing a sales team. On a macro level, this project contributes towards alleviating unemployment and instilling an entrepreneurial spirit which our country so desperately requires (Govender : 2005). Universities should also be more analytical and reflective of entrepreneurship and its huge potential to impact positively on the economy of the entire southern African subcontinent. They have great potential to influence the decision of an individual for or against a career as an entrepreneur. This is particularly important for young unemployed individuals who are either graduates or non-graduates, women and the unemployed in any particular society. Places of learning should be the catalysts of entrepreneurial motivation and should drive it forward as a viable alternative to working for someone else. Teaching should be facilitated to maximize the potential of individual students and to encourage a sense of curiosity and motivation in them. Above all, Universities should be seen as places where there is a teamwork mentality between students and academics with respect to things entrepreneurial. New patterns of work organization are appearing in the workplace and team-based work is increasing, with fewer levels of management and supervision, multi-tasking if not multi-skilling, and a greater need for effective communication skills (Probert : 1999). Learning groups could be established which would go a long way to sustain a climate of learning. In these groups of students, they would inspire each other and assist each other, with the guidance of academic staff, to succeed with a business venture.

Conclusion

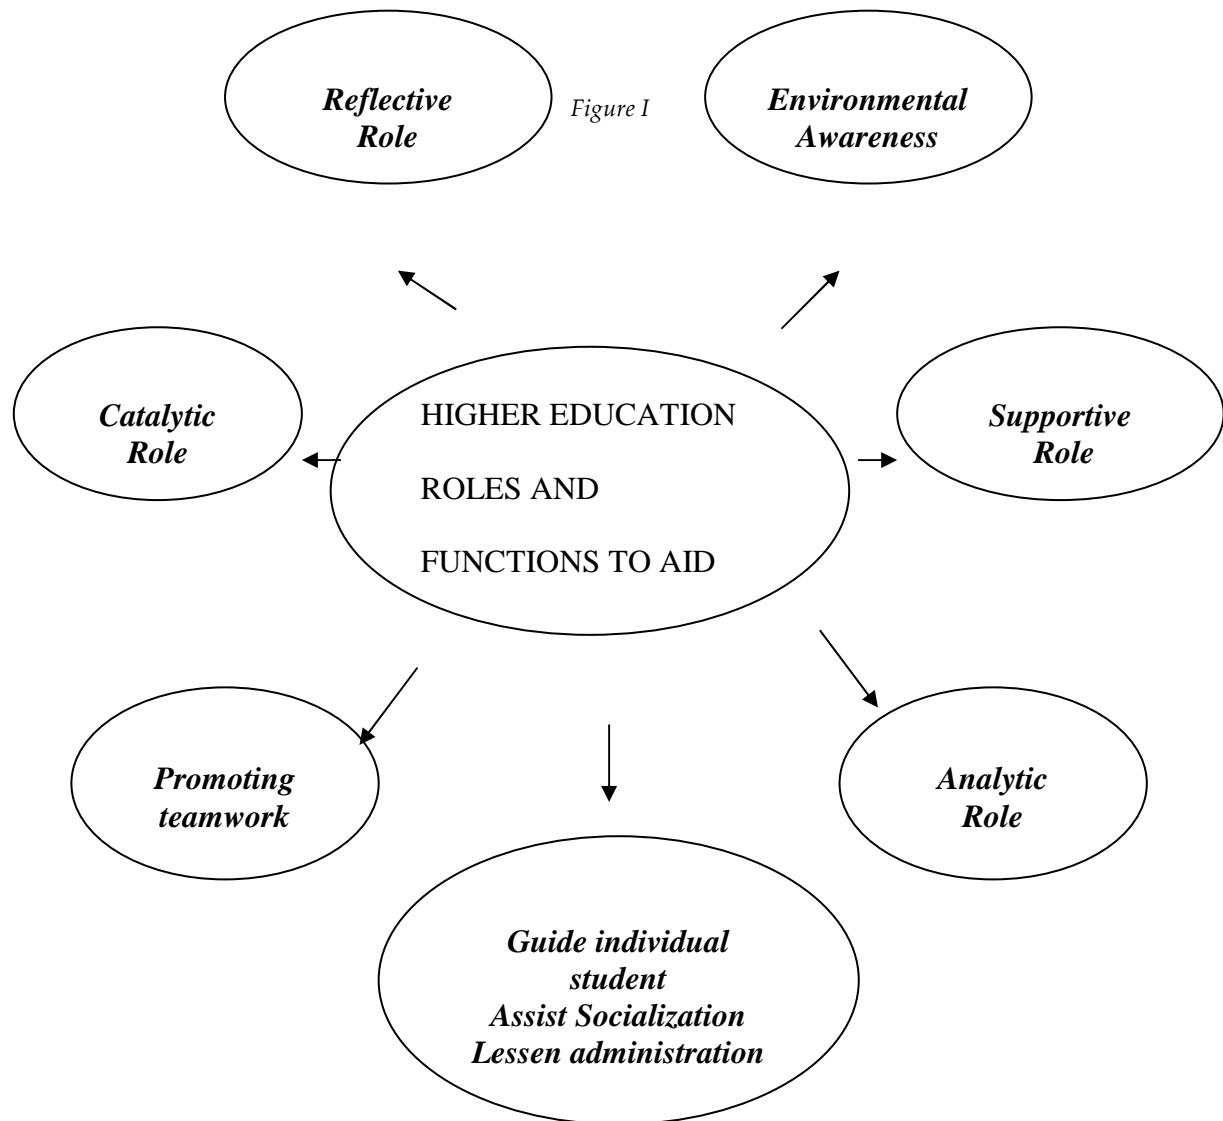

Entrepreneurship gives students a new way of looking at the world, irrespective of whether or not they opt to develop their own enterprises. New business start-up activity is probably one of the most important social activities for countries around the world. The rise of new business significantly affects economies and creates jobs and generally makes society more prosperous. Entrepreneurship is now a mainstream in many countries around the world. The young entrepreneur faces many challenges in attempting to launch and grow potentially good

businesses. About 11 % of entrepreneurs attempting to create high growth businesses, known as “opportunity entrepreneurs” expect to provide 20 or more jobs over a period of 60 months as opposed to 2% of entrepreneurs who are “entrepreneurs by necessity” (Zacharakis *et al* : 2001). This type of mentality is common globally, therefore, a vision of what entrepreneurship is all about will have very important implications on the economy as a whole. It should be fostered in light of job creation and the alleviation of poverty amongst the masses. Entrepreneurship provides individuals with career options and has great potential to aid society to become self-sustaining. It is a means of socio-economic upliftment for the downtrodden in society and should be vigorously promoted at school and higher education levels.

Students embarking on an entrepreneurial career path should have greater access to government financial support throughout their study. Private sector investment initiatives in entrepreneurial education should also be bolstered and in this regard, the government should provide incentives to the private sector enterprises which support quality entrepreneurial programmes. Business could, for example, assist universities to develop digital libraries which would make entrepreneurship initiatives worldwide accessible to virtually all entrepreneurship students. This would also enable students to contact specialists in the field and they could maintain electronic links. Each entrepreneurial student could interact with vast numbers of people around the world, quickly and simply and relatively inexpensively. The vision of the future can be drastically altered for entrepreneurship students by the use of the Internet. Higher Education institutions must become lively communities of intellectuals once again, as in the Renaissance, in which both academic faculty and students can collaborate more and discover together, understand and meaningfully utilize knowledge. The use of the Internet can never however, replace the personal interaction between students and academics.

This can also assist young unemployed graduates to gain a sense of worth in work. Students can be self-motivated and even self-learn with appropriate guidance and facilitation, where they are able to discover and self-actualize to an extent. Entrepreneurship education should continue to receive increased attention and should be more vigorously researched. Only by utilizing entrepreneurship will South Africa be able to cope with the challenges of this century. Universities cannot any longer sell the notion of preparing students for a “lifelong career”. The education revolution has arrived (Norman & Spohrer : 1996) and for successful entrepreneurship, top-notch education is paramount. Higher Education institutions should be providing extra entrepreneurial capacity and this should be especially aimed at high-potential student entrepreneurs (Driver *et al* : 2001), as it is these individuals who will ultimately succeed more and be able to employ others, thus alleviating the huge levels of unemployment in society. Opportunities must be created or seized and vigorously pursued (Timmons : 1999). Students must be taught to identify opportunities in the marketplace and their potential risks and should also be assisted to innovate and create something different in establishing a new venture.

Management skills must also be taught including planning, organizing, leading and controlling (Nieman & Bennett : 2002). The private sector could help them to obtain capital and resources and develop projects such as that of the DSA to reward them for their labours.

A model for entrepreneurial activity support from Higher Education

SERBIA BRAND IDENTITY: PERSPECTIVES OF RESIDENTS AND DIASPORA

Novčić, Branka¹; Damnjanović, Vesna²; Popesku, Mihajlo³

¹Faculty of Organizational Sciences, Univeristy of Belgrade. E-mail: novcicb@fon.bg.ac.rs

³Faculty of Organizational Sciences, Univeristy of Belgrade. E-mail: popesku@fon.bg.ac.rs

Abstract

The main aims of this research paper are to identify, compare and contrast different perspectives of Serbian residents and Diaspora regarding Serbia brand identity. Multiple surveying techniques consisting of on-the-filed and on-line surveys were applied. 900 responses were collected and results were analyzed using principal component analysis. Findings demonstrated that certain differences and similarities in the Serbia brand image perceptions between Serbian residents and Diaspora exist. First difference is reflected in the number of brand identity elements identified by each of the 2 examined groups. Diaspora identified 4 brand identity elements which are marked as mild nostalgia, business and pleasure destination, great cuisine and negative media bias; whilst residents identified 6 elements: people, obsolescence, negative media bias, cultural uniqueness, tourist destination and national treasure. Second difference, reflected in the mere content of the brand elements, is mainly determined by the fact that Diaspora's perception is mainly influenced by the nostalgia, whilst residents' by national pride. Except identified differences, certain convergences in the perception of two examined publics are evident. Both groups hold the view that Serbia suffers from negative media bias but still stays a recommendable tourist destination and a place to be.

Keywords: country brand identity, residents, Diaspora, Serbia

Introduction

After Yugoslavia fell apart, 6 newly formed countries (Serbia, Montenegro, Croatia, Bosnia and Herzegovina, Slovenia, FYROM) had tasks to create their new brand identities. Despite all the challenges, this opened numerous opportunities for international brand experts and marketing scholars to get involved and give contribution in the terms of destination branding and strategic brand identity development. Konecnik et al. (2010) argue that managing destination brands focusing on only one stakeholder is myopic. Contrast to this, our study examines destination brand perception through the spectacles of two interrelated but different audiences: Serbian residents (internal audience) and Serbian Diaspora (external audience). The country of Serbia appeared as a fertile research context for brand destination image type of study based on the following arguments. First, in 2003 after dissolution of Serbia and

Montenegro state union, Serbia became 'new to the market' country and a destination beckoning for a serious branding approach. Second, Serbia is endowed with Diaspora almost equal to the size of its own population. It is estimated that approximately 6 million Serbs live abroad, comparing to the 7,5 million Serbian citizens living in Serbia (Statistical office of the republic of Serbia, 2010; Ministry of Religion and Diaspora of the Republic of Serbia, 2011). Third, Serbia is economically dependent from Diaspora, which represents a significant source of foreign income. In 2010, Diaspora forwarded to Serbia 3,1 billion EUR, or 5% of Serbian GDP (Mikavica, 2011). Therefore, there is a strong economic rational to provide a better understanding of Diaspora's perception of their homeland identity.

This having said, Serbia, with all its properties, represents an interesting and suitable context for a comparative (Diaspora-Residents) brand perception research with possible contribution to both theory and practice.

Literature review

First literature stream relevant for this study is general literature on destination branding, destination brand identity and destination image. The interest of scholars and practitioner for the issues surrounding these topics is steadily growing in the recent years (Qu et. al. 2011; Roy and Banerjee, 2007; Tasci and Kozak, 2006). In the period 1998-2007, 74 destination branding publications by 102 authors were identified (Pike, 2009). Mainstream studies on brand strategy development at the national level mostly explore attitudes of external stakeholders, usually focusing on the multiple stakeholder groups. For example, Anholt (2005) explores consumer perspective on America's brand image from the viewpoint of ten different countries. Morgan et al. (2003) examine influence of public and private sector stakeholders on brand image of New Zealand. Ekinci and Baloglu (2007) explore visitors' opinion about brand personality of Turkey.

Second relevant literature stream has particular focus on destination image of ex-Yugoslav republics. A respectable number of studies outlined rebranding necessity of former Yugoslavian republics that appeared as new states on the global scene burdened with their post-conflict media image. The increased interest was followed by the number of publications. For example, Hall (2002) examined Serbia brand identity and found Serbia as the meeting place of cultures, religions and languages. Furthermore, he found Serbia as multiethnic country where all the ethnicities have one thing in common - their homes are wide open to the friends. In the case of Bosnia, Duborija and Milvic (2008) recognized local people as the key element for building a distinctive brand image of Bosnia. In the case of Croatia, Martinovic (2002) analyzed poor international destination brand recognition. Martinovic (2002) suggested Croatia to focus on geo-economic position, natural resources, human resources, tradition and social and cultural activities in positioning their destination brand. Konecnik and Go (2007) describe endeavours of Slovenia to position their small country on the fierce international destination market using

slogan "I feel Slovenia". None of the identified studies explored their Diaspora's perception of home country.

Third literature stream is studying importance of local people for a destination brand identity. In the case of Portugal (Freire, 2007), friendliness of local people was found to be important for brand building process in Portugal. In the case of Stoke-on-Trent (UK), Phillips and Schofield (2007) found that perception of residents is an important component of the place brand identity. Previous studies on Serbia by Hall (2002) and Popesku et al. (2010) explored brand identity of Serbia, focusing exclusively on internal stakeholders.

Fourth and final relevant literature stream for this study is literature on Diaspora and their importance for home country branding. For example, in the case of Caribbeans, Conway and Benjamin (2010) have identified multiple roles of Diaspora: development through remittances, contribution to disaster relief, investments savings in home country, doing business in home country, giving professional advices to local communities, etc. In the case of Samoa, a Pacific Island country, it was found that citizens and Diaspora have significant impact on Samoa's branding success and development of tourism industry (Scheyvens, 2007). Newland and Taylor (2010) found a strong association between nostalgia and returning visits of Diaspora to the home country. Furthermore, Newland and Taylor (2010) concluded that nostalgia helps Diaspora to maintain a sense of identity and community while living abroad. Morgan et al. (2002) argue that nostalgia as a feeling is the most important element of marketing communication strategy toward Diaspora. Diaspora, as an important stakeholder for brand image of a country, on internal plan, can be active, both as tourist visitors and as entrepreneurs contributing to the homeland's economical and industrial development. On the external plan, Diaspora can play a vital role in representing their home country as good ambassadors.

Building on the actual literature and identified literature gap our research has and having in mind immense economic importance of Diaspora for Serbia as a country, it would be important to examine and compare their perceptions with the perceptions of residents. The proposed research question can be framed as following: *What are the differences and similarities between Serbian residents and Diaspora in relation to the elements of Serbian destination brand identity?*

Methodology

The questionnaire consisted of relatively large number of attitudinal questions on a number of frequent stereotype attitudes shared in the discourse of everyday communication, media, history and collective conscious of Serbs. This might appear as a radical and risky approach in the research design, but in the cases when researchers do not have previous study to refer to, or the phenomena of study is new, a start from the scratch seems inevitable. Attitudinal statements were collected within a period of 12 months from national media (TV and newspapers) and 10 focus groups. 4 different researchers were independently coding frequent issues regards

perception of Serbia and the lists were then compared and convergences identified. Further inspiration for the questionnaire design was found in the work of Ristiano (2005) who provided theoretical framework consisting of generic elements of a country's brand identity. Thus, our initial questionnaire consisted of 7 clusters of questions: demography, brand culture, brand personality, brand character, brand symbols, brand name, and brand slogan related questions. We undertook pilot testing to test the questions and make sure that questions are appropriate and relevant. The questionnaire was pilot tested on a group of 160 examinees. Final list of issues consisted of 38 most frequent attitudinal statements on the image of Serbia and a number of socio-demographic questions. In the phase of confirmatory research, PCA was used in order to distinguish significant from insignificant brand image elements. To measure attitudes, 5-item Likert scale was used with *Strongly Disagree* - weight of 1, and *Strongly Agree* - weight of 5, as the scale anchors. The original questionnaire had a question labelled "residence" where optional answers were: permanently in Serbia, occasionally and permanent elsewhere. This question was used to capture if our examinees were member of Diaspora or residents. Serbs that occasionally live in Serbia were identified as Diaspora, as well.

Surveying lasted for three weeks in April 2010. People were surveyed on-line and on the field. In order to avoid response bias through the on-line survey, on the field only people older than 40 years were interviewed. In order to secure responses from Diaspora, one group of surveyors was placed on the Belgrade airport. After expiration of the surveying period, on-line survey was closed. Results were coded and inserted in the SPSS 17.0 software, which was used for statistical analysis. Following good practice of Palant (2005) and Malhotra (2007), prior to the data analysis, error screening and data cleaning was undertaken. After insuring that there are no missing values or values of the variables that fall outside defined ranges, it was preceded to the data analysis. Following statistical tools were used: (1) **Descriptive statistics** tools were used to capture average values on the examined issues. These tools were very helpful to extrapolate demographic profile of participants and their general impressions. (2) **Factor analysis**. Exploratory and confirmatory factor analyses were used. The aim of this tool was to reveal underlying structure (i.e. Serbia brand identity) and determine how many reliable and interpretable brand elements can be found within both of the examined groups.

Findings

In total 900 people were surveyed, from which 740 residents and 160 Diaspora. Both of the groups, in the terms of size, were suitable for principal component analysis. According to the recommendation by Tabachnik and Fidell (2007) and Stevens (1996), it is comforting to have at least 300 cases or 150 cases, in the case when solutions have several high loading market variables (above .80). These conditions are met in both of our target groups (refer to the Table 1 and Table 2 for further details).

As this study aimed to determine and discuss differences and similarities between Serbian residents and Diaspora regarding elements of Serbian destination brand identity, first step was to split dataset into two groups – residents and Diaspora and conduct separate analyses. Second step was to determine brand identity elements for each of the two groups and test their explanatory power. Final step was to compare results and give critical evaluation of the similarities and difference and their implications for theory and practice.

Serbia brand Identity: Residents' perspective

The surveyed residents (N=740) were in average 30.36 years old (std. dev. 9.969, median 27, mode 25, range 15 to 81 years). Prior to the performing of principal components analysis (PCA), the suitability of data for factor analysis was assessed. PCA was repeated 3 times with exclusion of attitudinal statements with communalities lower than .5. Finally, 27 attitudinal statements have left. Inspection of the correlation matrix revealed that all of the coefficients were equal to or higher than .3. This confirmed that dataset is suitable for the factor analysis. The Kaiser-Meyer-Olkin value was .882, exceeding minimal required value of .6 (Kaiser 1970, 1974) whilst Bartlett's Test of Sphericity reached statistical significance of .00, supporting factorability of the correlation matrix. Initial PCA was performed used Oblimin rotation technique which suggested 8 factors/components. In order to determine optimal number of factors, parallel analysis (MonteKarlo simulation) was used and eigenvalues were compared with the eigenvalues given by the PCA (Pallant, 2005). Parallel analysis showed 6 components with eigenvalues exceeding the corresponding criterion values for a randomly generated data matrix of the same size (27 variables x 740 responses). Thus, we found that optimal factor number was 6. We facilitated another PCA and forced procedure to suggest 6 factors. The 6 component solution explained a total of 55.51% of the total variance of Serbia as destination brand. To aid in the interpretation of identified components, Oblimin rotation was performed. The 6 brand identity elements emerged (for the detail findings of PCA please refer to Table 1.):

- (C1) **People** – 25.54% of total variance explained. It was found that people are the most significant brand identity element. Despite the life in a country burdened with problems, Serbian people enjoy and celebrate life with the sounds of Serbian folk music. They are talented for sports, curious and good looking.
- (C2) **Obsolescence** – 8.75% of total variance explained. Serbia was found as a country that falls behind modern world and current trends. Serbia was also described as mainly rural, under-developed and non-European country.
- (C3) **Negative media bias** – 7.01% of total variance explained. Negative media bias seems as the outcome of long years of conflict in the region and role of Serbian people in these misfortunate events. Serbia and Serbs were usually presented in foreign media as “bad guys” and initiators of civil war in Yugoslavia. Despite the fact that

Balkan conflicts are more than a decade behind, Serbian media picture is still considered to be negatively biased and not authentically presented in the domestic in foreign media.

- (C4) **Recommendable tourist destination** – 4.99% of total variance explained. Serbia was found to be hospitable country, with great cuisine and glorious history, recommendable to every foreign visitor. This is also a point of self-reference as respondents identify themselves with the role of a good host which is a part of Serbian cultural matrix.
- (C5) **Rich national treasury** – 4.72% of total variance explained. Serbia is perceived as rich in archeological sites, monuments, monasteries and natural beauties. Even though aware of national treasury, it would be interesting to examine how many of these places are in the reality visited by Serbian residents.
- (C6) **Cultural uniqueness** – 4.5% of total variance explained. Serbia is described as a country with distinctive culture, where tradition, countryside and church play vital roles in the everyday life of Serbian people.

Table 1: Serbia brand image perceived by Serbian residents - rotated component matrix for PCA with Oblimin rotation for 6 factor solution

Serbia brand Identity: Diaspora perspective

In total 160 Serbs from Diaspora participated in the survey. Examined Diaspora (N=160) was in average 31.84 years old (std. dev. 9.005, median 30, mode 29, range 17 to 61 years). Prior to the performance of principal components analysis (PCA), the suitability of data for factor analysis was assessed. All of the 38 attitudinal statements had communalities higher than recommended value of .5. PCA was then fully performed. Inspection of the correlation matrix revealed that all of the coefficients were equal to or higher than .3. The Kaiser-Meyer-Okin value was .758, exceeding recommended value of .5, whilst Bartlett's Test of sphericity reached statistical significance of .00, thus supporting factorability of the correlation matrix. Initial PCA was performed using Oblimin rotation technique which suggested existence of 4 factors. In order to determine optimal number of factors, parallel analysis (MonteKarlo simulation) was used and projected eigenvalues were compared with the eigenvalues given by the PCA (Pallant, 2005). Parallel analysis showed 4 components with eigenvalues exceeding the corresponding criterion values for a randomly generated data matrix of the same size (38 variables x 141 responses). Thus, we found that optimal factor number was 4. We facilitated another PCA (Kaiser-Meyer-Okin value was .877 and Bartlett's Test of sphericity reached statistical significance of .00) that was performed using Oblimin rotation technique and forced procedure to suggest 4 factors and reduced the number of attitudinal statements from 38 to 14 due to unsatisfactory communalities. Next PCA, showed that one out of fourteen attitudinal statements had communalities less than .5 and was excluded from further analysis. The final number of elements (attitudinal statements) was 13.

The PCA revealed 4 component of Serbia brand identity among Diaspora (for full details please refer to Table 2.). This solution explained a total of 69.52% of the total variance of Serbia as Brand construct:

- (C1) **Nostalgia** - 22.58% of total variance explained. This is the strongest brand identity element for Diaspora. As the proverb says "There is no place like home" it should not be surprising that Serbs from Diaspora feel homesick and nostalgic. This is a strong emotional entanglement that keeps Diaspora always close to the "fire".
- (C2) **Business and pleasure destination** – 21.18% of total variance explained. Diaspora usually sees Serbia either through business or pleasure. As explained in introduction, Serbia is dependent on money coming from Diaspora and most Serbs from Diaspora have significantly better standard of living than majority in Serbia. Many of Diaspora Serbs invest their capital in Serbia and expand their business there. On the other hand, part of the Diaspora Serbs visits Serbia only for the leisure purposes and reunion with their family and cousins.

- (C3) **Negative media bias** – 11.14% of total variance explained. Negative media bias reveals that Serbia and Serbs are usually presented in inappropriate manner in almost every foreign country. This also interesting as it reveals inertia of foreign media and deeply rooted prejudice of Serbs as bad guys stemming from the civil war in Yugoslavia.
- (C4) **Great cuisine** – 14.16% of total variance explained. Serbs are fond of Serbian cuisine and this is also close with the phenomenon of nostalgia. Food takes the central place in Serbian culture and staying hungry is one of the worst fears of an average Serb. Opposite to Serbian residents, Serbian traditional food is not so available and accessible to Serbian Diaspora and this might be the reason why Serbs living abroad daydream about proper Serbian dish made just as “grandma does”.

Residents and Diaspora: Divergences and Convergences in brand perceptions

The first major difference, in the perception of Serbia brand identity by Serbian residents and Diaspora, was found in the number of elements identified within both of the groups. Serbian residents outlined six elements, out of which the most positively associated elements of Serbian Brand identity are: People, Negative Media Bias, Obsolesce, and Tourism destination. On the other side, Serbian Diaspora perceived only four elements of Serbia brand identity: Mild nostalgia, Business and pleasure destination, Negative Media Bias, and Great Cuisine.

Comparing the results of Serbian residents and Diaspora, it is possible to conclude that both audiences recognize Serbia as a recommendable tourism destination for business and pleasure. Also, Serbian residents had a more detailed approach when analyzed Serbian brand identity features. This can be related to a range of "first hand" information and experiences that are accessible to them.

Second difference can be found in the core emotions that drive both audiences. Serbian Diaspora is often driven by the emotion of nostalgia (longing for home) and it reflects on perceived elements of Serbia brand identity. Serbian residents rated people as the most important element of Serbia brand identity. Serbian sportsmen, scientists and young talented people make often Serbian public proud, as they are the main source of good news for Serbia.

Finally, both audiences agreed that media bias is negatively associated with Serbia has a negative influence on the destination image and international positioning of Serbia as a destination brand. But still both Serbian Diaspora and Residents hold the view that Serbia is a recommendable destination for tourism, business and pleasure. (See Exhibit 1. for graphical description of differences and similarities of Serbian Diaspora and Residents).

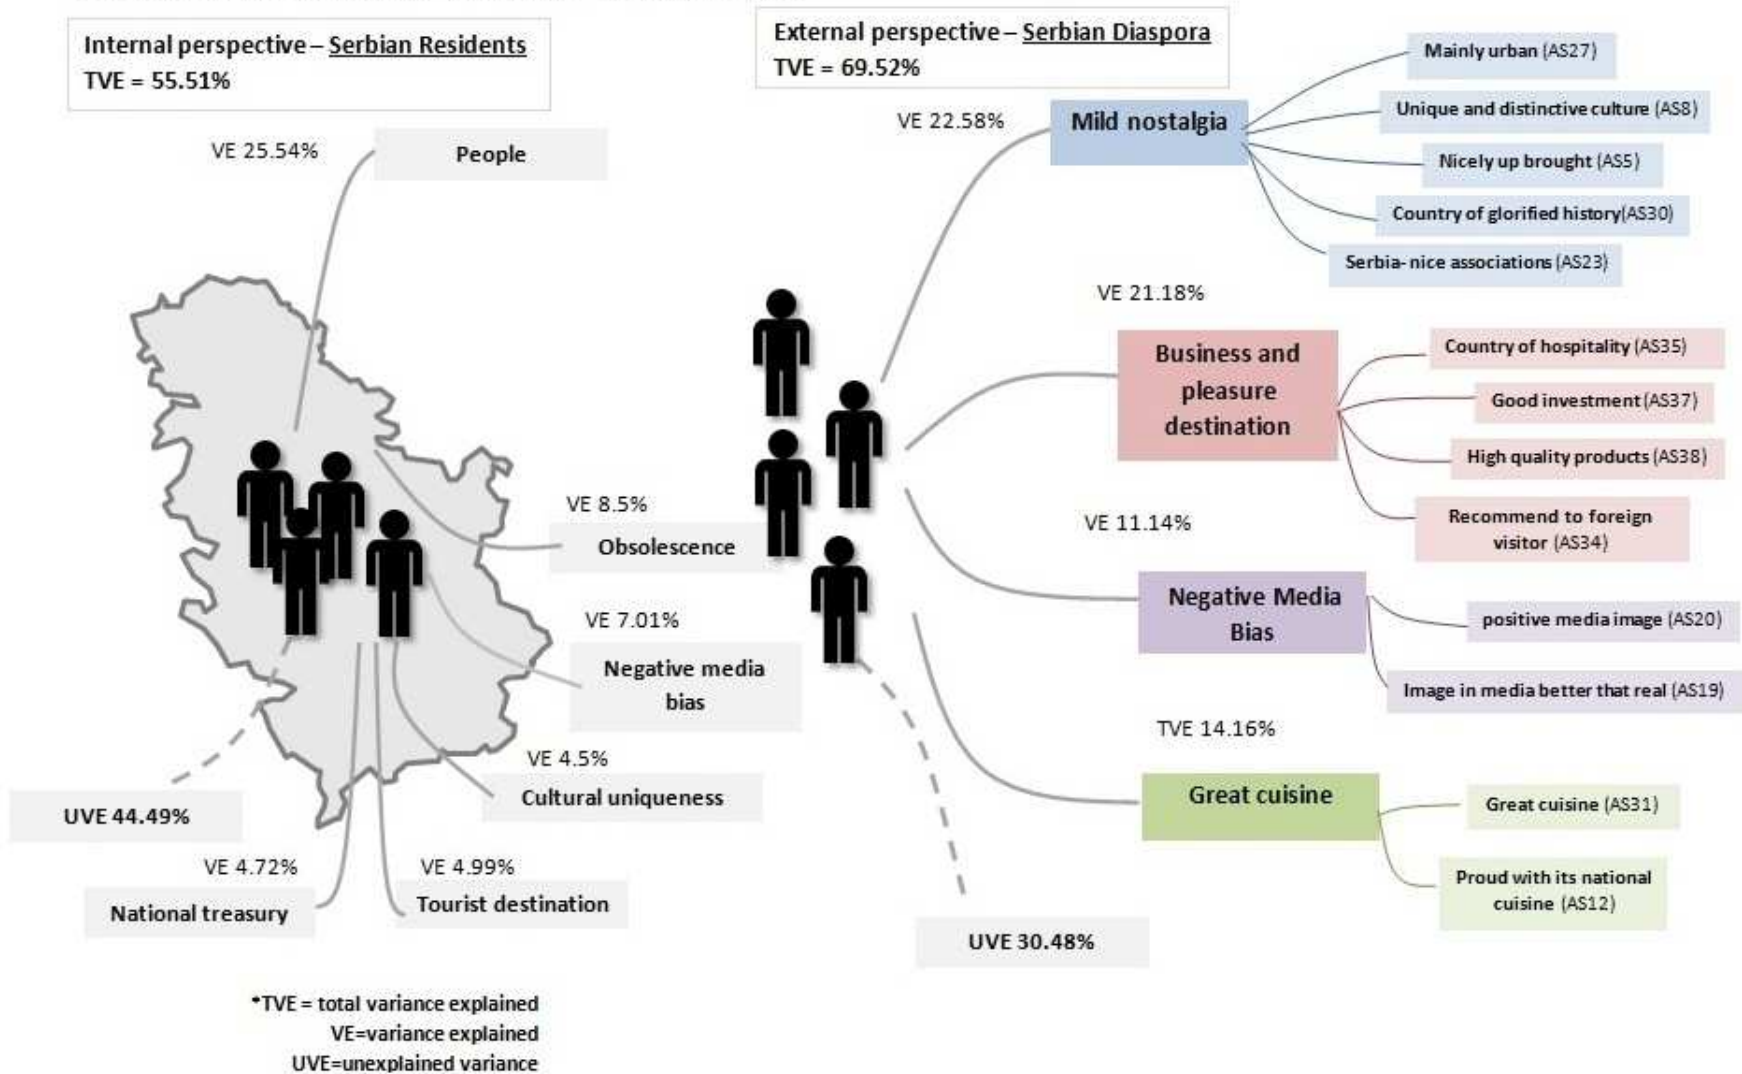

Conclusion

Referring to the research question stated at the beginning of the paper and according to our findings, significant differences and similarities between Serbian Diaspora and Serbian residents exist. Serbian Diaspora identified 4 elements of Serbia brand identity: **mild nostalgia, business and pleasure destination, negative media bias** and **great cuisine**. Residents were more detailed and identified 6 broad brand identity elements: **people, obsolescence, negative media bias, cultural uniqueness, tourist destination** and **national treasure**. Furthermore, both audiences are driven by different emotions that are strongly affecting their perception of Serbia as a brand - Diaspora by nostalgia and residents by national pride. Diaspora and residents highlighted that negative media bias that follows Serbia as a country has a strong impact on external perception and positioning Serbia as a brand. Lastly, despite all negative associations that surround Serbia, both audiences match opinion that Serbia is still recommendable tourist destination and a great place to visit.

There are several limitations of this research study that need to be highlighted. Primarily, small sample size of Diaspora, as well as period spent living abroad that was not taken in consideration for this research can be seen as significant limitation of this study.

Having in mind the fact that Serbian Diaspora has a great impact on Serbian economical and social development; future research should be specifically targeted for countries where majority of Serbian Diaspora live. Further research should also focus on recognizing core values of Serbian brand identity from residents and Diaspora perspective in order to create a unique destination branding strategy for development and differentiation of Serbian brand identity from its competitors at the Balkans and Mediterranean region.

NEGOTIATIONS BETWEEN GERMANY AND LATIN AMERICA: A CROSS CULTURAL CUALITATIVE STUDY

Ogliastri, Enrique¹

¹INCAE & IE Business Schools. Email: Enrique.Ogliastri@ie.edu

Abstract

This is a summary of research about the inter-cultural negotiation processes followed in Germany and Latin America, highlighting similarities and differences. Results are based on research carried out with managers on Latin American and German negotiations cultural values. The study includes 110 interviews using a semi-structured questionnaire on a concrete negotiating experience in one of these cultures. The author offers suggestions on how to negotiate more effectively in the German and Latin American cultures. The purpose of the paper is to build theory using a qualitative, comparative and grounded theory approach to cross-cultural negotiations.

This paper includes five sections. The first part presents the research. The second continues by summarizing results on the sequence of negotiation processes in the Latin American culture. The third section contrasts by presenting characteristics of negotiating processes followed in German culture. The fourth part analyzes the similarities and differences found using a quantitative Globe study with managers on German and Latin American cultural values. Finally, the fifth section presents several conclusions and recommendations for people from these cultures who will be negotiating with the other.

A negotiation culture is understood as the set of values, beliefs, behaviors, customs, expectations, process and rationales shared by people from a region or collectivity and used when they try to make an agreement to do a common project or to solve differences or conflicts of interest.

Keywords: negotiation cultures, cross-cultural management, qualitative/quantitative comparisons.

THE STUDY

Objectives

- To describe the sequence of negotiation behaviors in Latin America and Germany.
- To understand the differences and similarities between Latin American and German negotiation cultures.
- To predict and highlight negotiation misunderstandings and problems associated with cultural patterns in these two regions.

- To offer guidelines and advice for people about to engage in negotiations with the other culture.

In summary, the purpose of this paper is to build theory based on practical experiences.

Methodology

Qualitative research on intercultural negotiations is anthropological (describing and understanding the phenomenon from the participants' perspective) and sociological (symbolic interactions describing and interpreting the negotiating process to understand the participants' behaviors). Likewise, it requires studying the culture from the outside (what is said by those who are negotiating in the culture) and inside (the internal perspective) (Dorfman, 1996; Morris et al, 1999). As what usually happens with qualitative methodologies, the analytical process has been primarily one of induction and comparison, meant to develop an explanation on one culture's way of negotiating with the other one (Glaser & Strauss, 1967).

The process began with research questions rather than hypotheses: how do Latin Americans negotiate with Germans (and Germans with Latin Americans), why do they negotiate that way, what characteristic processes do they use, and what recommendations can be made to them and to those negotiating with them? The research questions were very concrete, limiting the theoretical field to negotiating practices.

Research questionnaires were targeted for one specific negotiation experienced by the respondents. To avoid stereotyping, the questionnaire focused on only one experience. Interviewees were asked, through open questions, to narrate their experience with the other culture, from pre-negotiation through the negotiation sequence. It also included a question about experiences that were radically different from the ones narrated, in order to assess whether they had described an isolated incident from their general experience. Finally, they were asked to describe what they had liked the most from that particular experience (and what they had not liked), what amazed them, the similarities or differences they thought existed concerning participants in the negotiation, the other party's negotiating behaviors and the advice they would give a friend or colleague who had to negotiate in that country. See the questionnaire in Appendix 1.

This paper is based on a data analysis using the constant comparative method on 110 interviews about a concrete negotiation experience in the other culture (Germans in Latin America, and vice versa). Data analysis consisted of semantic coding/classification of interview statements based on 20 predetermined dimensions adapted from Weiss & Stripp's (1985) framework: content analysis of open-ended questionnaire data.

I used two successive "samples." The first was a thesis written by Ovalle (2000) based on 86 interviews (with 36 Germans and 50 Latin Americans). The second was a thesis written by another student who had not read the first one; he used 24 interviews conducted while he

was living in Hannover (Germany) for eight months during the World's Fair in 2000 (Martínez, 2001). The second thesis reached similar conclusions, validating the first. This paper integrates the results from both research projects.

Another way I validated the data was to incorporate responses from groups of Latin American managers with experience working in Germany, and vice versa; they have reviewed and validated the information presented. A final source of validity is the comparison I made to results from other studies about these managerial cultures, including a qualitative study of intercultural negotiations between Colombians and the Dutch and quantitative measurements from the Globe study.

I achieved inter-rater reliability by training my students to select and classify sentences from the interviews. This revision had face validity because the answers were mostly straightforward behavioral descriptions, without much interpretation or inferences. We continued independently selecting/coding the information until achieving a complete fit; this took five interviews for one student and three for the other one.

THE CULTURAL SCRIPT OF NEGOTIATIONS IN LATIN AMERICA

Not much research on negotiation processes in the Latin American culture exists. Ogliastri's research (1992; 1997; 2000) shows that there are several similar negotiation patterns that are followed throughout different countries in Latin America. He concludes that even though not all Latin Americans negotiate the same way, it is possible to identify traditional patterns or guidelines that have been established and are widely used in negotiations: a negotiation culture. This paper confirms such general conclusions, but points to specific behaviors and sequences of events in experiences with German counterparts.

2-1. In Latin American culture negotiators are supposed to get to know the other side personally before starting business. Culturally, personal relationships are very important in business, and it is a plus to be friendly, soft and warm. Meetings are often relaxed, with few time pressures. Negotiators are expected to use their instinct and first impressions to evaluate whether they trust you and your company. Negotiations become a very interpersonal process. Latin American culture avoids conflict and open confrontation, preferring to use close, personal relationships to soften the experience.

2-2. In Latin American culture negotiations are not usually prepared for in great detail. Additionally, negotiators often hesitate to share information or data about the problem because they believe the other party will use it against them.

2-3. In Latin American culture there is a belief and assumption that there are winners and losers in negotiations: one side wins at the expense of the other in a "zero sum" situation, in which the problem is basically solved by distributing benefits. Bargaining and haggling are standard negotiation tools. The process often starts by making exaggerated offers and demands, aimed at framing and positioning for subsequent negotiation moves.

2-4. Latin American negotiations emphasize persuasion. Negotiations often begin with hospitality: people in a good mood, telling jokes, being friendly and warm, or trying to find personal similarities. Negotiators try to be quite eloquent (convincing you with their reasoning, moving you emotionally) and turn to power as a last resort (using loud voices and disinterest to intimidate).

2-5. In this culture people express emotions quite openly. In Latin America it is believed that a genuine and authentic person is one who openly shows what he or she is feeling. In some parts of the region, people can be more hostile, but in the majority, it is customary to conceal this aggression and show more affection. Some negotiators control their emotions and are more aware of how to use them to have an impact on others. Generally, though, the emotional side of Latin American culture shows less concern for rationality; there is much more romanticism, as demonstrated by Pascal's quote: "The heart has reasons that reason cannot know."

2-6. In Latin American culture negotiators analyze all points on the table at the same time, as a "package" or negotiation block, instead of using a more traditional technique of going down the agenda, agreeing on a point and moving to the next. This package method corresponds to the most advanced negotiation theories, since it creates more mutual value through the exchange of concessions. However, many people from outside the region find it disorienting and chaotic.

2-7. Many sub-cultures in Latin America play on language ambiguities. A "Yes" may in fact mean "maybe" or even "No," if the negotiation party does not "read" the underlying context in which things are said (subtle signals on how people speak or body language). In these settings, literal translations can be completely incorrect. These sub-cultures tend to exist in areas away from the coasts (for example, Bogota, San José de Costa Rica, La Paz and Quito).

2-8. Latin American culture is full of uncertainty, which makes people very flexible and able to manage new or unforeseen situations; therefore, negotiators in Latin America should be prepared for a wide margin of error around any commitment made. This means that agreements can change and the legal "Act of God" (casus fortuitous) in contracts is, in fact, relative.

2-9. Even though business is often a short-term deal in Latin America, people consider the personal relationships they develop while negotiating to be long-term. Therefore, they try to maintain good personal relationships with the other side even if no business agreement is reached.

A COMPARISON WITH THE GERMAN NEGOTIATING CULTURE.

Several studies have analyzed German culture and negotiation processes (Flippo, 1996, Glouchevitz, 1997, Kenna & Lacey, 1985). The main difference between those studies and this paper is that I offer a more concrete and precise perspective without implying universalism

or that the results only reflect interactions with the Latin American culture. In addition, I am focusing solely on negotiation cultures and cross-cultural processes.

I have collected 218 written experiences of negotiations between Germans and Latin Americans. However, in this section I am using only the 110 included by the two bi-cultural students in their theses about German negotiating patterns written under my supervision (Ovalle, 2000; Martínez, 2001). Based on these studies, I developed four main conclusions about how negotiations are different in the German culture.

3-1. In Germany, negotiators are expected to study all the business details before beginning the negotiation and define the objectives they wish to achieve. These objectives may be optimistic, but are not irrational. German culture places emphasis on achieving sustainable results in the long-term. In contrast, negotiations in Latin America often are started without thorough preparation, and there is a short-term focus.

3-2. In German negotiating culture opening demands are presented objectively with the reasons and data behind them. This pragmatic approach allows for an upfront presentation of objective data, a confrontation, of sorts, using facts without arrogance or personal attacks. In cultures that place emphasis on bargaining, like in Latin America, negotiators tend to make exaggerated requests to see how the other party reacts and push the limit to an extreme so that an agreement in the middle can be reached. These are two very different ways of negotiating.

3-3. Another difference is that German culture expects an ordered negotiation process, in which one negotiation point is discussed at length until it is resolved. Negotiators avoid moving on to the second point until the first is finished. Most people process items using a "point-by-point" negotiation style, in a methodic and orderly manner. This is very different from "package" negotiation, like in Latin America (and Japan), where negotiators discuss everything at the same time and "nothing is agreed upon until everything is agreed upon." Negotiating in a block or package is hard to do for "monochronic" (one thing at a time) and orderly cultures that prefer to finalize one item before beginning the next. Although it is important for negotiators to be organized, in negotiation, the inability to discuss several items at the same time is an obstacle to more comprehensive solutions.

3-4. Personal relationships during negotiation also differ. In Latin American culture people can be emotional, personal and warm, even in business negotiations. In contrast, the German culture places an emphasis on rationality, being objective, hiding emotions and not mixing personal and business topics. An intellectual confrontation about data is considered unemotional, and it clashes with the Latin Americans' preferred style.

The following section presents cultural differences found in recent studies that can help us understand these negotiation patterns better.

ANALYZING THE DIFFERENCES

Several studies have shown that Latin American- and German-speaking countries belong to two different cultural regions in the world (Schwartz, 2008; Chokkar et al, 2007; House et al, 2004; Inglehart and Carballo, 1997; Ronen S., Shenkar, O, 1985). Each region has its own set of values and practices (Ogliastri et al, 1999; Szabo et al, 2002). Table 1 presents a summary comparison between these two different cultures, focusing on East and West Germany (Brodbeck and Freese, 2007) and Latin America (Ogliastri et al, 1999). Identifying these differences helps us to understand negotiation patterns better and how misunderstandings may occur. For most of these variables, the Table presents current cultural practices as well as those values or preferences that managers have, which have been identified in research on general cultural traits. This Table has been prepared exclusively to facilitate understanding on the abovementioned differences in negotiation patterns between Latin American and German cultures; there are seven key differences between behavior and values between these two negotiating cultures.

Table 1: Cultural similarities and differences between Germany and Latom America

VARIABLES	Germany: current culture/practices	Germany: desired or preferred culture	Latin America: current culture/practices	Latin America: desired or preferred culture
1- Uncertainty avoidance	High (A)	Low (C)	Low (C)	High (A)
2- Family and group collectivism	Low (C)	Low (C)	High (A)	High (A)
3- Assertiveness	High (A)	Low (C)	Average (B)	Average (B)
4- Orientation toward performance	High (A)	Average (B)	Low (C)	High (A)
5- Future orientation	High, long-term outlook (A)	Low, focus on present (C)	Low, focus on present, short-term outlook (C)	High, future outlook (A)
6- Time	Monochronic		Polychronic	
7- Importance of communication context	Low		High	

Source: Elaborated by the author based on data from GLOBE (Brodbeck and Freese, 2007, Ogliastri et al, 1999) and Van Hoof et al (2005).

Note: The letter A represents results with a standard deviation higher than the overall average in the Globe study.

The letter B represents results with a standard deviation just above or below the overall average. The letter C represents results with a standard deviation lower than the average. Globe interviewed 17,000 middle managers in 61 countries. The first column represents the "as is" (current common practices) situation in the home countries of the interviewed managers; the second indicates what they think the situation "should be" (preferred values).

For example, managers from Germany described their culture as "highly inclined to avoid uncertainty" (A), but wanted them to have a "low inclination to avoid uncertainty" (C).

4-1. According to the Globe Study on middle managers (Chokkar et al, 2007), German and Latin American cultures are completely different in terms of trying to avoid uncertainty, though there is a trend for convergence between the two. German managers try to avoid unforeseen events at any cost; they want to minimize uncertainty, so they carefully prepare for the negotiation and leave nothing to chance. They take little risk. At the same time, they would prefer for business relationships to have a little less structure than what their culture normally expects so the process can be more flexible. On the other hand, Latin American managers live with uncertainty and would like much more security and institutionalism. These trends are positive for both parties' negotiation processes because they may be able to meet half-way.

4-2. German culture is individualistic, both in family life and institutionally or socially, and this trend is not likely to change. Latin American culture is the opposite, in which people value collectiveness in families and groups, cohesion, and loyalty. They value group benefits and achievements over individual ones. The two cultures are clearly different, both in terms of practices and preferred ideals.

4-3. German culture accepts assertive, aggressive and confrontational communications, and uses direct and serious language. New negotiation theory suggests a "soft on the person, hard on the problem" approach; however, being "soft" or "hard" is culturally-relative. In the Latin American culture, on the other hand, people are raised to be softer in personal relationships and in the middle in terms of assertiveness. Problems with interpersonal business relationships reflect these differences in values: an effective way to solve a problem for some, being "hard on the problem," can be interpreted as being "hard on the person," since relationships are not always seen as separate. Fortunately, German managers would prefer less aggressive interactions, and Latin American managers would prefer more direct and assertive ones, so it is possible that they could negotiate together somewhere in the middle.

4-4. Something similar is seen in performance orientation, which is declining in German culture, but increasing in Latin America. This convergence will facilitate the negotiation process so that the negotiators focus more on results than personal relationships.

4-5. In terms of time, Germans would prefer to not think so far in the future as they do now. The opposite is true for Latin Americans, who would prefer to move from a present, short-term perspective to a more long-term one.

4-6. Another topic related to time that has been studied by Edward Hall (1966, 1998) has to do with the process: German culture is monochronic, meaning people prefer to do one thing at a time and do it well. In negotiations this means that they analyze and agree on issues point-by-point. This process is not as appropriate according to new negotiation theory because it causes them to miss opportunities to exchange priorities and trade off concessions, which result in mutual value creation. The apparently disordered and confusing process of discussing several points at a time, exploring concessions of one point for another, requires a

polychronic mentality (doing several things at once), which is more common in Latin Americans culture.

4-7. Finally, one other cultural difference is the importance placed on communication context (Hall, op. cit.). Cultures with little communication context speak clearly in univocal tones, avoiding ambiguity and misunderstandings. Other cultures, like the Latin American or Japanese ones, have much greater communication context, in which the message is relayed not only through the words used, but also by the way they are said, the tone of voice, gestures, non-verbal communication and body language. Like the Dutch (Van Hoof et al 2005), Germans operate with little or low communication context. This makes negotiations done with literal translations difficult and results in misunderstandings.

SUMMARY AND ADVICE

The four main differences between the Latin American and German negotiating cultures include the following topics: prior preparation to reduce uncertainty, the use of bargaining or objective technical standards, the process of negotiating packages and the type of interpersonal treatment expected by each side.

Latin Americans could learn from the German culture how to prepare better and improvise less, not open negotiations with exaggerated and unfounded demands and use objective standards. They should remember that an attack on a problem does not equal a personal attack. It must be clear that Germans separate their personal and professional lives, and Latin Americans should not get upset by their distance since it is something normal in German culture. By learning about German culture and values before the negotiation, Latin Americans will be able to understand them better, feel less frustrated and make the necessary adjustments.

On the other hand, German negotiators could learn from the “package” negotiation technique used in Latin America, to make concessions on different points, instead of trying to solve everything in order, point-by-point. Likewise, they should accept that Latin American culture is less aggressive and direct and that they might see the Germans as being arrogant and confrontational, which would not be productive in the negotiation. In order to incorporate Latin American values and culture, Germans would have to be more flexible and less impatient, developing warmer relationships. Sometimes these types of experiences make us more aware about our own cultures and understand that “normal” is culturally-relative.

This cultural analysis reviewed traditional practices and lessons learned in families, schools and organizations in society. We have highlighted general values and preferences, some of which are different from traditional ones, in these regions. However, generalizations at the cultural and individual levels are different. Individuals are distinct and unique. It should be highlighted that our data shows dissatisfaction with current cultural trends: things that Germans and Latin Americans would like to change. In particular, it seems that there is a

certain convergence between the two in several key areas. In today's global world, it is imperative that negotiators be able to understand very different cultures in order to be effective in the negotiation process, as well as enrich their own understanding.

APPENDIX 1

Questionnaire No. 1
Formal International Negotiation

Name of respondent _____ Nationality (culture) _____

Country/culture the respondent negotiated with: _____

Company/Organization _____ Date of the negotiation _____

Name of the interviewer _____ Date of the interview _____

Recall your negotiation experiences in other countries. Think of a former experience that has been particularly significant.

- Specifically, think of one concrete formal negotiation (purchase or sale, conflict resolution, discussions to reach an agreement, etc.) where you participated and that involved people or entities from two countries.
- What were the previous issues (interests) leading up to this negotiation? (What would have happened to each party if no agreement was reached; what were their alternatives? BATNA) What were the main options for each party?
- How did you and they prepare for this negotiation? What were the pre-negotiations, how did they approach you?
- How did you decide who was going to negotiate, what would be on the agenda and where would the negotiation take place?
- How did the negotiation begin? (Was it a haggling/bargaining process with an excessive opening demand?) Who opened the negotiation? How did each of the parties go about their openings? Were criteria and or objective criteria sought or established, or was it a mere bargaining of positions?
- What were the main events in the process? How did you get to the most important points?
- How was the deal closed? Was it a good deal? (satisfactory to both parties, took a long time, etc.)

- What about this experience called your attention the most? What did you like the most? What did you like the least? Do you think people from the other country are similar to you? (in what respect?) Different from you (in what respect?) What are they like?
- Do you think this was a typical experience? Have you had experiences that differ much from this one? (with people from the same country or culture)
- What advice would you give someone (a colleague or a friend) going to this other country to negotiate?
- In brief, how do people from that country usually negotiate? What is the difference between that culture and yours that you experienced in the negotiation you just recounted?
- If you had to do this negotiation again: would you change your behavior? What would you do differently and why?

GREEN ECONOMY: THE CASE OF SUSTAINABLE BUILDING CLUSTER IN GREECE

Papadopoulos, Ioannis^{1,2}; Trigkas, Marios^{1,2}; Ntalos, George^{1,2}; Eleni, Premeniou^{1,2}

Abstract

The aim of the present original for the Greek standards research, was to reach the necessary conclusions in order to detect the critical mass of the professionals who really wish, either to get actively involved or to support the establishment of a sustainable building cluster, which will contribute in green economy.

For the present research, which was made in mid of 2010, the methodology followed was this of editing, gathering and processing, of questionnaires specially constructed for the purpose of the study. The questionnaires were addressed to businesses and organizations that are directly or indirectly involved to the establishment of the sustainable building cluster. The data were processed and analyzed using SPSSWIN ver 17.0 and the relative statistical tests of Frequencies, Descriptives and Crosstabs, independence tests between all variables using X2 criterion, correlation analysis and analysis of variance (t-test), and content validity tests of the variables used in the questionnaires were also made.

Greek enterprises estimate that the wave of “green buildings” is coming to Greece. Most of them are forecasting that in the next 5 years this will be institutionally established and they are getting prepared for this.

The targets set from the most Greek enterprises, in order to support the sustainable building cluster and to be supported by it, are mainly focused on the development of new innovative products, on the improvement of the quality of the products that they produce, on their conformation to environmental legislation and on the improvement of their business' image/fame, on the reduction of pollutants and wastes and on the reduction of production cost.

For the development of sustainable building in Greece, the factors that have been found to play the most significant role and on which attention should be paid by Greek cluster's enterprises, seem to be: the economic situation of the country, the appointment of advantages and benefits for the users of new “products” of sustainable building, the implementation of appropriate and effective ways of publicity, promotion and advertisement of sustainable building, and the support of the investment from financing programs.

Clusters are gaining continuously growing significance and they can play a fundamental role towards the direction of “green economy”, and the improvement of innovative and entrepreneurial landscape of a country in the basis of cooperation and synergy creation of Greek construction companies and related organizations, in order to overcome the consequences of the national and global economic crisis and secure a further development.

This research is the first one in Greece, trying to investigate the critical factors that are incorporated and shape the meaning of sustainable building in Greece, in the light of economic crisis, but also investigating the challenges that arise for green economy and development.

Keywords: green economy, clusters, sustainable building, environment, entrepreneurship, sustainable development, innovation

Introduction – Aim of the Study

Sustainability towards a green economy and entrepreneurship

The update of European strategy, as it was expressed through the review of Lisbon strategy with “Europe 2020” strategy, is aiming to the exit from the economic crisis and the preparation of the E.U. economy for the next decade (Rizzuto, 2011; European Commission, 2010; European Policy Center, 2010; Erixon, 2010; Frazer et al., 2010). Among others, priority will be given on: a) connection between innovation with R&D, b) the efficient use of E.U. resources, in order to attain a low carbon emissions economy and c) the promotion of entrepreneurship and the development of new skills for the creation of millions of new jobs across Europe.

In the framework of this strategy and following the Kyoto Protocol, European Union is obligated to reduce its greenhouse gas emissions per 20% till 2020 in relation to the levels of 1990. The environmental policy of all the nations that have signed the Kyoto Protocol, in which Greece is also participating, is mainly determined by actions which have to do with the reduction of human activities' contribution in climate change, and with the conformation of the countries to the commitments and the targets of the protocol, based on the National Programs of greenhouse gas emissions reduction (Saikku et al., 2008; Narayan et al., 2007; Carraro, 2000; Oberthur and Ott, 1999; Grubb et al., 1999).

The actions related to the confrontation of climate change, have to incorporate a change of the existing developing model, towards the direction of a sustainable, green economy of low or zero, if possible, carbon emissions with the use of modern technology. Besides the focusing on environmental protection, when considered a singularity, sustainable development is the result of the growing awareness of the global links between mounting environmental problems, socio-economic issues having to do with poverty and inequality and concerns about a healthy future for humanity. It strongly links environmental and socio-economic

issues (Hoppwood et al., 2005). The development of this model has to be based on, and supported by the horizontal coordination of mitigation and reconciliation policies in the sectors of energy, industry, agricultural production and many others such as the sector of constructions and building (Blakely and Leigh, 2009; Haughton and Hunter, 2003; Russo, 2003; Adams, 2001; Breheny and Batey, 1992). The cost of emissions reduction and adaptation in climate change, may seem relatively high in the beginning, but is much lower in comparison to the cost that we will have to pay because of any inaction. (Van Vuuren et al., 2006; Nordhaus, 2001; Manne and Richels, 1999).

Regarding Greece in specific, according to a recent report evaluating the cost of climate change (Bank of Greece, 2011), the most unfortunate scenario from the aspect of the tension of human climate change, corresponds to the absence of any action for the reduction of the human gas emissions that causes this change and it was characterized, according to the report, as the Scenario of No Action. In this case it is estimated that the Greek GDP will suffer a reduction, in annual base, of 2% in 2050 and of 6% in 2100. The total accumulated cost of the No Action Scenario for Greek economy, concerning the period till 2100, expressed as a reduction of the base year GDP, is up to €701 billions (in fixed prices of 2008). According to the best scenario called the Adaptation Scenario, the Greek GDP will show a reduction of 2,3% and 3,7% during the years 2050 and 2100, correspondingly, and the adaptation cost it is estimated up to €67 billions. However, the adaptation measures are not able to erase the total of the losses because of climate change, they just reduce them.

The tendency in most developed countries has to do with the turn of people towards the achievement of a better life quality, the sustainable management of natural resources showing respect to the environment. Thus, the interest of the market nowadays points to the development of a continuously growing “green development”, “green economy”, “green entrepreneurship”, “green building”, especially for the small and SME’s, but also to the improvement of citizens' quality of life (Allen and Malin, 2008; Berchicci, 2008; Henderson, 2007; Bansal, 2005; Brown, 2003; Milani, 2000; Pedler et al., 1996; Pearce and Atkinson, 1993).

The key of green development and economy lies to the principal of sustainability and sustainable management. At this point, we have to mention that the meaning of sustainability has been originally developed by Carlowitz in 1713 (according to Speidel, 1972) and has started being implemented by the end of the 18th century. At a next stage it has constituted the conceptual principal of the reasonable environmental management globally. Sustainable development, concerns development in such a way that satisfies the needs of today's generations, without decreasing the capability for the satisfaction of the needs of future generations (Bell and Morse, 2008; WCED, 1987; Stamou, 1985).

The Sustainable building (Radlin and Falk, 2009; Bunz et al., 2006; Russo, 2003; Anink et al., 1996) concerns the design, construction and operation of buildings and landscapes that incorporate energy efficiency, water saving, minimization of wastes, the prevention of

pollution, the efficiency of the resources of the materials that are used and the quality of life in buildings, during all the different phases of a building's life. Per definition, sustainable development, leads to "living cities" that respond to residential and environmental needs, not only through resources and energy saving, but also through the capability to support more productive, stable and innovative economies in urban areas (Haughton and Hunter, 2003).

Greece, incorporating these policies to its residential development, legislates in favor of a more environmental friendly building and house activity. The energy demand of the house sector in Greece, is expected to show a relatively small increase during the next years, mainly because of the relatively small increase of population and of the introduction of more efficient energy technologies (National Program of greenhouse gas emissions reduction – Governmental Paper A'-58/5-3, 2003). The average annual increase of energy consumption in the sector during 2000 - 2020 is expected to reach 1%. Energy activity is improving with an average annual rate of 1.9% (National Program of greenhouse gas emissions reduction – Governmental Paper A'-58/5-3, 2003).

After the previous analysis, the question that rises as a challenge for Greece is: Can sustainability and entrepreneurship in building and construction sectors constitute a common platform of policies and business strategies approach, for a greener economy?

The answer has already been given through the already implemented policies, in the framework of NSSF 2007 – 2013 (National Strategic Statement Framework) and the Sector Programs "Environment – Sustainable Development" and "Entrepreneurship and Competitiveness". The main development object concerns the protection, improvement and sustainable management of natural environment, in order to comprise the background for the improvement of citizens' quality of life as well as to contribute to the improvement of competitiveness of Greek economy. At the same time, the improvement of the Greek business and production system's competitiveness and extroversion is being aimed, with significant emphasis being given on innovation through the promotion of the National Research, Development and Innovation System, on the products' quality improvement and on the promotion of business clustering.

The role of clustering

At the same time, more positive results are being observed, concerning firms of many economic sectors, which are collaborating and participating into a cluster and thus this participation is recognized as a valuable tool for economic development (European Cluster Observatory, 2010; National Observatory of SME's, 2009; European Commission, 2005, 2006 and 2007; Cortright, 2006; Robinson, 2002; Rosenfeld, 1997; Malmberg *et al.*, 1996). The growing focusing on clusters and innovation systems, reflects the importance of specific initiatives at a regional level, that will become the driving force of innovation capabilities and

of business competitiveness (Trigkas, 2010; Makios *et al.*, 2006; Gordon and McCann, 2005; Pittaway *et al.*, 2004; Prastakos *et al.*, 2003).

Porter (1990), describes the cluster idea in the light of the “*diamond of competitive advantage*” which reflects the meaning of a cluster and how the position of an enterprise into it affects its strategy and productivity. The four elements of this diamond incorporate factors dealing with the enterprises resources, demand factors, related and supporting industries and enterprises and finally, the business strategy, its structure and its competition.

According to the Hellenic Organization of SME’s and Craftsmanship and the National Observatory of SME’s (2009) as clusters are defined “*groups of competitive enterprises, usually established in neighboring regions, which interact aiming to economies of scale (common procurement, logistics, storage etc.), to resources access (capital markets, development and transfer of knowledge, specialized personnel), to direct and accurate information and in general to initiatives undertaking regarding the reduction of production cost, and the improvement of business - participants operation and competitiveness*”. In these clusters, besides the enterprises – participants (known as body enterprises), supporting enterprises and organizations are also participating, such as industries' associations and professional chambers, technological institutions, research centers and universities, governmental organizations, financing organizations, network brokers etc. which offer services of a horizontal character towards the cluster participants.

A cluster is formed by the participating enterprises, but also constitutes an separate operational entity, institutionalized or not. Each successful cluster, implements more effective activities that either the enterprises – participants were promoting individually, or were not promoting at all till now. These activities aim to the participants’ enhancement, as well as to their external business environment enhancement, from which the cluster takes resources and capabilities (National Observatory of SME’s, 2006).

Clusters are mainly composed by enterprises that are operating in the same economic sector (*horizontal clusters*) or into different sectors of production process, meaning that they belong to the same logistics (*vertical clusters*). Those enterprises are called either “enterprises-participants” or “body enterprises”. Clusters are located to a specific geographic region, since the neighboring facilitates communication, inter transportations but also business interacting (Shields, 2003). But if business transactions are not affected by geographic distance, clusters may be developed in wider geographic regions. Thus, clusters exist at local, regional, national an international level. Clusters may also be developed in an urban and agricultural environment.

Industrial clusters constitute a total of enterprises and related financial organizations which are located close to each other (Cortright, 2006; Shields, 2003). These neighbouring enterprises often enjoy advantages regarding their production, because of this specific neighbouring (Cortright, 2006).

The importance of clusters is underlined also by O.E.C.D. (2002) through the investigation of the way in which business clusters help innovative activity of enterprises through knowledge flows, new ideas and information inside the cluster, under the framework of a wider innovation system. Cooperation with innovation organizations, in the framework of such a system, gives competitive advantages to the enterprises since the cooperative organizations have the capability to provide specialized know how towards the enterprises, specialized personnel, financing opportunities and R&D for the production of new products (Trigkas, 2010; Drucker, 1985). For that reason, we can state that innovation systems are constituted by: a) the enterprises of a cluster along with the supportive units, b) innovation organizations, c) interactions between all the above.

The key for success of such an innovation system is the way that the above mentioned organizations and enterprises are interacting in such a network (Pittaway *et al.*, 2004) as well as individual elements such as, the applied policy, the existing legislation, infrastructures, the capability for market financing and development (Woolthuis *et al.*, 2005).

Also, firms that are already exporting their products, are more supportive to the establishment of a cluster, while the absence of new products development, the low promotion of products, the weakness of exporting and the tendency of focusing only on low prices of products as the only competitive advantage, are the most important problems in decision making regarding the creation of a cluster (Papadopoulos *et al.*, 2008).

A related study that was conducted in Greece concerning the establishment of a cluster for small enterprises has shown that, the main objective of businessmen participating into a cluster, is the growth of competitiveness through the implementation of new innovative activities for the promotion and development of new products, while their priorities concerning decision making in investing, are the improvement of quality, of productivity and the development of marketing (Karagouni *et al.*, 2009).

The European Community directions for the coherence policy of 2007-2013, have as a target the improvement of knowledge and innovation in the basis of economic development (GSRT, 2007). Concerning the growth and the improvement of investments for research and technological development, one of the priorities that have been set, is the enhancement of cooperation between enterprises and between enterprises and public institutions of research/higher education, supporting the establishment of regional and inter regional clusters of excellence (GSRT, 2007; National Observatory of SME's, 2006).

According to a recent report of the European Clusters Observatory (2010), clusters constitute a fundamental part of the European economic reality but also of the policy for innovation and entrepreneurship, as mentioned. The benefits of clustering concern the achievement of economies of scale and scope, reduction of transactions cost, increase of interactions and cooperation between the enterprises based on confidence relationships, reduction of costs because of specialized occupation, business services, products and raw

materials, public investments for the satisfaction of specific sectors' needs, creation of markets for the satisfaction of specific products' needs. Furthermore, clusters are recognized as the driving force for innovation through knowledge flows between its members both because of their geographic closeness as well as through the creation of new knowledge.

Perspectives of a sustainable building cluster in Greece

According to the above, sustainable building cluster rises as a new form of economic activity, having as a core the private green entrepreneurship, in cooperation with universities, research centers, organizations etc. aiming to the development of cooperation and in extension the maximization of environmental protection, the improvement of business environment, but also as a new opportunity for competitive advantage and implementation of national strategic policy for a green economy. This new tendency and reality should be used by the Greek enterprises (producers, suppliers, scholars, constructors), but also by the citizens who wish to participate into a sustainable building network, in order to modernize the way of doing business and gain themselves significant and multiple benefits that will rise from this specific action.

In the construction and related activities sector, a significant number of clusters across Europe is operating, which shows the potentials of the sector. If we include also, the number of clusters concerning further elements of construction – building sectors (wood, metal, aluminum, electric materials, real estate etc.), it is obvious that at a European level there is a significant perspective of clustering development (European Commission, 2007).

In Greece, according to the report of European Cluster Observatory (2010), there is great specialization in the construction sector, where a significant number of employees are being occupied, with the rest of the sectors to follow. Regarding the regions where this accumulation exists, Attica stands in the first position with Northern and Central Greece, Aegean islands and Crete following (European cluster observatory, 2010). In Greece, very few cooperative structures are operating comparatively to the rest European countries.

The construction sector in Greece

The construction sector in Greece consists one of the most dynamic sectors of economic activity having a total Gross Added Value in current prices for 2009 up to €9.581millions (Greek Statistic Service, 2010). In a GDP percentage, it is up to 4% for the same year. Counting in the data concerning related sectors of economic activity (ICAP, 2009 and 2008), which are in a direct or indirect relation to building sector, such as manufacturing industries, real estate, financing sector etc. it is obvious that the constructions and related sectors hold a significant percentage of total national GDP and occupation.

The data concerning the basic financial figures in the construction sector of Greece (Greek Statistic Service, 2010), show the clear upward tendency of the sector for the period 2000 – 2007. Thus, during 2007, in Greece 108.829 firms were operating in total, occupying 304.589

employees, which is a very significant number. The percentage change for the specific period is up to 35,5% concerning the number of firms, 42,4% for turnovers from constructive activities and up to 65,1% for the turnovers from building activities. It is considered that in general, the course of the numbers is positive, at least until the period before the financial crisis of 2008.

Nevertheless, the above positive ambience in the construction sector was inverted by the recent economic crisis. The positive course of the sector was inverted from 2006 and hereafter while a dramatic decline occurs since 2008, whereon the effects of the crisis start to become visible in Greece too. The negative effects of the crisis that the Greek construction and building sector experiences can be understood better, considering the figures of the decade 2000 – 2009. For this period, the percentage change of the number of buildings was -22,1%, of number of floors -26,8%, of volume -29% and of their surface -29,7%, while their value has changed 74% showing a positive sign, which shows the great increase of the estate value, beside the reduction of demand.

The situation seems to get worse in a dramatic way during 2010, after the recent financial measures in Greek economy. During the period of May 2009 – April 2010, the total building activity index (private and public), has shown a decline of 12,1 % concerning the number of building licenses, of 22,0% concerning surface and of 26,0% in volume, in relation to the corresponding period of May 2008 – April 2009. During the same period of May 2009 – April 2010, private building activity index shows a decrease of 12,2% in total concerning the number of issued building licenses, of 22,5% concerning surface and of 27% in volume, compared to the corresponding period of May 2008 – April 2009.

The above mentioned data, underline the imperative need that exists in the sector concerning the enhancement of production activity, the boosting of demand and competitiveness of the Greek constructive enterprises, in order to be able to successfully overcome the difficult economic circumstances, reversing the present negative ambience and boosting economic development of the sector and of the country in general.

The aim of the present original for Greece research, was the extraction of the necessary conclusions in order to study, at a first stage, the demand of “green buildings” and then to detect the critical mass of professionals who really wish, either to get actively involved or to support the establishment of the sustainable building cluster, as well as to indicate the importance of individual factors and obstacles considering the cluster’s operation and to investigate, in what way this could contribute towards green economy in Greece.

Methodology

The research was based on the collection of primary data from statistical databases, which were processed, analyzed and their results were presented, regarding the quantitative data of the mentioned cluster, such as the construction sector, building activity etc.

The implementation of a specialized research followed, concerning clusters and sustainable building in Greek market. For the data collection of this original research, as a method, the one of editing, collecting and processing of specially constructed for the purposes of the study questionnaires was used, according to the basic principles of marketing research, responsibility, transparency, validity, perception and connection to strategy (Gordon and Langmaid, 1988; Tull and Hawkins, 1990; Doyle, 1998; Aaker *et al.*, 2004; Papadopoulos *et al.*, 2010).

The questions that were used, were aiming to originally study the factors of demand, knowledge, willingness and philosophy of the involved stakeholders (scholars, manufacturing industries, suppliers, constructors, research centers, universities, institutes, organizations) concerning the establishment of the sustainable building cluster.

The potential participants of the cluster, who constituted the study's population, were categorized in 5 major groups. The 1st group contained the materials production industries such as: wood, steel, concrete, gravel, glass, asphalt, plastics, petrochemicals etc. In the 2nd group belong the frames manufacturers, furniture, plumbing, electrical, sanitary, floors, solar collectors' manufacturers etc. The 3rd group contained the dealers and suppliers of timber, steel, aluminum, concrete and other raw materials. The 4th group was composed by civil engineers, architectures, decorators, constructors – contractors, real estate corporations, brokers etc. Finally, the 5th group contained organizations that belong to the category of the cluster supporters, which are the government and innovation supporting organizations, organizations that legislate, promote and educate and more specifically Universities and Technological Educational Institutes, Research Centers, Chambers, Developing Agencies, Public Organizations, Consultants etc. Two different questionnaires were created, with many common questions, the one of which was addressed to the enterprises and the other one to the organizations.

The questionnaire was pilot addressed to 5 enterprises and experts with experience in clusters. From this pre sampling these questions that needed to be rephrased were detected, and thus the quality of the questionnaire was improved, taking its final form (Dillman, 2000). The time period of questionnaires collection was August 2010. Finally, 33 enterprises and organizations responded, and thus the research sample is considered adequate (>30) for the extraction of reliable conclusions.

The data were edited, processed and analyzed through the specialized statistic package SPSSWIN ver 17.0 and all the relative statistical tests were made such as frequencies, descriptive and crosstabs, independence tests between all variables using the X^2 criterion, correlation analysis and analysis of variance (t-test), as well as questionnaires' content validity and credibility (Norusis, 2007; Howitt and Cramer, 2003).

Figure 1: Groups of enterprises and organizations of the study

Results

Evaluation of the sustainable building demand in Greece under the framework of green economy

The organizations and enterprises participating to the relative market study that has been conducted, believe in total that the construction of single “green buildings” (buildings that have the minimum possible energy consumption and use environmental friendly materials) could create a general positive “tendency for sustainable building” in Greece too.

Only some variations exist, concerning the time that the above mentioned “movement” will be developed in a significant level in Greece too, with the existence of an sufficient number of “green” buildings. The majority of the organizations and enterprises of the research (53,6%) believe that “green” buildings will be able to be established in Greece in the next 5-10 years. The most optimistic (29,8%) forecast that this “movement” will be established in the next few years (1-5).

The findings concerning the increase or not of the demand for sustainable building internationally during the last years, is that an increase has been observed in a moderate and satisfactory rate. The factors which have been observed to be altered concerning the demand for sustainable building, as well as their alteration rate, are shown in Table 1. These that have been altered in a moderate level are the enhancement of the media’s role, the enhancement of the role of environmental training and the financing of related activities.

The Pearson correlation analysis concerning the alterations of the demand factors for sustainable building has shown that:

- The more this kind of activities is financed, the more the number of certified professionals, the number of certifying projects and acquisition of experience and

know how from the industry in subjects of sustainable building is increasing (Pearson correlation coefficient = 0.604, 0.721, 0.562, 0.475 respectively at a significance level of 0.01, 2-tailed)

- The more the number of certifying projects in subjects of sustainable building increases, the bigger the number of certified professionals, the number of certified buildings and the acquisition of experience and know how from the industry will also be, (Pearson correlation coefficient = 0.818, 0.796, 0.635 respectively at a significance level of 0.01, 2-tailed) and
- The more the movement of “green buildings” is getting stronger, the more several business opportunities are being developed, corporation schemes are being enhanced along with environmental training and the role of the media is also getting bigger (Pearson correlation coefficient = 0.564, 0.649, 0.547, 0.548 respectively at a significance level of 0.01, 2-tailed).

Table 1: Alteration rate of sustainable building demand during the last years (ranking 1-7, with 1 = not at all, 4 moderate and 7 in a very high rate)

FACTORS	Mean	Std	t-test
Enhancement of the media's role	4,07	1.44	15.5
Enhancement of the role of environmental training	4,04	1.46	13.3
Financing of activities	3,90	1.78	11.2
Acquisition of experience and know hoe by the industry in sustainable building subjects	3,73	1.55	13.2
Development of entrepreneurial opportunities in Greece and abroad	3,63	1.54	12.9
Enhancement of the “sustainable building” movement	3,60	1.61	12.2
Number of certified professionals in sustainable building subjects	3,47	1.48	12.8
Development of corporation schemes in sustainable building subjects	3,41	1.48	12.5
Number of certification projects in sustainable building subjects	3,32	1.47	12.0
Acquisition of experience and know how by the consumers in sustainable building subjects	3,03	1.45	11.5
Number of certified sustainable buildings	2,76	1.60	9.3

In a percentage of 93,3% it is considered that sustainable building will increase the construction price of buildings in relation to the conventional building, in an average percentage of 12,5% approximately. More specifically, this percentage of increase is estimated up to 5-10% from the majority of those questioned (46.4%).

Since it is forecasted that sustainable building will increase the construction of buildings price in relation to the conventional ones, it is of great importance to investigate the percentage of increase that Greek consumers are willing to pay in order to gain the benefits (direct and indirect) from a construction that will be created under the principals of

sustainability. This percentage is estimated up to 7% approximately by those questioned in the research. The majority (82.8%) considers that this percentage can not overcome in any case 10% (Figure 2).

Figure 2: Percentage % that is estimated that the consumers are willing to pay extra in order to buy or construct sustainable buildings

The benefits that the users of buildings that have been built according to the principals of sustainable building seem to enjoy, are at least the following:

- Greater energy efficiency in a percentage of 20-50% (from the 66.7% of those questioned), or 44.7% in average.
- Greater water saving in a percentage of 10-20% (from the 43.3% of those questioned), or 28.6% in average.
- Minimization of wastes in a percentage of 20-50% (from the 33.3% of those questioned), or 32.0% in average.
- Better prevention of pollution in a percentage of 20-50% (from the 39.3% of those questioned), or 50.3% in average.
- Better efficiency of resources, concerning the materials used in a percentage of 20-50% (from the 46.7% of those questioned), or 37.4% in average.
- Better quality of life in a percentage of 50-75% (from the 43.3% of those questioned), or 51.3% in average.

Approximately 5,000 are the enterprises that constitute the industry of sustainable building that can be developed in Greece in the next years. The main characteristics of this industry which seem to affect in a greater, average and smaller rate the development of sustainable building, have mainly to do with:

- The prices of the environmental friendly materials
- The customers and the prevalent public opinion
- The import of new products with environmental characteristics

- The environmental legislation that affects the sectors dealing with building activity
- The existing demand for products with environmental characteristics

For the development of sustainable building in the Greek market, the elements which seem to play a very significant role and should be carefully attended by the Greek firms of the cluster, are: a) the economic situation of the country, b) the appointment of advantages and benefits for the users of “new” products of sustainable building, c) the implementation of appropriate and effective promotion and publicity methods for sustainable building and d) a set of other elements mentioned in the following Figure 3 which worth to be taken seriously into consideration, by the decision makers that will take the related decisions about the creation and operation of the sustainable building cluster.

The Pearson correlation analysis concerning the alterations of the factors affecting the development of sustainable building in Greek market, has shown that:

- The greater the economic crisis of the country is, the more significant is the institution and the implementation of a legislation framework, for the development of sustainable building and the allowance of motivations and investment support from financing programs (Pearson correlation coefficient = 0.677 and 0.428 respectively at a significance level of 0.01, 2-tailed)
- The support of investment from financing programs should be accompanied with the institution and implementation of the legislation framework concerning subjects of sustainable building (Pearson correlation coefficient = 0.533 at a significance level of 0.01, 2-tailed),
- The bigger the competition between enterprises for sustainable building is, the more significant is the factor of market studies implementation (Pearson correlation coefficient = 0.617 at a significance level of 0.01, 2-tailed),
- The bigger the investment for sustainable building is, the bigger the entrepreneurial venture is (Pearson correlation coefficient = 0.552 at a significance level of 0.01, 2-tailed),
- The more accurate the cost accounting of sustainable building is, the better and more significant as a factor will the pricing of the “product” be (Pearson correlation coefficient = 0.664 at a significance level of 0.01, 2-tailed) and
- The better the business organization is, the more significant the implementation of market studies concerning sustainable building is, as well as, the more appropriate the information of salesmen for the comparative advantages and the specific characteristics of sustainable building is (Pearson correlation coefficient = 0.588 and 0.671 respectively at a significance level of 0.01, 2-tailed).

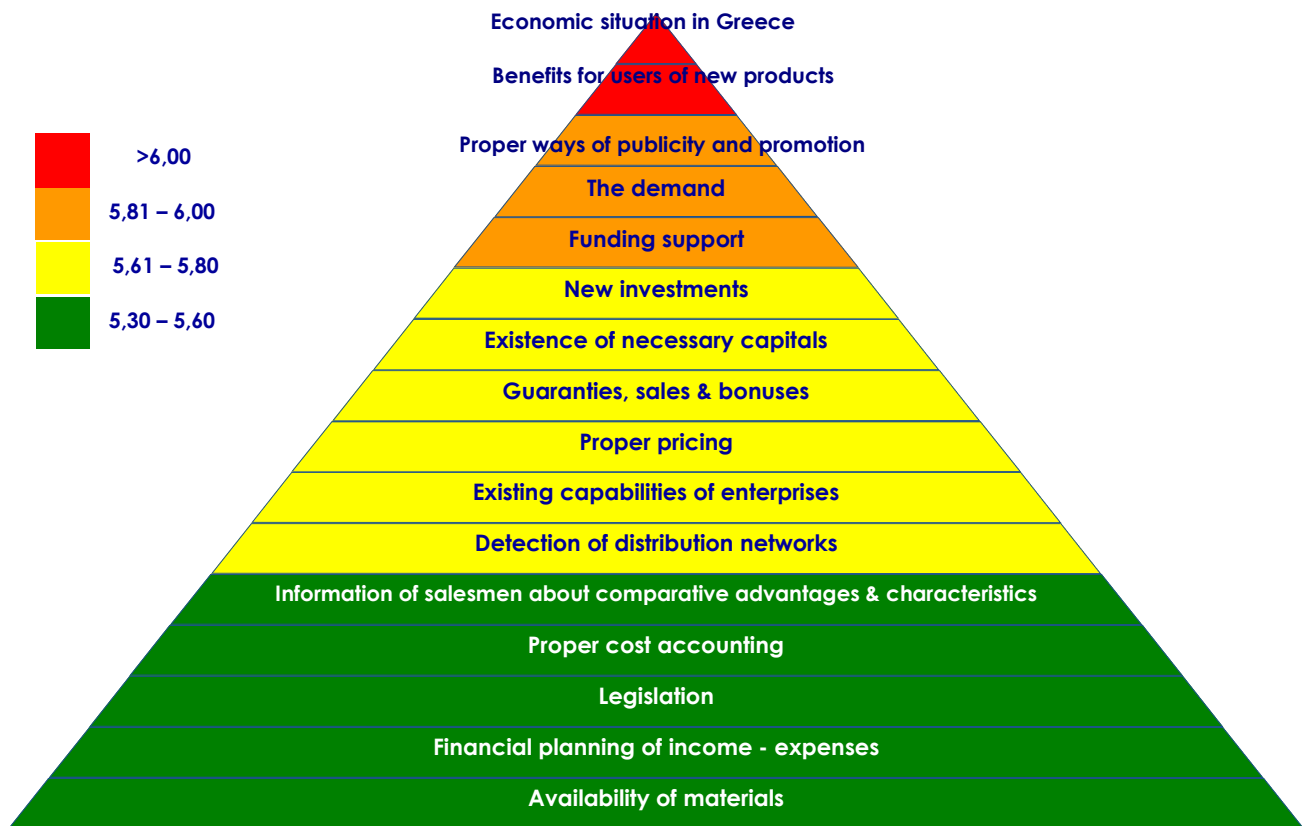

Fig. 3: Significance of sustainable building development factors in Greek market (7 the most significant)

Unfortunately, Greek enterprises are operating in an environment which creates many serious obstacles for their entrepreneurial activity. The most significant of them, that the present study has shown, seem to be in declining ranking: bureaucracy during the establishment as well as during the operation of enterprises, the intensely observed in nowadays economic uncertainty, the corruption of the system especially concerning public services as well as the operation of the banking system for the granting of the needed working capital for the enterprises, their financing, as well as the level of interests rates (Table 2).

Especially the factor of economic uncertainty, seems to be significantly statistically correlated to the implementation or not of exports by the enterprises which are going to participate in the sustainable building cluster, according to X^2 test (Pearson $X^2 = 3.027$, Cramer's $V = 0.323$ for a significance level greater than 90% Approx. Sig= 0.099). This means that the enterprises that export, are directed towards this activity when there is economic instability in their headquarters' country.

Also, enterprises which were established before 2000 consider the absence of information from related organizations, as a very significant obstacle for the development of their entrepreneurial activity. On the contrary, the existence of perchance political instability, doesn't constitute an obstacle for exports. Finally, corruption constitutes a more significant obstacle for the smaller enterprises (that occupy less than 10 employees).

Also, enterprises which were established before 2000 consider the absence of information by related organizations, as a very significant obstacle for the development of their entrepreneurial activity. On the contrary, it doesn't constitute an obstacle for exports the existence of perchance political instability. Finally, corruption constitutes a more significant obstacle concerning smaller enterprises (that occupy less than 10 employees).

Table 2: Main obstacles in developing entrepreneurial activity of the Greek enterprises which could participate in the sustainable building cluster, until today

FACTORS	AFFECTION RATE
<i>Bureaucracy</i>	62,1%
<i>Economic instability</i>	51,7%
<i>Corruption</i>	50,0%
<i>Operation of the banking system</i>	41,4%
<i>Institutional framework of business and labor legislation</i>	34,5%
<i>Absence of market</i>	17,2%
<i>Competitiveness arrangements</i>	13,8%
<i>Political instability</i>	10,3%
<i>Absence of information organizations</i>	10,3%
<i>Transparency</i>	6,9%

Seeking financing sources for economic enhancement and support for environmental activities of the sustainable building cluster enterprises, it seems that Greek enterprises are focusing mainly on European Union which supports and co finances them (Figure 4). Financing by the firm's own sources seem to stand relatively high in the list of financing sources. This means that the study's enterprises don't hesitate, and some of them have proven it until today, to use part of equity capitals, for the financing of environmental activities, boosting this way their social accountability.

In order to find connections among financing sources for economic enhancement of environmental activities of the study's enterprises, the Pearson correlation criterion was implemented. The analysis has shown that in order to receive financing from the European Union, financing from the central government of the country should respectively exist (Pearson correlation coefficient = 0.729 at a significance level of 0.01, 2-tailed). Of course the existence of the above mentioned financing is negatively correlated to the individual financing of enterprises (Pearson correlation coefficient = -0.417, at significance level of 0.05 level (2-tailed).

Fig. 4: Funding sources of Greek enterprises that could participate in HGBC for their environmental activities and evaluation of their significance (7 the most important factor)

Regarding the development of a specific policy for the effective implementation of sustainable building for the enterprises themselves, the factors that seem to play a fundamental role are: the adoption of innovation strategies and culture (mean 5.82 with max 7.0), the leadership and management of new ideas (5.75), technology and information systems (5.75) and the development of new co operations with foreign firms (5.52). A minor role, but at an important level, seem to play the easy access to new markets (5.41), the engineering corporations (5.39), research institutes and the rest academic institutions (5.38), specialized personnel and certified staff (5.29), as well as construction companies (5.00). In a small rate, appears the role of external business consultants (3.70).

Good leadership and appropriate management of new ideas for the development of sustainable building seems to be significantly statistically correlated to the choice of specialized personnel in their firm (Pearson correlation coefficient = 0.597) and to the adoption of innovation strategies and culture (Pearson correlation coefficient = 0.557. Correlation is significant at the 0.01 level (2-tailed). Furthermore, the adoption of innovation strategies and culture is positively correlated to specialized personnel of the sustainable building cluster enterprises (Pearson correlation coefficient = 0.647 at significance level of 0.01).

On the contrary, the main obstacle for the development of a specific policy regarding sustainable building seem to be the absence of appropriate financing sources (mean = 5.79, max = 7), at least until today (Figure 5). In high ranking stands also the factors of: a) the very high cost of the alterations needed, and should be made by the enterprises themselves (mean = 4.93), b) the absence of customers response in new products and services (4.82), since until today no kind of a significant promotion towards the public opinion about sustainable building subjects has been implemented, c) the very long period of the necessary investment's return on capital (4.81), d) the absence of know how and innovation flow organizations, in the building sector (4.79) and e) the existing weaknesses of the Greek legislation framework (4.75).

Figure 5: Significance of obstacles for the development of a policy for sustainable building, of the Greek enterprises that could participate in the sustainable building cluster (ranking 1-7, with 1 = not significant, 4 moderate and 7 very significant)

A very important parameter for the establishment of the sustainable building cluster is the intension and the willingness of the enterprises and related stakeholders to develop co operations between them. The present research has shown that the total (100%) of the participants develop such co operations, which is very encouraging for the cluster's first establishment.

From the up to date activity of the research participants, it seems (Figure 6) that the most important co operations are those with customers (mean=5.25, max=7.0), with construction

companies (5.09) and with engineering companies (4.92). Good seem to be also the co operations with governmental or private non profit research institutes (4.55), with R&D enterprises (4.45), as well as with Universities and TEI (4.45). In a moderate rate until today, co operations are being developed with other enterprises of the same sector (3.91), as well as with their competitors (3.67). Through the participation of the enterprises and organizations in the sustainable building cluster, co operation between them will be necessarily developed and their benefits will be multiplied.

Figure 6: Co operation degree with several organizations of firms that could participate in the sustainable building cluster (ranking 1- 7, where 1= any, 4 = moderate, 7 = very much)

Seeking the short-term, mid-term and long-term demand and development of sustainable building in Greek market, it is estimated that the population percentage that will respond to the institution of sustainable building will be: in short-term (1-2 years) 4.7%, in mid-term (5 years) 11.3% and in long-term 27.6% per weighted mean. The greater percentage (41.4%) of those questioned estimates that in short-term 3-5% of Greek households will response , 44.8% estimates that there will be a response in 5 years from 5-10% of them, while in 10 years there is a great optimism that the response will reach the percentage of 10-20% in average from 27.6% of them (Figure 7).

Figure 7: Percentage % that the enterprises which are going to participate in the sustainable building cluster, consider that the Greek population will correspond to the institution of sustainable building today, in the next 5 and 10 years.

Households which are estimated to respond directly to the institution of sustainable building, are in a percentage of 75.9% those of higher income and only in a percentage of 20.7% the smaller and lower income households. This is logical, because in times of economic crisis someone wants to ensure his survival first, and then to get interested for the environment (internal and external) in which he spends his life. By the end of the economic crisis, which is estimated in the next 3-5 years, sustainable building will expand to all income classes. Therefore, the economic crisis does not constitute an restraining factor for the development of sustainable building, at least in a mid and long-term period, since based on the previous result of the present study, the market – target has been determined.

Conclusions - Proposals

The building sector which includes many other sectors and subsectors holds a very high and dynamic position in Greek economy. Its problems are well known, because of the global financial crisis, but also because of the Greek economic crisis. The increase of competitiveness and environmental protection constitute basic priorities for the European Union as well as for Greece. Best practices around the world should be used in maximum. The idea that the society should live in an environment that is designed and operates incorporating energy efficiency, water saving, waste minimization, pollution prevention, increase of the efficiency of the sources in the materials that are used, but also ensuring a better quality of life inside buildings based on the principals of “green economy”, has already grown. Sustainable building with its multiple benefits for the enterprises, the stakeholders, the cooperating

organizations and the consumers that have been pointed by the analysis, constitute a direct necessity and the significance is taken for granted.

Greek enterprises estimate that the tendency for “green’ buildings is coming in Greece too. The majority of them estimate that in the next 5 years this institution will be established and they are getting prepared for this. The market study has shown that the percentage of Greek population which will respond to the institution of sustainable building in short-term period (1-2 years) is estimated at 4.7%, in mid-term (5 years) at 11.3% and in long-term (10 years) at 27.6%. But, in order this movement to be successful, the cooperation between many enterprises dealing with building is required, in the form of a cluster, enjoying all the benefits that come from that. The present research has proven the maturity of the enterprises and the directness of their participation in such a movement.

Despite any increase on buildings’ construction price according to the principals of sustainable building, their implementation is worthy, if we consider the environmental and economic benefits for the users during the whole period of the building’s life, as well as the consumers’ intension to pay in average an amount of +7%, in relation to the conventional construction.

For the development of sustainable building in Greece too, the factors that have been detected to play the most significant role and should be especially attended by the Greek enterprises of the cluster, seem to be: the economic situation of the country, the appointment of advantages and benefits for the users of “new” products of sustainable building, the implementation of appropriate and effective promotion and publicity methods of sustainable building and the support of investment from financing programs.

Further research could be conducted in a much bigger sample of Greek enterprises and organizations that will participate in the sustainable building cluster and will contribute to the development of the Greek green economy.

The appointment of appropriate strategies that the cluster’s enterprises will implement, in order to pass the message of “sustainable building” to the Greek consumers, should be the main point for the continuation of this research and the connection of its results to the present study.

Furthermore, the present research could be conducted at an international level in countries such as: Cyprus, Italy, France, Germany, Bulgaria etc. in order to have comparable data concerning the situation and the ways of effective implementation of green economy through the promotion and publicity of the green buildings movement.

Best practices and case studies could also be investigated and appointed, in order to constitute guides for the survival and development of the sustainable building cluster enterprises. Through this kind of research we will be able to detect several key points of sustainable building and successful business activity in the frameworks of the cluster such as,

financing capabilities and viability of a cluster, staff training in subjects of sustainable building as well as of citizens, protection of the household income through money saving, and development of new entrepreneurial opportunities.

**THE INTERMEDIATE COMMUNITY: A BEHAVIORAL / BARGAINING
APPROACH FOR CONFLICT RESOLUTION AT THE LOCAL LEVEL/ BAYESIAN
ANALYSIS**

Papakonstantinidis, Leonidas A.¹

¹Professor, Head of Local Government Dept., Kalamata, Greece

Abstract

The paper explores the Nash' equilibrium point and the "Non Cooperative Games Theory" for extension of bargaining solution analyses, applied in the local development field.

Social trust and social cohesion conditions (sensitization process) within the Community develop the necessity of building social capital at a local level. That presupposes that the local community builds up a "new local standard," based on local people's sensitized instant reflection behaviour. By its turn, sensitized behaviour must be considered in the frame of any "bargain", between two, taking place inside the Community. "Instrumental rationality" has been proved to be the main obstacle toward the socio-sensitized behaviour in the bargain process. Hence, a scientific dialogue in the socio-philosophical level has been developed on how "instrumental rationality" should co-exist with the "sensitized behaviour" at local levels leading to a "society of citizens."

Nash' "bargaining solution" is based on binomial probabilities ($p, 1-p$) distribution, corresponding 1-1 with those utility functions "prices" (disagreement fear factor). In its extension, which may be the paper's contribution in this academic dialogue, the author hypothesizes that the Intermediate Community (the "C" factor) produces a new behavioural type that converges the interests of both sides at a local level. By converting a

binomial distribution ($p, 1-p$) into a trinomial distribution, ($p_1, p_2, 1-p_1-p_2$) combined with 3 utility function "prices", the dynamic behavioural sensitization process may converge into the integrated local development limit-end.

Thus, the resulted behaviour leads into the absolute cooperation, which steps on the same rules of globalization. The paper, then, argues that this resulted behaviour reflects the end point of the local development process.

Introduction- the purpose

The purpose of this paper is threefold. First, to point out the interaction between local development, as a part of social capital building in local areas and the games theory, especially, the Nash "non Cooperative Game Theory" including the bargaining problem and

focusing on conflict interests within local community, second, to formulate a quick overview on Nash equilibria in the frame of a bargain, as well as Harsanyi's Nash refinement, i.e. games with incomplete information, played by bayesian players (or condition probabilities distributions), highlighting the welfare economics vs normative economics and third, to create a base for alternative local development approach, coming from the above mentioned synthesis, so called the "win-win-win papakonstantinidis model"

Local Development/Welfare Economics and the Bargain

Over past decades, the concept of local development, as well, as the "equivalent" social capital at the local level seemed to be out of the scientific dialogue, for the reason that Regional Development Science, coming from the decade of 50's (Walter Isard, 1956) was the dominant approach of the peripheries economics. Local development, mainly based on social capital building and social networks, has developed in the recent literature. Having its origins in Latin America, current interest in the concept of social capital in the field of national development stems from the limitations of an exclusively economic approach toward the achievement of the basic developmental goals: sustained growth, equity, and democracy (Alejandro Portes, Patricia Landolt, 2000). The record of application of neoliberal adjustment policies in less developed nations is decidedly mixed, even when evaluated by strict economic criteria. It was the dominant reason that a scientific dialogue open, on Normative and Welfare Economics

In the first half of the twentieth century, most leading economists [(Pigou, 1928), (Kaldor, 1939), Samuelson, 1985) etc] devoted a significant part of their research effort to normative issues, notably the definition of criteria for the evaluation (Samuelson, 1977) of public policies. The situation is very different nowadays. "Economists do not devote a great deal of time to investigating the values on which their analyses are based. Welfare economics is not a subject which every present-day student of economics is expected to study", writes (Atkinson, 2001) who regrets "the strange disappearance of welfare economics". Social capital and social cohesion at the local level with respect to physical, architectural and cultural environment, (Wilkinson K, 1991) may be proved to be the key-point for the local development process. At the same time, local people have to continuously negotiate (bargain) each-other expected to derive individual profit from this bargain. So it is necessary, costs and benefits of these negotiations be measured (Gannon A, 1991)

Interaction between bargain and behavior (behavioral approach)

Dewey and Bentley, 1949 wrote that (John Dewey, Arthur Bentley, 1949): "A behavior is always to be taken transactionally: i.e., never as of the organism alone, any more than of the environment alone, but always as of the organic-environmental situation, with organisms and environmental objects taken as equally its aspect".

In this frame, is there any correlation between bargain and behavior in the bargain and during the bargain?

In his excellent book under the title “Behavioral Game Theory: Experiments in Strategic Interaction” (Colin F. Camerer, 2003) defines the behavioral games theory: “Behavioral game theory is about what players actually do. It expands analytical theory by adding emotion, mistakes, limited foresight, doubts about how smart others are, and learning to analytical game theory. Behavioral game theory is one branch of behavioral economics, an approach to economics which uses psychological regularity to suggest ways to weaken rationality assumptions and extend theory. Interaction bargain-behavior is the main assumption in this paper Bargainers behavior, is shaped by many factors, but instrumental rationality may be the dominant criterion. At any case, recent literature provides us with the relation between knowledge and behavior So, an overview is attempt (Papakonstantinidis L.A: (2005)”, as to find the relation between “knowledge transfer and knowledge creation”, in the frame of the “Modern Innovation Theory- M.I.T” (M.M Fischer, 2006 Nonaka and others) Behavior thus may resulted from this knowledge types’ synthesis, as the table

*Table: Knowledge Creation/ Information/ Types of Behavior
Papakonstantinidis, 2003*

<i>Type of Knowledge-1</i>	<i>Type of Knowledge-2</i>	<i>Synthesis</i>	<i>Resulted Behavior</i>
<i>tacit</i>	<i>tacit</i>	<i>Sympathetic</i>	<i>Socialization</i>
<i>tacit</i>	<i>codified</i>	<i>Conceptual</i>	<i>Externalization</i>
<i>codified</i>	<i>tacit</i>	<i>Procedural</i>	<i>Internalization</i>
<i>codified</i>	<i>codified</i>	<i>Systemic</i>	<i>Networking</i>
<i>sympathetic</i>	<i>systemic</i>	<i>Conceptual</i>	<i>Sensitization</i>
<i>systemic</i>	<i>systemic</i>	<i>Procedural</i>	<i>Strategic</i>

The different examples of knowledge types synthesis and the resulted 1-1 behavior leads us to understand the bargain-behavior assumption, based on information given. From the other hand, bargainers information may be the dominant result of this cross-related knowledge types.

Despite Nash “complete bargainers information” Harsanyi distinguishes between complete and incomplete information, that each player has from the others bargaining behavior

Thus, the hypothesis of bargain-behavior interaction is very important in building the suggested “Intermediate Community” model: Following the Harsanyi’s Bayesian Theorem original game can be replaced by a game “where nature first conducts a lottery in accordance with the basic probability distribution” (Harsanyi (1966-revised 1967). Suggested model is mainly based on this point: In my mind, the suggested in the paper “Intermediate Community” and its “win-win-win papakonstantinidis” methodological tool is fully aligned

with the “Harsanyi’s transformation”, with a difference: original bargain between 2 can be replaced by a game, where intermediate community first conducts a lottery in accordance with the basic probability distribution. In addition, “Intermediate Community” (the “C” factor) should be seen as the result of a “new” suggested bargaining behavior, coming from sensitization process locally (Papakonstantinidis L.A:2005). In this frame, Intermediate Community is given in terms of a continuous sensitization process, tending to sensitization itself, inside the community.

Assumptions

- The main hypothesis is that development (especially, local development) may be sighted as the output of the bargaining trends.
- Social interactions regularly lead to mutually beneficial transactions that are sometimes puzzling
- Bargaining is strongly correlated with bargainers behavior (as above mentioned)
- We could imagine the intra-community relations as a continuous bargain between 2- It is rather a dynamic “winning strategies instant reflections” game, based on competitive interaction relations
- All players have complete information about the game being played.- J. F. Nash, “instrumental rationality”, 1950
- Sensitization is a kind of “information”, making the given information complete – Papakonstantinidis, 2002)
- Each player has a subjective probability distribution over the alternative possibilities – (Harsanyi, 1967),
- If a type is associated with several states but cannot distinguish between the states, it assigns a probability distribution over the set of types. If a type is associated with only one state, then that type believes with certainty that it is in that state (Ben Danford, 2009) .
- The main assumption(Papakonstantinidis, 2004): Introducing the “Intermediate Community”, as the third bargainer in a bargain between 2 ,a new state is resulted thus converting a binomial probabilities distribution (Nash win-win equilibrium) into trinomial probabilities distribution, so that each of the three(including the community) to win [win-win-win]
- The assumption that local development is based on a continuous “sensitization process”, trending to the limit end of the process (Papakonstantinidis, 2004), through the bargain: There is an interaction between people’s (involved in each of the bargains) behavior and the bargain itself. A dynamic evolution characterizes the

interaction which will pass in next generations by the memes (Richard Dawkins 1976)

- The limit of this continuous process may be proved to be the absolute players' sensitization, leading to the absolute cooperation, which is the best strategy for all the involved players in the bargain (under the Harsanyi's condition of a perfect players information)

A quick overview on Nash equilibria in the frame of a bargain

In Social Sciences, we have to define a Rule such as to meet the majority needs, without neglecting the minority needs: In math terms, we have to define a differential equation in a model, setting the "Nature", "State" in the centre and then finding losses and benefits resulted by deviation from this function-rule This analysis provides us with knowledge in real as well as in non real situation (Papastathis, 2004) The bargain is highlighted as a "game", Decisions are concerned as "instant reflection winning strategies" Payoffs are weighting by individual probabilities distributions, by taking into consideration that each player has a complete information about the other player's information conducted their bargaining behavior (Common Knowledge of Rationality- C.K.R, Varoufakis Y, 2001).

The bargain – Nash (Nash J. F . (1951)

During the decade of 40's John von Neumann and Oscar Morgenstern had developed the "zero sum two players game" theory based on "maximin-minimax" strategic decision, as the reaction to a given winning strategy, coming from the other player: Maximizing the minimum profits and/or minimizing the maximum losses. This was a full competitive idea (win-loose) useful only for the war decision making but not for piece period.

Despite the maximin-minimax Neumann approach (Neumann von J., Oscar Morgenstern, 1944) John Forbs Nash proposed in 1951 ("Non Cooperative Game Theory"-Annals of Mathematic, 1951) a "solution" to the problem of how rational players would play, to win - now called Nash equilibrium. According to Nash, a priori coalitions must be excluded, as they do not generate "pure individual strategies". In the opposite, a game (bargain) based on "instant reflection strategies" may be accepted as it generates pure individual strategies

According to the Bargaining Problem in its math expression "An n -person game is a set of n players or positions, each with an associate finite set of pure strategies and corresponding to each player i a payoff function π_i which maps the set of all n -tuples of pure strategies into the real numbers" (Kuhn- Nassar, 2000)

Following the literature (Kuhn W.H -Nasar S, 2001), Nash's idea, based on the idea of equilibrium in a physical system, was that players would adjust their strategies until no player could benefit from changing. All players are then choosing strategies that are best (utility-maximizing) responses to all the other players' strategies (Colin F. Camerer, 2003). Nash equilibrium is a solution concept of a game involving two or more players, in which

each player is assumed to know the equilibrium strategies of the other players, and no player has anything to gain by changing only his own strategy unilaterally. If each player has chosen a strategy and no player can benefit by changing his or her strategy while the other players keep their unchanged, then the current set of strategy choices and the corresponding payoffs constitute a Nash equilibrium (win-win situation). A game may have multiple Nash equilibria or none at all (Aumann, Robert J. 1976). (each strategy in a Nash equilibrium is a best response to all other strategies in that equilibrium) (von Ahn, Luis, 2008)

Formal definition of Nash equilibrium (B. D. Bernheim, B. Peleg, M. D. Whinston, 1987),

Let (S, f) be a game with n players, where S_i is the strategy set for player i , $S = S_1 \times S_2 \times \dots \times S_n$ is the set of strategy profiles and $f = (f_1(x), \dots, f_n(x))$ is the payoff function for $x \in S$. Let x_i be a strategy profile of player i and x_{-i} be a strategy profile of all players except for player i . When each player $i \in \{1, \dots, n\}$ chooses strategy x_i resulting in strategy profile $x = (x_1, \dots, x_n)$ then player i obtains payoff $f_i(x)$. Note that the payoff depends on the strategy profile chosen, i.e., on the strategy chosen by player i as well as the strategies chosen by all the other players. A strategy profile $x^* \in S$ is a Nash equilibrium (NE) if no unilateral deviation in strategy by any single player is profitable for that player, that is

$$\forall i, x_i \in S_i, x_i \neq x_i^* : f_i(x_i^*, x_{-i}^*) \geq f_i(x_i, x_{-i}^*).$$

A game can have either a pure-strategy or a mixed Nash Equilibrium, (in the latter a pure strategy is chosen stochastically with a fixed frequency). Nash proved later that if we allow mixed strategies, then every game with a finite number of players in which each player can choose from finitely many pure strategies has, at least, one Nash equilibrium. Later (1995) R. Aumann, 1999) and Brandenburger, show that, if players' payoffs are mutually known, their rationality is mutually known, their beliefs (or "conjectures") about other players' actions are commonly known and they have a common prior, then, for each player j , the conjectures of all the other players about j 's action agree and the n -tuple of such conjectures (one conjecture about each player) form a Nash equilibrium when viewed as a mixed strategy profile.

Besides, if the payoffs are commonly known to all bargainers, then the Common Knowledge of Rationality (CKR), is the main Nash assumption. Harsanyi, suggested later (Harsanyi, 1967) that "Complete information requires that every player knows the strategies and payoffs available to the other players but not necessarily the actions taken. Games of incomplete information can be reduced, however, to games of imperfect information by introducing "moves by nature"

Bargain may lead either in agreement or disagreement. Utility expresses the constraint or the "fear factor" (Papakonstantinidis L.A, 2002, 8/14) of disagreement for the negotiator who desires negotiations to be led in agreement more than the other one. Who needs more, negotiation to be led in an agreement expects more utility, but –probably he has to lose in terms of "shares", due to risk lack. In the opposite, who is indifferent about "agreement" or

expects less utility /per unit, has- to win in “shares” under the dogma “the more risk, the more profit” Each of “negotiators” has, therefore to think twice (2-person anticipation) according to his & the other’s expectations so both to win, maximising the outcome of negotiation (win-win)

John Harsanyi: From Incomplete to Imperfect information (sub-game)

John Harsanyi made a major contribution to welfare economics by two different interventions:

The first one is often called the “impartial observer argument”. An impartial observer should decide for society as if he had an equal chance of becoming anyone in the considered population. This is a risky situation in which the standard decision criterion is expected utility.

The second Harsanyi’s argument, worldwide as the “aggregation theorem”, is about a social planner who, facing risky prospects, maximizes expected social welfare and wants to respect individual preferences about prospects.

The key step in (Harsanyi’s,1955) Harsanyi’s argument, based on Bayesian, or conditional probabilities distribution was the claim “...that expected social welfare would be the weighted sum of expected individual utility functions, assuming that whenever all individuals are indifferent between any two probability distributions over social states, then so is society..” (Stanford Encyclopedia, 2001) Players have initial beliefs about the type of each player (where a belief is a probability distribution over the possible types for a player) and can update their beliefs according to Bayes’ Rule as play takes place in the game. In a Bayesian game, the incompleteness of information means that at least one player is unsure of the type (and so the payoff function) of another player (see below)

Harsanyi grappled with the analysis of “incomplete information’s” games, where the players are uncertain about games situation parameters (or even some of them, as payoff functions, or about the other players’ information about the game situation etc) Harsanyi’s approach for modeling a Bayesian game in such a way, allows games of incomplete information to become games of imperfect information

Games of “incomplete information” (between C- games and I-games) must not be confused with “games of imperfect information”, although they have been extensively discussed in the literature:

The first case concerns games where the players are uncertain about some important parameters of the game situation, such as the payoff functions, the strategies available to various players, the information other players have about the game, etc.

The second case concerns games in which the history of the game is not available to all players.

Besides, “complete information” requires that every player knows the strategies and payoffs available to the other players but not necessarily the actions taken. Games of incomplete information can be reduced, however, to games of imperfect information by introducing “moves by nature”

According to Harsanyi, each player has an objective probability distribution over the alternative possibilities: in this framework, probability distributions for each player is assumed to be mutually consistent or, they can be considered as conditional probability distributions derived from a certain “basic probability distribution” over the parameters, which are unknown to different players, even if it was assumed (by literature) that these probability distributions entertained by the different players are mutually “consistent”, in the sense that they can be regarded as conditional probability distributions derived from a certain “basic probability distribution” over the parameters unknown to the various players. However, the theory meets also those cases where the different players' subjective probability distributions fail to satisfy the above assumption (the condition of mutual consistency for the players' probability distributions). According to Harsanyi J. (Harsanyi, 1967), in cases where the consistency assumption holds, the original game can be replaced by a game where nature first conducts a lottery in accordance with the basic probability distribution, and the outcome of this lottery will decide which particular sub-game will be played. However, every player will know the “basic probability distribution” governing the lottery.

Following Harsanyi's concept, a Bayesian game can be modeled by introducing Nature as a player in a game. Nature assigns a random variable to each player which could take values of types for each player and associating probabilities, In this nature randomly chooses a type for each player according to the probability distribution across each player's type space). Finally, Harsanyi utilitarian theorem (Stanford Encyclopedia, 2001) states that the social welfare function is the weighted sum of individuals' utility functions if: (i) society maximizes expected social welfare; (ii) individuals maximize expected utility; (iii) society is indifferent between two probability distributions over social states whenever all individuals are.

Formal definition (Harsanyi , 1967),

The game is defined as:

$G = \langle N, \Omega, \langle A_i, u_i, T_i, \tau_i, p_i, C_i \rangle_{i \in N} \rangle$, where

- N is the set of players.
- Ω is the set of the states of the nature. For instance, in a card game, it can be any order of the cards.
- A_i is the set of actions for player i . Let $A = A_1 \times A_2 \times \dots \times A_N$.
- T_i is the types of player i , decided by the function $\tau_i : \Omega \rightarrow T_i$. So for each state of the nature, the game will have different types of players. The outcome of the players is what determines its type. Players with the same outcome belong to the same type.
- $C_i \subseteq A_i \times T_i$ defines the available actions for player i of some type in T_i .
- $u_i : \Omega \times A \rightarrow R_i$ is the payoff function for player i

Proposal

Starting from the Harsanyi's refinement concerning the Nash equilibrium, the objective of this paper was to formulate an argument on how it should be possible to provide appropriate tools for local development, taking into consideration the suggested "sensitization process" (behavioral analysis) and its interaction with the bargain and during the bargain. For this purpose, we have to suggest the "Intermediate Community" in a bargain between 2, but not as the result of transferring a game of incomplete information to a game of imperfect information. According to the paper's proposal, the "Intermediate Community" (Nature as a player in the Game which first conducts a lottery in accordance with the basic probability distribution) must be seen as conscious choice, taken by local people in the frame of sensitization process: Sensitized people should conduct their bargaining behavior in a "new" type of bargain, less competitive, more cooperative, even if adopting the "Non Cooperative" instant reflection winning strategies' concept for modeling a Bayesian game in such a way, allows competitive games of incomplete information to become more cooperative games of perfect information: sensitization, may be one of factors influenced this sep-by-step change at the local level (see the LEADER EU Initiative's application in Greece (Papakonstantinidis L.A, 2003), during the 1991-1994 period

The limit of the continuous sensitization process defines a new behavioral status, in the bargain between 2, which trends from pure competition to the absolute cooperation, which is the best of all instant reflection, individual winning strategies

The suggested "Intermediate Community model" (see at the triangle relation scheme below) or "win-win-win papakonstantinidis model" (as any of the 3 parts of the negotiation has to win from this) is the end/purpose of this paper's contribution

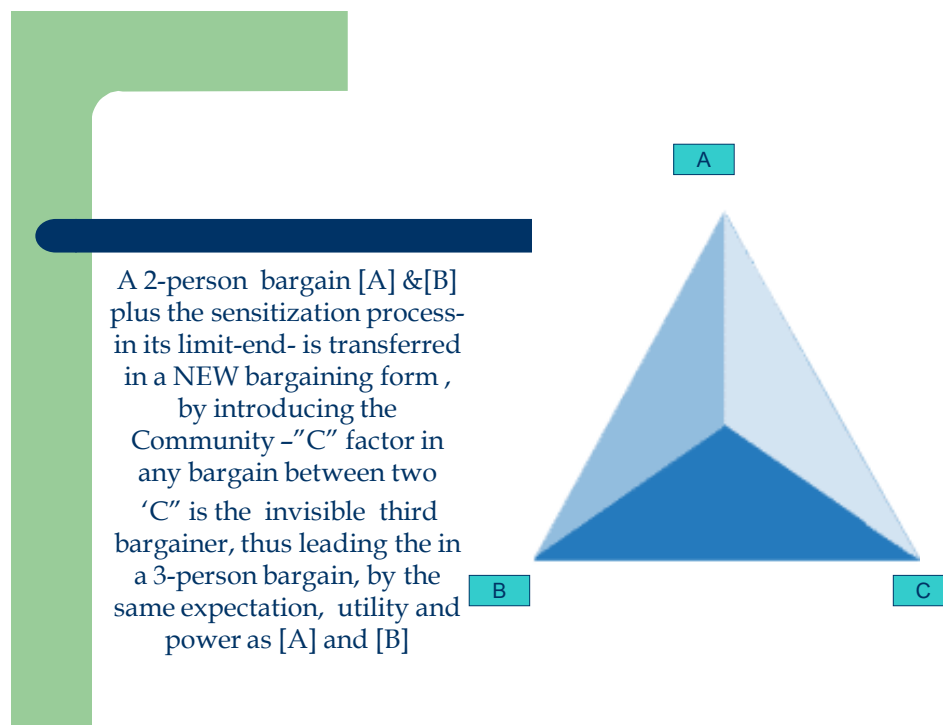

Especially,

- Introducing the “Intermediate Community” – (“C” factor) as the THIRD (invisible) part in a bargain between 2 provides us with a “sensitization measure” to go the local development on Bargaining belief , in that case, should be continuously strengthen, thus tending to the limit of a pure and absolute cooperation, especially in an Inequality Age, due to capital accumulation (Amin Samir , 1970)
- Defining the Intermediate Community in terms of a continuous sensitization process, at the local level with social and endogenous characteristics. These may be seen as the output of the continuous sensitization process AND perfect information (the sensitization)

$$\lim_{i \rightarrow \infty} P_i(\&) Q_i(\&) R_i(\&) = \max U_a U_b U_c$$

$i \rightarrow \infty$

$P_i(\&)$..strategy under the P_i ..probabilities distribution, U_a .. utility functions or, how to transform a “competition” into the absolute cooperation, taking into account the integrated information, coming from knowledge transfer AND the sensitization process in the community, thus maximizing bargainers utilities and the Community utility (U_c) (Papakonstantinidis L.A, 2002)

Now, we have to reproduce the Harsanyi Bayesian game's formal definition, with some difference which is the paper's contribution: introducing the “Intermediate Community” as the 3rd imaginary part of the negotiation between 2, as well as weighting of certain variables

with coefficients, it should be possible to define the suggested “win-win-win papakonstantinidis model”

The (sensitized) game is defined as:

$$G^{**} = \langle N, \Omega^*, \langle A_i, u_i, \phi_{T_i}, \tau_i, p_i, C_i \rangle_{i \in N} \rangle$$

- N is the set of players.
- Ω^* is the set of the states of the “Intermediate Community”, depended on local people bargaining intra-community behavior
- A_i is the set of actions for player i . Let $A = A_1 \times A_2 \times \dots \times A_N$.
- T_i is the types of player i , decided by the function $\tau_i : \Omega \rightarrow T_i$. So for each state of the nature, the game will have different types of players. The outcome of the players is what determines its type. Players with the same outcome belong to the same type.
- $C_i \subseteq A_i \times T_i$ defines the available actions for player i of some type in T_i .
- $u_i : \Omega \times A \rightarrow R$ is the payoff function for player i
- ϕ : the sensitization coefficient of T_i : Each state of the Community (Nature, Local Community, Physical Environment etc) must be (according to model definition) weighted by the “ ϕ ” appropriate sensitization coefficient of T_i , thus providing behavioral convergence towards community prevailing ethos (John Friedman, Clyde Weaver, 1979)

Finally,

- Nash equilibrium is based on binomial probabilities ($p, 1-p$) distribution, corresponding 1-1 with those utility functions “prices” (disagreement fear factor). In its extension, the author hypothesizes that the Intermediate Community (the “ C ” factor) produces a new behavioural type that converges the interests of both sides at a local level. By converting a binomial distribution ($p, 1-p$) into a trinomial distribution, ($p_1, p_2, 1-p_1-p_2$) combined with 3 utility function “prices”, the dynamic behavioural sensitization process may converge into the integrated local development limit-end.
- Paper focus on local level’s behavior by a rural, social and ecological development’s methodological tool, worldwide known as win-win-win papakonstantinidis model, taking into consideration the memes approach (Blackmore Susan, 1999) influenced biological and cultural “behavior” for the next generations (Dawkins Richard, 1976)

- Paper adopts the Bayesian Nash equilibrium (Harsanyi) which defines the strategy profile and beliefs specified for each player about the types of the other players that maximizes the expected payoff for each player given their beliefs about the other players' types and given the strategies played by the other players.
- Sensitization" may concerned as information, thus changed the 2parts imperfect information, into a complete information as Harsanyi conditional probabilities claims
- Each of players following his/her best individual instant reflection winning strategy, having perfect information, as well as initial beliefs about the type of each player where a belief is a probability distribution over the possible types for a player) can update his/her beliefs as play takes place in the game (according to Bayesian Rule)
- Introducing the "Community" as the "third" part in a bargain between 2, we can imagine a "new bargain type" in which the "Community" (Nature, common values, ethic etc) is included
- That is reflected in bargainers behaviour, tending to the sensitization, in its limit-end (perfect sensitization, at the local level)

Coming from the above, the resulted behaviour leads into the absolute cooperation, which steps on the same rules of globalization. The paper, then, argues that this resulted behaviour reflects the end point of the local development process. That is the end of sensitization process.

Abstract

The organizational long term success of promotional campaigns and the integration of marketing communications are affected by the effective use of information communication technologies, including the use of the Internet. Internet technology, as a source of communication, had become an important and exploring tool for marketers in the past. Today, the Internet implementation in the marketing process is inexpensive, delivers instant international reach, offers great real time feedback and reaches millions of people for whom the Web is the centre of virtually all communications.

Although the term word-of-mouth marketing hasn't really changed over the years, what has changed is the increased opportunities that companies have nowadays to foster it. Social media is a channel which is considered to be especially useful in enabling word-of-mouth between people, and especially because of its large number of users, word-of-mouth can now spread not only from one to one, but more like one to thousands, depending on how many 'friends' one has. This of course, may backfire since a dissatisfied customer may spread negative word-of-mouth to thousands of people, virtually overnight, with the company having little control over the content and dissemination of this.

With social media on such a rise, some may say that traditional marketing practises as we know them are phasing out. However, it may also be assumed that they are not necessarily phasing out, but are rather 'supported' by a stronger sibling – that of social media. The aim of this research is to identify and discuss the growing popularity of social media and explore its potential impact on marketing practises and especially Marketing Public Relations.

Keywords: marketing public relations, social media, promotion, consumer generated marketing

Social Media

Social media is a natural extension in the communications world. The Chartered Institute of Public Relations (2010) define social media as the term commonly given to websites, online

tools and other interactive communication technologies which allow users to interact with each other in some way, either by sharing information, opinions, knowledge or interests. Social media are often defined in narrow terms (Tuten, 2008) and regarded as synonymous with social networks like Facebook and MySpace. Social media is often characterised as sites where participants can produce, publish, control, critique, rank and interact with online content (Tuten, 2008). Examples include: blogs and micro-blogs, video sharing, bookmarking applications, wikis, forums, and opinion sites as well as social networks (Giannini, 2010). What makes social media so popular is the fact that it enables consumers to interact and share information.

With the emergence of social media, companies are now going beyond simply maintaining a website for basic transactional purposes and traditional promotion. They are rather finding new ways to interact with customers, in search of a more long term relationship rather than a once-off sale relationship or one-way communication which most websites may be confined to. According to a research study by digital communications agency The Group, 56 per cent of FTSE 100 companies now run a corporate Twitter account and the proportion of FTSE 100 companies with a Facebook page has gone up from 25 percent to 38 percent ((Murphey, 2011).

In the last few years, a number of tools which are typically referred to as consumer-generated marketing or consumer-generated media (CGM) are regarded as the 'hottest' tools of MPR. This form of media describes a variety of new sources of online information that are created, initiated, circulated and used by consumers intent on educating each other about products, brands, services, personalities, and issues (Blackshaw and Nazzaro, 2004). CGM encompasses all the marketing messages and brand exchanges created by consumers themselves which subsequently result in creating word-of-mouth communication and a 'buzz' about the brand. The latest trend is for consumers around the globe to demonstrate a preference towards the use of social media in creating messages regarding brands and corporations as well as exchanging them through blogs, video sharing, forums, and social networks. Undoubtedly, social media is a powerful tool that can be used by companies in their integrated marketing communication campaigns since it enables them to interact in an informal and more personal way. Consumers expect brands and their companies to engage with their customers and their 'fans'. CGM offers many opportunities to marketers. Increasingly, what marketers are realising is that social media gives the power to consumers to move from spreading the word about brands from a one-to-one basis to a one-to-hundreds, or even one-to-thousands.

One of the fundamental objectives of marketing is to develop relationships with customers. The internet is no longer only to find information; it is there to enable companies to more effectively engage in relationship building. According to Gummesson (2008) relationship building is the interaction in networks of relationships. The internet can be used to create this network of relationships. Carter (2009) believes that one of the best ways to form

relationships and create influencer value is by going socially since now the market has evolved. The Web 2.0, or Marketing 2.0, is a powerful mix of new and traditional marketing tactics where it allows people to share, collaborate, participate and co-create forming relationships (Weber, 2007; Tomlinson, 2008; Carter, 2009).

The need for this creation of relationships has also brought about the rise of social networks (hereinafter SNs), one part of the social media platform. Social media networking is not really something entirely new – the foundation is quite old as a matter of fact. It dates back to primitive life when people started to live in groups because they had a need to belong. They lived together, worked together – much like what we have even today. It is a basic biological need to feel belongingness and this feeling can be enjoyed by forming groups. Today these groups are quite more advanced since we belong to a family group, a work group, even a sport group. This advancement has also seen the emergence of these ‘online’ groups. Much like the closeness we may feel within our ‘real groups’, we may also feel this closeness within our ‘virtual groups’.

People in groups share information because they trust one another; hence people who join social networks are thus considered to be quite open about sharing information because they too feel they are sharing with their close friends, their intimate group - although the word ‘intimate’ has now expanded to mean a few hundred ‘intimate’ friends for some people. Now, something shared by one of these few hundred friends is likely to be more believable by any form of message that comes from the outside world. You somehow *know* your friends, and you trust them – you may not *know* a company representative and thus surely cannot trust a stranger. Companies have come to realise the fact that basic word-of-mouth principles are even stronger in this online world.

SN is used to create awareness and ultimately relationship building. It is clear how the marketing mix, relationship building, the internet and SNs make a perfect combination when they mix together. Although some may disagree with the notion that SN may not be suitable for developing business relationships (Hayes, 2008), nonetheless, the supporters of SNs outnumber the criticsers (Ellison et al., 2007; Fulgoni, 2007; Ofcom, 2008). Hearn et al. (2008) state that in social media, communication may occur through both a computer or a mobile phone, and that communication is typically directed from one to many, but to be effective, in many cases it should be interactive and an engaging process and so to improve relationship building as stated above.

According to the E-consultancy report (2009) SN exploded during 2007 and 2008, mainly because of the immediacy of the internet together with the ease of communicating to a huge audience with a strong desire for self-expression. It is this explosion that has caused many companies to realise the marketing potential of SNs. Although this sudden explosion may have taken many by surprise, the effectiveness of SNs may not be as quick to reveal. Young (2008) believes that just like any other relationship, the relationships formed through SNs

take time to show their value, and thus companies need to remain committed to it in order to reap these benefits.

Internet technology means that there are changes in the marketing domain of planning, strategy creation and especially in market communication (Vasiljev et al., 2007). According to Jefkins (2000), the dynamic development of the internet will affect all areas of a business and therefore will have a huge potential for marketing. Internet marketing involves companies' efforts to market products or services as well as building relationships over the internet (Kotler and Armstrong, 2006). Brassington and Pettitt (2007) agree that since more homes and businesses are getting connected, the internet has now become a very important marketing tool.

Currently there are a number of SNs: to name a few, Facebook [as according to Mintel (2008) the leader in the SN market], Bebo, MySpace, Hi5, LinkedIn. Facebook was the seventh most popular site on the World Wide Web with respect to total page views (Ellison et al., 2007). SN sites have different focuses; LinkedIn is oriented towards work related contexts; MySpace was mainly created for unknown musicians to get their music heard; Bebo is targeted for young teenagers. Facebook has perhaps almost all the university student population, which was also the original purpose for the formation of this social networking site. A recent report by Mintel (2010) suggests that online social networking is expanding with 248 million unique monthly users in December 2009. Furthermore, the marketing spend on SN sites has also increased by 166% from 2007, thus reaching \$2.4 billion in 2009 (Mintel, 2010). Facebook groups, for example, can grow at an incredible pace, and it has been known for groups to have formed and grown to more than one million members in just one week (Holzner, 2009).

Adding any new form of communication vehicle requires integration into the overall communication and even marketing strategy. Similarly, social media marketing needs to be incorporated into the overall strategy. Social media requires that companies need to interact and engage with their audience but they should also realised that their customers are now the main drivers of conversations (Brown, 2010).

Marketing Public Relations

It is a fact that the way people in the 21st century communicate is significantly different with how they used to in the last century. Today nearly a billion people have Internet access and subsequently communicate instantly with others. They are able to retrieve and analyse information about people and organisations instantly with a desire to share the information with others. Enabled by internet-driven new media consumers have become 'intermediaries' and have the power to filter the message. Today, more than ever before, it has become crucial for organisations to find more credible and durable ways to develop a two-way brand relationship with their customers and prospects, one that utilizes both traditional and new media channels. This 'new' emerging environment has led to marketing strategies that use

the fundamental ideas and tools of public relations in innovative approaches, fostering interactions between organisations, products, consumers and the media.

Marketing Public Relations (hereinafter MPR) refers to public relations activities designed to support marketing objectives (Harris, 1993) such as raising awareness, informing and educating target audiences, gaining understanding, building trust, giving consumers a reason to buy and motivating consumer acceptance. According to Kitchen (2010), MPR has a potential to be a leading tool in integrated marketing communication due to the general ability of public relations (PR) to contribute in achieving marketing objectives. MPR is a program that aims at protecting or enhancing the image of a brand and building the brand sales by encouraging a number of intermediaries (connectors) for example the traditional mass media, the electronic media, opinion leaders and consumers to voluntarily pass a message about the firm or product to their target audiences.

MPR is a late 20th century phenomenon with a wide coverage in the public relations, advertising and marketing press. It is a tool often used to complement and extend the reach of advertising in reaching niche markets where it may be expensive to advertise. It is also used at certain periods in the product's lifecycle in order to generate interest and excitement. MPR can also enhance the impact of personal selling by instilling trust and long-term relationships with the customers. It can provide that linkage with the customer that nourishes loyalty and continued usage. What was a long-time ago considered to be product publicity, integrated in the public relations effort has evolved into a package of techniques and tools that aim at increasing a company's sales of its products a services. Armstrong and Kotler (2009) stipulate that a number of marketing tools classified as consumer-generated marketing (CGM) have evolved over time, one of which is MPR, in which consumers voluntarily create and share messages and other brand exchanges themselves. The literature reviewed refers to these messages and exchanges as word-of-mouth and buzz. The essence of MPR is that it requires the marketer to hand over his or her promotional message to an intermediary in order to reach the ultimate customer. The intermediary will then voluntarily pass a message about the firm and its products to their audience of businesses or consumers.

Henry (1995, p.3) describes MPR as: "a comprehensive, all-encompassing, public awareness and information program or campaign directed to mass or specialty audiences to influence increased sales or use of an organisation's product or service." Giannini (2010, p. 4-5) defines MPR as: "any program or effort designed to improve, maintain, or protect the sales or image of a product by encouraging intermediaries such as traditional mass media, the electronic media, or individuals to voluntarily pass a message about the firm or product to their audience of businesses or consumers."

MPR and the Marketing Communications Mix

MPR has the potential to enhance the impact of promotion in the marketing efforts of a firm and it can complement the more traditional tools such as advertising, sales promotion,

personal selling and direct marketing. This is primarily due to its focus on creating consumers and media “buzz” which can extend the impact of advertisements beyond the thirty seconds. MPR’s media mentions and considerable word-of-mouth communication can assist the firm’s sales promotion efforts by generating publicity, can instil trust between the salespeople and the customers, and can overcome the customer’s inherent resistance to the salesperson’s and direct marketing efforts. Essentially, MPR can work effectively with the traditional promotional tools to generate immediate response, foster long-term relationships, spread word-of mouth and elicit media mentions.

It is important to recognise that the traditional promotional tools are paid for by a sponsor, usually an organisation. At the same time a firm in using these tools does not use intermediaries to spread the message, which is at the heart of MPR. It usually uses the media and for this reason the messages are often faced with suspicion and criticism by the target audience. On the contrary, in the case of MPR, where the messages are spread voluntarily, they tend to be more believable and the target audiences are more receptive to them since they are characterised by a third-party endorsement. This is the most valuable contribution of MPR to the traditional promotional mix.

Media are not the only vehicles for disseminating a promotional message to target audiences. The use of non-media connectors (NMC) to reach out to consumers and create word-of-mouth communication through both live and electronic means is gaining popularity (PQMedia, 2007). A non-media connector is active in a given brand or industry. It can either be a professional in a specific field or simply a consumer with a love for a brand, product or organisation. NMC can be bloggers, experts and opinion leaders, celebrities but also ordinary people who have a passion for a product, industry, issue or an organisation (Giannini, 2010). NMC can be used by organisations to create a buzz, to spread the word, to create excitement through conversations, blogs, live events and social media (Voight, 2007).

MPR and Social Media

The fundamental difference between MPR and the other types of marketing is the connectors that spread the message. MPR is all about creating a buzz about a product by encouraging intermediaries (connectors) such as traditional mass media, the electronic media, or individuals to voluntarily pass a message about a product or company to their audience of businesses or consumers. MPR’s unique characteristic in engaging another party in the communication process other than the marketer and the receiver creates another dimension in the communication process, which can be both a challenge and/or an opportunity.

Media are not the only communication channels for getting a promotional message across to target customers. Although approaches for using non-media connectors (NMC) have always been used, today they have received a heightened interest. PQ Media (2007) reveals that these techniques whether they are called buzz, grassroots, community, or cause-marketing aim at facilitating word-of-mouth communication through live and electronic

means. A non-media connector who can either be a professional or simply a consumer with a passion towards a brand, corporation or a product category has the power to influence their social circles. Voight (2007) suggests that marketers using NMCs expect them to use their resources in order to exercise influence over their friends, family, professional and social groups through conversations, blogs, live events and social media. This however, implies that the marketer will lose control of the message since connectors usually do not simply transmit messages but they also edit them. Since connectors can use electronic media as well as social media to connect with their audiences around the globe marketers have in their hands a great opportunity; to influence their connectors so that they will generate favourable publicity. Social media creates an environment that encourages a two-way conversation that corporations can capitalize on it in a way that can benefit their business and their customers.

Marketers have become increasingly interested in social media since a study carried out by Cone Inc. in 2008 showed that 93 percent of social media users believe that companies they buy from should have a presence in social media. In addition, 85 percent share the view that a company should interact with its customers via social media. Also, 56 percent feel a stronger connection and more satisfaction with the service received by a company when they interact in a social media environment (ConeInc, 2008).

Social media has become the vehicle 'of the day' for connecting marketers with connectors and their audiences. At the same time, it has become a challenge for them since when a marketer shows up in a social network such as LinkedIn or Gather.com this can create a negative reaction among its members. Firms that wish to make a presence in a social network must focus their efforts on creating an interesting content, fostering a community, and engaging with their customers in a more direct, casual and personal way. Customers embrace and appreciate this and they can become more receptive towards their favourite brands. The change that social media has brought about to communications has been quite significant. Appreciating this, marketing managers must accept the fact that a great amount of information (either negative or positive) is being communicated by individual consumers to other consumers via social media, and this information is directly influencing all aspects of their purchase and post-purchase behaviour. They must also realise that consumers are turning away from traditional elements of the promotion mix, by reducing the reliance on advertising as a source of information. Finally, managers must learn to talk with their customers rather than talking at them which has been the case with traditional media (Mangold and Faulds, 2009).

Furthermore, the majority of public relations professionals state that their job has been made easier because of the use of communication technology by expediting the circulation of information to reach broader audiences (DJandPRSA, 2007). Social media enables practitioners to directly enter into conversations with their audience, but it is also used to strengthen their relation with them, and hence their effectiveness. Although practitioners are

slower to integrate more technologically complicated tools, they seem very comfortable with blogs and podcasts showing that the future does indeed look digital for them as well (Eyrich et al., 2008).

Conclusion

There is no doubt that traditional marketing has changed. Endorsements are now passed from trusted customers and other third party sources to prospects. Prospects no longer rely on ads solely. They use a multitude of information sources. Marketers must now become brand ambassadors with a real understanding of their brand's value proposition. Word-of-mouth communication and hence, MPR have not changed. What has changed are the opportunities that enable it. These have increased due to social media. Social media gives the opportunity to marketers to create a 'buzz' about the firm and its products by connecting with people through a dialogue which is more honest and genuine. This brings MPR onto another level. One that has the potential to create stronger bonds with customers, create more positive customer attitudes and enhance the reputation of the firm.

The literature is suggesting that there is indeed a development in the way that marketers now communicate with their audience. The authors are hence suggesting that research needs to be carried out in order to support and further develop the literature. A few questions that arise that could be investigated include: do companies also appreciate this development of social media as a communication tool, and specifically as an ally of MPR activities? Do companies use, or do they consider using social media to complement their MPP efforts? How do consumers view social media as a communication tool used by companies?

With social media being in the forefront of today's consumption world, it is imperative that further research is carried out to clarify whether social media is indeed all that it promises to be, or whether its just another buzz word.

COOPERATIVES AND GOVERNANCE: FORWARD-LOOKING OR STUCK IN THE PAST?

Paranque, Bernard¹; Bouchon, Caroline, Michard, Benoît; Plasse, Anthony

¹Euromed Management. Email: bernard.paranque@euromed-management.com

Abstract

Compared to equity-based companies, the challenge posed by partnerships resides in the nature of the undertakings given by their partners and owners, which may be backed by all their personal wealth. Although financial performance is rarely questioned, even if it is debatable, the concept of “social performance” remains to be defined, and gives rise to a core question, namely its relationship to financial performance, i.e. an organisation’s ability to generate the necessary surplus for it to expand, and to obtain the funding required to generate that surplus. It is actually the nature of the project that is being questioned, together with the shared view of the resources required to achieve the targets that have been set.

Keywords: Cooperatives, equity-based companies, performance, governance

Acknowledgement

Authors Bouchon, Michard and Plasse were studying for their Master’s Degrees in Business Studies when they wrote their dissertation, entitled “The influence of legal status and governance on the implementation conditions for an effective Corporate Social Responsibility Policy”. This article is based on their final dissertation. A comparative study of traditional Limited Companies (French Sociétés Anonymes, or SAs) and Cooperative Enterprises (French Sociétés Coopératives de Production, or SCOPs)”. This article is based on that study

This project was supported by the AG2R-La Mondiale Chair in “Finance Reconsidered: Investment, Solidarities and Responsibility”. It is a revised version of the paper presented under the same title at the 3rd CIRIEC International Conference on the Social Economy in Valladolid (Spain), which took place on April 6th and 8th 2011

Introduction

The concept of Corporate Social Responsibility, or CSR, and its development, has been the subject of extensive research. Likewise, a large amount of material on social performance and *stakeholders* (Freeman, 1984) has been published, together with discussions on the role and place of organisations in society (Carroll, 2008).

Although problems have arisen, “*the movement for corporate social responsibility has won the battle of ideas*” (Crook, 2005). Matten and Moon’s (2008) research has demonstrated this trend and analysed it as the result of institutional developments. Based on the research published

by neo-institutionalists such as DiMaggio and Powell (1983), and Meyer and Rowan (1977), the authors would stress the importance of the concept of legitimacy in organisational practices, which is based on three mechanisms: coercive isomorphism (compulsory laws, rules and standards), mimicry (influence of those practices considered as best practices) and normative pressure (influence of new educational and professional standards). The concept of CSR, as conveyed by these processes, has therefore gained legitimacy.

However, in the “field”, a study conducted by *Groupe Alpha* (2009), based on companies included in the CAC 40 Index, has highlighted its limitations, since the year in which the French New Economic Regulations Act (NRE) came into effect⁷⁵. Although the average rate of compliance with the Act, which ranges between 85% and 90%, is fairly high, and has remained relatively stable since 2004, the average quality of the information provided has not, conversely, met expectations, with a satisfaction rate of 50% to 55%. This situation has prompted the authors to draw the following conclusion: “Although sustainable development is attracting considerable attention in terms of the potential solutions that it offers for recovering from the financial and economic crisis, companies are still not using social reporting as a risk and opportunity management tool, but merely as an external communications aid”. This conclusion is only one step away from saying that “[...] for most conventionally organized public companies -which means almost all the big ones- CSR is little more than a cosmetic treatment” (Crook, 2005).

The question that arises, therefore, is finding out how the concept of Corporate Social Responsibility can find its place in corporate governance, as a response to social issues that have been widely discussed elsewhere, in the knowledge that implementation of the concept also depends on organisations’ willingness to pay some attention to the interests of all their stakeholders, even if they do not take them into account.

In order to make a contribution to this debate, we looked at a specific organisational structure, which is supposedly more democratic in terms of its corporate governance (Dunlavy, 2006). This organisational structure can be described, somewhat generically, as a cooperative⁷⁶.

We selected seven companies based in the Paris or Lyon regions. The names of the companies are as follows: *Coopaname*, *Les Menuiseries de l’Ain*, *Chèque Déjeuner*, *SECAD*, *CNE*, *Cité Création* and *Maison de la Danse*. As SCOPs are not required to publish social reports, and the data we needed to obtain were mainly qualitative, the method we selected to gather information was the meeting. We conducted our meetings in three stages, each of which included a portion of the questions that reflected our research assumptions.

⁷⁵ Official Record of May 15th 2001

⁷⁶ For historical reference purposes, please see François (1997), Prinz (2002) and Holyoake (1902).

Comparison between a traditional Limited Company and a SCOP

Under French law, a company is defined as a corporate entity that has been “founded by two or more persons who have contractually agreed to assign goods or their labour to a common company, in order to share the profits thereof or benefit from the ensuing business. In the cases specified in law, a company can be founded based on the will of a single individual. The members undertake to share the company’s losses”.

The intention of our research is to analyse the implications that the type of company – as defined by its legal status and governance procedures – has for the conditions that make implementing an effective CSR policy possible. In order to do so, we will compare so-called traditional Limited Companies and Cooperative Enterprises, which are Limited Companies with specific governance procedures.

These companies are both equity-based companies, but present significant differences, which may have an influence on their governance in terms of their CSR.

Whereas traditional Limited Companies do not set a minimum level for employee shareholders, 65% of SCOPs’ voting rights must be held by employee-shareholders. Operating procedures for traditional Limited Companies do not specify a minimum equity capital requirement for employee-shareholders while conversely, SCOP employee-shareholders must own at least 51% of the equity capital. Employee profit-sharing is not compulsory if a company has fewer than 50 employees, and is equivalent to 5% of net income for traditional Limited Companies; however, for SCOPs as a whole, employee profit-sharing amounts to between 25% and 84% of net income. We have also noted that SCOPs’ legal status limits dividend payments to 33% of net income, which is not the case for traditional Limited Companies. One final important difference is the voting method at General Meetings of Shareholders, which is based on the “one man, one vote” principle for SCOPs, while the traditional “one share, one vote” model is used for traditional Limited Companies. We believed that it was significant to study this differing involvement in decisions.

Although SCOPs’ employee-shareholders appear to be consulted in a more democratic manner, which is not the case, apparently, for traditional Limited Companies, does this mean that the former are a more fertile ground for social dialogue? In other words, does democracy lead to greater social dialogue?

The SCOP case therefore enables us to study a company where ownership, control and responsibility are concentrated in the hands of the same individuals. However, whenever responsibility, control of the decision-making process and the corresponding risk are concentrated, decision-makers are likely to tend to avoid taking risks (Jensen and Fama, 1983). The governance system may hinder innovation and investment as a result.

The democratic structure of SCOPs leads to greater social dialogue

According to a study of the “social reports” published by 36 companies in the CAC 40 Index, the vast majority of those companies do not, apparently, present the report to their Employee Committee before it is published, although this is provided for in the NRE Enactment Decree (*Groupe Alpha*, 2008). Only three companies in the sample make the effort to let their employee representatives have their say.

In contrast, voting in a SCOP takes place on a *one man, one vote* basis. In addition, over half the voting rights must be held by the SCOP’s employees. Therefore, all employees may have their say, without any distinction being made as to the position or the number of units that they hold in the company. We can therefore assume that a social dialogue is easier to establish in this type of organisation.

A SCOP would also appear to allow both physical and social closeness between those involved in the decision-making process. Indeed, unlike what happens in traditional Limited Companies, both factors no doubt enable greater empathy in the decision-making process. If we refer to Levinas (Bevan and Corvellec, 2007), it is through encountering “the Other” that taking responsibility becomes possible. By making room for a democratic dialogue, a SCOP might therefore enable more responsible decisions to be taken.

Greater autonomy means having responsibilities

If one wants to behave responsibly, the first condition to fulfil is undoubtedly to *be able* to exercise that responsibility. This means that one needs to have a certain amount of room for manoeuvre in one’s actions, and to retain the option of making a choice, i.e. being confronted with an *undecidability* situation (Derrida, 1996). Indeed, it seems extremely difficult to talk about *responsibility* in the case of an action performed under constraint or as part of exercising a form of duty. In our examination of published material on governance and the organisation of work practices, we noted the increasing importance granted to taking the owners’ interests into account in the strategies adopted by organisations (Jensen and Meckling, 1976). Reading traditional Limited Companies’ social reports enabled us to establish a certain number of facts that support this assertion: employees have little involvement in the decision-making process, while charters and procedures guide the company’s actions. More emphasis is placed on rational factors than on human ones, and the reports support that assertion: they display a collection of numbers and little stories that have no real connection, and contain no real thought. The data seem self-contained, without the need to explain a *human* approach: “*it seems that the organization is ruled by nobody – that is, it is moved only by the impersonal logic of self-propelling principles*” (Bauman, 1994).

What emerged from our meetings with SCOP employees and management depicts a very different reality. First and foremost, it is reflected in a management structure that seems less entrenched. In this context, Joffrey Bernard, from *Menuiseries de l’Ain*, referred to

communication flows that are flatter than in a traditional company. He added: *“There is no set reporting line that we must all adhere to. It’s actually more flexible [...]”*. Odile Michel, from *Cité Création*, explained that there were no social differences and confirmed *“that there was no management structure, which helped communication”*. Elise Naccarato from *Chèque Déjeuner* mentioned *“a management structure that is perhaps a little blurred”*. She also put forward the possibility *“of further discussions with management in the event of disagreements”*.

This more flexible management structure was also reflected in the relatively high degree of autonomy granted to employees in day-to-day decisions. This point was clearly apparent in several answers: *“We have a wider freedom of action and greater autonomy”* (*Chèque Déjeuner*). The *Cité Création* employee that we interviewed gives four marks out of five to the discretionary powers granted to her within her field of expertise. *SECAD*’s quality assurance manager mentioned a *very wide* margin for manoeuvre.

In fact, this relative freedom of action is enabled by the atmosphere of trust that reigns in the organisation. Interviewees emphasised this concept, which appears absolutely vital to the way in which a SCOP is run. *“We don’t always have a boss on our backs checking up on us”*, was the colourful summary offered by *Chèque Déjeuner*’s press attaché. The concept of *trust* also appears in the comments made by *Cité Création*’s co-managing director. *CNE*’s Chairman and Chief Executive also underlined this feature in order to explain his attachment to the organisation: *“when you are happy at a company and you feel trusted and supported, you can’t do anything but like that company”*. It even appears that the trust granted is a necessary condition for joining or at least remaining at the SCOP. This idea was summed up perfectly by Didier Debauche (*SECAD*): *“[...] Compared to a conventional meeting, interviewees needed to come once, and then twice or even three times, so that they wouldn’t be hired if we weren’t sure that they were coming here for the long-term, and that they had a communal bent. We are happy to have the candidate that we hire join our family and to give them their fair share of the pie. But we need to be sure about the individuals, and that they have proven their skills, their knowledge and their people skills”*.

In some cases, the relationships between SCOP members extended beyond their working relationship. The traditional notion of a company as just a bundle of contracts did not, in many respects, seem very relevant. The bond between SCOP employees appeared to go beyond the legal and formal framework. In meetings, this was reflected by the use of terms that are not very current in a corporate context: *community* (*Coopaname*), *family* (*SECAD*), *friendly relationship* (*Menuiseries de l’Ain*), *togetherness* (*CNE*). A SCOP tends to think of itself more as a homogeneous whole, or as a social *unit*, rather than as a place or an interaction network for personal interests. The existence of a collective goal that is served by collective responsibility emerges.

A collective goal served by collective responsibility

Through the responses that we obtained, it seems that an SCOP is a unit where bonds of solidarity and mutual assistance are formed. *Collective responsibility* can and must be

understood in the cooperative, in two forms. First and foremost, it corresponds to the fact that responsibility is not *divided up* according to the level of involvement in a final outcome. This applies as much to day-to-day tasks as to the strategic decisions that are taken unanimously or are voted on a *one man, one vote* basis. In theory, an employee cannot avoid being involved in what the organisation does because of their position. Where strategic goals are concerned, the involvement of the company members brings about *de facto* collective responsibility. There are discussion forums where one can make one's voice heard, while the General Meeting of Shareholders rubberstamps the decisions that have been taken, in some ways. This is how we understood Odile Michel's comments: *"Yes, I didn't always agree. Some decisions were hard to take. I wouldn't have taken them all on my own. I understand that it was better for the company to take these decisions. But there were times when I disagreed. [...] At the end of the day, the decisions are taken by a majority. I expressed my misgivings. The majority took a different view. In the end, I think that it was a good thing, although personally, I found it hard"*. Shared responsibility also emerged in the company's day-to-day operations, since our contact at the *Menuiseries de l'Ain* told us that *"everyone is going to be more involved in everyone else's work because the outcome is the same for everyone"*. In fact, Elise Naccarato from *Chèque Déjeuner* came to a similar conclusion: *"When I ask a director to do an interview, they're all usually very available (even though journalists always make appointments from one day to the next and at impossible times), whereas this was not the case at all in the place where I worked before. You needed to ask six months' in advance, and if they weren't there, that was my problem, even though the goal was the company's best interests, because, as far as I'm concerned, it isn't a problem if they don't do the interview"*.

The other shared meaning that we can apply to the notion of *shared responsibility* is that of responsibility towards the community. In other words, there is a will to make sure that the wellbeing of other co-workers is taken into account and that it is not called into question by any member of the organisation. This is the way in which Stéphane Veyer talked about *collective responsibility*. In some cases, group thinking goes the full course – if we choose to use economic terms – in putting the collective benefit above the marginal individual benefit. This appears quite clearly at the *Menuiseries de l'Ain SCOP*, where the members, during a crisis period, decided *"to sacrifice some of that year's profits in order to keep shareholders and part-time workers"*, even though *"they were fully aware that they would feel the effect at year-end"* (the profits to share among themselves would be lower).

Motivation is at the heart of social dialogue

Motivation is based on the way *the forces that determine behaviour interact*.⁷⁷ An individual is motivated when they are convinced that their actions and efforts will achieve a result and bring them an attractive reward (Vroom, 1964). Several factors influence the level of motivation shown by an employee who, like other individuals, is motivated by his or her needs being met. There are three types of need, the need for achievement, the need for power

⁷⁷ Le Robert, *Dictionnaire culturel de la langue française* (2005)

and the need for affiliation and one of those needs predominates in every individual. That need is the one that they will seek to fulfil (McClelland, 1961). A study of our interviews shows that these needs are concerns that feature in the way that SCOPs are run, and that they can therefore be met. The need for achievement relates to accomplishment, and internal promotion is very widely practised within the SCOPs that we held meetings with. For example, Jacques Landriot, the Chairman and Chief Executive of the *Chèque Déjeuner* Group, began his career as a salesman. Likewise, René Deville, the Chairman and Chief Executive of *Compagnie Nouvelle d'Electricité* started out as an apprentice. Employees may therefore be motivated by the opportunity to succeed. Second, the need for power depends on the influence that the employee may have. In fact, we should acknowledge the power held by employees in SCOPS, due to the democratic way in which these entities are run. Every employee's opinion can have an influence on discussions. In fact, Juliette Rajon, from *La Maison de la Danse* clearly explained to us "that the advantage is being at the centre of the information and being able to vote on resolutions". Lastly, the final need described by McClelland, the need for affiliation, refers to social relationships. Enjoying satisfactory social relationships can therefore be a way to be motivated at work. In fact, this point was raised by a large number of the individuals who answered our questions. Many of them talked about getting along well, a pleasant working environment and friendly relationships. ("We discuss things. There are no divides, it's more like being friends", says Joffrey Bernard, from the *Menuiseries de l'Ain*). The SCOP model therefore seems to enable its employees to satisfy at least one of the needs mentioned by McClelland, which enables them to be motivated at work.

Another determining factor for motivation is the sense of fairness (Adams, 1965). When individuals see their situation as being fair compared to others' situations, they are more inclined to be motivated at work. In fact, we tried to find out whether SCOP employees considered their compensation system to be fair, and received a positive response in every case. For example, Odile Michel from *La Cité Création* understood this clearly when she told us, after having explained the compensation system, that "it seems a good way of rewarding everyone's contribution to me". Therefore, there is a sense of fair compensation, as well as of a fair distribution of the workload. "I would define our system as a fair distribution of the workload", says Joffrey Bernard from *Menuiseries de l'Ain*. The way in which SCOPs are run in terms of working practices and the compensation paid to each employee seems to create the conditions required to motivate their employees.

Finally, employees' propensity to be motivated at work may be due to their involvement in the life of the company. The more an individual is involved in their work environment, the more likely it is that they will be motivated to do their work conscientiously. The SCOP status makes member-employees decision-makers and involves them in the way the company is run. In fact, their involvement is obvious, as is the resulting motivation. This was especially highlighted during an interview at *La Maison de la Danse*, during which Juliette Rajon stated

that: *“People who have decided to be shareholders expect to be informed and involved. (...) they are interested and curious. They want to work for the firm”*.

The SCOP model therefore appears more likely to motivate its employees. Those employees are in turn more disposed to do the best that they can in their work and to be involved in it, which enables them to develop and apply a code of professional ethics.

Personal interests that coincide with those of the company

During our meetings with SCOP management teams and employees, we noted the existence of a strong connection between coming to work for the company and for themselves. Joffrey Bernard, from the *Menuiseries de l’Ain* described that link as follows: *“The fact that we share in the profits is one of the most important points for the company. We don’t necessarily have to motivate our troops like normal companies have to. When we get up in the morning, we know that part of the profits will be returned to us. At SECAD, Didier Debauche explained that “for the company to thrive, his salary was in play, and potentially its net income as well. It is to everyone’s advantage that the company works, and works well”*. Employees’ interests clearly coincide with those of the company. The way they treat their work can then be assimilated to the way they would treat themselves; in other words, they take good care that their company runs properly.

For René Deville, Chairman and Chief Executive of *La Compagnie Nouvelle d’Electricité*, *“if a person knows how to share, they will fit in well here”*. All employees therefore need to have traits in common. There seemed to be a very strong corporate culture. In fact, Stéphane Veyer from *Coopaname* used these terms when he explained that *“There is a corporate culture, and if anyone joins the company and is completely out of step with that culture, the other people at the company will make them understand that they are in the wrong place very quickly.”* Convergence of individual principles and interests with those of the company appeared to form an integral part of SCOPs. This way of running a company could thus enable everyone to be involved and to abide by a code of professional ethics. In fact, Juliette Rajon, from *La Maison de la Danse*, stated that *“the way the company is run suits me perfectly. I want to be involved in the company”*.

Employees are more likely to act in accordance with the standards and values of a company if they feel proud of belonging to it (Gara-Bach and Gaha, 2007). Pride in belonging to a company might therefore play a role in aligning the interests of the individual and of the organisation. As Odile Michel said *“I am proud of the SCOP’s business. I am proud of contributing my skills and my energy so that we can keep going as long as possible. I am proud of now being able to say that the company is 30 years old”*. Meanwhile, Elise Naccarato, from the *Chèque Déjeuner* Group, added that all the employees shared this sense of pride (*“They are all quite proud of their company”*.) It therefore seems that SCOP employees are more willing to behave in a way that is in line with their company’s principles and interests.

Identifying individual interests with the company's interests can also be the result of an individual's attachment to their company and of whether they are able to identify with it (Mowday, Steers and Porter, 1979). Effectively involving an employee in their company motivates them to do their work well and to work towards the good of the company; this is another incentive to adhere to a code of professional ethics.

Stéphane Veyer, the Chairman and Chief Executive of *Coopaname* described it like this: *"My level of attachment is huge (...). The cooperative project implemented by Coopaname is undoubtedly part of my identity. This project carries my convictions and those of all the others as well. We all have some of the same convictions on that point"*. This attachment is also very evident if we look at the seniority of the employees. *"People rarely leave our company before they retire. Because they are attached to it and because they are involved"* (René Deville – CNE). The same applies to the *Chèque Déjeuner* Group. Elise Naccarato told us that the current Chairman and Chief Executive was in fact the one who succeeded Georges Rino, who founded the Group in 1974. At *SECAD*, Didier Debauche confirmed that many of the founders were still there, which demonstrates the involvement of the employees in their company. The seniority of the management team and the attachment of individual employees to their company is therefore another characteristic feature of SCOPs, where the operating procedures therefore seem favourable to motivating and involving every employee.

In the SCOPs that we studied, the financial side did not, in fact, seem to be the most important one. Salaries, for example, did not increase as quickly and as significantly as in the private sector, although SCOP employees remained there for a very long time. In fact, employee motivation stemmed from other factors that are linked to the specific way in which SCOPs are governed.

A common interest is what drives these companies. The people that we interviewed told us this, almost word-for-word. At *Cité Création*, in Odile Michel's opinion, *"The team is going in the same direction, towards expanding Cité Création's business. No one is looking to expand their own business within the group. The collective interest is always paramount"*. Later, Odile Michel added that: *"The collective interest is paramount, i.e. the interest that the company survives"*. When talking about his colleagues' goals, René Deville (*La Compagnie Nouvelle d'Electricité*) put it this way: *"If we are talking about the managers, who are in charge of projects' profitability, theirs is a personal action that works for the group. Everyone therefore takes responsibility for the collective good, i.e. for the collective interest. Lastly, Stéphane Veyer explained to us that at Coopaname, "We innovate, we experiment and we invent within the social economy framework, with the aim of seeking what is in the collective interest of our members"*.

Our research enabled us to understand the importance of the collective interest within these companies. The individual is therefore not only motivated by individual reward, which would be purely financial, but also by seeking the common interest, which can bring them more. For Stéphane Veyer at *Coopaname*, the collective interest is linked to pooling risk and

therefore being able to become an entrepreneur in a safe way (*We pool a certain kind of risk-taking, we don't need to register, we take the risk and we spread it over 400 people*). The *Chèque Déjeuner* Group's employees also enjoy a certain safety net, which is authorised by the collective, if we take into account the solidarity fund, to which 3% of annual profits are allocated and which all employees may access in the event of a personal problem.

Are the decisions taken more responsible because they are discussed?

As we have seen, the importance granted to social dialogue, which does not exclude risk-taking, is significant in SCOPs. It enables any potential problems that the company may encounter in the near or distant future to be anticipated. *"We don't leave anyone out. We don't need to break down any barriers, unless people don't dare to express themselves. We should not leave any dark, unexplored areas. I think it creates more value"*. (Didier Debauche, *SECAD*). These discussions are at the very centre of SCOPs' strategy. They make it possible for them to think of innovative solutions. Employees' concerns are also one of the drivers for the company's strategy. For example, almost all the SCOPs that we met are involved in socially responsible initiatives, in terms of the environment, or professional development, etc. We would note that these initiatives were mostly instigated by the SCOPs' employees. This is precisely because they include people who are very involved in the voluntary sector, in aid, and in humanitarian initiatives. *"Anything that involves "hard core" economics and finance is beyond them. When they come back from Mauritania or the Sahel and they get here, talking about a 13th month bonus or profit sharing is beyond them. Let's start by thinking about what we could do so as not to use too much water and to save water and electricity"*. *"So, as Didier Debauch also explained during our interview, we drew up an estimate of the building's energy consumption and what it costs us"*.

This initiative enables the company to retain a high level of internal skills and to be more socially responsible.

Nonetheless, employee relations have their limits. The directors of the SCOPs that we met were aware of this issue. *"The more we try to get as many people as possible involved in specialised issues, the greater the risk that people do not have the necessary capabilities for taking the most responsible decisions"*. This point emerged from our interview at *La Maison de la Danse*, when Juliette Rajon told us that: *"People always have an opinion about everything. The problem is then how reliable that opinion is. Once again, where day-to-day decisions are concerned, I think that asking everyone's opinion is unnecessary and sometimes even dangerous"*. Joffrey Bernard (*Les Menuiseries de l'Ain*), added that, as far as he was concerned, it wasn't always right to believe that someone who was very good at their job as a furniture installer would be able to take the right decisions for the company. *"And that's where, in my opinion, the SCOP system reaches its limits, because we need directors and managers who are aware of the environment in which we operate."*

It would therefore seem that it is not suitable to take all decisions on a collegiate basis, although issues needed to be discussed within the SCOP. Management were aware that an

SCOP where there are no discussions or democracy can rapidly become an empty shell. In other words, if an SCOP does not take the opinion of its employees into account, it forfeits all the advantages of the discussion process and everything that helps it to be more socially responsible. Even if there was a social dialogue at the companies where we conducted our interviews, most of them observe that this process was not obvious. For instance, when we questioned Didier Debauche, (SECAD) about the opportunity for employees to express themselves, his answer was: *"I think it's an advantage for the company, a real advantage. However, it requires a real organisation process to make it happen. When I talk about organisation, it's so that it benefits the company. The process has to be organised. And it needs to be properly prepared to be organised. This means an agenda and preparing projects in advance"*. M. Debauche added: *"We never anticipate, which means that people often receive the agendas for Board or Shareholders' meeting on the day, and have no time to take a step back. This increases the number of questions and slows down the process"*. The social dialogue process must be organised so that it is effective and makes the company more socially responsible.

Conclusion

Nowadays, Corporate Social Responsibility is a concept that most company management teams can no longer allow themselves to reject, or even avoid. From an economic and social standpoint, that would mean taking a risk with rating agencies, politicians, voluntary organisations and civil society as a whole. The resulting cost could therefore be significant. This means that the entire corporate world is boasting about its initiatives for the benefit of society. However, we very often forget the main point, namely responsibility, which the CSR acronym is in fact increasingly tending to replace. Most of the time, responsibility is replaced by a study that is like a corporate social responsibility assessment, prepared along the same lines as a financial performance report.

For us, responsibility is first and foremost an approach, a human review of what "I can do", what "I am able to do", as well as who the people I need to account to are, and what their needs are. For me to be able to exercise "my" responsibility in an organisation, that organisation needs to offer me the possibility of answering these three questions as part of its day-to-day operating procedures. Before talking about CSR, we need to ask ourselves whether it is possible in a model where management is the dominant force.

What our research has enabled us to highlight is the fact that a traditional Limited Company, which is the most widespread and symbolic model of a major equity-based company, did not really allow CSR to be implemented. In fact, it is hard for such companies to meet the three conditions set out above, which served as the basis for our review, no doubt because it is more subject to the shareholder constraints promoted by its governance system than to a democratic process.

The reason for this observation can be found in the way we look at the management team. In the dominant organisational model – which includes traditional Limited Companies – the

“scientific” concept of management, combined with a negative perception of its representatives’ behaviour, has given rise – via a dual hermeneutic process – to individualistic and irresponsible practices (Ghoshal, 2005). In fact, talking about CSR in these companies becomes something of a contradiction: *“Our theories and ideas have done much to strengthen the management practices that we are all now so loudly condemning”* (Ghoshal, 2005).

Contemplating genuine CSR would therefore involve overhauling working relationships, in order to move closer to an enlightened democracy. In fact, this is what the alternative SCOP model sets out to do, and it seems to achieve that goal. Through our meetings, we discovered that SCOP employees appear to enjoy more autonomy and to take part in major strategic decisions, which enables them to recognise that they are taking on a collective responsibility. Their personal interests are aligned with the collective interest through two processes, namely self-regulation and the incentive system. Finally, because social dialogue is at the heart of an SCOP’s principles, it seems easier to include all the stakeholders in the decision-making process. Can we then say that *“Within the old form [of ownership], workers’ cooperative factories actually represent the first break with the system. (...) We should consider capitalist equity-based companies, and likewise cooperative factories, as forms of a transition from the capitalist mode to the collectivist mode. The difference is that, in the first case, the contradiction is resolved in a negative way, while it is resolved in a positive way in the second.”* (Marx, 1974, p. 105)?

HOW TO ENHANCE VALUE? A COMPARATIVE APPROACH BETWEEN MARKETING AND FINANCE

Paranque, Bernard¹; Cova, Bernard²

Abstract

What people do with brands has always been considered a source of value for them. Nonetheless, during the last decade, this phenomenon has been accelerated by the rising power of consumer communities, backed by the development of the internet and social media. It has been shown today that the success of a brand increasingly relies on the existence of a community of totally captive and loyal fans who co-create the value of that brand through their numerous practices. This paper seeks to respond to both these questions on brand value by drawing relationships between three worlds still unknown to each other: the world of the *brand communities*, the world of *brand management* and the world of *brand valuation*.

This paper seeks to respond to both these questions on brand value by drawing relationships between three worlds still unknown to each other: the world of the brand communities, the world of brand management and the world of brand valuation. One of the challenges is thus to avoid creating adverse effects by exercising too much shareholder pressure on the company-consumer relationship, while at the same time ensuring that the exchange value created is well-redistributed to the shareholders and not deviated to other ends of common knowledge or reputation, to the detriment of the wealth distributed to the owners of the company. On the other hand, it is also necessary to ensure that shareholder and financial demands do not jeopardise the means deployed for brand orchestration in order to acquire practices likely to carry exchange value.

Keywords: brand valuation, , consumer communities, brand management, brand communities, exchange value, use value.

Introduction

In the wake of this affirmation contained in the name of the track, the question we ask ourselves is twofold: on one hand, how interactions between the brand and its customers (Hatch and Schultz, 2010) can be transformed/ synthesised into "monetisable" shareholder value (de Chernatony, 2006 ; Salinas and Ambler, 2009) for investors, and on the other hand, how brand orchestration, supported particularly by/arousing the collaboration of consumers

grouped into communities (Muniz and O'Guinn, 2001 ; Schau, Muniz and Arnould, 2009) can manage to increase or endanger shareholder value.

What people do with brands has always been considered a source of value for them (Arvidsson, 2006). Nonetheless, during the last decade, this phenomenon has been accelerated by the rising power of consumer communities (Cova, Kozinets and Shankar, 2007), backed by the development of the internet and social media. It has been shown today (Veloutsou and Moutinho, 2009) that the success of a brand increasingly relies on the existence of a community of totally captive and loyal fans who co-create the value of that brand through their numerous practices (Schau, Muniz and Arnould, 2009).

This paper seeks to respond to both these questions on brand value by drawing relationships between three worlds still unknown to each other: the world of the *brand communities* (Muniz and O'Guinn, 2001), the world of *brand management* (Hatch et Schultz, 2010) and the world of *brand valuation* (Salinas and Ambler, 2009).

Brand values

The polysemantic nature of the word "value" is well illustrated by Foster [(Foster, 2011); see also (Willmott, 2010) and (Arvidsson, 2009)] in its three senses: moral, semiotic and economic. In the last case, its meaning rests on the distinction made by Marx between use value and exchange value. It is this latter sense that we shall employ in the course of reasoning in order to connect it to shareholders.

The term "use value" is to be taken in the generic sense, as applied to a *commodity*, [(Foster, 2011)] which « *is, in the first place, an object outside us, a thing that by its properties satisfies human wants of some sort or another. The nature of such wants, whether, for instance, they spring from the stomach or from fancy, makes no difference (...). Every useful thing ... is an assemblage of many properties, and may therefore be of use in various ways. To discover the various uses of things is the work of history* " (Marx, 1978, p. 51) and, it could be said, of consumers. In any case, "*use values must therefore never be looked at as the real aim of the capitalist; neither must the profit on any single transaction. The restless, never-ending process of profit-making alone is what he aims at*" (Ibid., page 157). Use values serve as the support for exchange value: "*only produced [by capitalists] ... in so far as they are ... the depositories of exchange value*" (Marx, 1978, p. 188), the source of shareholder value.

Exchange value does not characterise human relations – it is only one face of value (Marx, 1980, p. 207) - but rather, the dynamics of capital valorization on which these relations are built. It is the value created by the movement that gives rise to the increase in the value of the capital mobilised to produce it; i.e., the growth in the value of the capital applied to the production of goods and services.

We are thus not talking about the symbolic, ethical value created in exchange, but about an exchange relationship, the vector of which is the currency that represents the monetary

embodiment of this value. Money, the “universal equivalent” of wealth, the “socially recognised universal equivalent” (Marx, 1980, pp. 173, 214) is a special commodity that functions as a general exchange equivalent “against the particular and singular forms of wealth” (Ibid.), acts, goods or even services: “*The type of use value that backs value is of little importance; but value must be backed by use value*” (page 189). In other words, the goal of capitalist production is to increase the value of capital and to facilitate investment decisions that will result in opportunities for such increase, which modern financial theory calls the creation of shareholder value.

Hence, the creation of shareholder value is nothing but that exchange value that sustains the capital cycle through shareholders / investors.

Community practices and brand value

In these “use-exchange” dialectics, brand communities (Muniz and O’Guinn, 2001) or consumer tribes (Cova, Kozinets and Shankar, 2007) are ever on the forefront, on the crest of a wave of exchanges/exploitation that runs the risk that the sphere of exchange – through the policies followed by the company, and thus through shareholder pressure – may drive back the frontiers of use to appropriate its underlying exchange value (what has been called the “merchandising” of activities, as in the example of Modigliani).

The question is thus:

- on one hand, to define modes of transforming community practices (Schau, Muniz and Arnould, 2009) into exchange value acceptable to the community (the capacity of the company to make a product acceptable to the market) while encouraging that community to respond to it and also being able to anticipate its needs and projects related to identity (Arnould and Thompson, 2005)
- on the other hand, to “raise” shareholder value (brand value creation → brand valuation) on the basis of practices bearing/underlying/qualifying the brand [see the Coca-cola case (Foster, 2011)], so as to respond to shareholder expectations and/or attract new shareholders (investors in both cases)

One of the challenges is thus to avoid creating adverse effects by exercising too much shareholder pressure on the company-consumer relationship, while at the same time ensuring that the exchange value created is well-redistributed to the shareholders and not deviated to other ends of common knowledge or reputation, to the detriment of the wealth distributed to the owners of the company (Jensen and Meckling, 1976). On the other hand, it is also necessary to ensure that shareholder and financial demands do not jeopardise the means deployed for brand orchestration in order to acquire practices likely to carry exchange value.

Another challenge is the fact that at some given time there can be a perception of “exploitation” among the consumers [(Foster, 2011); (Willmott, 2010); (Tiffon, 2010)], a

withdrawal and at the same time a rupture, arising from a relationship that has revealed a dimension of unpaid work, the results of which are appropriated, “acquired” (Cova and Dalli, 2009) by the other party – the company and its brand – without any tangible compensation for the consumers. The question is, “*why do they not receive [the consumers] any economic reward for this labour?*” (Cova and Dalli, 2009, p. 326).

The response is that, in that case, the company, more precisely the shareholder(s), would be compelled to share a part of the additional income coming from that unpaid activity. Consequently, remunerated or not, the dialectic “brand value creation – brand community practices” carries a risk of being perceived as an appropriation attempt: “*As a lived experience, the appropriation consists of the fact that purposes incompatible with my motives are imposed upon my social activity*” (Sève, 2008, p. 505).

Thus, “*the value of brand provides a central performance measure and should serve as a performance indicator for various management purposes*” (Clifton, 2006, p. 52)

An important sequence thus comes into play. Any company activity, whatever the nature of its assets, is subject to a system of non-linear constraints:

- the constraint of accumulation; to wit, to acquire the capital necessary for its activity, whereby this capital may be tangible or not, social or human, etc.
- the constraint of valorization, which means the creation of potential added value (to the extent that it does not materialise on the market, see next point) through the incorporation of competences – possibly outside the market – on the basis of the assets mobilised and the services or goods purchased, or not
- the constraint of realization, which means that the new product proposed to the market should be validated by the consumers. This validation in market economy involves the purchase of and payment for the said product – i.e., a monetary transaction – and also, increasingly, the emergence, outside the market, of a dynamic’s socially validating values, whether or not these hold shareholder exchange value

This realization is thus a risk by itself, since if financial validation “*is more linked to the risks and insecurities of life itself*” (Arvidsson, 2006, p. 132), to that extent, its outcome originates in the quality of the market relationship through the brand “*made by a kind of loop*” (Arvidsson, 2006, p. 127).

The central operational difficulty is that this quality is hard to evaluate and the underlying risk is likewise hard to quantify. Study of the methods in use (Salinas and Ambler, 2009) shows that if the financial dimension of the brand community is well integrated (Isakovich and Johnston, 2009), the quality and modes of orchestration or, more precisely, of interaction between the company (Brand Value Creation) and the community (Brand Community Practices) would seem non-existent. When is there a risk of perceived exploitation? What

about the perception of faithfulness to the history, statements and values held by the company? How are these risks and stakes quantified, integrated, modelled, for them to be taken into account in the policies drawn up by the Board? [(Hatch and Schultz, 2010); (Tiffon, 2010); (Willmott, 2010)].

A study of tools and methods shows that both seem overly centred on the traditional concept of a passive client and not an active consumer whose behaviour and expectations interact with the financial objectives of the company regarding its brand, conceived as an intangible asset and source of income [Batchelor, quoted in (Willmott, 2010, p. 519)].

A blind point: the dynamics of the relationships “finance-market-community”.

The exchange value of brands has been the subject of significant research, both academic and practical (Salinas and Ambler, 2009).

Indeed, like an asset entered on a balance sheet, the brand should be validated by both the consumer market and the financial investment market. The specific feature of an intangible asset such as a brand is its dependence on the validation of its “value” by the market; i.e., brands must demonstrate the capacity to create value, not only for consumers (Ochs, 1998) but also (above all?) for the shareholders, who, at one time or another, will have the need, the urge or the choice to judge from among diverse investment opportunities. In this case, the possibility of selling will depend on the acknowledgement by a third party of the potential of the company strategy to create shareholder value, and thus the capacity of the seller to prove his capacity to ensure the monetary performance of the brand.

Consequently:

- either a buyer and a seller “meet” on the goods and services market, and make tangible, at a given moment and for a given buyer, the economic reality of the brand by means of a monetary exchange (its capacity to create “hard cash” value)
- or a market – the financial market – testifies to this capacity through purchases and sales of the securities of the company owning some brands, in witness of their capacity to extract shareholder value through value creation strategies for and by consumers

There thus exists a reality check: an realization, which is an exchange on a market – the goods market, where consumers acknowledge the value(s) of the brand, and the financial market, where investors validate an exchange value potential held by the brand. In both cases, the brand thus serves as *“a relational entity that only creates value in the context of an interaction and differential game between diverse agents”* (Heilbrunn, 1997). This validation by the financial market is so necessary that a company can only enter a brand as an intangible asset on its balance sheet during a purchase, an acquisition attesting to the interaction between a seller and a buyer on the market (Vernimmen, 2005).

This explains the stakes that the valuation of a brand represents for companies; i.e., how to coherently articulate two disciplinary fields such as marketing and finance in a context of development, where raising capital increasingly involves giving tangible form to contributions and expectations in terms of creating shareholder value.

According to Salinas and Ambler (2009, p. 42), there are three great methods on the subject: a cost approach, whereby *“the brand is valued on the basis of the cost of creation”*; a market terms approach, *“by reference to open market values”*; and an approach oriented above all towards income, *“based on the premise that future cash flow attributable to a brand dictates its value for its owner, our potential investor”*.

Not surprisingly, the authors note that the latter *“is the most popular approach”* (2009, p. 44), thus confirming that the entire stake around the debate about brands, from the point of view of companies, is actually the creation of shareholder value, exchange value, which involves not only developing the productivity of the company, but ensuring that this is capable of tapping the potential value likely to emerge from the production process and appropriating it.

One thing is to be noted: the different approaches presented by the authors cited remain static in that they fix the evaluation sequence in determining shareholder value (market value in the financial sense) without asking themselves about the global dynamics of the production process, including the moment of circulation in which new uses are developed that may be a source of values.

The question of the value of a brand is not new as shown by Fernandez (2001). He presented different methods used for doing itⁱⁱ. Among them, he mentioned *“Interbrand, Damodaran, Financial World, Houlihan Valuation Advisors, Market Facts, Young and Rubicam and CDB Research and Consulting”*. In his paper he mentions two important things:

“when valuing a brand, it is particularly important “for whom” the value is being determined (...)”

“Likewise, it is vitally important to define “for what purpose” it is wished (...)”.

If we adopt the shareholder standpoint, it is crucial, depending on if he is a seller or a buyer of a company with a brand: their expectations are not the same.

In this perspective, what are the methods used to calculate the value (Rodrigues, 2001; Fernandez, 2001; Lindemann, 2004; Salinas and Ambler, 2009)? One considers that the value of a brand is the value of the share on the financial market according to the fact that if someone wants to buy a share it is because he/her expects future earnings supported by the brandⁱⁱⁱ. Another approach seems to be more interesting for us. The value of a brand could be understood as the cost of its replacement:

“Present value of the historic investment in marketing and promotions.

“Estimation of the advertising investment required to achieve the present level of brandrecognition.” (Fernandez, 2001).

Among others approaches, this one is interesting for our comments because it directly links the management of the consumers to the management of the financial performance. Some authors like Rodrigues (2011) consider that this method is not able to evaluate the value generating by the brand and propose to use Economic value approach like Interbrand does. But our concern is not to calculate the future earnings but to identify the constraints face by the company to build its brand. In this perspective the so call Cost Based Approach is interesting to identify actions, and their cost, implemented by the company to manage its brand and its community.

Others methods focus more on the deal between a seller and a buyer about the expecting value of the brand, that means its capacity to create value in the future. The main problem is clearly quoted by Lindemann (2004) *“event today, the evaluation of profitability and performance of businesses focuses on indicators (...) that excludes intangibles ...”*. The problem is “for who” this evaluation is made. From a market standpoint, it is sure that intangibles must taking into account, because the expectation of A investor is about his future earnings; but from a bank point of view, which is focused on solvability, an intangible, a brand, has a value only if the firm is in a good situation. If it faces some problems (look at Lacroix), uncertainty rises about those earnings and so the value of the brand is in distress. To say the debate is between an individual approach, a firm facing an investor or a seller and a buyer, and a more systemic approach integrating others stakeholders, like consumers but also inside the firm itself between finance function and marketing function.

Conclusion: our research program.

To take into account the limit of the Cost Based Approach and the need to consider shareholder expectations, we will concentrate our analyze on Interbrand which is very well known since two decades because its method is focused on this relationship. *“Interbrand’s method looks at the ongoing investment and management of the brand as a business asset. This means that our method takes into account all of the many ways in which a brand touches and benefits its organization – from attracting and retaining talent to delivering on customer expectation.”* (Interbrand, 2010). This method has been recognised by the ISO standard 10668 (ISO, 2010). The organization argues that *“The standard guides users through a globally harmonised three-tiered analysis focusing on financial, legal and behavioural aspects. Examples include the legal rights and protection of a brand, market size and trends, its effect on purchase choices and the different attitudes of stakeholders towards the brand”*.

The measure of brand value is based on three pillars^{iv}:

- the financial performance, measured from investors standpoint with a concept close to the Economic Value Added (EVA; Brealey, Myers, Allen, 2006) to determine the profitability of the organization as a whole (Interbrand, 2010);
- the role of brand “*measures the portion of the decision to purchase that is attributable to brand*” (Interbrand, 2010);
- the brand strength “*measures the ability of the brand to secure the delivery of expected future earnings.*” (Ibid; Fernandez, p.12, 2001)

Interbrand has developed the understanding and measure of these “connector brands” (Isakovich and Johnston, 2009). Their brand strength can be determined based on the brands’ ability to ensure strong future connections. These metrics include a customer’s: 1) Brand loyalty; 2) Interactivity with the brand; 3) Engagement with community; 4) Perception of brand uniqueness. Concerning the third metrics “Engagement with community”, Interbrand (Isakovich and Johnston, 2009, p. 3) defines it as follows: “*The stronger the community that a brand creates for its customers, the more they will rely on the brand to create and sustain the community. This connection can refer to an actual community or a sense of community*”. Thus, some brands – the cult brands - are able to foster a sense of zealous appeal and resulting loyalty which is very valuable for companies owning them.

For us, the question is less about the tools than analysing the manner in which marketing/finance functions interact with each other in the process of putting an income-generating product or service on the market.

Going back to our outline, it would seem that “brand valuation” methods are built around the relationship with third-party financiers without taking into account among financial strategies certain contradictions that can potentially destroy value or serve as levers to create additional value: shareholder and investor demand for (short-term) profitability, marketing, the identification and implementation of activities, and their impact on communities.

i This said, the term "exploitation" in the Marxist context is ambiguous, since for Marx exploitation only exists in the production process, when the employee works beyond the time necessary and produces "surplus labour". It thus involves a contractual relationship, which is not the case of consumers. The fact remains nonetheless that their work, done outside the capitalist production process, determines a use value that carries a potential exchange value, provided it is integrated into this process (Marx, 1980, pp. 34, 182-183, 376).

ii According to Fernandez (2001) "There are many definitions for the brand concept but they are not feasible for brand valuation. For example, Aaker defines the brand as "a set of assets and liabilities linked to a brand's name and symbol that adds to or subtracts from the value provided by a product or service to a firm and/or that firm's customers". According to Lance Leuthesser (1995), the brand is "a product's additional value (for its customers) compared with what would be the value of another identical product without the brand". According to the Marketing Science Institute (1998), the brand is the "strong, sustainable, and differentiated advantage with respect to competitors that leads to a higher volume or a higher margin for the company compared with the situation it would have without the brand. This differential volume or margin is the consequence of the behavior of the consumers, the distribution channel and the companies themselves"."

MICRO-INSURANCE IN EMERGING MARKET: CHAPTER BANGLADESH**Parvez, Md. Shahriar¹**

¹Lecturer, Department of Business Administration, City University, Bangladesh. E mail: msparvez_educator@yahoo.co.uk

Abstract

The study focuses on Micro-Insurance in Bangladesh, an emerging market. The policy environment for Micro-Insurance market in Bangladesh is studied with the initiatives by various sectors. This paper also aims at understanding the perspective of Micro-Insurance in emerging market in Bangladesh.

The study uses published secondary data from various relevant sources websites, journals, publications and the researchers have used personal observation and experience regarding the country's socio economic and political background and their impact on the Micro-Insurance.

Microfinance institutions are developing new financial products and services to meet increasing client demand and Micro-Insurance is one of the products that are gaining wide attention in the world of microfinance. In Bangladesh this Micro-Insurance product of Microfinance is newly adopted various MFIs/NGOs and offer various products to the poor people and ensure their unknowable risk.

Bangladesh has been considered a pioneer in Micro-credit, yet diversification of financial products and services for the poor is not up to the mark. Although many MFIs are offering Micro-Insurance products to the poor, there are a large number of poor people uncovered by Micro-Insurance. Current Micro-Insurance products offered by MFIs/NGOs are coming from the supply side and other than the demand side. Although many MFIs/NGOs are offering Micro-Insurance products to protect their loan as well as provide social security to their clients though reducing risks and vulnerabilities, product diversification and professional Micro-Insurance operations are not developed. There are huge scopes of Micro-Insurance practical implications in the financial sector of developing countries and Bangladesh is one of them.

Keywords: Micro - Insurance, Microfinance Institutions (MFI), Non-Government Organization (NGO), Target Clients & Insurance Industry.

Introduction

Intensify risk and defenselessness is a core element of daily life for poor people. Poor people must often struggle hard to slowly generate income and build their assets to get out of poverty. Crises are recurrent in the lives of the poor. Such crises - personal, social, or natural - often involve high expenditures and drive poor families deeper into poverty. Most common crises are accidents, sudden hospitalization, and death of a bread earner, and loss of crops or

assets. Expenses incurred during such crises are met either by borrowing from moneylenders, sales or mortgaging of assets or by drawing on scarce saving resulting into a simultaneous reduction in income and saving, and an increase in debt and expenditure. Each crisis leaves a poor family weaker and more vulnerable. Traditional micro-finance schemes do not address such vulnerabilities and the necessity of risk reduction for the ultra poor. The informal coping mechanisms offer limited protection and are less available to poorer households and break down when most needed. Formal financial services can offer greater benefits at a lower cost than informal mechanisms but there is vulnerability to risk is reducing effectiveness and financial performance of micro-credit.

Insurance or risk protection is one mechanism that ties both the borrower and the institution. Mostly the MFIs only cover lenders part of risk by securing the credit whereas borrowers' part of risk is always overlooked. Any improvement in this area will help the MFIs not only to bring better customer satisfaction through better risk protection of unwanted risks faced by the borrowers but also contribute to the poverty alleviation role of micro finance. Undoubtedly, risk coverage of borrower's part of micro-credit is an important and interesting area to work with. For products like micro-insurance, increased attention is given to address clients' needs for risk management that in a sense helps the bottom of the pyramid to have more savings and thus pool them from the destitution.

Exacerbated risk and vulnerability is a core element of daily living for the poor people. Poor people must often strive hard to slowly generate income and build their assets to get out of poverty. Microfinance makes this process smoother. For this reason Microfinance is considered as proven strategy of poverty alleviation. But in the perilous world of scarcity, impulsive shocks such as illness, death within the family, especially primary household earners, and damage of property affect the process of income and asset building. Sometimes Microfinance itself is not sufficient enough to cope with these types of shocks. To cope with the shocks and vulnerabilities, poor people expect some financial as well as social security products like Micro-Insurance is increasing day by day.

Purpose

Millions of people in developing countries live in a state of destitution. Their opportunities for development are extremely restricted by economic and political conditions as well as their financial and social situations. Through different micro finance and insurance policies the poor could attain a better standard of life through programs prepared in the field of financial business services. Globally micro-credit is considered as an important tool for poverty reduction. Different micro finance institutions (MFIs) have different mechanisms and practices for micro-credit. Poor people confront many of the same risks faced by the non-poor (e.g., death, illness or injury, loss of property due to theft/fire and natural disasters), but these risks have greater financial impact and occur with greater frequency.

Moreover, the vulnerability of poor people is exacerbated each time they incur a loss, creating a vicious cycle that precludes lasting improvements in human and economic welfare. And Micro-Insurance is one of the most imperative products of Microfinance, and in Bangladesh it has a huge perspective market.

This paper aims at understanding the Micro-Insurance in the emerging market in the economic of Bangladesh.

Methodology

The study uses secondary data collected mainly from the office folder of International Network of Alternative Financial Institutions (INAFI), (Asia and Bangladesh) a worldwide network of development practitioners that are committed to improving the lives and livelihoods of the poor in the regions of Africa, Asia and Latin American by offering a range of financial and non-financial services as a means of poverty alleviation. And other related websites, journals, publications etc. all information and reference is provided in the reference section of this research paper. In addition to this the researcher has used personal observation and experience regarding the country's socio economic and NGOs/MFIs and their impact and standpoint of Micro-Insurance in Bangladesh.

Progression of Microfinance and insurance in Bangladesh:

The Microfinance industry in Bangladesh has been able to demonstrate a remarkable growth during the last two decades and to provide access to credit to around 30 million poor households (according to the Credit and Development Forum (CDF) Bangladesh). According to the Bangladesh Bank there are around 12000 (twelve thousand) branches of NGO/MFIs in Bangladesh. The average member size and borrower size of a branch is 1883 and 1413 respectively. Up to June 2006 - 2007 four big institutions including Grameen bank dominate the microfinance market of Bangladesh.

Table – 1
Coverage of Micro-credit Program

Organization	No. of Borrowers	Outstanding Loan (in million Taka)
NGO-MFIs (June 2006)	18,415,878	78,930.57
Grameen Bank (June 2006)	6908704	33235.46
Government Program (December, 2005)	1,997,240	7,710.05
Sub Total	27,621,573	120,493.52
Nationalized Commercial Banks (December, 2005)	2311150	32783.45
Private Banks (December, 2005)	164113	1106.46
Sub Total	2,475,263	33,889.91
Grand Total	30,096,836	154,383.43

*1 - <http://www.bangladesh-bank.org/>

Grameen Bank, BRAC, ASA and PROSHIKA account for 60% of the total amount of outstanding loans made by all MFIs, and it is widely believed that top 20% institutions account for 80% of the total market (Bangladesh Bank).

Development of MFIs/NGOs in Bangladesh:

The Microfinance industry in Bangladesh has exposed a significant growth over the last two and half decades. Before 1990, there were only 37 MFIs/NGOs operated Micro-credit programs.

Table – 2
Growth of MFIs/NGOs

Year	Number of MFIs
Before 1976	02
1979 - 1980	02
1981 – 1985	07
1986 - 1990	26
1991 - 1995	127
1996 - 2000	409
After 2000 in progress	1883

Source: Bangladesh Bank report & Microfinance Statistics of CDF (2007 - 2008)

The main dilemma of insignificant growth of MFIs/NGOs before 1990s were of Capacity to operate Micro-credit program and another important issue was availability of revolving loan fund. After establishing PKSF in 1990 as an Apex funding organization for funding Micro-credit program, there was a significant growth in the microfinance sector of Bangladesh. The

significant growth in the microfinance sector of Bangladesh was observed from 1996 to current year 2011.

The Insurance Industry in Bangladesh:

The insurance industry of Bangladesh has been considered as a growing sector. According to the publication of Bangladesh Bank (Financial Sector in Bangladesh) the insurance sector is regulated by the Insurance Act 1938 with regulatory oversight provided by the Controller of Insurance on authority under the Ministry of Commerce. A separate Insurance Regulatory Authority is being established. A total of 62 insurance companies have been operating in Bangladesh, of which 18 provide life insurance and 44 are in the general insurance filed. Among the life insurance companies, except the state owned Jibon Bima Corporation (GBC) foreign American Life Insurance (ALICO), and the rest are private. Among the general insurance companies, state owned Shadharan Bima Corporation (SBC) is the active in the insurance sector. A total of 31 insurance companies are listed in the capital market, of which 8 offer life insurances.

Table – 3

Source: Bangladesh Insurance Association (Provided by INAFI, Bangladesh) year- 2008-2009

Although the country has huge prospect in insurance sector due to large population, but this sector remains underdeveloped compared to that of neighboring countries. In FY 2007 - 2008, the growth of insurance sector was 7.6 percent (according to the Bangladesh Bank report, provided by INAFI); where as in FY 2002 - 2003 this growth was 12.4 percent. The GDP share of insurance Sector is increasing, in FY 2006-2007 the share of insurance sector in GDP was 0.4 percent, where as in FY 2002 - 2003 it was 0.3 percent.

According to the Khaled Mahmud Raihan publication (Insurance industry in Bangladesh; A rater's perspective) The Financial Express (October 11, 2008), Overall financial performance of the general insurance companies was found moderate. On an analysis, it was found that 15.38 per cent companies revealed poor financial performance, followed by 30.76 per cent marginal, 46.15 per cent above average and rest 7.71 per cent satisfactory financial performance. The average gross underwriting margin stood at 43.07 per cent ranging from 59.32 per cent to (43.92 per cent) during the period under report in this write-up. Considering the reserve for

unexpired risk, the average net underwriting margin was found at 8.78 per cent ranging from 24.58 per cent to (77.27 per cent). The average pre-tax operating margin was 12.89 per cent having wide deviation among the companies. The average return on average asset (ROAA) and return on average equity (ROAE) respectively stood at 5.54 per cent and 7.98 per cent. The average return on average investment (ROAI) stood at 8.48 per cent with a very small variation.

Unlike general insurance companies, the financial performance of life insurance businesses are measured by the surplus generated from the gap between actuarial valuation of liabilities and life fund. It has been found that average policyholders' surplus to net premium was 6.66 per cent ranging from 18.76 per cent to (2.44 per cent). Average surplus on assets stood at 4.53 per cent. Average incremental surplus to incremental life fund during the period stood at 7.84 per cent (ranging from 20.79 per cent to -0.02 per cent) indicating moderate growth of surplus against the life fund generation. Return on assets was also found moderate with an average of 7.82 per cent among the companies in the sample. (Table – 4: Chronicle of Insurance Industry in Bangladesh)*2

Simple Clarity & Overview of Micro-Insurance in the Emerging Market OF BANGLADESH

According to the Monique Cohen and Jennefer Sebstad (Microfinance opportunists*3) “Insurance is a mechanism that uses risk pooling to compensate individuals and groups adversely affected by a specified risk or event”. Insurance can be defined as such a social and economic security that pool risk, reduces vulnerability and provides more complete compensation.

Micro-Insurance is a subset of insurance that provides social security and plays role of social safety net to the poor. Its clients and operational methodology are different from the existing formal insurance companies. The clients of Micro-Insurance are poor and they depend on low income. Usually this income flows fluctuate considerably throughout the year.

In a very simple sense Micro-Insurance means insurance services provided to the low-income people. In a wide sense “Micro-Insurance is an insurance service which provides the protection of low-income people against specific perils in exchange for a pre-specified payment determined in proportionate to the likelihood and cost of the risk involved and made in advance” (according to the ADB viewpoint). So, Micro-Insurance is an integral part of the financial services for the poor and low-income people.

The definition of “Micro-Insurance” can be understood in two parts. First, the “Micro” portion of the definition refers to the subset of product that is designed to be beneficial and affordable for low-income individuals or groups. Second, the “Insurance” component refers

to a financial service that uses risk-pooling to provide compensation to individuals or groups that are adversely affected by a specified risk or event. Risk-Pooling means that a large group or pool of individuals or group contributes to share the losses resulting from the adverse situation or occurrence of a risky event. Persons affected by an adverse situation and negative event enjoy benefits from the contributions of many others that are not affected and due to risk sharing the affected persons receive compensation that is greater than the amount they have invested in the insurance policy. Products that allow affected individuals to receive only up to the amount they have contributed are considered savings products, and not insurance products. So insurance is different from saving as well as other financial products.

An Overview of Micro-Insurance in Bangladesh:

Micro-Insurance is a new concept, which is gaining attraction and popularity in Bangladesh. As a new concept a new product, the information and documents on Micro-Insurance, both from MFIs/NGOs sector and private insurance companies are very scarce. The Delta Life Insurance is the first private regulated insurance company in Bangladesh that entered in the Micro-Insurance in 1988^{*4}, inspired by the growing success of the Grameen Bank and other Micro-credit schemes in Bangladesh.

^{*3} - www.microfinanceopportunities.org/pubsMI.php

^{*4} - <http://www.deltalife.org/micro.htm>

Delta launched an experiment of its own, Grameen Bima and Village Insurance. Initially, the design for Grameen Bima called for collaboration with a Micro credit, NGO that provided the delivery structure for Delta's endowment product. This partnership dissolved after a short time because of a difference in objectives. With the tremendous success of Delta Life Insurance, some MFIs/NGOs as well as private insurance companies came forward to offer Micro-Insurance products to the poor people. The MFIs/NGOs came forward with health insurance and also loan insurance to protect their portfolio and reduce portfolio at risks.

Bangladeshi microfinance NGOs came into the Micro-Insurance scene in the late 1990s and early 2000s. Important players in Micro-Insurance are BRAC, Grameen Kalyan, ASA, Proshika, Gonoshashtho Kendra, Sajida Foundation, Shakti, Dhaka Community Hospital, Nari Uddug Kendra, Dushtha Shasthya Kendra, Integrated Development Foundation (IDF) and Society for Social Services (SSS). (Source: all information provided by the INAFI, Bangladesh). Gonoshashtho Kendra is the first NGO which offered Health Micro-Insurance in Bangladesh. BRAC started its health Micro-Insurance in 2001, Grameen Kalyan started Micro-Insurance in 1997 and SSS launched health Micro-Insurance in 1993. ASA launched Micro-Insurance products in 1993, with loan insurance with a view to help the member's family in case of sudden death (source: ASA annual report 2004).

Proshika started Micro-Insurance products in 1997. IDF started Micro-Insurance program in October 1997 in response to requests of group members to help their families in the case of serious sickness or death of any earning members (source: IDF annual report 2004). In 2003,

the ILO's WEEH (Women's Empowerment through Employment and Health, July, 2005) project carried out an extensive study to take inventory of Micro-Insurance product in Bangladesh. The study covered twenty organizations that provide thirty-six schemes in various parts of the country. Three of these are large NGOs, namely BRAC, Grameen Kalyan, and Proshika. These NGOs have nationwide reach though their organizational infrastructure built on established micro-credit groups across the country. Sixteen schemes are provided by small to medium locality based NGOs such as the Chittagong based IDF. These schemes provided by the NGOs are not for profit and cover risks such Primary health, Hospitalization, Life, Loans and Property. Lastly, one scheme is run by a commercial insurance company – Homeland Life Insurance.

Their schemes have nationwide coverage and their risks coverage is limited to Life insurance. According to ILO study, they have isolated the thirty-six schemes of twenty organizations in five categories.

Table – 4
Types of Micro-Insurance in Bangladesh

<i>Types of Schemes</i>	<i>No of Schemes</i>	<i>Distribution (%)</i>
<i>Health</i>	<i>14</i>	<i>39</i>
<i>Life</i>	<i>13</i>	<i>36</i>
<i>Loans/Capital</i>	<i>06</i>	<i>18</i>

<i>Disaster</i>	<i>01</i>	<i>02</i>
<i>Total</i>	<i>36</i>	<i>100</i>

Source: Inventory of Micro-Insurance Schemes in Bangladesh by WEEH ILO, September 2003-2004 (provided by INAFI Bangladesh)

The premium of Micro-Insurance collected Taka.636.14 crore in 2006, which went up to Taka. 767.10 Crore in 2007 and Taka. 917.98 Crore in 2008*5

The Practice of Micro-Insurance in Bangladesh:

According to the Contribution of Micro-Insurance Augmenting the Poverty Alleviation Role of Microfinance*6 by Professor M. Ziaulhaq Mamun, PhD (IBA, DU), Bangladesh a country of 140 million people is very densely populated. Majority of the population is living in the rural areas and are deprived of basic social services (e.g., health, Medicare, etc.). Micro-insurance is rapidly expanding in Bangladesh.

Micro-insurance products are becoming more competitive, and there are varieties of risk mitigation options available to the low-income market. The very first micro-insurance scheme was introduced 1972 by Gono Shashtho Kendro. Besides regulated insurers, many MFIs have some level of insurance provision covering disability and/or death. Recognizing the link

between good health and productivity, some MFIs are also trying to bring quality health care to people who have not had access to these in the past.

The MFIs/NGOs came forward with Micro-Insurance Products during the late 1990s and early 2000, when they observed that due to death of Microfinance clients, the felony and portfolio at risks of the organization usually increases. When the NGOs/MFIs scrutinized the demand from the clients' side then they offer Micro-Insurance products. Beside, the success of Micro-Insurance products a private insurance company also encouraged MFIs/NGOs to offer insurance products for there Microfinance clients.

Table – 10

Nature of Micro-Insurance Products offered by Insurance Companies

<i>Key Factor</i>	<i>Product Features and Packages</i>
<i>Target clients</i>	<i>Occupation based low income people of informal economy. Usually the households who earn less than US\$100 per month. Some insurance companies offer Micro-Insurance products whose monthly income varies from Taka.600 to Taka.5000. The age range of the policy holders is between 18 to 45 years. Some companies also offer Micro-Insurance products up to 55 years clients.</i>
<i>Premium rate</i>	<i>The premium charges per Thousand (1,000) Taka insurance coverage varies from Taka.3.25 to Taka.13.33 per month depending on nature of products, insurance plans, size of insurance coverage, insurance maturity period, installment procedure of premium and the age of policy holder. Another Micro-Insurance package named single premium policy, where the premium rate per Thousand Taka insurance coverage varies from Taka.757.40 to Taka.1448.80 depending on insurance plans, the age of policyholder and insurance maturity period.</i>
<i>Premium collection procedure</i>	<i>Usually premium is collected monthly/ quarterly/ half yearly/ yearly installments depending on insurance plans and policy holder's interest.</i>
<i>Duration of insurance policy</i>	<i>Most of the cases the duration of insurance policy vary between 6 to 15 years. But in some insurance plans the duration of insurance policy is up to 30 years.</i>
<i>Size of insurance coverage</i>	<i>The size of insurance coverage usually varies from Taka.5000 to Taka.100, 000 depends on policy holders premium rate. But in some insurance plans the size of insurance coverage amount is up to Taka.3, 60, 00. For single premium term package usually the size of insurance coverage is 2.5 times or 250 percent of insured amount.</i>
<i>Types of risk coverage</i>	<i>In most of the cases the death risk of insurance policy holder is covered. Some Micro-Insurance products also cover health and accidental risks along with life by charging some additional premium. Beside, these there are some insurance plans which provides fund for child education, and marriage of daughter after the death of parents. In these insurance plans the parent of children is policyholder. The death risk of this insurance policyholder as well as death risk of children is covered in these plans.</i>
<i>Claims paid or premium refund</i>	<i>Usually the claims are paid to the family members of deceased policy holder. Moreover, a certain percentage between 10% to 25% bonus on insured amount is paid after a certain period (3 to 4) years. Some Micro-Insurance product package also include a certain percentage of profit like 7% on bonus if the policy holder doesn't withdraw it when due and this interest along with bonus is paid after the maturity of insurance term if the policy holder alive. Some plans have also pension system. If the policyholder doesn't withdraw the full insured amount along with profit bonus, she/he will get monthly pension for 5 to 10 years. If the policyholder dies during this pension period, then the rest of the pension amount will be paid to the successor of the policyholder. In child stipend or education plans, the children will get a certain amount of stipend in</i>

	<p><i>very month up to completion of his/her master's level education.</i></p> <p><i>In female children marriage endowment plan, the daughter of the policyholder will receive the insured amount along with profit at the age of 18years. For single premium package if the policyholder doesn't die, then the policy holder usually receives 2 times or 200% of the deposited premium</i></p>
<i>Other benefits</i>	<p><i>Some Micro-Insurance Product package includes other benefits like savings and credit opportunity. Usually the policyholders can withdraw a certain percentage of deposited premiums as loan after a certain period.</i></p>

Proportional Analysis of Micro-Insurance Products Offered by NGOs/MFIs and Mainstream Insurance Companies:

“Micro-Insurance” the insurance for the poor, this is core theme of Micro-Insurance and already it has observe that both NGOs/MFIs and Commercial Insurance Companies offered this product of the Microfinance. If the product design and packaging, and the management and operational methodology of NGOs/MFIs and mainstream insurance companies are critically analyzed then there are some fissure or gap and it will be observed between NGOs/MFIs and mainstream insurance companies.

The following tables can clearly depict the comparative or proportional analysis of Micro-Insurance products offered by NGOs/MFIs and mainstream insurance companies.

Table – 11
Comparison of Micro-Insurance products of NGOs/MFIs and
Mainstream insurance companies

<i>Key Factors</i>	<i>NGOs/MFIs</i>	<i>Mainstream Insurance Companies</i>
<i>Target Clients</i>	<i>The Members of NGOs/MFIs. The target clients of NGOs/MFIs are usually both rural and urban poor people specially the women</i>	<p><i>Occupation based low income people of informal economy. Usually the households who earn less than US\$100 per month and the age range between 18 to 45 years.</i></p> <p><i>Some insurance companies offer Micro-Insurance products whose monthly income varies from Taka.600 to Taka.5000.</i></p>
<i>Product Design Methodology</i>	<i>Usually the product is designed by considering Microfinance context and usually try to amalgamate with various</i>	<i>The Product is designed by considering the income level of target clients and also following some guidelines of the</i>

	<i>Microfinance products like loan and services</i>	<i>insurance regulatory authority and actuaries.</i>
<i>Premium Rate</i>	<i>The premium rate varies depending on the nature of products. The premium rate is determined through unstructured calculation upon assumptions.</i>	<i>The premium rate varies depending on the nature of products, insurance plans, size of insurance coverage, insurance maturity period, installment procedure of premium and the age of policy holder. The premium rate is determined through structured calculation by the Actuaries who are authorized to calculate the premium rate.</i>
<i>Premium Collection Procedures</i>	<i>The premium collection procedures depend on the nature of the products. In most of the cases premium is collected once at a time during loan disbursement. Sometimes premium is collected through weekly installments.</i>	<i>Usually premium is collected monthly/ quarterly/ half yearly/ yearly installments depending on insurance plans, financial conditions and policy holder's interest.</i>
<i>Duration of Insurance Policy</i>	<i>In most of the cases the duration of insurance policy is for 45/46 weeks of 1years. Moreover, some MFIs offer insurance for 4 to 8 years and also for whole membership term of client</i>	<i>Most of the cases the duration of insurance policy vary between 6 to 15 years. But in some insurance plans the duration of insurance policy is up to 30 years.</i>
<i>Size of Insurance Coverage</i>	<i>The size of insurance coverage varies depending on the product nature. In Loan and Livestock insurance usually the outstanding loan is exempted. For Life insurance generally 3 to 7 times of deposited amount or a certain amount of money is provided as insurance coverage.</i>	<i>The size of insurance coverage usually varies from Taka.5000 to Taka.100, 000 depends on policy holders premium rate. But in some insurance plans the size of insurance coverage amount is up to Taka.3, 60, 00. For single premium term package usually the size of insurance coverage is 2.5 times or 250 percent of insured amount.</i>
<i>Types of Risk Coverage</i>	<i>For each insurance product the types of risk coverage is different. For Loan and Life insurance the death of insurance client and sometimes the death of household head/earner are also covered. Some organization also covered accidental risks. In Health insurance usually the some portion of the primary health care, essential medicine and hospitalization costs of clients are covered. For Livestock insurance losses of livestock/poultry are covered.</i>	<i>In most of the cases the death risk of insurance policy holder is covered. Some Micro-Insurance products also cover health and accidental risks along with life by charging some additional premium. Beside, these there are some insurance plans which provides fund for child education, and marriage of daughter after the death of parents. In these insurance plans the parent of children is policyholder. The death risk of this insurance policyholder as well as death risk of children is covered in these plans.</i>
<i>Investment of Deposited Premium</i>	<i>The NGOs/MFIs invest most of the deposited premium as revolving loan fund and the rest of the amount is</i>	<i>The insurance companies invest the most of the deposited premium in government bond and securities, stock exchange or</i>

	<i>deposited in the bank.</i>	<i>readily marketable securities. Some deposited premium is also invested for long term investment</i>
<i>Claims Paid or Premium Refunded or Bonus Paid</i>	<i>In most of the cases in premium is not refunded if there is no claim. But some organizations offering Life and Health insurance refund premium with 4% to 5% interest after the maturity of insurance term if there is no claim.</i>	<i>A certain percentage between 10% to 25% bonus on insured amount is paid after a certain period of 3 to 4 years. Some Micro-Insurance product package also include a certain percentage of profit like 7% on bonus if the policy holder doesn't withdraw it when due and this interest along with bonus is paid after the maturity of insurance term if the policy holder doesn't die. For single premium package if the policyholder doesn't die, then the policy holder receives 200 percent of the deposited premium.</i>
<i>Other Benefits</i>	<i>NGOs/MFIs sometimes provide additional benefit i.e. some lump sum amount and funeral cost along with providing insurance coverage amount.</i>	<i>Some Micro-Insurance product package includes other benefits like savings and credit opportunity. Usually the policyholders can withdraw a certain percentage of deposited premiums as loan after a certain period.</i>

Prospect of Microinsurance in Bangladesh

Insurance has been considered as security product for the high and moderate income level people of the society. But during the last one and half decades it is observed that along with the affluent people of the society, there is a dormant demand for insurance among the poor community and earlier they couldn't expose it. But after involving with Micro-credit program and also other development activities, the poor people considered that their social security is important to survive in this harsh world of poverty. From this realization the quiescent demand for insurance came forward and after the first Micro-Insurance product offered in 1988 in the country, the growth of this product was tremendous and significant growth also has been observed till now. It is expected that the growth will continues.

There are different types of uncertainty and vulnerability for low-income households, such as life cycle events, death, disability, loss of property, etc. in the lifecycle events of the poor some risks and vulnerability is negligible, but there are some occasional events such as epidemics, serious natural disasters that are all considerably more risky than life cycle events. Life cycle events are relatively predictable as compared to disability, illness or losses to property resulting from accidents, disasters, etc. Correspondingly, the resulting losses or costs for each of these sources of vulnerability can vary from small to very large. The uncertainty and vulnerability is daily companion of the poor people of the country and the

government social security and social safety net program alone can't compensate their different type's losses. So there was a demand for Micro-Insurance from long time and the demand will also exist in future.

Conclusion:

Insurance is the risk protecting product, which is not only the mechanism for reducing vulnerability but also, ensures social and economic security to the insured. Insurance protects households against those risks that they are unable to protect themselves through informal mechanisms, savings or credit. Insurance providers are concerned that coverage of risks can be provided on a sustainable basis. Therefore, insurance is appropriate when there is an overlap of perspectives of both the household and the provider.

Poor people have different needs and priorities. Designing insurance products on a one-size-fits-all platform runs the risk of neglecting these differences and affecting any insurance program adversely. There are two main issues i.e. product design and policyholders issues that discourages MFIs/NGOs and Insurance companies to tap poor households with insurance products. The product design issues include high transaction costs, irregular income flows, and due to the difficulties in controlling moral hazard and due to adverse selection. The policyholders' issues include higher risks in providing this product as well as issues regarding affordability.

Furthermore, poor households have limited understanding about insurance and there is a misconception about insurers. Microfinance providers are also challenged by their need to achieve scale, the need for data and skills for actuarial analysis, reinsurance and investment.

It is worldwide recognized that Bangladesh has been considered as pioneer in Micro-credit with diversified products. Many NGOs/MFIs in Bangladesh are striving to offer demand driven and diversified financial products and services to the poor people. But still a significant number of poor people are vulnerable to adverse situation in their life cycle and untapped with social security products like insurance that can be a social safety net for them. Although, different types of institutions providing Micro-Insurance which is relatively new in Bangladesh. A small number of schemes have been in operation for more than six years while the majority has operated for three years or less. The evolution of the Micro-Insurance concept stems from the development and wide spread implementation of Micro-credit models as a development strategy. The viability of the credit-model was heavily constrained by contribution defaults, micro-credit institutions needed to complement credit with social security type services. Today, the Micro-Insurance model has become an important development tool aiming to safeguard or reduce the likelihood of credit defaults by addressing certain high economic costs to credit groups and their family dependants resulting from emergency health expenditures, death of a family member, and damage to property caused by fires or natural disasters, but that are not significant.

It is true that developing and offering new product always has some risks. Sometimes NGOs/MFIs and Insurance companies ignore poor people because they consider the financial sustainability of this Micro-Insurance product. But many of the risks and vulnerabilities faced by the low-income clients served by MFIs are insurable, in these cases; well-designed Micro-Insurance products can have an important development impact.

The challenge is to ensure that the product developed is appropriate for the needs and preferences of the households, is financially viable, and is provided through institutions that have the resources and expertise to manage the finances and the risk inherent in the product. If the Micro-Insurance products can be developed in such a way that addresses the needs of the poor, then this product can be financially viable and sustainable. Moreover, Insurance companies can also come forward with social security products for the poor. As a pioneer of Micro-credit NGOs/MFIs as well as Insurance companies can address the needs of the poor to achieve the United Nations Millennium Development Goals and cover all poor people of the country with social security product like insurance and ensure social safety nets by the year 2015.

By observing the upper situation we are now able to say that the Micro-Insurance is one of the products of Microfinance, which is new but valuable and its prospect in Bangladesh is up going because, Bangladesh is a developing country, and in every development there are some risk factor involve, Insurance is one of the risk protecting product, but most of the insurance companies offer it to the well earned people, no body think about the poor, but the Micro-Insurance changes this kind of believe, and bring the insurance product for the poor people for Bangladesh, which protect the poor for there various miserable hazard, and keep a happy smile in their face, for this reason day by day the number of clients of Micro-Insurance increases, and now demand side of this product is increases and in the meantime the supply side is also increases by the NGOs/MFIs and Insurance companies, and now they want to implement new polices according to the demand of the poor, so if the NGOs/MFIs and insurance companies ensure their promise then the Micro-Insurance prospect is increase day by day in Bangladesh.

Appendix A: Bangladesh Economy

The economy has grown 5-6% over the past few years despite inefficient state-owned enterprises, delays in exploiting natural gas resources, insufficient power supplies, and slow implementation of economic reforms. Bangladesh remains a poor, overpopulated, and inefficiently-governed nation. Although more than half of GDP is generated through the service sector, nearly two-thirds of Bangladeshis are employed in the agriculture sector, with rice as the single-most-important product. Garment exports and remittances from Bangladeshis working overseas, mainly in the Middle East and East Asia, fuel economic growth.

<i>GDP:</i>	<i>\$208.3 billion (2007 est.)</i>
<i>GDP growth rate:</i>	<i>6.3%</i>

Appendix B

Table – 4
Chronicle of Insurance Industry in Bangladesh

Year	Milestone for Insurance Industry
1818	First life company of India Sub-Continent named Oriental Life Insurance Company was established in Kolkata.
1850	First Non-Life insurance company name Triton Insurance Company commenced business in Kolkata.
1938	British Government enacted Insurance Act 1938 to regulate Insurance business in Indian Sub-continent
1947-1971	49 insurance companies transacted both life and general insurance schemes. Ten insurance companies had their head offices in East Pakistan, 27 in West Pakistan, and the rest elsewhere in the world
1972	The government of Bangladesh nationalized insurance industry in 1972 by the Bangladesh Insurance Order 1972. All 49 insurance companies and organizations transacting insurance business in the country were placed in the public sector under five corporations.
1973	On 14 May 1973, a restructuring was made under the Insurance Corporations Act 1973. Following the Act, in place of five corporations the government formed two: the Sadharan Bima Corporation for general business and Jibon Bima Corporation for life business.
1973	The government established Bangladesh Insurance Academy (BIA) in Dhaka to impart training to insurance professionals and others taking up insurance as a career. The academy started functioning in early 1974.
1984	Insurance Act 1973 was amended in 1984 to allow insurance companies in the private sector to operate side by side with Sadharan Bima Corporation and Jibon Bima Corporation.
1988	Bangladesh Insurance Association was formed on 25 May 1988 under the Companies Act. It is registered with the Registrar of Joint Stock Companies and has 30 members.
2000-2005	Up to 2000, the government has given permission to 19 general insurance companies and 10 life insurance companies in the private sector.
2005 – Current 2011	62 Life and General Insurance Companies both from public and private sectors are operating business in Bangladesh.

Introduction

A successful brand works as an emotional attachment force that always encourages consumer's perception toward that brand among the other brands. A new product's brand name is an important determinant of its success in the market place (Cooper, 1994). A successful brand makes this relationship stronger than earlier. Now-a-days firms are increasingly seeking to leverage this good relationship by extending their brands into new product areas and that is brand extension, refers to the use of established franchise to a different product class (Keller, 2008). Substantial research has been done on how consumers evaluate brand extensions (e.g. ;Keller,2003;Balachander and Ghose ,2003). Because These days Brand extension is a very popular way of the organizations to challenge the competition with new intensity because new product with a new brand name is always risky and there lies a lot uncertainty that the product may not be accepted. The statistics tells new products experience failure rates between 80% and 90 %, and brand extension fails at a lower rate (Keller 2003). Another advantage of using brand extension is the reduction of communication costs (Tauber, 1981; Aaker, 1990; Aaker and Keller, 1990)5. Instead of launching a new brand, brand extension is becoming a branding strategy for new products. For Fast Moving Consumer Goods as well as services, more than 80% of the new products introduced are brand extensions (Rangaswamy, et.al., 1993; Ernest and Young and Nielsen 1999) Keller (2003).

In brand extension research, brand equity is predominantly considered as consumer based brand equity rather than company based brand equity and that is why success or failure of brand extension is mainly dependent on the consumer evaluation of brand extension (Klink and Smith, 2001). Past research in brand extensions have established main determinants that influence the extension success (for reviews see Grime et al., 2002; Czellar, 2003; Vo'lkner and Sattler, 2006) mainly factors related to brand associations, extended category, perceived fit and consumer characteristic (Czellar 2003; Reast, 2005; Volckmer and Sattler, 2006).

A negative impact of brand extension would cause a great damage to the essence of core brand values. Research results produced by Ernest and young and Nielsen (1999) (Völckner & Sattler, 2006; Mahajan, Muller & Wind, 2000) in European countries brand extensions failure

rate of around 80% in fmcg field. This statistics are also not much mind soothing. Like any other strategy, it has both positive and negative side. Therefore, despite their benefits, extensions can be risky (Ries and Trout 1986).

Brand name encourages with a symbolic meaning to assist consumer recognition and decision-making processes (warnerfelfelt, 1988) and likewise brand extension facilitate consumer decision making process by the established brand names (Alba and Hurchinson,1987).For a successful brand extension among various consumer characteristic, consumer innovativeness plays an important role because consumer innovativeness influences consumers learning and purchasing process of new products in the market place. (Yu Henry xie,college of Charleston).Innovators are more likely to be receptive to the new ideas and experiences. Consumer's propensity to try and purchase new products earlier (Roger1983/2003)in the market place nevertheless has certain impacts on consumer's brand loyalty(Hirschman 1980)14 and ,consequently ,acceptance of brand extension ,because brand extension have been extensively applied in the launch of new products(Aaker and Keller 1990). The International handbook on innovation By Larisa V. Shavinina describes innovators as having marketplace knowledge, opinion leadership, price insensitivity, higher level of income and gregariousness (cosmopolitanism).There are several factors responsible for reigning of a product in a innovative minds. The scope of study is to pinpoint the dimensions of innovativeness, which are early adoption of newness (Roger,1983/2003),high income (The International handbook on innovation By Larisa V. Shavinina,2003) and Satisfying a desire for knowledge" (Sheth, Newman, & Gross, 1991, p. 162) for product category or brand.

Perceived similarity is found to be the most relevant variable that can highly influence the acceptance of brand extension (Völckner & sattler 2006). The fit of extension with the core brand category depends on physical features, functions, prestige value, or the skills required manufacturing the product (Aaker and Keller, 1990).Consumers have to perceive some dimension of similarity between a parent brand and the extension to obtain the effect (Boush et. Al. 1987; Aaker & Keller 1990; Völckner & Sattler 2006; Ahluwalia 2008).Similarity dimensions induces acceptance of brand extension a lot. In recent times the idea of fit refers three dimensions namely usage similarity, association similarity, and competence similarity (Leif E. Hem and Nina M Iverson, 2008)21.And this fit is equally important for tangible products(Boush et al. , 1987;Aaker and Keller,1990,Park et al.,1991) and services (de ruyter and Wetzels,2000, Van Riel et al.,2001;Hem at al. ,2003;Lei et al.,2004).Some researchers have found that higher consumer innovativeness increases purchase intention of new services (Hem at al., 2003; Siu et al., 2004) and tangible products (Völckner and sattler 2006).

Brands credibility provides its consumers with assurance of quality. credibility is based on the sum of past behaviors has been referred to as "reputation" in the information economics literature (see Herbig and Milewicz 1995). Now brand reputation or brand credibility can be measured by considering two dimensions namely brand expertise and brand trust (Erdem

and Swait, 1998, 2004). Because reputation can be built based on brand trust that consumers gain after having expertise on the brand. This study also proposes, this two dimensions mainly leads to parent brand reputation. Moreover brand reputation become strengthened if an organization delivers service and product as expected (Argenti & Druckemiller, 2004).

Research Gap

Innovativeness Satisfies a desire for knowledge (Sheth, Newman, & Gross, 1991, p. 162). In general, the knowledge of a target group is highly decisive for how decisions are made for branded products (Alba & Hutchinson 1987, Keller 2003)²⁸. According to Czellar, 2003). Past research shows mixed results for the effects of consumer knowledge on extension evaluations (e.g. Dawar 1996; Herr et al. 1996). More research on the effects of perceived knowledge on assessments of brand extensions is required. Innovativeness researchers stress the importance of the social or symbolic component of consumer innovativeness (Roehrich, 2004; Rogers, 2003; Venkatraman, 1991)^{29b}. In this connection this study propose higher income is another dimension for measuring innovativeness.

Consumers tend to evaluate extensions more positively when they identify some similarities with the parent brand (Aaker & Keller 1990; Czellar 2003; Hem et al. 2003; Völckner & Sattler 2006)²³. However, there are number of examples for successful brand extensions that lack an overall perceived similarity with the parent brand (Klink & Smith 2001; Maoz & Tybout 2002). The virgin brand has been extended to huge range of products, such as magazines, train company, holidays, personal computers, bridal services (Keller 2008). For more specific insights the dimensions of perceived similarity should be considered. Proposed dimensions of perceived similarity are usage similarity, association similarity, and competence similarity (Leif E. Hem and Nina M Iversen, 2008). Considering this dimensions lead to us to know the many different ways a consumer can perceive a similarity between parent brand and the extended product.

The attitude towards extension is favorable when consumer trusts the brand (Reast, 2005) and buys the brands products regularly or shows a commitment to purchase them (Völckner and Sattler 2006) and this lead to them as experienced consumers who are more likely to try the extension (Swaminathan et al, 2001; swaminathan, 2003) and develop brand reputation. In past research Trust is recognized as a complex consumer concept and there is also not much study on brand expertise.

Product categories (Bristol 1996, Schmitt and Dube, 1992) is also important in extension success (reviews see Grime et al., 2002; Czellar, 2003; Völckner and Sattler, 2006) because Consumer attitude towards extension will be different for different product category.

There is not much study on the dimensions of these accepted variables and that is why brand extension failure made the scope of the study on the dimensions of these variables with account of the product category.

Objectives

- 1) To understand the dimensional significance of these three variables in acceptance of brand extension.
- 2) To know the strength of the dimensions and how they differs in account of product category.
- 3) To investigate empirically whether there is any significant dimensional difference between overall brand extensions in two different sectors respectively fast moving consumer goods (Lays) and service sectors (Bsnl).

Conceptual framework and hypotheses

brand extension

Extending the equity of a brand is brand extension. A “good” brand extension strategy is one where the brand name aids the extension, while a “very good” brand extension also enhances the parent brand name (Aaker, 1991). Estimates vary, but as many as eight out of ten new products are introduced as a brand extension (Simms 2005; Keller 2008). Brand extension not only reduces communication cost as well as new brand introduction cost but also increases the success probability, as the advantage of extensions compared to new brand names is that extensions borrow awareness and positive associations from the parent brand (Aaker & Keller 1990; Völckner & Sattler 2006; Ahluwalia 2008).

Category fit and fit dimensions

Similarity fit is considered to know how far the consumer perceives the extended product category is similar to the parent product (Smith and Park, 1992). Bridges et al. (2000) findings suggested that the connection of any salient and relevant parent brand association (e.g. category, brand concept, brand specific associations) to the extensions can be used by consumers in forming the perception of fit. Higher perceived fit involves a better evaluation of extensions (Aaker and Keller, 1990; Boush, et al., 1987; Aaker and Keller, 1990; Boush and Loken, 1991; Dacin and Smith, 1994; Keller and Sood 2002) as Perceived similarity is found to be the most relevant variable that can highly influence the acceptance of brand extension (Völckner & Sattler 2006). To obtain the effect of fit Consumers have to perceive some dimension of similarity between parent brand and the extension (Boush et al. 1987; Aaker & Keller 1990; Völckner & Sattler 2006; Ahluwalia 2008). The fit of extension with the core brand category in turn depends on physical features, functions, prestige value, or the skills required manufacturing the product (Aaker and Keller, 1990). The idea of fit refers three dimensions namely associations similarity, usage similarity, and competence similarity (Leif E. Hem and Nina M Iversen, 2008). Association is nothing but a brand’s image is also more likely to transfer to an extension (Broniarczyk & Alba 1994). Usage is what extent extensions and existing product share the same usage context (Aaker & Keller, 1990) and similarity of the competence is resources needed to produce the two products (Aaker & Keller 1990; Klink

& Smith 2001). So these three dimensions should positively effect on overall evaluation of extension.

It is easier to understand functional similarity in case of extension from complex product because to understand other similarity dimension a consumer require a good level of expertise. Thus we predict in case of extension from complex product category, usage similarity has stronger significance than other similarity dimensions.

H1 Associative similarity, usage similarity and competence similarity have a positive effect on evaluations of extensions.

H2 usage similarity has a stronger positive effect than association and competence similarity on attitude towards brand extensions in case of extension from complex product category.

Parent brand reputation and brand reputation dimensions

Parent brand plays an important role in the success of an extension (Reddy, Holak and Bhat, 1994)⁵⁹. In brand extension research brand reputation has been defined in terms of consumer perceptions of quality associated with a brand (Aaker and Keller 1990, Barone et al. 2000, p. 390)⁶⁰. High quality brands lead to be more credible, expertise and trustworthy (Dhananjay Bapat and J.S. Panwar, 2009). But consumers evaluate less favorably for average quality brands (Keller and Aaker, 1992). The concept of reputation can be termed as credibility. Credibility is based on the sum of past behaviors has been referred to as "reputation" in the information economics literature (see Herbig and Milewicz 1995). After Aaker and Keller (1992) again Erdem and Swait, (1998, 2004) proposed brand reputation or brand credibility can be measured by considering two dimensions that is brand expertise and brand trust. This study also strengthens the same. Because the attitude towards extension is favorable when consumer trusts the brand (Reast, 2005) and buys the brand's products regularly or shows a commitment to purchase them (Völckner and Sattler 2006) and this leads to them as experienced consumers who are more likely to try the extension (Swaminathan et al., 2001; Swaminathan, 2003). Because experts variably process a rich and well-organized knowledge structure in the specific domain (Alba & Hutchinson) and can yield greater customer trust in the brand.

Day by day consumers are faced with more complex market results confusion among them. The Apple case study on brand experience for their iPhone, use tag line **Simplicity is the ultimate sophistication** by Steve Jobs, Co founder and chief executive officer of Apple. He emphasizes on simple and useful experience and that leads to more experience. So as simple as, consumer perceive the parent brand's skills and ability in the new product category as a brand Expert that improves the brand extension evaluation (Swaminathan et al. 2001; Swaminathan 2003). Because the experts can easily trace the similarity between original brand and extended product. Thus, we have hypothesized that,

H3 Brand trust and brand expertise have a positive effect on evaluations of extensions.

H4 Brand expertise has a stronger positive effect on attitude toward brand extension, for extensions from simple product category than complex.

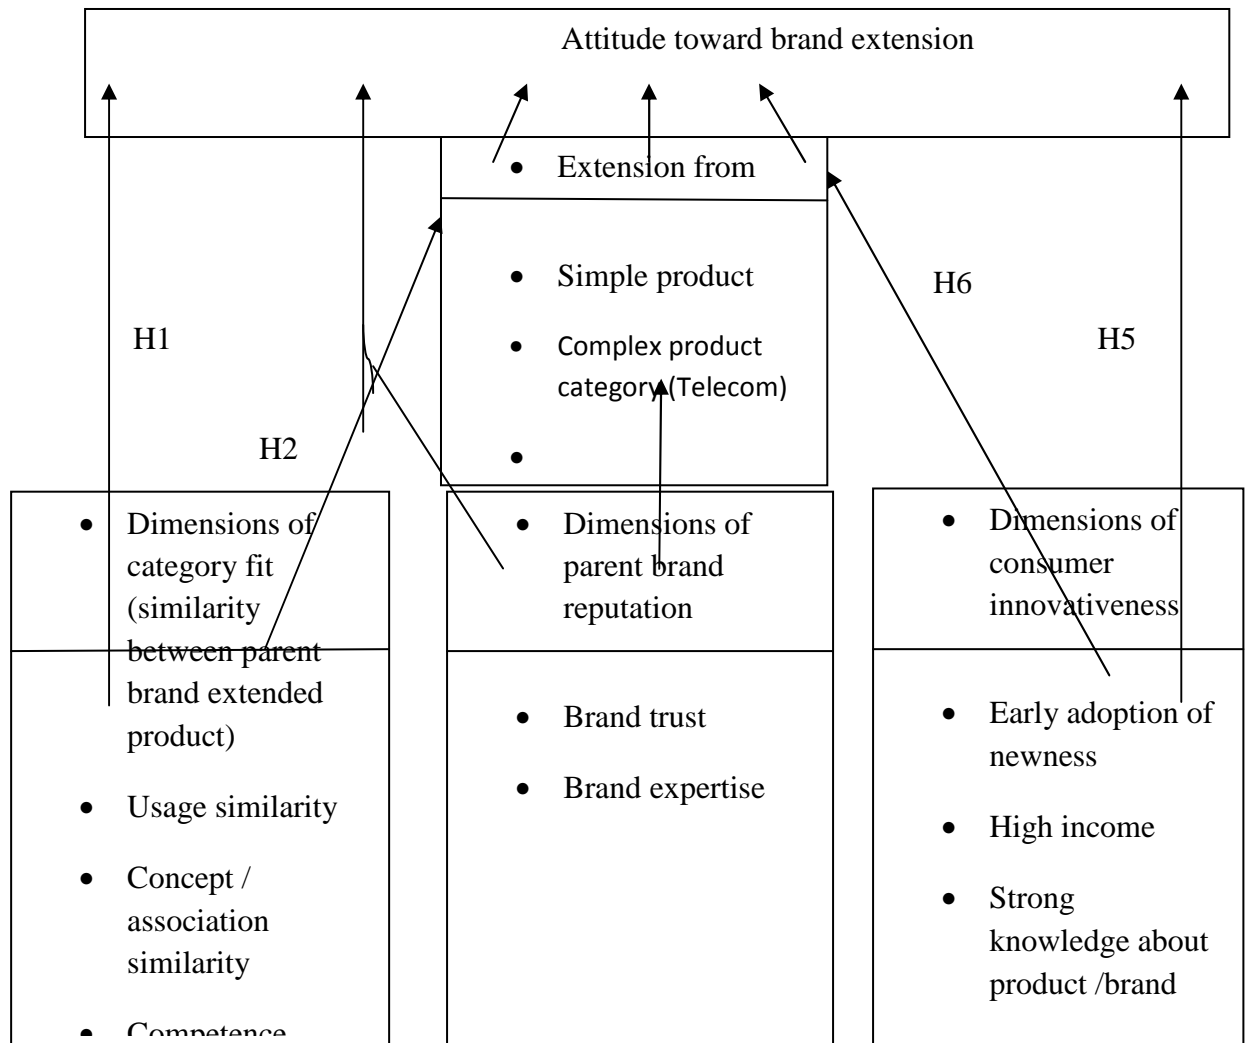

Consumer innovativeness and innovativeness dimensions

There is huge importance of consumer innovativeness given in the literature on adoption of innovation. A basic tenet of diffusion theory is that individuals respond differently to new products (Gatignon and Robertson 1985). Rogers (1983) considers these differences to be driven by consumer innovativeness. Consumer Innovativeness defined as “the degree to which an individual is relatively earlier in adopting an innovation than other members of his system” (Rogers and Shoemaker 1971, p.27). The early adopters minimize the chance of new product failure (Im et al, 2003) or consider new ideas (Roehrich, 2004) very soon. Marketplace knowledge opinion leadership, price insensitivity, higher level of income and gregariousness (cosmopolitanism) may characterize consumer innovator. (The International handbook on innovation By Larisa V. Shavinina). This research proposes three dimensions of innovativeness respectively earlier in adoption of newness (Midgley and Dowling, 1978) 18, high income. (The International handbook on innovation By Larisa V. Shavinina) and another important dimension is Consumer’s brand knowledge (whilst Muthukrishnan 1991; Roux and Boush 1996) 19d or product category knowledge (Broniarczyk and Alba 1994). So we hypothesize that these three dimensions have a positive effect on overall evaluation of extension.

In this research consumer knowledge implies that how much s/he have knowledge about the product category or brand (Klink and Smith, 2001). Again reaction towards extensions can be affected by the individual’s knowledge of the brand (Klink and Smith, 2001) and which in turn consumer innovativeness. We predict consumer reaction will be more positive with strong product category or brand knowledge for the extensions from complex product category. Because it is more difficult to evaluate and making a purchase decision for a complex product extension.

H5 Early adoption of newness, knowledge about product or brand and high income has a positive effect on overall evaluations of extensions.

H6 knowledge about brand or product has a stronger positive effect on overall evaluations of extensions for extensions from complex product categories than from simpler product categories.

Model for Evaluation of successful brand extension considering dimensions of three variables Fig.1

Selected parent brands and their extensions for this study

Parent Brands	LAYS SNACKS	BSNL TELECOM
EXTENSIONS	CHOCOLATE	PC
	APPLE JUICE	CABLE TV
	ICECREAM	INSURANCE

Table 1

Methodology

research design

We have this two brands respectively LAYS is representing simple product category as well as renowned fast moving consumer goods brand and BSNL is representing complex product category as well as renowned service brand.

To test the above-mentioned hypotheses for this study, two brands are chosen and used in similar kind of study by (Aaker and Keller, 1990). The criteria are (i) high quality, having strong brand image, (ii) brand not having been broadly extended previously (iii) ability to elicit relatively specific associations.

questionnaire development and main data collection

We have made a questionnaire for each of the two parent brands and conducted the study in Jaipur. Questionnaire was distributed among business students in the various places of Jaipur. For each sample Among the 410 questionnaires collected, 28 had to be removed due to non response biases. A total of 382 complete questionnaires were collected for LAYS snacks and BSNL telecom.

Measurement and Scaling

Dependent variable – Overall evaluation of brand extension simply to measure the reactions towards the proposed brand extension measured based on the items used by Bergkvist and Rossiter (2007).

Independent variable – Perceived similarity with three dimensions of this extension variables namely usage similarity, concept association and similarity of resources needed to produce evaluated perceived similarity on a five point likert scale anchored from “not at all similar” through to “very similar”.

Brand reputation assessed as the average of perceived expertise and perceived trustworthiness (Keller and Aaker 1992). Respondents evaluated this on five point likert scale with the end points “totally disagree” and “totally agree”.

Innovativeness dimensions namely early adoption of newness, consumer knowledge of product or brand and high income evaluated on five point likert scale anchored by totally disagree and totally agree.

Analyses

Descriptive statistics

Table (4) and (5) shown the means and standard deviations of each extension of snacks and telecom. The mean scores of the variable not much varied across the extensions of the snacks and telecom.

Factor analysis

Factor analysis revealed that all dimensions truly loading in their respective variable. For telecom sample Eigen values are in between, 1.56 and 2.38. And total variance is greater than 71% for snacks sample eigen values are in between, 1.55 and 2.27 and total variance is greater than 72%. Following are the factor analysis table for snacks and telecom

Snacks Rotated Component Matrix^a

	Component			
	1	2	3	4
What attitude do you have towards this extension	.811			
If this brand extension existed ,I would be likely to try it	.777			
Overall I am very positive to this extension lays-chocolate	.805			
If this brand introduces new products I would like to try as I am continually seeking new ideas and experiences		.732

Bivariate analysis

Correlations between the variables are shown in table (3) (4) and (5) .Table (3) considers entire sample irrespective of product category. Considering snacks and telecom sample , each consisting three hypothetical extensions namely Lays chocolate, Lays apple juice and Lays ice cream and Bsnl PC, Bsnl cable TV ,Bsnl insurance. Table (3) reveals positive and significant correlation between three-dimensional perceived similarity and overall evaluation of the brand extensions (H1), two dimensional brand reputations and overall evaluation of the brand extensions (H3), three-dimensional innovativeness and the overall evaluation of the brand extensions (H5). Thus H1,H3,H5 were supported.Again individually For snacks and Telecom sample, H1 is supported.Second hypothesis is only for complex product category I.e. for telecom sample. But usage similarity is not having higher effect than other similarity dimensions.So H2 is not supported, again we will test this hypothesis applying regression analysis for more convincing result. H6 is also supported individually for both sample.We have found knowledge has higher effect on attitude towards extension for complex product category than simpler. So H5 is also supported. Moreover, correlations between the parent brand reputation dimensions and overall extension attitude were significant for both snacks

and telecom sample. Brand expertise have stronger positive effect on attitude toward brand extension for simple product category than complex .So,H3 and H4 were supported.

Multivariate analysis

To get result that is more convincing we applied multiple regression analysis.

The dimensions of perceived similarity variable, had a strong impact on overall attitude towards extensions. Among the three dimensions usage similarity (snacks $b = .153^{***}$, $p = .01$); (telecom $b = .147^{***}$, $p = .01$) and association similarity (snacks $b = .166^{***}$, $p = .01$); (telecom = $.144^{***}$, $p = .01$) had a significant effect in both of the sample. However, no significant effect was found in case of competence similarity in snacks sample ($b = -.004$) and telecom sample ($b = -.002$).So maybe there is some relative importance differs among the dimensions but overall we can say our H1 is supported to a good extent. As per our second hypothesis, usage similarity has a higher effect on overall extension attitude than association similarity and competence similarity when the extensions are from complex product category, is also be supported. Thus, H1 and H2 were supported .

Regression summery of the model

<i>Variables included (independent variables)</i>	<i>Snacks</i>	<i>Telecom</i>
<i>2. early adoption of newness</i>	<i>.311^{***}</i>	<i>.362^{***}</i>
<i>3. consumer knowledge about the product or brand</i>	<i>.112^{**}</i>	<i>.154^{***}</i>
<i>4. high income</i>	<i>-.007</i>	<i>.034</i>
<i>5. brand trust</i>	<i>-.022</i>	<i>-.074[*]</i>
<i>6. brand expertise</i>	<i>.085[*]</i>	<i>.073[*]</i>
<i>7. association similarity</i>	<i>.166^{***}</i>	<i>.144^{***}</i>
<i>8. usage similarity</i>	<i>.153^{***}</i>	<i>.147^{***}</i>
<i>9. competence similarity</i>	<i>-.004</i>	<i>.002</i>
<i>Adjusted R[^]</i>	<i>.34</i>	<i>.40</i>

<i>d.f.</i>	<i>372</i>	<i>372</i>

Table 9

$P < .01$ ^{***}

$P < .20$ ^{*}

$P < .10$ ^{**}

consumer innovativeness having three dimensions namely early adoption of newness (snacks $b = .311^{***}$, $p = .01$); (telecom $b = .362^{***}$, $p = .01$), consumer knowledge about the product or brand (snacks $b = .112^{**}$, $p = .10$); (telecom = $.154^{***}$, $p = .01$) showing an overall

positive and strong effect on attitude towards extension but high income (snacks = -.007);(telecom =.034) has no such effect on attitude towards extension.As expected consumer knowledge about brand or product category has a higher standardized beta coefficient for extensions from complex product categories than simpler.So H5 and H6 were supported.

The proposed dimensions of brand reputation are namely brand trust (snacks $b = -.022$); (telecom $b = -.074^*$, $p = .20$) and brand expertise (snacks $b = .085^*$, $p = .20$); (telecom $b = .073^*$, $p = .20$). H5 is partly supported that brand trust and brand expertise has a positive effect on attitude towards extension.. Only experiencing, the brand makes a consumer a brand expert. In addition, It is desired to have simple but useful experience which further intend them to use more products of that brand. Brand Experience has a higher effect for the extensions from simple product category (H6) than complex. Higher standardized beta coefficient reveals that. So H3 and H4 were supported.

Discussion and managerial implications

Undoubtedly, brand extension is a popular brand strategy and marketing approach to come with new products. These Dimensional perspectives surely, will rich the extension literature to a good extent .The entire study, reveals the nature of constant dynamism of a market. Not very far but in a recent past brand trust was a very influencing variable but presently brand expertise is more important for accepting a new product .Consumer knowledge is found to be more significant for extension from complex product category extension. As expected usage similarity has stronger significance than other similarity dimensions on attitude towards extensions in case of extension from complex product categor. As per the industry perspective Usage similarity ,knowledge about brand or product category is more important in service industry but in fast moving consumer goods industry brand expertise is a significant dimension for keeping brand reputation.

This study will contribute not only to understand the dimensions of these three variables mainly influence the market but also it will be helpful for the marketers to understand the changing market dynamism because Strategic planners need detailed insights of changing market to develop brand extension strategies . This research work implies in case of extensions from complex product category managers need to focus on usage situation (smith and Park 1992) other than association similarity and competence similarity. CRM positively impacts customer satisfaction (Mithas, Krishnan, & Fornell, 2005). By building relationship, managers should help consumers to develop their knowledge (Maoz & Tybout 2002) about product category or the brand. Likewise to Hong Youl ha and Helen perks (2005) This research also finds brand expertise as an essential variable.

Future research scope

In brand extension research what actually creates future scope even after substantial research on the same. Simply some brand extensions fails, some extension get succeed, and

this is what creates some more research opportunity. As discussed earlier in the paper, that dimensional perspective is something new to brand extension research so there is a lot and obvious scope of doing research in the same, considering other potential variables. Because now a then there are loads of drivers already came into reflection but hardly there dimensions came into extension study. When you are more into competition, you should be strategic to explore the area of profitability. The same thought applied in this paper by considering the proposed dimensions of three mostly acknowledged variables. However, also other drivers left untouched in dimensional perspective. So the researchers who wants to go, more in depth in brand extension research they can go for other factors with their proposed aspects .This study considers accountability of product category because There is not much study on the same(Bristol 1996,Schmitt and Dube,1992) Because consumers differs in the dimensional perspective for a same variable towards extension attitude for different product category whereas product category is also important in extension success (reviews see Grime et al., 2002; Czellar, 2003; Vořlkner and Sattler, 2006).

EVALUATING STRATEGIC DECISIONS BETWEEN REVENUE AND VALUE. THE OUTLOOK FOR THE TERMINI IMERESE INDUSTRIAL SITE

Pellicano, Marco¹; Ciasullo, Maria Vincenza²

¹Full Professor of Business Management, University of Salerno (Italy)

²PhD in Business Management, Associate Professor of Business Management, University of Salerno (Italy). Email: mciasullo@unisa.it

Abstract

The aim of the paper is to provide an interpretative scheme of the micro-macro interactions which, bearing in mind two perspectives (business oriented and ethic driven), underlines how by taking the ethical path, decisions taken have an effect on income and on business' viability. This provides a starting point for elaborating on the theme of reconciling business viability and social expectations which in some cases can prove problematic when it comes to management choices. Finally, the paper attempts to define a clear demarcation line regarding entrepreneurial responsibility, beyond which businesses must never venture even if this entails harming the viability of the firm.

The empirical case represents an emblematic example of how, when facing an emerging problem where it is difficult to reconcile business viability with social expectations, there are various possible solutions ranging from shareholder-driven choices to stakeholder oriented choices. That of Fiat's CEO seems to have been a choice mainly oriented at safeguarding the owners' interests rather than those of the stakeholders within the relational context of Termini Imerese.

Keywords: Corporate Social Responsibility, Ethics, Socio-economic Value, Shareholder, Interactions, Viability.

Introduction

In the present social, not to mention economic context, all firms require legitimisation and consensus in order to be able to operate (Coda, 1988). It is therefore important to consider a decidedly "relational" vision of the firm where the governing body identifies decisions as strategic when said decisions are characterised by their having a significant impact on micro-macro interactions. The importance given to relations in the sphere of firms' management processes is supported by the assertion of the stakeholder theory (Freeman, 1984) and by studies in corporate social responsibility (Waddock, 2004). It is clear how identifying stakeholders and the possible interconnections that are created between stakeholders and the firm's management is fundamental (Freeman, 2005). From this perspective, according to behavioural theory (Cyert, March, 1963) firms were once considered as a coalition of

individuals, and more recently as a system-network of stakeholders, that is, a system of stakeholders requiring organising (Evan, Freeman, 1993). Even considering that the aim of survival – based on the vital capacity of the firm to generate sustainable value over time, that is, value that comprises an important social dimension and whose relations provide the driving force for development (Wheeler, Davies, 2004) – acts as a fundamental compass that constantly guides management's actions, strategic decisions required to be taken by firms can nevertheless appear very different depending on the viewpoint of the analysis: from the point of view that is predominantly in the interests of the shareholders; or that which seeks value and wellbeing in the interests of all stakeholders involved.

The aim of the paper is to provide an interpretative scheme of the interactions which, bearing in mind the two aforementioned perspectives, underlines how by taking the ethical path, decisions taken - even if they are directly aimed at providing requisite responses to legitimate social expectations - have an effect on income and on viability that must be carefully assessed *ex ante*. This provides a starting point for elaborating on the theme of reconciling firm viability and social expectations which in some cases can prove problematic when it comes to management choices. Finally, the paper attempts to define a clear demarcation line regarding entrepreneurial responsibility, beyond which businesses must never venture even if this entails harming the viability of the firm.

The empirical case represents an emblematic example of how, when facing an emerging problem where it is difficult to reconcile firm viability with social expectations, there are various possible solutions ranging from shareholder-driven choices to stakeholder oriented choices. That of Fiat's CEO seems to have been a choice mainly oriented at safeguarding the owners' interests rather than those of the stakeholders within the relational context of Termini Imerese.

Methodology

Regarding methodology, the paper develops its theoretical analysis and empirical research using a cyclical model which begins with the theory, proceeds to the empirical analysis phase and then returns to the theory (Bryman, 1988; Lazarsfeld & Rosenberg, 1955). From a methodological viewpoint, the case study concentrates on understanding the dynamics behind the forming of various management choices and on the effects they produced (Eisenhardt, 1989). To develop the case study, both secondary and primary data was used (the latter obtained by means of questionnaires). The results from the case study cannot be subject to statistical generalisations or theory testing, but the case study can be used to generate theoretical constructs, propositions and/or midrange theories (Eisenhardt, 1989; Yin, 2003).

Firms as a system of relations

The advent of systemic capitalism (Golinelli, 2005), has induced firms, within their specific context of reference, to develop interests increasingly crowded with relations with both economic and social stakeholder. The stakeholder theory (Freeman, 1984) sees the firm as a entity situated at the centre of a complex web of connections, each of which needs nurturing through structured and lasting relationships. Managing relations with stakeholders, therefore, becomes a defining element for management, in as much as the evolutionary dynamics of the firm are constantly influenced by powers and pressures brought to bear by entities in that particular context as well as the continuous remodelling of the order and priority of interests resulting from management action. All of this highlights the complexity of taking responsible actions that go beyond a merely contractual and conflictual vision of relations to embrace a more co-operative and supportive vision. Based on the above-mentioned perspective, firms can be defined as a network of relations that are activated, regulated and oriented towards the creation of socio-economic value and whose end is to increase the firms' chances of survival (Pellicano, 2004). From this stems an inter-systemic vision, which places emphasis on the individual particularity of each single firm seen as a specific configuration of relational networks (Zan, 1992).

This projecting outwith the firm, introduces the concepts of context and environment, both of which need to be clearly defined.

The relational context comprises all the possible economic and social relations a firm can activate.

The environment, constitutes the setting which extends beyond the relational context. Here we find not only economic phenomena, but also political, cultural and technological phenomena, all of which impact the firm and influence its ability to survive.

Through managing relations, firms "activate the environment" (Thompson, 1967; Weick, 1969) and model it. In this way, firms "create" the context of reference most suited to itself, which helps it develop. These reflections reveal the difference between environment and context, where the former appears an objective given common to many firms; the latter being subjectively perceived, activated and managed by the firm's governing body and appearing specific and particular. In choosing the entities with which to communicate, the governing body must first and foremost be capable of identifying certain dynamics as potential supporters for the creation of value. At this point, for the governing body it is essential to listen to the context with which it relates and, consequently, adopt coherent and responsible behaviours. However, context can be increasingly defined as a synthesis of a range of entities, cultures, instances and expectations, and requires composite governance in as much as it must be capable of bringing together a multiplicity of aspects or it risks the social delegitimation of the firm. In other words, context is characterised by its being a "system of systems", that is, a complex web within which each and every event is influenced by the

intentional and conscious action of each component and where the evolution of each component depends, to a greater or lesser degree, on the actions of each other component and where the evolution of each component depends, to a greater or lesser degree, on the actions of the others. This highlights the overthrowing of the logic according to which the management of the firm can exert a kind of unilateral control of relations with stakeholders (Freeman, Evan, 1990) and instead favour profoundly collaborative relations that are based on forms of involvement and on dialogue (Ayuso, Argadona, 2007). Therefore, if context is seen to be characterised by a closely woven network of interacting systemic entities, for management, this would imply that they have the obligation, as well as the responsibility, of considering not only single relationships with stakeholders (systemic entities), but also of interpreting the effect of relations undertaken in a comprehensive and interconnected fashion. Moreover, management must constantly aim to co-ordinate the interests of various categories of groups of interest with the firm's need for viability. As such, it is clearly necessary to identify and prioritise the important effect that behaviours adopted by firms have on the wellbeing of the context and the environment. From this perspective, the analysis of the impact of firms on the relational context cannot avoid considering the effects of their behavioural dynamics as the result of relations activated with other institutions and socio-economic systems; just as it cannot disregard the influence and pressures the various, complex economic, social and cultural powers exert on firms. The absence or the progressive loss of harmony with the context, and thus also with the environment, can lead to an incorrect orientation of the dynamic evolution of a firm, reducing on the probability of the firm surviving. On the other hand, the various levels of public consensus enjoyed by firms is closely linked to the correct identification and selection of subjective interests and to the methods used to guarantee their fulfilment.

From this point of view, the theoretic premise from which viability originates and develops is represented by the idea of considering firms as being immersed in a specific context subjectively perceived by the governing body and, as such, value, the result of the managing and guiding action of said governing body, is formed within a complex system of contextual relations. From this perspective, action taken by the governing body must tend to reconcile the interests of the various stakeholders of the context with the firm's requirements for viability. It therefore follows that the governing body needs to constantly evaluate the impact (in socio-economic terms) and the risks (in terms of consequences) inherent in the decision to give priority to the satisfaction of one systemic entity over that of another which is held to be less important (Coda, 1995).

An interpretative scheme of interactions

The interpretative scheme (Fig. 1), which we are about to describe, proposes analysing, from the governing body's point of view, how the interaction between the firm and its relational context can influence performance and therefore, by way of summary, the firm's

survival. From this perspective, we adopt the socio-economic value (Pellicano, 1995) as the parameter able to explain the aforementioned interactions in a concise fashion. The proposed scheme, therefore, could help top management to evaluate *ex ante* the effects that typical business decisions can produce on firms' prospective income following specific initiatives, choices and projects of considerable strategic impact. It is clear how evaluations of the type described are decidedly not easy; these decisions inevitably impact the firm's level of risk, but a more extensive and thorough evaluation carried out preventatively increases awareness when taking decisions. As we will highlight, such a delicate trade-off is not only the result of the skilled predictive ability of the decision-maker, but also promotes appropriate ethical conduct.

The starting point is "*ex ante* income", that is, a pre-existing income situation determining strategic options, by which, as we have said, we mean business choices having significant impact on the systemic entities of the context (considered together) and characterised by an equally significant expected effect on the firm. The model supports strategic decisions by using provisional estimates and evaluations, attempting to identify their effects.

The scope of the actions taken, which stem from the dynamic reading of context and of consequent interactions, provide social and economic value, which, ultimately, is evaluated through a measurement system of so called "*expected*" or "*ex post* income". Expected income, therefore, is the effect of interaction dynamics with the context stemming from the choices taken.

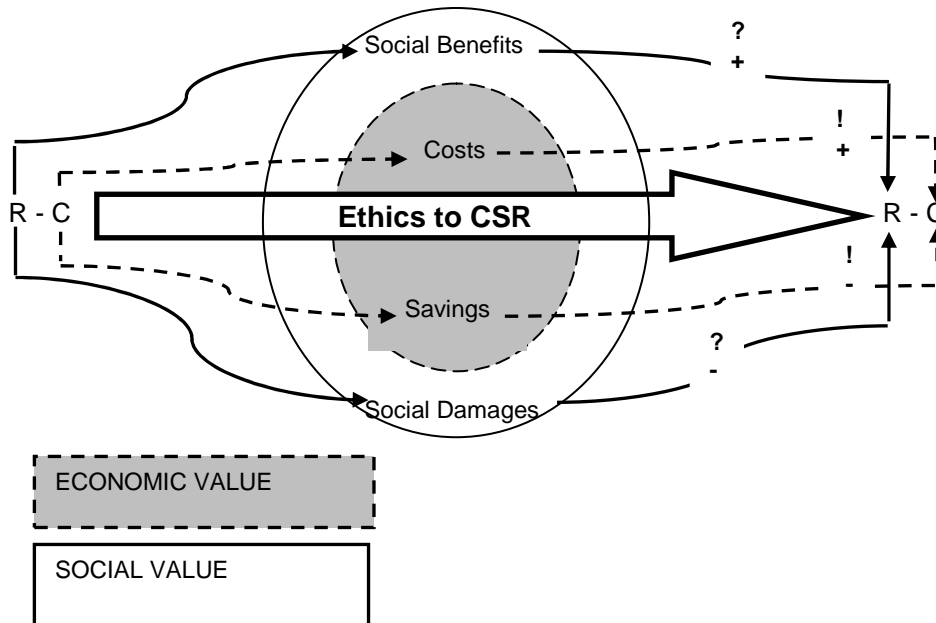

The evaluation of decisions characterised by their significant impact on the relationship between firms and the context can be analysed from two different perspectives:

- Business Oriented, in which stakeholders are scientifically used in an instrumental fashion to improve the outlook for income. In this case, relations between stakeholders tend to be conditioned by the reaching of the aforementioned objective.
- Ethics Driven in which choices taken and behaviour adopted towards stakeholders do not immediately appear directed at improving the outlook for income even though such effects cannot fail to be considered. In this case, interactions with stakeholders tend to create a structural and balanced relationship based on mutual satisfaction in terms of balancing required undertakings with contributions offered.

In reference to the configuration of the interests of associated parties (Laz & Sebenius, 1986, Rumiati & Pietroni, 2001), the two perspectives highlight the move from a transactional logic to a relational logic. From the first perspective, relations are based on a predominantly antagonistic win-lose type of logic and stability with each stakeholder is sought on an essentially negotiatory basis with the objective of creating, as far as possible, positions of

contractual strength. From the second perspective, relations are based on a collaborative win-win type of logic aimed at seeking virtuous equilibriums capable of producing agreement and cohesion with the majority of stakeholders.

Figure 1 - The VES model

Source: Our creation

The business oriented analysis perspective comprises two options which, albeit apparently at odds with each other, are based on the same economic logic, which we have already discussed.

Regarding expected income, the perception one has of stakeholders can function as a:

- a) Threat;
- b) Opportunity.

Option a) stems from a conceptual approach for which issues inherent in the firm-context (socio-natural) relationship end up representing limits, constraints or even threats to prospective income for firms. Such a vision sees management committed exclusively to seeking opportunities for economic 'savings' through the socialisation of costs (Vaccà, 1973), meaning that they avoid taking on some of the costs brought about by their firms; that is, through processes of "efficiency" and "savage restructuring" that impose sacrifices on third parties (Dematté, 1997). The immediate and objective effect of such options brings about cost containment or reductions in costs which can be seen in the positive difference between the "ex-post" and the "ex-ante" income. Faced with such a decidedly economic effect, however, only a short-sighted top management could avoid considering the damage that the

socialisation of costs causes to the context's other stakeholders and to the community. But that's not all. In fact, what emerges from the structure of the scheme is that the "negative return effects" should be carefully evaluated. These effects are felt in diminished earnings that can result from damage to the firm's image in the eyes of the stakeholders who feel themselves to be progressively damaged by the choices and behaviour adopted by the firm itself. It is clear, however, that while the evaluation and quantification of the advantages obtained by cutting costs is, as we have said, certain and more or less simultaneous, the effects on the expected income pay the price for conduct that, over time, is sanctioned by the market and by society in terms of a drop in sales and loss of consensus, trust and attractiveness. In other words, a structural deficit on the consensus front risks significantly prejudicing the firm's income.

Option b) stems from a decisional process aimed at seeking constant enrichment of the value content of the systemic output proposed to stakeholders who are characterised by a particular socio-environmental sensitivity, resorting however, to image and manipulatory policies. Such an option sees the firm adopt an attitude aimed at generating offers attractive enough to satisfy the expectations of the different stakeholders that control the resources the firm needs. Faced with the expectation of positive returns in terms of increased earnings, this option involves an increase in associated costs and has a certain and immediate bearing on prospective earnings. It is clear, in fact, that the complex systemic offer of increased value content and, in general, responding to more extensive social demands implies firms facing costs that are often significant, and that impact both economic and financial aspects (Sciarelli, 2002).

The upstream expectation with such an option is that the social advantages that benefit users and improve satisfaction levels, over time can translate into economic advantages in terms of increased flow of earnings and/or lower management costs, or rather into advantages regarding reputation and motivation (Molteni & Todisco, 2008). The above considerations result in an increase in the level of harmony between the firm and its stakeholders which in turn leads to the latter displaying a more helpful disposition towards the former, and therefore in positive returns in terms of the firm's image and sense of appeal.

Therefore, when faced with what are certainly increasing costs, the decision to consider the relationship with stakeholders as an opportunity to achieve increased earnings doesn't guarantee noticeable returns in the short term. Consequently, while the social costs are more or less immediate the benefits are potentially transformed into earnings only in the long term. As we have said, the two strategic options outlined, though substantially speculative, share an exclusively economic common logic whose end must invariably be linked to the prospect and expectation of increased earnings for the firm. Thus the options have a common end, though different means. Analysing the two options together, we can observe how both options, by producing immediate economic effects, 'bet' on achieving a positive reaction from

the social milieu. With the first option, the bet is based on the expectation of being able to contain the decrease in earnings to within the level of the amount saved; with the second option, it's based on the expectation that increased earnings will more than cover the costs sustained.

In the Ethic Driven perspective, decisions aren't taken in the direct pursuit of economic advantage and thus the social vision is not based on a utilitarian type relationship (Bowie, 1999); on the contrary, it is aimed at maximising the well-being of the context through highly collaborative relationships. The governing body has a high level of openness which encourages it to widen its reading of the context in the conviction that each relationship is important. In other words, an enlightened and long-term policy contributes to reducing forms of short-sighted business practices. In this type of logic, long-term business behaviours are capable of matching the firm's requirements for competitiveness and for profitability with the highly cohesive humanistic needs of all stakeholders, so this adhesion to ethics provides not only a guarantee of correct and transparent behaviour but also a solid basis on which to build an engaging and motivational organisational context (Coda, 1985, 2004) that is the result of adequate evaluation processes of those who operate within the firm in various roles. Thus we see the contribution of strategic ethics in the creation of value for the firm's stakeholders. Clearly, the contribution tends to grow in function of the sharing of values, which is fuelled through forms of engagement aimed at strengthening knowledge, trust and agreement, but above all through forms of inclusion aimed at avoiding the unjustified exclusion of stakeholders. On closer inspection, exclusion can be avoided by respecting ethical principles valid in their own right.

Guiding the "ethical path" is a system of values aimed at correctness, transparency and loyalty that is followed by the individuals within the organisation and which, when shared, become founding elements of the firm, and representing for the firm, a kind of identity or conscience. Last but not least, the ethical path can be seen in the heightened sensitivity of a "moral" governing body (Carrol, 2000) that helps give direction to the evolutionary dynamics of the firm through a correct reading of the real contribution that each stakeholder is able to bring to the process for generating wealth (Ghoshal, 2005). The affirmation of ethically correct values, and their incorporation into the firm's practices, necessarily leads to the growth of individual morality of those governing the firm, be they businessmen or discretionary technical management bodies.

Clearly, when firms take the "ethical path" - albeit to supply incumbent responses to legitimate social expectations - there are effects on "ex-ante" income projections and on effective "ex-post" income, effects that on the whole are valuable. Following such a logic, taking decisions that might cause income to contract in the short-term can create the premise for future well-being, increasing the firm's viability in terms of consensus, trust and transparency (Frederick, 1988). As such, it can be said that the ethical option, result of a

governing and management philosophy that pervades the entire firm, defines business behaviour that has a positive impact on firms' risk-return profile. A decisional process aimed at seeking virtuous good-sense solutions tends to reduce intra-systemic and inter-systemic conflicts while also helping to reduce the risk of failing to pursue economic aims.

Fiat: disembarking in Sicily and exit strategy

The plant was founded in 1970 in Termini Imerese thanks to a significant contribution made on behalf of the Region of Sicily to Fiat. In order to obtain this localisation within the territory, a purpose-built company called Sicilfiat was created where Fiat retained a majority hold of 60% of the shares. In 1977, Fiat bought out the other partners with the result that the plant became one of the many belonging to Fiat (Fga). In April 1970, with a workforce of 350, the plant began production, placing on the market the famous "500".

A tortured journey

Termini Imerese immediately became a difficult plant both because of its exorbitant maintenance costs and its poor yield and productivity. Economically, the plant was not particularly important as it made only a modest contribution towards the company's total production. The factory has only ever produced one model at a time, thus linking its performance to the momentary requests of the market. 1993 saw the plant's first restructuring which made thousands of workers redundant, drastically cutting the number of jobs. In 2002, workers were again alarmed following the approval of a reorganisation plan that included extraordinary temporary redundancies and the closure of the plant for a year. There was also the hypothesis that the Termini Imerese plant might be converted into an energy production plant, a sector in which Fiat was already present with its Italergergia and which Fiat's management saw as being strategic. However, the reorganisation never took place. Back then, the company's image was already somewhat damaged; general opinion was that Fiat had realised this establishment thanks to public funding, but that once the economic thrust from that assistance had ceased, Fiat was inclined to close an activity that it considered marginal, but which for the area of Sicily represents (still today) its most significant industrial plant (Volpato, 2008). In 2004, Fiat management again began discussions regarding their Termini Imerese plant, however, interventions on behalf of: politicians, local institutions and the government led to the then managing director signing the agreed reorganisation plan. Thanks to the objectives of increased growth detailed within the 2007-2010 strategic, the agreement with the social entities was signed, in which Fiat's right to effect long-term redundancies was recognised. The agreement not only anticipated the survival of the plant until 2009, but also the realisation of investments necessary for the start up of new production with increasing quantities and the development of an adequate network of suppliers aimed at overcoming the logistical-economic constraints of the Sicilian plant.

Full-blown crisis and exit strategy

Towards the end of 2008, with the arrival of the world economic crisis, there are new problems for the company as well as for the Termini Imerese plant, considered the least productive by Fiat analysts and therefore included in a list of the group's firms to be closed in an attempt to regain efficiency. 2009 begins badly for the plant, with continual announcements of redundancies, probable closure of the plant for an indefinite period of time, and suspension of redundancy payments, all of which leaves the 1,500 workers, the 600 people within the network of suppliers and the local community extremely anxious. The 2010-2014 strategic plan presented to the government on 21st April this year, decrees the official and definitive closure of the plant by the end of 2011.

Underlying motivations and associated justifications for the exit strategy

The copious amount of literature that exists on Fiat (Volpato, 1996; 2004; 2008; Enrietti, 2007), shows how the various periods of crisis that the firm has undergone over time are at least in some part to be blamed on an economic group accused of being overly forceful and arrogant in periods of growth, completely unwilling to reconcile its own interests with the interests of the context from which it draws the resources necessary for the firm's development. This results in the formation of a very poor business culture, a decisional model highly focussed on top management levels where managers expected non-critical acceptance of all the strategies defined (Autieri, 2004), thus transforming collaborators, even capable ones, into 'yes man' executives (Volpato, 2004). If initially the market forgave many of the errors that were committed, from 2000 onwards, things changed. The transformation of the automobile market, characterised by a segmented demand and a preference for particular and exclusive products, has, over time, reduced the level of Fiat market control, their market share having progressively decreased.

According to the new managing body, the turnaround launched in 2004 should have led to a significant reorientation of company culture, the intention being to achieve a double objective: on the one hand, to clearly define the company's role, on the other, to re-conquer the faith on behalf of the company's stakeholders, in particular, social stakeholders, through forms of collaboration aimed at establishing forms of reciprocal advantage (Marchionne, 2007). Moreover, the company began a process of international expansion through a series of collaborative agreements with foreign partners.

The brusque interruption of the path of development that appeared in late 2008, became clear with the explosion of the world crisis.

The strategic program that stems from the 2010-2014 industrial plan brings up some points of significant interest.

First of all, Fiat appears to be much more global and increasingly less Italian. In particular, there is a proposal to gradually move the company's board of directors to the United States,

with a reduction of members in Italy, and, at the same time, a de-localisation of production towards low cost areas. In particular, while Italian plants may be used at 50% of their productive capacity, some foreign plants (Like Serbia and Turkey) will be exploited up to 130%.

Moreover, the transfer of the cars from the other Fiat establishments is also scheduled. Fiat believe that with the spin-off of its industrial vehicles, Fiat Auto will also have opportunities for development through mergers and partnerships with other automobile companies. It is clear how such a decision favours financial development rather than real development.

Finally, the following reasons are given as having guided the closure of the Termini Imerese site:

- the establishment is, above all, anti-economic: producing a vehicle in Sicily costs around 1,000 euro more than in other plants;
- there is a more restricted network of suppliers, which means that most components arrive in Termini Imerese from other national factories at great expense to the company;
- to make the situation worse, the size of the plant is problematic; it is small and production is limited. Due to the economic crisis, though it has an effective capacity of 100-200 thousand units, the plant only assembled 60 thousand;
- to all this you have to add the delays and the role of local bodies who, for one reason or another, invariably delayed investments for developing infrastructures and facilitating the presence in loco of firms producing components.

Moreover, the managing director's line of thought, clearly revealed in a number of interviews he gave, can be summed up as this: the conflict of interest is not between Fiat (owners and top management) on the one hand, and the workers at Termini Imerese on the other: rather it is between the Fiat employees at Termini Imerese and all the other Italian Fiat employees. That is to say, in this arbitrary logic, the choice of sacrificing the Sicilian employees, albeit a painful one, appears justified by the need to safeguard the other employees and avoid an even more traumatic and socially devastating choice which would see Fiat Auto obliged to resort to the more incisive option of productive de-localisation. But it is still legitimate to wonder how come the salaries of top and middle management were increased and why, at the same time, they went ahead to distribute profits (250 million euros in dividends).

The stakeholders' reactions

Fiat's behaviour was greeted by bitter criticism and strong protests which arrived principally from the employees of the Termini Emerese site, but increasingly also from various stakeholders (politicians, mayors, media, consumer associations etc.), making quite a

stir both locally and nationally. Even the Church intervened, urging people to unite their efforts in a bid to end the conflict.

In summary, what expires is a loss of faith not only in a company that over time both exploited significant public funding, directly and indirectly, and that not two years previously had taken on the responsibility of strengthening their network of suppliers, but also in the various public institutions held to be incapable of safeguarding social and civil rights. For the local area, it is the end of an industrial dream that lasted forty years and that is a cornerstone of the Sicilian economy.

Moreover, regarding Fiat's industrial plan, union representatives (belonging to about ten organisations), complain that very little recognition was given to their role and they were very poorly informed about the logic of the formation of the plan; in other words, Fiat was only interested in dealing with the government, ignoring the unions' point of view. The compromise reached between Fiat and the government has safeguarded some plants, but with the request of implementing early retirement and redundancies. The fear is that once Fiat have rid themselves of Termini Imerese, they will progressively abandon the other national plants, especially those in the south which are perceived as being the weakest link in the chain.

The re-conversion of the Termini Imerese site in Fiat's absence

There are many hypotheses for the saving of the site. In particular, of the 21 proposals submitted to Invitalia (advisor to the Minister of Economic Development), fourteen are already at a more advanced stage. Of these, eleven have already begun a process aimed at evaluating feasibility, and three are ready to do so. The sectors involved in planning initiatives are: automobile, media, manufacturing, research and agriculture.

In particular, the project called "Sunny car in a sunny region" seems to be attracting much interest. The project is the result of a partnership between a Sicilian businessman who is president of the Private Equity Cape and the Indian firm Reva Electric Car Company (global leader in the production and marketing of electric cars). The project has two aims: on the one hand, the production of automobiles and vehicles fuelled by renewable energy; on the other, the creation of electric vehicle solar energy recharging plants to be realised all over the region. The project, which

anticipates an overall investment of 935 million euros, would ensure the creation of around 3,500 jobs.

At this point, one can't help wondering why Fiat itself didn't consider the re-conversion of the site, above all when you consider that the firm has been operating for some time in the automobile sector and is a leader in the low-emission engine category. Exponents of Fiat's management while confirming the inevitable closure of the plant due to competitive disadvantages and structural and economic-financial difficulties, underline that there is a

significant collaborative commitment on behalf of Fiat's top management (in particular with central government) aimed at favouring the creation of a serious and credible alternative project. However, no indication has been given as to what this alternative project might be. Moreover, regarding the social impact of the exit strategy, Fiat's responsibility and commitment was confined to their having announced the decision with thirty months notice so as to leave enough time for the necessary re-conversion process.

The results produced by the empirical research underline how company management is reluctant to explain any possible compatibility of alternative projects with the group's strategy. In fact, from the few replies we received (all anonymous) it was impossible to understand what their strategy actually is.

Regarding trade unions, political entities (Municipalities, Regions, Provinces), the many replies we received suggest the following:

- Fiat will not support any alternative project; the international expansion strategy the firm intends to follow wants nothing to do with an area it finds weak and unattractive. This is also confirmed by the fact that the Region of Sicily had declared it was willing to invest 400 million euros in the improvement in infrastructure and technology; nevertheless, Fiat was unmoved by the proposal.
- regarding the proposed projects for the re-conversion, the fear is that the assurances of the government will remain simple assurances and that the initiatives will never get off the ground.

Ethics and CSR

The doctrine highlights the need to match economic operations with ethically inspired behaviour. In particular, behavioural correctness depends completely on ethics in as much as being responsible to someone for something implies a "need to be" (Rusconi, 1997). However, one must clarify that from a methodological point of view, ethics has an individual structure as it is fruit of the values of the single individuals that make up the firm's structure and is expression of a specific and developed internalised culture. On the basis of what we've said, company ethics are a "derived" as they stem from the values and behaviour of individuals; they are "relative" and "subjective" as they are the expression of the greater or lesser combination of moral and economic values, the latter of which are typical of the business world (Sciarelli, 2007).

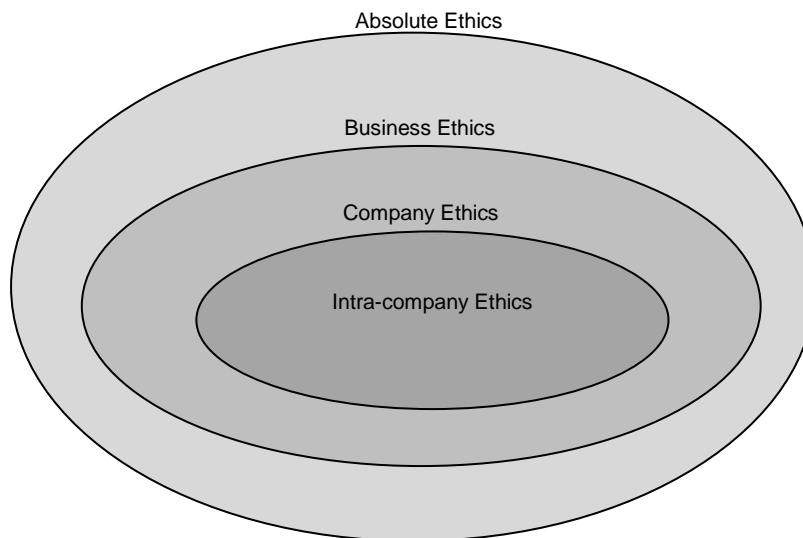

But on closer inspection, the application of ethics in firms also bases its stability on the micro-macro exchange theory. Following such a logic, the firm's "standing in society" is only legitimised when the firm adopts correct behaviour in the exchange between the benefits it receives from society and damage it causes to society (Donaldson, 1989). Thus we see the contribution ethics make to the creation and diffusion of value on behalf of the stakeholders the firm deals with.

To get a better understanding of the meaning of business ethics, you can't avoid considering the most general concept at the heart of firm culture. This is because firm culture puts into practice the elaboration of orientations (values) and behaviours (actions) shared by the majority of the internal components of the firm's structure (Barile, *et al*, 2008). This consideration induces us to argue that it is in the culture itself that ethics (in as far as they are linked to values) and responsibility (in as far as it is linked to behaviour) are to be found. If the firm internalises an ethical value system that can help guide its actions, it is highly probable that the behaviour displayed towards stakeholders will be based on behavioural correctness. In that sense, ethics can be defined as a behavioural model aimed at identifying criteria and values that guide conduct towards good, favouring the principles of honesty, justice, fairness and respect for human dignity.

The socially correct behaviour of firms however, cannot consist in merely respecting the contextual restrictions and laws. Reference must be made to the concept of the wider socio-cultural context and shouldn't be limited to considering as rules only those enforced by specific local legislation, but should also encompass moral and religious obligations.

If it is true that behavioural correctness stems from a system of individual values, that is, subjectively encoded values, then it is also true that these subjectively encoded values are the result of the internalising of absolute principles, filtered by contextual constraints and rules. By their very nature, these values extend beyond context, and tend to be objective in as much as they are universally recognised. Absolute principles encode the inalienable and binding rights of all human beings in all their various shapes and sizes.

To make things clearer, it's a good idea to express the analysis in the following levels (Fig. 2):

Figure 2 – Levels of business ethics

Source: Our creation

- Absolute ethics, that is, principles generally universally recognised as such, and therefore, objective. This level defines socially supportive behaviour, and is aimed at the conscience of the firm decision-taker (Rusconi, 2007);
- Business ethics, characterised by constraints and rules of conduct generally accepted in a specific socio-cultural context. Of all the different contexts, business contexts embrace relative ethics (Sciarelli, 2007) aimed at bringing together complex equilibriums, otherwise defined as entrepreneurial ethics;
- Company ethics, inherent values regarding social systems with particular reference to those in the business sector, as they are organisations resulting from the combined action of many individuals, each of whom has his own system of values. At this level, there are strategic company ethics and ethics within companies as held by individuals.

We affirmed that where there is full consistency between values characterising specific business contexts and all the universal principles, firms naturally tend to adopt responsibly correct behaviour. In other words, in order for business conduct to be considered absolutely correct ethically speaking, there must be as high a level as possible of compatibility between the system of values of a specific firm and the general set of principles universally considered to be those reflecting the essential values of fairness, justice, social support and so on. During the subjective internalisation processes of the above-mentioned principles, the filtering action provided by context has a distorting effect if the constraints and rules valid in that same context are not in line with the absolute principles. On the contrary, if there is full compatibility between the contextual constraints and rules and the objective principles, then

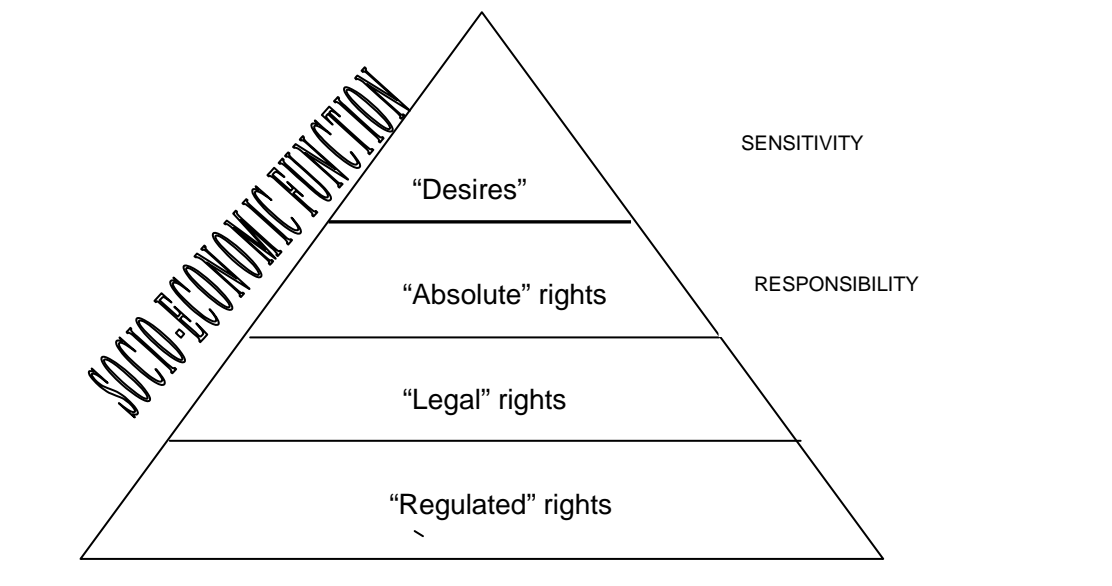

the subjective internalisation process will be facilitated, thus strengthening the subjective values.

It is clear how behavioural correctness is the result of adequate responses to the legitimate expectations of the firms stakeholders. The expectations cover not only the fulfilment of rights, but also interests linked to requirements, needs or mere desires. Considerations of legitimacy must, however, transcend the stakeholders' power of influence and capacity for retaliation. In other words, ethics is that type of management that knowingly causes damage to its own firm rather than damaging the rights of third parties (Donaldson, Preston, 1995).

This respects the fundamental premise that any firm that survives only through the abuse of power to towards those weaker than itself cannot really be considered a firm and therefore doesn't deserve to exist. It is to be hoped that governing bodies concentrate their efforts on coming up with creative solutions that over the long-term, are capable of integrating absolute ethics and company ethics in a synergetic fashion.

In an attempt to further clarify this issue, we suggest taking another look at Carroll's pyramid (1979,1991,2004) regarding firms' responsibilities (Fig. 3).

Figure 3 – Re-examing Carroll' pyramid.

By creating and distributing socio-economic value, firms are able to supply satisfactory responses to the various expectations expressed by their stakeholders.

Above all, one can clearly deduce that the basis of firms' responsibility must be concerned with the fulfilling of their economic stakeholders' (clients, suppliers, employees, distributors etc.) rights based on contractual type relationships (regulated rights).

Based on such an assumption, business responsibilities can increase and change depending on the problems inherent in the relationships between the firm and its socio-institutional stakeholders. And it is the firm's responsibility to respect the legal rights of its stakeholders as they are sanctioned by specific contextual jurisdictions.

Finally, the firm's responsibilities towards its stakeholders must necessarily extend to respecting their universally recognised absolute rights as human beings, minors, workers, women, even if they are not considered 'rights' by law.

Above and beyond the system of business responsibility, but in the sphere of the firm's social function, one can also include helpful or liberal acts aimed at satisfying 'mere' desires. These aren't exactly a firm's duty (as they are not aimed at respecting rights), but rather, a kind of marked sensitivity towards the social context that encourages the firm to adopt behaviours displaying the principle of solidarity. It follows that the firm's overall sense of society is a function of its corporate responsibility and social sensitivity. And it is this, what we now call "summa", that singles out the firm's socio-economic function.

Therefore, in the sphere of firms' socio-economic function one can identify a clear demarcation line between areas of entrepreneurial responsibility and the area of social sensitivity.

By the former we mean firms' obligation to respond in a behaviourally coherent and correct fashion to the expectations of its stakeholders who enjoy various types of rights. This as a result of their having strong enough ethical values to give the correct orientation to their behaviour. It is therefore possible to argue that the area of responsibility shouldn't entail free will since choices are proper and mandatory responses.

Regarding the latter - where social stakeholders' expectations aren't so much rights as justifiable desires - the firm's behaviour appears to be fruit of free will that can nevertheless express a greater or lesser attention, sensitivity and helpfulness towards the social context.

Final considerations on the case study.

In the light of the considerations inherent in the delicate relationship between ethics and social responsibility, and given the findings of the empirical research, it is possible to reach the following conclusions:

- with their decision to abandon Sicily, Fiat's top management can't be "formally" accused of failing in their CSR since it found itself faced with a problem where there were two different conflicting values, each of equal importance; that is, efficiency and solidarity;
- however, while the problem and the particular contextual requirements may have put pressure on the firm, it would seem that the firm undervalued the impact of its choice. In other words, faced with the serious needs and expectations of

stakeholders, management didn't display that due attention, sensitivity and helpfulness that one would have expected;

- the scarce corporate sensitivity displayed, can probably be attributed to an under-developed sense of ethics in as much as Fiat did not display correct behaviour, failing to guarantee an adequate equilibrium through the "social contract" stipulated with the local context from which over time, the company enjoyed more advantages than it was able to contribute;
- one can reasonably argue that top management showed little inclination for change, demonstrating a lack of entrepreneurial creativity. Even though Fiat is a diversified group, it didn't put any effort into identifying possible alternative activities. Clearly, this unwillingness to change did not facilitate the development of widespread creativity;
- from which we can deduce that a greater level of corporate social sensitivity would have resulted in a different degree of willingness to listen and engage with the stakeholders, and a willingness to discuss a choice which appeared predetermined and which was strongly defended. Such an attitude could have helped the firm develop more creative solutions to the problem solving, favouring the emergence of alternative solutions to the exit strategy.
- there is also the hypothesis, though it's impossible to validate both in the short-term and long-term, regarding the choice of an alternative option to the exit strategy. Following this logic, if management had chosen to revitalise the Sicilian establishment realising projects more or less similar to those submitted by other businesses, or had they at least shown the willingness to participate in projects promoted by other businessmen that they thought compatible with the group's assets, one has to wonder if by realising and taking on an alternative project, it might have been possible to come to a more positive conclusion, both strictly in business terms regarding increasing the company's revenue, and improving Fiat's social reputation which has undoubtedly been damaged since they took their decision.

As we have said, the point of view that Fiat's managing director took underlines how the drama of the Sicilian workers shouldn't be interpreted in a way that sets the interests of the owners against those of the workers, but rather should be seen as a conflict between groups of stakeholders. Even if we accept this interpretation, what the paper reveals is how the company's lack of willingness to explore alternative solutions can be attributed to Fiat's top management, solutions that at least potentially could have changed the game that is presently coming to a dramatic end with a win-lose type logic that sees the redundancy of the plant's workers and the subsequent detriment to society, and which in the future, alternatively, could have come to a different conclusion, with an alternative project that was sustainable

both from an economic and social point of view and which could have resolved the problem using a win-win type logic.

Implications for future empirical research

Further possible developments in research might involve a study aimed at evaluating how the Termini Imerese case will impact - over the medium and long term, from 3 to 5 years - the reputation and market results of Fiat's group, by means of an analysis capable of combining:

- the direct effects produced by the exit strategy both on the Sicilian territory, and the country as a whole;
- the effects caused by further developments to the Termini Imerese site. In this case, it would be interesting to evaluate how a positive or negative implementation of the alternative solution, which will be selected in the near future, will impact Fiat both from an economic point of view and regarding its reputation.

Abstract

This paper investigates the impact of corporate taxation on the location of foreign direct investments in European Union countries. Significant changes have occurred in EU economic environment during last decades: enlargement of European Union (EU) and European Monetary Union (EMU), decreasing the tax levels due to the tax competition, deep economic crisis followed the period of growth, and the FDI flows have increased considerably during the period. The analysis was conducted based on the aggregated manufacturing foreign direct investments world flows into 23 European Union countries. The main result from estimated econometric model based on a cross-section data of country variables is that effects of taxation on manufacturing foreign direct investment are statistically significant. The results show that increase of nominal corporate income tax by one per cent is associated with decrease of manufacturing FDI by 0.03 percentage points. Considerable differences were discovered in the behaviour of FDI flows into small and large countries. Larger countries face lower elasticity of FDI to the tax rate. The results suggest that tax policy aimed to increase FDI is particularly important for smaller countries.

Keywords: foreign direct investment, European Union, corporate taxes, manufacturing

Introduction

The income flows generated by foreign direct investments (FDI) are subject to corporate income tax in most of the host countries. The expected cash flows from investments and the value of investments are heavily influenced by the level and mechanism of taxation influencing in turn the investors' readiness to invest into particular country. The question of how corporate taxation influences FDI is a major research question both from the scientific and policy viewpoint.

Despite the fact that number of studies have been carried out to clarify the problem, it remains topical. The empirical study is motivated by the following facts: (1) economic conditions and business motivation in many countries have been changed due to the enlargement of European Union (EU) and European Monetary Union (EMU) during last

decades; (2) intensive process of tax competition has been present in EU during the same time; (3) it covers the period from 1998 to 2008, starting with the end of last crisis and ending with the approximate peak of last big economic crisis; and (4) the FDI flows have increased considerably during recent years.

The paper draws from two main strands of literature. First, increased attractiveness of countries for FDI resulting from lower tax burden is treated in literature on the tax competition. The choice of variables in this paper is partly based on some results of these articles. Second, the preliminary choice and expected influence of variables is based on studies about the factors influencing inward FDI.

The theory of tax competition suggests that capital mobility and country size have impact on the taxation policy. Krongstrup (2002) pointed that larger countries face lower elasticity of capital to tax rate and therefore choose higher tax rates compared to smaller countries. The asymmetry described by Bucovetsky (1991) implies the following: when a large country changes its tax rate, more capital will move out of the country than when a small country increases its tax rate by the same amount. However, the investment decisions depend on the perspectives of the host country's economy and its openness, on growth rate, quality of institutions and on many other factors.

The tax competition model explains partly the behaviour of European countries whereby they introduce tax policy measures to compete for mobile factors. Small open economies are not able to influence the capital flows considerably. They lower taxes on capital income for the purpose to affect the costs to overcome the problem. As a result of free movement of capital other countries are forced to decrease tax rate too. The asymmetry described by Krongstrup (2002) implies that larger countries tend to have higher tax rates on capital compared to smaller countries when capital is mobile across countries.

Winner (2005) examined the tax competition empirically using a sample of 23 OECD countries. He assessed the impact of two components of tax competition – capital mobility and country size – on the taxation of factor incomes on the basis of period 1965-2000 and concluded that the tax rates in large countries are bigger than in a small countries. A paper by Benassy-Query, Fontangne and Lahreche-Revil (2005) evaluated the influence of taxation on FDI, with a special focus on the impact of corporate tax variables, by taking into account tax schemes for avoiding double taxation. Empirical results of research on China suggest that tax rates and incentives are important determinants of FDI (Tung and Cho 2001). In their regression analysis, FDI is dependent on infrastructure, tax incentives, wage rates, unemployment rate and population. It was found that the wage effect and unemployment effects are insignificant. The focus was on tax and infrastructure variables. According to the results of regression analysis, zones and cities with lower tax rates and greater tax incentives attract more foreign direct investments than other areas.

In recent years some comprehensive researches concerning the influence of corporate taxation policy on foreign direct investments have been done. One of them is the empirical analysis of the European Commission's Directorate for Taxation and Customs Union written by Fatica, where she examines the asymmetric effect of taxation on FDI. Fatica (2009) found that FDI respond significantly to the taxation in countries with low quality of institutions. The effective tax rate was not important enough to attract foreign investments in other countries.

To summarize, the results of previous works indicate that tax policies have significant impact on the investment location decision. Size of the economy influences the level of the tax rates supporting the theory of asymmetric tax competition. It is important to understand that the level of taxation impacts the gains from investment. Past empirical work, which focused on the relationship between foreign direct investments (hereinafter FDI) and corporate tax rate has found mixed evidence about the influence of taxes on the level of FDI flows. Studies undertaken before 1990 show that FDI flows are not sensitive to the changes of tax rates; later studies indicate that the taxation in a country impacts the FDI flows.

The impact of taxation on FDI has been subject of a sizeable literature, as reviewed for example by de Mooji and Everdeen (2006) and Devereux and Mattini (2007). Nicodeme (2009) claimed that home-country taxation is relatively unimportant. Ruding Committee (1992) questioned the firms' managers asking the importance of taxation in the firm's investments decisions. The results supported the view of importance of taxation. Our own earlier empirical studies support the idea that foreign direct investment is sensitive to the changes in corporate income tax rates, especially in the sector of manufacturing and wholesale and retail trade.

The current paper presents an empirical analysis of aggregated FDI inflow into EU countries from all countries in the world. The paper examines the impact of corporate taxation in host country on FDI inflow into the European Union countries and attempts to address two related questions. The first question is how sensitive foreign investors to the corporate income tax differences across European Union countries. Answering to the above-mentioned question requires the determination of corporate income tax differences between EU's countries and ability of EU open economy to attract FDI. Second question is whether the smaller economies are forced to choose a lower tax rate for attraction of foreign capital. The hypothesis is that there is a connection between the size of the country and taxation policy for the attraction of foreign direct investment.

We examine what influences investors' choice on the location for FDI into EU. The analysis follows the empirical research of regional investment decisions in China (Tung and Cho (2001)); according to the results of which zones and cities with lower tax rates and greater tax incentives attract more foreign direct investments than other areas.

The choice of variables in the econometric model was supported by empirical research of Winner (2005). According to his regression equation and statistical evaluation, the impact of

capital mobility on capital tax burden is significantly negative. The statistical equation shows that increase of capital mobility by one percentage point is associated with decrease of capital tax burden by 0.18 percentage points. Positive effect of capital mobility on capital taxation, in case the country size is identified, has the expected sign for capital taxes.

The research conducted by Moore, Steece and Swenson (1987) on determinants investigated the impact of tax rates on foreign direct investment concluded that corporate income tax has a small impact on foreign direct investment. The analysis was also restricted to foreign direct investment in manufacturing. Similarly to Root and Ahmed (1978), the authors assessed the different scopes of independent variables. These are availability of essential resources like level of electricity prices and natural gas prices, economic determinants such as unemployment rate, manufacturing wage rate, corporate tax rate and business climate variable. Significant variables are infrastructure development factors like number of airports, length of railway lines, port facilities, and roadways. Size of the country evaluated with the help of population number, average number of sunshine days, average number of heating days were also among the significant determinants. The authors used three tax variables: statutory marginal tax rate, average effective corporate income tax rate and unitary tax rates. Final choice of variables included into this study was made in the course of empirical modelling.

The paper is organized as follows. This overview serves as a basis for the econometric model presented in the section three. In the second section the overview of data is given and in the last section a summary and conclusions are presented.

Data

The period under examination is 1998–2008 with the sample consisting of 23 investment host countries (11 new Member States and 12 old Member States). The panel data set contains time series of 11 observations per each of the 23 countries. Thus, the total number of observations of all variables is 253. Manufacturing foreign direct investment data were obtained from the database of Eurostat. Since data concerning tax rates and some other variable became available only for the period of 1998–2008 the sample was limited to the mentioned period.

Whether the host country is a member of the Euro zone is expected to be significant for the location choice with expected positive influence. The dummy EURO is equal to one in the case if particular country used common EU currency. Another dummy (EU) with expected positive influence on FDI is equal to one when the examined country is an EU member state. During the period under investigation, the number of EU member states increased from 15 to 27.

The main objects of the study are the tax variables. Nominal corporate tax rate, implicit tax rate in the field of corporate income and number of double tax treaties in the host country are

the tax variables expected to affect foreign direct investment. Double taxation is avoided with help of the agreements between home and host country. Also, the openness of the country toward the foreign investments is partly measured by activity of the country in the international agreements. The variable measuring the possibility of investor to avoid double taxation of earned income is the number of tax treaties signed by the host country (*DTA*). Most of the EU member states are also members of the OECD and the adoption of OECD model agreement is obligatory for its members. 16 countries of the sample were members of OECD in 1998 and 17 in 2008. Data on the tax treaties is extracted from the IBRD database, where the texts of all tax treaties in the world are available.

Source: European Commission (authors' calculation).

The variable concerning the nominal corporate income tax rate (CORT) is most important in this study. The data are extracted from the intermediate report of the European Commission written in October 2009 (European Commission) (Table 1). In 2008 the average corporate income tax rate was 23% that is approximately 7% less than in 1998. Statutory corporate

income tax rate was decreased during the period under examination by 9 per cent in small countries and by 11 per cent in large countries (European Commission, author's calculation).

The influence of real corporate income tax variable was controlled with the implicit corporate income tax rate extracted from the database of TAXUD of European Commission. An implicit tax rate is calculated by dividing the revenues from taxes on a special activity or good by an appropriate corresponding aggregate tax base from national accounts statistics. The calculation of implicit tax rates is relatively straightforward and requires less statistical input than, for example, microeconomic or marginal tax rates. The usage of effective tax rate would be more appropriate but it was impossible because of unavailability of data. Implicit tax rate is expected not affect very much the FDI flows into EU manufacturing because the tax rate during the period under examination did not change. The mean of implicit tax rate in 2008 was 23,3% and in 1998 – 23,6%. (European Commission, authors' calculation). The influence of implicit tax rate was checked to be sure if it has impact on manufacturing FDI.

The other independent variables in the study are the level of economic development in the country measured by gross domestic product, unemployment rate, the level of development of the country's infrastructure by length of railway lines and length of motorways and number of internet users, market size variable measured by number of inhabitants, expensiveness of labour measured by labour costs index. These country-specific factors are expected to impact local factor costs and factor supply. Some of the above-mentioned variables were used in basic estimation and some of them for robustness checks.

The host market potential is measured by size of host country, unemployment rate and level of infrastructure development. The size of host country, measurable by the (log of) number of inhabitants (POP) that is expected to have positive sign because large countries have to be with large market potential than smaller. Second, the (log of) unemployment rate (UNEM) is used. An increase in unemployment will lower the direct investment as the indicator of slowdown of economic activity on the country level. On the other hand, unemployment is connected with general economic development, which probably will be expressed in the negative coefficient of correlation between growth of gross domestic product and unemployment rate.

According to the Ernst & Young European Attractiveness Survey (2008), international investors claim that provision of physical infrastructure is one of the valuable factors (54% of respondents). The level of development is measured by length of railway lines and roads. The infrastructure variables as the (log of) level of development of motorways and rail lines (LENGTH) are expected to have positive impact on FDI.

Econometric model and results

Based on the earlier research it was assumed that manufacturing foreign direct investments depend on taxes and other macroeconomic variables

$$INV_{it} = \beta_0 + A TAX_{it} + B X_{it} + u_{it} + \varepsilon_t \quad (1)$$

where INV_{it} represents FDI inflows to country i in the period t divided by nominal GDP and multiplied by 100, TAX_{it} is a vector of tax variables in the host country, and X_{it} is a vector of macroeconomic control variables. The term u_{it} allows for fixed effects that may be across countries, i , and/or periods, t , and ε_{it} is the error term.

After several attempts we decided on the following log-linearised equation to be estimated:

$$\log INV_{it} = \beta_0 + \beta_1 \log POP_{it} + \beta_2 \log UNEM_{it} + \beta_4 \log LENGTH_{it} + \beta_6 EURO_{it} + \beta_7 EU_{it} + \beta_8 CORT_{it} + \beta_9 DTA_{it} + \varepsilon_t \quad (2)$$

The tax variables included are the number of tax treaties (DTA) and corporate tax rate (CORT). The dummy variables concerning Euro and EU membership are included. A dummy variable (EURO) takes value 1 when particular country is the member of European Union. Additionally, the dummy variable (EU) describes whether the country has adopted the euro.

The results of Hausmann test indicate that random effects model is not appropriate. The fixed effect model was used with different estimated intercepts for each pool member. The likelihood ratio test indicates that the model has cross-section fixed effect. Cross Section Weights method was used for estimation and according to that, cross-section residual variances were the estimated. The tax rate variables are statistically significant while the variables of international taxation, corporate income tax rate, size of the market, measured by population, at the 1% level and level of unemployment at the 5% level. EU membership variable became statistically significant at 10% level. The expected signs are reported in Table 3 together with the regression results.

Source: authors' calculations.

Note: t-statistic in brackets. ***- significant at the 1% level, **- significant at the 5% level, *-significant at the 10% level.

Graphical analysis and calculations confirm that the log-linear specification appears to be appropriate for the data. Estimated coefficients, summary statistics, p-values and t-statistics are reported in Table 2. The dummy variables concerning the adoption of Euro became insignificant. The European Union membership and development of infrastructure variable became significant on the 10% level of significance whereas the nominal corporate tax rate and number of tax treaties became statistically significant variables on 1% level. The market size variable became also statistically significant in the model.

The final model describes the relationship between the inflow of manufacturing foreign direct investments in the member state, the market size, the level of unemployment, infrastructure and tax rate variables. The amount of foreign direct investments depends on the corporate tax rate that negatively impact the level of investments and the variables measured by market potential level in the host country influenced positively. The model fits

well with the data ($p < 0.0000$, $R^2 = 0.9$) and the variables are significant at the 10% level, except Euro variable. The model shows that the level of foreign direct investments into manufacturing depends on corporate tax rate, openness of country for foreign investors, measured by the number of tax treaties, and level of unemployment and market size of country. The number of tax treaties also impacts the level of manufacturing foreign direct investments. The growth of unemployment impacts negatively the investments.

It was also examined how appropriate is the baseline model (2) for the small countries and large countries. The estimation results for small member states (population below 10 million) show that corporate tax rate and number of tax treaties are significant. For the large EU countries the nominal corporate income tax rate variable is also significant. Additionally to the tax variables the market potential of the country and EU variable are significant. The level of infrastructure development, adoption of Euro and unemployment are non-significant for the large member states. The taxation has an impact on foreign direct investments into manufacturing.

The coefficient of corporate tax rate is -0.0258 that measure the elasticity of foreign direct investments to corporate tax. The mentioned coefficient for large countries is -0.0169 and for small countries the coefficient is equal to -0.0397. The elasticity is bigger in the case of small countries. In general, the study discovered that a 1% decrease in statutory corporate tax rate increases the percentage of foreign direct investments of country GDP by 0.03%. This seems to be a quite marginal result, but in nominal values this means that 1% decrease of corporate tax rate will attract additional 18 billion euro in year into manufacturing sector of European Union countries. These results point to the importance of the corporate tax policy of making the investment environment more attractive. The results are close to those of Winner (2005).

The influence of implicit tax rate to the manufacturing FDI was insignificant. The reason for the result is probably in the informational content of statutory tax rate. Foreign investors control the legislation of host country before the investment decision.

To control for the robustness of the results the manufacturing foreign direct investments were compared with others sectors and the same estimation model was used for some non-manufacturing sectors (financial intermediation and wholesale trade). All estimated tax elasticity's are summarized in Table 3.

The impact of the degree of human capital as a control variable was checked via Human Development Index (*HDI*). Additionally, the labour cost index (*LABCOI*) was included that is expected to affect manufacturing foreign direct investment. Increase in the labour cost index is expected to have a negative effect on foreign direct investment. Low labour costs are also an important determinant for attracting new investments into the country. The human development index variable has probably positive impact on manufacturing FDI, since more skilled labour attract more FDI (Table 4). Surprisingly, the cost of labour does not affect FDI

significantly. The results show that degree of human capital development affects FDI positively.

Table 3. Overview of the influence of the country size.

Observations	Tax rate elasticity		No of observations

The development of IT-sector has intuitively significant impact on the further development of manufacturing in European Union. It is examined through the level of IT expenditures as percentage of GDP of the country under investigation (ITEX). The impact of the tax and other variables remains unchanged. The information of level of internet access by households and enterprises is available in Eurostat data base from the year 2002. The results suggest that the higher IT expenses do not affect the amount of manufacturing foreign direct investments significantly. The estimated coefficients are not significant (Table 4).

GDP growth is also fairly important as it directly determines the dynamics of foreign direct investments. The economic growth (GGDP), measured as percentage growth of GDP, is expected to be important factor for the attracting of investors. The country with greater potential is more attractive for investors and the sign is expected to be positive. Higher expected growth should attract more FDI inflows. The result shows that the higher GDP per capital has not impact on the amount of manufacturing foreign direct investments. The variable of GDP growth is significantly important on 10% level (Table 4).

Conclusions

The analysis of manufacturing foreign direct investment flows and macroeconomic indicators across the European Union countries during the period of 1998–2008 demonstrates that the policy of reducing the tax burden encourages foreign investors to invest into the sector. Two main questions were examined: the impact of changes of taxation on the foreign direct investment, and the importance of country's size on this impact. Taxation of corporate investments is important for attracting foreign direct investments.

The coefficient of the corporate tax rate in the model is significant and negative. The number of agreements for the avoidance of double taxation signed by the host country with different investor countries was also found to be significant. According to the regression estimation, the corporate income tax rate is significantly important for the inflow of manufacturing foreign direct investments into the European Union countries regardless of the size of the country. But also a development of infrastructure is attracting foreign direct investment.

The results of the study give a clear indication that corporate tax rate is statistically significant for manufacturing foreign direct investments. In general, the study discovered that a 1% decrease in statutory corporate tax rate increases the percentage of foreign direct investments of GDP of EU country by 0.02%, approximately by 18 billion euro in Europe. The mentioned coefficient for large countries is -0.0169 and for small countries the coefficient is equal to -0.0397. The elasticity is bigger in the small countries. These results point to the importance of the corporate tax policy with the purpose of making the investment environment more attractive particularly for the smaller countries.

Benassy-Query, Fontangne and Lahreche-Revil (2005) have suggested that a higher provision of public goods increases the attractiveness of the country for FDI, and the authors suggested that higher taxes can be partly compensated for by an increase in the building up of public infrastructure. The impact was found to exist also in this study.

However, some limitations are worth of mentioning here. First, not all countries were included into the study because of the lack of relevant data. Second, the set of variables should be bigger for the further research. Third, a new variable should be constructed based on the human development index excluding the influence of unemployment and labour cost index to avoid possible problems of multicollinearity. Fourth, in order to simplify the model the tax exemptions were not taken into account that may distort the results in small scale. Fifth, the economic significance of results is relatively low.

Further research is needed for the purpose to evaluate the importance of corporate taxation and incentives of the corporate taxation for the different industries with the wider selection of variables. It's necessary to stress that usually non-manufacturing sector is driven by different factors, but the robustness checks were run with the variables of the base model.

Some results of present study not included here indicated that asymmetries may of the influence of tax regime exist between the different types of countries and that the influences studied in this paper may be dependent on the phase of economic cycle. The further research of these questions has to be based on bilateral data.

Abstract

This work is focused on the acquisition of minority shareholdings by private equity funds and is organized into different sections. The first section consists in the description of the research project and the type of tools and methodologies used. It also deals with private equity and the venture capital activity as well as several types of classification about the investment stage. This section will also mention the investment process for the acquisition of a shareholding by a private equity or a venture capital fund. In the second section it describes the divestment phase of a private equity fund and lists the different kinds of divestments. The third section presents a questionnaire, whose content will be analyzed in detail. The fourth part describes the results of this research which are then further briefly discussed in the conclusion.

Keywords: private equity, venture capital, divestment phase, minority shareholdings, investment stage.

Private Equity and Venture Capital Activity

This work is focused on the acquisition of minority shareholding by private equity funds. The different stages of the investment process and the divestment phase have got a deep importance.

For the realization of this work, a questionnaire, which will be argued later, has been developed. This questionnaire has been sent to most of the Italian private equity companies affiliate to AIFI: the Italian association of private equity.

The private equity activity concerns the acquisition of control ownership or minority ownership in firms in a middle/long term perspective, in order to realize a capital gain about the future divestment of shares.

Private equity (EVCA Glossary) provides equity capital to firms generally not quoted on a stock market. Private equity can be used to develop new products and technologies, to expand working capital, to make acquisitions, or to strengthen a company's financial structure. It can also resolve ownership and management issues. A succession in family-owned companies, or the buyout and buying of a business done by experienced managers may be achieved by using private equity funding. Private equity is sometimes identified with venture capital. The latter is a subset of a larger private equity asset class which includes

venture capital, LBO's, MBO's, MBI's, bridge and mezzanine investments. Historically venture capital investors have provided high risk equity capital to start-up and early stage companies whereas private equity firms have provided secondary tranches of equity and mezzanine investments to companies that are more mature in their corporate lifecycle. Again, traditionally speaking, venture capital firms have higher hurdle rate expectations, will be more mercenary with their valuations and will be more onerous in their constraints on management than will private equity firms. While these descriptions are technically correct and have largely held true to form from a historical perspective, the lines between venture capital and private equity investments have been blurred by increased competition in the capital markets over the last 18 - 24 months.

Venture capital (EVCA Glossary) is thus used to fund an early-stage (seed and start-up) or an expansion venture. Offsetting the high risk the investor takes is the expectation of higher than average return on the investment. Venture capital is a subset of private equity.

A private equity fund is a vehicle for enabling pooled investment by a number of investors in equity and equity-related securities of companies. Generally, these are private companies and the shares are not listed in stock exchange. The fund can take the form of either a company or a Limited Partnership.

In this way, investors provide capital to firms, not typically listed, that need some cash to grow.

There are three terminologies of private equity and venture capital activity:

1. Usa;
2. Europe;
3. Italy.

In the Usa, the institutional activity on capital of risk is the "activity of private equity" that includes venture capital and buy out transactions. This distinction is done according to the type of investors who do the operation.

Venture capital activity can be divided in two subclasses (Gervasoni and Sattin, 2008):

1. early stage financing in which venture capital funds focused on investing in companies in the early part of their lives (Giorgino, 2006).
2. expansion financing also called development capital. The financing provided with the growth and expansion of a company, which may or may not break even or trade profitably. Capital may be used to: finance increased production capacity; market or products for development; provide additional working capital.

Buyout transaction is a transaction financed by a mix of debt and equity, where a business, a business unit or a target company are acquired with the help of a financial investor from the current shareholders (the vendor). Buy out transaction can be divided into (EVCA Glossary):

1. Management buyout (MBO): in this kind of buyout the target's management team acquires an existing product line or business from the vendor with the support of private equity investors.

2. Management buying (MBI) is a buyout transaction in which external managers take over the company. The Financing is provided to enable a manager or group of managers from outside the target company to buy into the company with the support of private equity investors.

3. Institutional buyout (IBO): in this buyout operation outside financial investors, as private equity houses, buy the business from the vendor. The existing management may be involved from the start and purchase to a small stake. Alternatively, the investor may install its own management.

4. Leveraged buyout (LBO) is a buyout in which the capital of the new company includes a particularly high level of debt, mostly of which is normally secured against the company's assets (Tartaglia, 2009).

The early stage financing deals with the financing of firms in the first stage of life, whereas expansion financing are based on investments in firms already developed that need capitals to grow further.

In Europe, until now, there is a classification between private equity, concerning all transaction carried out during the different stages of the life cycle of firms subsequent to the initial, and venture capital, that concern start-ups financing.

In Italy AIFI, which is the Italian association of private equity and venture capital, has defined the private equity activity as (AIFI Glossary) "the investment activity in risk capital of unlisted companies, with the aim of promoting the enterprises in a middle-long term". It follows that venture capital activity is a part of private equity activity, which focuses on the financing of businesses in the early stages of their life cycle.

In this work the following classification (Gervasoni and Sattin, 2008) has being adopted:

- a. Early stage financing;
- b. Expansion financing;
- c. Change financing.

Generally, the acquisition of minority shares, is attributed to the second category is attributed, whereas the third category concerns the business of buy-out, usually referring to the majority investment (AIFI, 2010).

After the fund raising activity the investment process should be analyzed to acquire a minority stake.

The investment process is divided into: deal flow; preliminary approach; due diligence; deal structuring; strategic plan; monitoring-reporting; way-out.

The process that defines the price of the shareholding is very important. In the next part of this article the divestment phase, the principal aim of this work, will be described.

The Divestment/ Exit Phase

This phase is extremely sensitive because the main purpose of the institutional investor is to obtain an high return on its investment, usually measured by the IRR (internal Rate of Return)

In this phase we must consider two fundamental issues, whose outcome will determine the amount of gain for the institutional investor::

1. determine the best time in which divestment will get the best possible performance (timing);
2. define the most appropriate channel for disinvestment that, according to the previous factor, will get the maximum economic return.

The exit consists in liquidation of holdings by a private equity fund. Among the various methods of exiting an investment there are:

1. trade sale that consists in the sale of company shares to industrial investors;
2. sale by public offering (including IPO): it is the sale of the shares on the stock market, fall into this category of the IPO, where the public offer is linked to the process of the first listing and the "sale of quoted entity", the sale of the shares on the stock market is made of different moments after being placed;
3. replacement or secondary buyout: the company share is sold to another private equity or venture capital fund;
4. buy back: it deals with the buy back of the company shares by the original member who, during the work of private equity operator, keeps being in the company with a minority or majority share
5. write-off: this last type is referred to the case of total or partial demolition of the value of the investment, resulted in a loss of value due the holding period of the company share.

When choosing the channel of disinvestment should be taken into account:

- the phase that is going through the stock market exchange;
- the market trends of M&A transactions.

According to a research (AIFI, 1995), two models can be identified by observing two different strategic approaches where investors in venture capital use to program the divestment phase; we can identify:

- path sketcher model: in this first model, the investor does not program the previously way-out but try to increase the probability of success. In this way the investor is concerned primarily to complete the divestment without deciding ex ante the type of exit strategy will be realized;

- opportunist model: In this second type of model, the basic philosophy is the ability of management to enhance the target company. The private equity operator can enhance the target company creating the value in absolute terms. The main type of disinvestment, for this model is represented by IPO (Initial Public Offering) (AIFI, 1995).

Questionnaire And Content

In this section, the questions included in the questionnaire will be analyzed. This questionnaire has been sent to the most private equity Italian companies affiliated to AIFI.

The aim of the questionnaire was to explore the current state of private equity in Italy, with particular interest to the divestment phase.

In the header of the questionnaire, the 13 companies in the research sample had to fill the name of the private equity fund, capital raised, capital invested.

The first question required to fill the number of portfolio shareholdings and their amount.

In the second question companies had to enter the number and amount of investment operations during the last three years. Companies must also indicate the number and the amount reported to the minority shareholdings.

In the third question private equity companies had to enter the average amount of investments in the last three years, with particular reference in the minority shareholdings.

The fourth question required to enter the number and the amount of the shareholding sold in the last three years. In this question too, companies must enter number and amount according to the minority shareholding .

In the fifth question they had to fill the interest rate return obtained in the last three years.

In the sixth question, companies had to enter number and amount of the shareholdings, divided and grouped according to different investment stage: early stage, expansion, restructuring, replacement, leveraged buyout...

The seventh question was represented by a table in which private equity or venture capital companies must enter this element reported to each shareholding acquired:

- acquisition year;

- sold year;
- purchase value;
- investment stage;
- expected period of the investment;
- majority or minority shareholding;
- expected divestment type;
- terms and divestment terms.

The divestment terms, that can be included, regard:

- tag along right;
- IPO;
- drag-along right;
- put and call;
- right of first offer.

In the last question of the questionnaire firms had to fill the following elements for the sold shareholdings both majority ones and minority ones:

- acquisition date;
- sold date;
- purchase value;
- investment stage;
- majority or minority shareholding;
- holding period;
- divestment type expected;
- divestment type used;
- sales value;
- IRR obtained;
- terms and divestment terms.

Results

In this section, the research results will be disclosed. Companies that have completed the questionnaire are 13 out of one hundred. The redemption rate was not high (less than 10%), this is the major limit of our research, but fortunately the companies that responded were important and representative of the whole market. In some cases the companies refused to

answer even if we assured the privacy, probably due to the unsatisfying results of the last period .

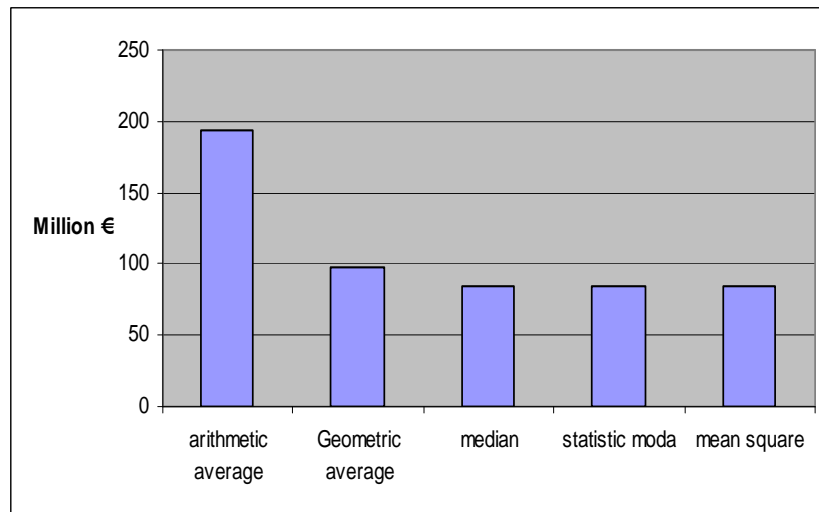

Fig. 1 – Capital raised

The arithmetic average of the capital raised by these funds is 194 millions euro. This data is influenced by one companies that have raised 1.200 millions euro to create the private equity fund. This value conditioned the mean square, which is 84.87. The statistical median of the range of the value is 85, as the “statistical mode”.

Considering the capital invested, the companies have acquired shareholding for a average of 38 millions Euro. This value takes into account majority and minority shareholdings. In that case, the mean square is 10.34 because the difference between the companies is less than before. The median of the sample is 26.

Fig. 2 – Capital invested

The average of the number of the portfolio shareholdings is 4.92 and this value is confirmed by the median and by the “statistical mode” that have the value of 4. The mean square, in that case, is 0.90 and this mean that the value are similar each other.

Fig. 3 – Number of portfolio shareholdings

The average value of the portfolio shareholding refers to the sample which is 29.64 millions euro. This value is influenced by a company that has a portfolio shareholding value of 140 and this increases the mean square (11.35). The median is 18.

According to the number of shareholdings acquired, the values are:

- 2010: the arithmetic average is 1,7 and the median is 1. The value of different companies are similar, in fact the mean square is low (0.75) whereas the mode is 0 because 5 companies out of 13 haven't done investments;
- 2009: in this year companies have acquired less shareholding and the average decrease to 0.61. This value is lower than 2010, in fact median and mode are 0. The value are similar each other and the mean square is lower than 2009, arriving to 0.26;
- 2008: the average is 1.15 that is more than 2009 but minor than 2010. Median and mode are respectively 1 and 0. The mean square is 0.34 and it confirms that the values are similar.

In reference to a sample analysis, in 2010 companies have acquired 22 shareholdings with the 86% represented by minority shareholding. This percentage decreased to 75% (6 minority shareholdings out of 8 total) in 2009 and in 2008 it reach the 53% (8 out of 15).

According to the number of shareholdings acquired in the last three years, the following charts show the trend of the total and minority shareholdings.

Fig. 4 – Total shareholdings and minority shareholdings in last three years

Fig. 5 – Majority and minority shareholdings acquired in the last 3 years
Next figures illustrate the situation of the minority shareholdings.

Fig. 6 – minority and majority shareholdings in 2010

Fig. 7 – minority and majority shareholdings in 2009

Fig. 8 – minority and majority shareholdings in 2008

We can notice the trend of the average amount of investment in the last three years:

- 2010: the average is 6.78 millions of euro whereas the same value reported on the minority shareholding shows a average of 4.56 millions euro;
- 2009: 6.62 millions euro for total shareholdings and 5.83 for minority shareholdings
- 2008: 6.93 millions euro for total shareholdings and 6.90 for minority shareholdings.

Fig. 9 – average amount of investment in the last 3 years

In this work, the average amount of the minority shareholdings decreased in the last three years. These values are correlated to AIFI results of the first half of 2010, where there is a decrease of the average amount.

In 2008 investments were 15: this data can be divided according to the investment stage as follows:

- early stage financing: n° 2 investments corresponding to 13.3% of the total investment in 2008;
- expansion financing: n° 11 investments corresponding to 73.4% of the total investment in 2008;
- restructuring financing: n° 2 investment corresponding to 13.3% of the total investment in 2008.

Fig. 10 – Investments in 2008 divided according to the investment stage

As we have seen, investment in 2009 were down 47%. In this year the number of investment operations has been 8, divided as follows:

- early stage financing: n° 3 investments corresponding to 37.5% of the total investment in 2009;
- expansion financing: n° 3 investments corresponding to 37.5% of the total investment in 2009;
- restructuring financing: n° 2 investments corresponding to 25% of the total investment in 2009.

Fig. 11 - Investments in 2009 divided according to the investment stage

In 2010 total investment increased in 175% reaching a total of 22 investments. This data can be divided according to the investment stage as follows:

- n° 9 investments in early stage financing corresponding to 41% of the total investment in 2010;
- n° 10 investments in expansion financing corresponding to 45% of the total investment in 2010;
- n° 3 investment in restructuring financing corresponding to 14% of the total investment in 2010.

Fig. 12 - Investments in 2010 divided according to the investment stage

The average expected period of the investment was 4.78 years and this value is confirmed by median and mode which are 5. Furthermore, mean square is zero, so the values are very similar to each other. The expected type of divestment most commonly used is trade sale, with 42.31% of choice. The second expected type of divestment is the secondary buy out with 38.46%, the third is initial public offering with 13.46% and the last is buy back with only 5.77%. The chart in fig. 13 shows the trend of the expected divestment type.

Fig. 13 – The expected divestment type

In the 50% of the acquired shareholding, it has been entered the lock-up clause.

If we consider all the acquired shareholdings, the contract term most frequently chosen by the private equity investors is drag along right with 50% of choice. Gradually, it follows that: tag along right (41.7%), buyback (41.7%), right to sale the company 41.7%), put and call (33.3%), IPO (33.3%) and right of first offer (25%).

Fig. 14 – The distribution of the divestment terms

In the last three years, because of the financial crisis, divestments have decreased. In fact, in 2010 there were only 4 divestments with two reported on a minority shareholding. In 2009 there were only 2 divestments with only one on a minority shareholding. In 2008 there were a partial recovery with 6 divestments and 2 reported on a minority shareholding.

Fig. 15 – Divestment activity

Conclusion

By analyzing the results obtained in the present research, we can notice the impact of the financial crisis has been remarkable in the private equity sector.

This work shows that, in 2010, there was a slow recovery in fund raising activity but the values are similar to those of 2006.

The AIFI results of the first half of 2010 show that investments activity is decreasing, too. There are positive signs coming from the fund raising activity. This data increased of 63% over the first half of 2009. Early stage financing and expansion financing represent the principal type of investment, as well as the results obtained in this work. In the last year, the

investment of minority shareholdings increased when compared to the previous period, because there was an increase of the investments in expansion financing.

This has happened as a result of the financial crisis. With the increase of the interest rate and the cost of money, buy out operations decreased. In this way the expansion financing increased. In this work, the results of the expansion financing are similar to AIFI results of first half of the 2010.

The impact of the financial crisis has decreased the leveraged buy out operations. Private equity funds are focusing on small and medium-size firms which represent the future of the business.

This consequence is linked to the financial crisis. In 2009 leveraged buy out decreased in the 84% compared to the previous year. So, the acquisition of minority shareholdings has increased.

As this work shows, early stage operations increased in the last three years. This data is confirmed by AIFI results of first half of the 2010. The Italian business of private equity are changing because the private equity interest are increasing towards small and medium-size firms. Early stage and expansion financing represent the way of the future.

In the present work, early stage operations were the 13.3% in 2008. In 2009 they reached 37.5% and in 2010 the 41%. In the Italian business, small and medium-size firms dominate, so that private equity and venture capital can help to these companies to survive in the international competition.

In a period of financial crisis, new opportunities can rise. Private equity seems to be interested to seize the chance given by this recent crisis.

Considering the divestment activity, AIFI results show a decrease over the previous year. Firms are trying to postpone the time of divestment. In the present work, the main type of divestment is trade sale followed by secondary buy out, IPO and buy back.

These years, there is a moment of transition, in which the trend market of the private equity has being accused the negative effects of the crisis. In this work, there was few divestments in the last three years: 6 in 2008 (including two divestments of minority shareholdings), only 2 in 2009 (with one of minority), and 4 in 2010 (with 2 divestments of minority shareholdings). This is happening across Europe.

According to the IRR of sold shareholdings of firms which have answered the questionnaire, we have to remark that only 3 shareholdings out of 12 divestments have been sold. Moreover, 3 write off (2 total and one partial) have been realized. Two write off deal with the minority shareholdings. These last years, as already précised, there have been lots of write off. This data is a consequence of the financial crisis.

A follow up to this research will be an analysis “a posteriori” about the divestment type actually done, relating this to the declared intentions. This also will evaluate if the end of the Financial Crisis modifies the divestments modes of minority shareholdings.

The economy recovery will be slow, but there are some positive signs coming from the private equity and venture capital business.

Abstract

Banking activities today are global in nature and impact industry and governments across the world, as witnessed during the banking industry meltdown during the global financial crisis. We investigate the banking profession during the financial crisis by focusing on the rhetoric of chief executives of major banks and relevant stakeholders. Our analysis reveals that institutional maintenance of the banking profession was dominant, whereas institutional change remained difficult due to the limited scale and nature of the rhetoric employed towards it. We also find that while the bankers and various internal and external stakeholders engaged in institutional maintenance, change was mostly focused upon by external stakeholders. Our findings thus highlight the challenges in institutional change related to professions, particularly due to the strong role of the professionals themselves in institutional maintenance and their avoidance of institutional change. While we focus on the United States banking industry, given its primacy in global finance, our findings have implications for the banking profession across the globe. We interpret these findings to provide insights on institutional work related to professions and draw broader theoretical implications for the literature.

Introduction

The global financial crisis that marked the first decade of the 21st century has brought attention to the institutional structures underlying most modern capitalist societies (Davis, 2009; Kotz, 2009). This attention has also spilled over to certain professions that were seen as closely intertwined with the existing institutional systems. The banking profession, in particular, has been at the center of investigations into the crisis, given the large-scale bankruptcies and restructurings of major banks that have caught the attention of experts (Crotty, 2009) as well as the general public (Taibbi, 2009).

In this paper, we initiate an examination of the banking profession during the financial crisis. Media accounts indicate that the banking profession became one of the primary targets during the crisis, with several questions being raised about its role as a key institution underlying the major events of the crisis. As the profession came under attack in

the public realm, the chief executive officers (CEOs) of major banks, in their role as representatives of the profession, became the center of attention. Various stakeholders targeted these bank CEOs in their commentaries, and the CEOs also provided their own accounts to the public through quotes in the media. These commentaries are rich in rhetoric: Bank CEOs referred to themselves as bankers “doing God’s work”, were praised for being “consummate professionals” or “leaders”, and were also critiqued using a variety of terms, such as “lame-duck”, “arrogant”, and even accused of being outright fraudsters and liars. In order to systematically analyze these accounts in the public realm and delineate their theoretical implications, we draw upon recent theoretical developments in neo-institutional theory, referred to as the *institutional work* literature (see Lawrence and Suddaby, 2006; Lawrence et al., 2009).

Institutional work refers to the creation, maintenance and disruption of institutions by various individuals and organizations through purposive action (Lawrence and Suddaby, 2006, p. 215). In particular, rhetoric, or more generally, purposive use of language, serves as a form of institutional work that deserves more research attention (Lawrence and Suddaby, 2006, p. 239; Suddaby, 2010). Further, the key role of professions in institutional maintenance and change, including the maintenance and change of the profession itself, has been highlighted as particularly important (Scott, 2008, p. 219) and yet remains underexplored in the literature (Hwang and Powell, 2009; Lawrence et al., 2009).

These theoretical developments are particularly relevant to our focus on the banking profession during the financial crisis. On one hand, the profession became one of the primary targets of rhetoric aimed at institutional change in the broader finance industry. On the other hand, the profession attempted to use rhetoric to maintain the norms and rules related to it and thereby preserve its existing key role in the finance industry and modern finance-based societies (Davis, 2009). This context thus provides a unique opportunity to observe institutional work undertaken by key actors related to the banking profession. Banking has been considered a profession in prior literature, given that bankers are bound by common norms, rules and associated training (Borsodi, 1977; Green, 1979; Seal and Croft, 1997).

Our paper contributes to the growing literature on institutional work, particularly to the emerging strand that highlights connections between professions and institutional maintenance and change (Hwang and Powell, 2009; Lawrence and Suddaby, 2006; Lounsbury, 2002; Scott, 2008). We also contribute to the stream of research that examines responses of actors facing pressures for institutional change (Barnett and King, 2008; Maguire and Hardy, 2009; Suchman, 1995), particularly where several connected actors, such as the constituents in a specific profession, are investigated in an integrated manner (Desai, 2011; Hoffman, 1999).

The rest of our paper proceeds as follows. First, we briefly discuss the context of banks during the financial crisis. Second, we describe our data, analysis technique, and results. Finally, we interpret our findings and discuss their implications.

Banks and the Financial Crisis

The global financial crisis has been attributed to causes deeply connected to the banking industry, particularly the sub-prime loans and related practices, such as credit default swaps and collateral debt obligations (Crotty, 2009). The start of large-scale mortgage defaults in 2007 in the United States provided the trigger for dramatic events in the banking industry. These events included the bankruptcy of Lehman Brothers; the buyouts of Bear Sterns and Merrill Lynch by JPMorgan Chase and Bank of America, respectively; the bankruptcy and buyout of Washington Mutual by Bank of America; the change in structure of investment banks Goldman Sachs and Morgan Stanley to deposit holding banks in order to allow their bailout by government funds; and the bailout of Citigroup by government funds. The events at these banks in the United States created global ripples, given that modern banking activities are global in nature and impact industry and governments across the world. In Table 1, we present a timeline of events related to major United States banks, along with names of bank CEOs who had tenure during these events. For further details, see for example, Reuters (2010) and CNN (2008).

Table 1. Timeline of Major Bank Events and Bank CEO Tenures during the Crisis

<i>Major Bank</i>	<i>Key Crisis Event(s)</i>	<i>CEO Tenures</i>
<i>Lehman Brothers</i>	<i>Bankruptcy (Sep 15, 2008)</i>	<i>Richard Fuld (1994 - May 15, 2009)</i>
<i>JPMorgan Chase</i>	<i>Acquired Bear Sterns (Mar 17, 2008)</i>	<i>James Dimon (Dec 31, 2005 – Present)</i>
<i>Bear Sterns</i>	<i>Acquired by JPMorgan Chase (Mar 17, 2008)</i>	<i>James Cayne (1993 - Jan 7, 2008) Alan Schwartz (Jan 8, 2008 – Present)</i>
<i>Bank of America</i>	<i>Acquired Merrill Lynch (Sept 15, 2008)</i>	<i>Kenneth Lewis (2001 - Dec 31, 2009)</i>
<i>Merrill Lynch</i>	<i>Acquired by Bank of America (Sept 15, 2008)</i>	<i>John Thain (Nov 14, 2007 - Jan 22, 2009)</i>
<i>Goldman Sachs</i>	<i>Converted to deposit holding bank to accept government bailout (Sept</i>	<i>Lloyd Blankfein (May 31, 2006 - Present)</i>

	21, 2008)	
<i>Morgan Stanley</i>	<i>Converted to deposit holding bank to accept government bailout (Sept 21, 2008)</i>	<i>John Mack (June 30, 2005 - Jan 1, 2010)</i>
<i>Citigroup</i>	<i>Bailed out by government funds (Nov 24, 2008)</i>	<i>Vikram Pandit (Dec 11, 2007 - Present)</i>
<i>Washington Mutual</i>	<i>Declared Bankruptcy and acquired by JPMorgan Chase (Sep 25-26, 2008)</i>	<i>Kerry Killinger (1990 - Sep 8, 2008)</i>
<i>Wells Fargo</i>	<i>Acquired Wachovia (October 11-12, 2008)</i>	<i>John Stumpf (June 27, 2007 - Present)</i>

Sources: FDIC and various media reports available online

Taken together, these events in the banking industry brought attention onto the banking profession in a manner that was unprecedented in recent memory. For example, the Financial Crisis Inquiry Commission was set up by the United States Congress to examine the causes of the financial crisis, and bank CEOs were a prominent set of constituents publicly cross-examined.

Methods

As the banking profession became the focus of public attention, the media published several statements made by bank CEOs and various stakeholders. These statements constitute a source of public data for the analysis of rhetorical forms of institutional work related to the banking profession. Media as a source of data for analyzing actor positions has been well established in the literature (Krippendorff, 2004). Further, rhetorical analysis has been suggested as useful for institutional theory research (Green Jr. et al., 2009; Suddaby, 2010; Zbaracki, 1998), including research that focuses on the role of professions from an institutional perspective (Suddaby and Greenwood, 2005; Greenwood and Suddaby, 2006). Finally, analysis of rhetoric has been particularly relevant for understanding institutional elements during crisis situations (Desai, 2011; Hoffman, 1999; Zilber, 2007).

Data

We considered several events for fixing our data collection time-frame and finally settled on the start of public hearings by the Financial Crisis Inquiry Commission (FCIC) as a defining event in terms of collection of rhetoric. The FCIC defines itself as “a bipartisan commission that has been given a critical non-partisan mission – to examine the causes of the

financial crisis that has gripped the country and to report our findings to the Congress, the President, and the American people” (FCIC, 2010).

We chose an 18-month period, January 13, 2009 – July 13, 2010, for our data collection. The FCIC commission started its public hearings on January 13, 2010, in recognition of the fact that, by then, the issues surrounding the crisis had escalated into a major public concern through various reports and commentaries in the media. We considered a time period stretching to January 13, 2009, i.e. one year preceding the first FCIC public hearing, as it allowed us to collect the rhetoric building up to the FCIC hearings. We extended the time period to July 13, 2010, to allow us to capture the key concerns voiced in the public realm during the critical first six months of the hearings.

Our study considered those bank CEOs whose tenure included the key decisions made by their bank during the financial crisis, around 2007-2009. In order to ensure we did not miss any relevant rhetoric, we also collected quotes of CEOs who had been primary decision-makers during the crisis but who had since then relinquished the CEO position. For example, John Thain was CEO of Merrill Lynch when the key decision regarding its buyout by Bank of America was made. Though Thain subsequently resigned in 2009, he continued to be a focus of, and a source of, Merrill Lynch-related rhetoric during the crisis.

For the time-frame mentioned above, we conducted searches using the Factiva database for media articles, using each CEO's first and last name as keywords. Specifically, we looked for media articles that included either quotes by the CEOs or by any other stakeholders on the banking profession. In collecting the articles, we cast a wide net that included major publications such as *The Wall Street Journal*, *Financial Times*, *The Economist*, and *Fortune*, along with any other media outlets if we were able to find quotes that met our relevance criteria. In this manner, we found 116 relevant media articles.

We read through the media articles and identified 239 direct quotes by the CEOs and 182 quotes by various stakeholders. These were later reduced to 196 and 150 quotes respectively, through omitting quotes that were repetitions or were not relevant to the discussion on banking profession and financial crisis.

Analysis and Results

We analyzed our data in the following manner. We read through each article with a focus on the quotes, referring to the additional information in the article to provide context. We then followed a bottom-up approach to categorize the data, rather than imposing any top-down categories. We first marked the quotes through keywords that identified key issues, such as “banker skills,” “bank CEO concerns,” “lack of transparency,” etc. We then collated these quotes into logically connected, higher-order categories. Each quote was thus coded into categories and sub-categories by identifying thematic distinctions (Krippendorff, 2004, p. 107) based on the most salient persuasive appeals (*pisteis*) used in each quote (Suddaby and Greenwood, 2005). Coding in each category or sub-category was non-forced, i.e. a quote

could be assigned to multiple thematic categories if there was sufficient ground for considering that it fit into more than one category.

The coding was performed by two raters who had previous experience with such coding, and who were also familiar with institutional analysis and the financial crisis. The first rater independently coded all quotes. To assess inter-rater reliability, the second rater independently coded about 20 percent of the quotes by bank CEOs and 25 percent of the quotes by stakeholders (Suddaby and Greenwood, 2005). We calculated Krippendorff's alpha (Krippendorff, 2004; Hayes and Krippendorff, 2007) and found it to be 0.88 for coding of the quotes by bank CEOs and 0.93 for the quotes by stakeholders. These values of the alpha are fairly high and are acceptable; they are also expected, given that the raters had previous experience of thematic coding on common projects related to the current phenomena (Krippendorff, 2004).

We discuss the overall findings of our content analysis below, and to fully convey the richness of our results, we also share specific quotes as illustrations. We ensure that at least one quote from each category or sub-category is presented (identified by *italic* font in parentheses). Later, in the interpretation and discussion section, these findings are used to identify the main rhetorical strategies employed during the crisis.

Bank CEO Rhetoric

For quotes by the bank CEOs, we identified three main thematic categories: "Assurance," "Blame" and "Care." The Assurance category included quotes by the CEOs that were made to highlight positive aspects of any entity directly connected with the banking profession. We identified five such entities and coded these as a sub-category, "Assurance Focus": *self* (bank CEO), *bank employees*, *bank*, *banking industry*, and *transacting bank*. "Transacting bank" referred to a bank other than the CEO's bank that was involved in a merger or acquisition with the CEO's bank during the financial crisis. We also noted that these assurances referred to positives of the entities across a wide time frame, and created a sub-category, "Assurance Time-Period," to identify whether the assurance was given using positives in the *past* or *present* or making predictions for the *future*.

Our second main category, Blame, consisted of quotes in which the bank CEO assigned blame towards some entity for what went wrong during the crisis. To generate more nuanced insights, we created a sub-category, "Blame Focus," to capture the direction of the blame, i.e. whether it was directed towards a constituent *internal* to the banking profession - *self* (bank CEO), *bank employees*, *bank*, and *banking industry*; or towards tangible and intangible entities *external* to the profession - *government*, *economy*, *market*, *speculation*, *society*, *media*, *other-specific*, and *non-specific*. The "other-specific" category included a set of miscellaneous parties such as lawyers, hedge funds, short-sellers, etc. The "non-specific" category included quotes where the CEO deflected blame away from internal constituents in a general manner, without pointing to any specific external party.

We identified a third main category, “Care,” for quotes in which the CEOs claimed that their profession was serving various stakeholders. Given our focus on the banking profession, we considered *self* (bank CEO), *bank employees*, *bank*, and *banking industry* as *internal* stakeholders. The *external* stakeholders included *clients*, *shareholders*, *financial system*, *economy*, *society*, and *country*.

Bank CEOs directed most of their rhetoric towards providing Assurance by highlighting positive aspects of internal constituents and by placing Blame on external constituents, in about equal measure (75 and 79 quotes, respectively). There was, however, also a substantial effort by CEOs to portray their roles as involving Care toward external constituents (37 quotes). Perhaps not surprisingly, Blame directed towards internal constituents was the least frequently observed response (23 quotes) (see Table 2).

In providing Assurance, the CEOs relied mostly on highlighting past or present aspects (26 and 20 quotes, respectively) of their bank. For example, Alan Schwartz referred to certain positives that his bank, Bear Stearns, had held in the past (*Assurance: Bank: Past*):

“Different assets have different levels of risk and should have different amounts of capital held against those assets. By those measures, which I think are the measures we were most looked at by most agencies and regulators, Bear Stearns had very strong capital ratios.”

Similarly, Kenneth Lewis asserted that Bank of America was already in positive territory and in a position to repay the government’s Troubled Asset Relief Program (TARP) funds accepted to bail out the bank during the crisis (*Assurance: Bank: Present*):

“Bank of America is well positioned to meet the continuing challenges of the economy and markets. The Merrill Lynch and Countrywide integrations are on track and returning value already. We are in position to begin to repay the federal government's TARP investments.”

The third largest group of Assurance quotes (16) referred to future potential of banks, as in the prediction by Vikram Pandit, Citigroup (*Assurance: Bank: Future*):

“After the financial crisis ebbs, Citigroup will generate industry-leading returns.”

In contrast to the Assurance for banks across all three time-periods, CEOs mostly focused on the past when it came to providing assurances about themselves (14 quotes). For example, Richard Fuld reflected on how he did whatever was possible prior to Lehman Brothers’ bankruptcy (*Assurance: Self: Past*):

Table II. Bank CEOs Rhetoric

Rhetorical Strategy	No. of Quotes	Direction of Rhetoric														
		Assurance	75	Self (21)			Bank Employees (7)			Bank (63)			Banking Industry (1)			Transacting Bank (4)
Past	Present			Future	Past	Present	Future	Past	Present	Future	Past	Present	Future	Past	Present	Future
14	5			2	4	3	0	26	20	16	1	0	0	1	2	1
Blame	99	Internal (23)						External (79)								
		Self	Bank Employees	Bank	Banking Industry	Government	Economy	Market	Speculation	Society	Media	Specific-Other				
		8	2	9	6	27	3	11	8	6	3	34				
Care	40	Internal (22)					External (34)									
		Self	Bank Employees	Bank	Shareholders	Banking Industry	Clients	Financial System	Economy	Society	Country					
		0	1	14	5	2	10	6	5	7	4					

Note: Total counts across sub-categories exceed the counts in some categories due to non-forced coding.

“Not that anyone on this committee cares about this, but I wake up every single night thinking, ‘What could I have done differently? What could I have said? What should I have done?’ And I come back to this: at the time I made those decisions, I made those decisions with the information I had. I can look at you and say this is a pain that will stay with me the rest of my life.”

The largest group that received Blame from bank CEOs was a miscellaneous set comprising ratings agencies, hedge funds, short-sellers, mortgages brokers, etc. (Other-Specific: 34 quotes). For example, James Cayne, Schwartz’s predecessor at Bear Sterns, used interesting imagery to portray the hawkishness of external constituents and his bank as a victim (*Blame: External: Other-Specific*):

“I have tried to avoid conspiracies, rumours. I heard the same rumours everybody heard, that hedge funds . . . ganged up . . . and that was all part of a picture of a big, fat goose walking down a lane, that’s about to get eaten up alive.”

Perhaps surprisingly, given the government bailouts of major banks, government and its agencies came in for the second largest share of Blame (27 quotes). The Treasury and Federal Reserve were typically criticized, along with some blame for the Securities and Exchange Commission (SEC) and other regulators. Some of the grievances related to perceptions of unfair treatment. For example, Kerry Kissinger of Washington Mutual lamented (*Blame: External: Government*) his company’s bankruptcy:

“I believe that Washington Mutual’s seizure was unnecessary and the company should have been given a chance to work its way through the crisis. I also believe it was unfair that Washington Mutual was not given the benefits extended to and actions taken on behalf of other financial services companies within days of Washington Mutual’s seizure.”

In cases where government bodies had played a role, bank CEOs still found plenty to complain about. For example, referring to Bank of America’s takeover of Merrill Lynch, supported by the government, Kenneth Lewis suggested that the government bodies coerced him to act in an unprofessional manner (*Blame: External: Government*),

According to testimony Mr. Lewis provided to New York’s attorney general in February, the Bank of America CEO felt ‘forced’ by Treasury Secretary Henry Paulson and Federal Reserve Chairman Ben Bernanke to go through with the Merrill deal despite mounting losses and his reservations about the deal.

and also pointed to the lack of follow-through on the part of government bodies:

“I recall a statement by Mr. Bernanke, that ‘We view you as strong and having acted appropriately in difficult circumstances, that we’ll make sure you continue that way’. [Bernanke] even went so far as to say, ‘We want to do something that when the public hears about it your stock goes up.’ That didn’t happen.”

Interestingly, perhaps betraying an inability to find enough specific parties to blame, the CEOs also prominently blamed intangible entities (Market, Speculation and Society receiving 11, 8 and 6 quotes, respectively), as illustrated by Alan Schwartz's comment (*Blame: External: Market, Speculation*):

"We, like many other financial institutions, relied on the belief that the market for highly rated tranches of structured securities, including those supported by Fannie Mae and Freddie Mac mortgages, would remain liquid, but when the markets for those securities became frozen, it left the firm susceptible to rumor and speculation."

Lloyd Blankfein of Goldman Sachs went so far as to blame the public due to their ignorance in understanding highly complex issues and hinted at the media's complicity in perpetuating this ignorance (*Blame: External: Society, Media*):

Goldman's businesses "serve a real purpose" but people "can be confused" by what is in the "pop press from time to time."

Perhaps recognizing that they were under public scrutiny, the CEOs made several attempts to highlight that they and their profession served constituencies other than themselves. Not surprisingly, no CEO suggested that their decisions were made with their own individual interests in mind (*Care: Self = 0* quotes). Similarly, serving the interest of bank employees or the industry was also not highlighted (1 and 2 quotes, respectively). Acting in the interest of the bank itself was most often mentioned under the Care category (14 quotes). In these cases, the bank took on a life of its own as an entity to be preserved and cared about, as in this excerpt by John Thain (*Care: Bank*):

"I have received thousands of e-mails saying, 'Thank you for saving our company.'" And yet [Thain] admitted that the decision to sell Merrill Lynch – a 94-year-old institution that was always 'bullish on America' – had been painful. "This was a great job. This was a great franchise. Emotionally, it was huge responsibility."

Clients emerged as the second largest group that bank CEOs said they cared about (10 quotes), as exemplified by John Stumpf's comment (*Care: Client*),

"And it's mostly about making sure that we are not confused and no one in the Company is confused about what we are here to do every morning. We are here to serve customers. That's the reason we get up in the morning."

and by Lloyd Blankfein's attempt to erase stereotypes of fat-cat bankers:

"We are not lounging around in our sunglasses, basking in our certain future. We stay very close to our clients."

However, the CEOs went well beyond their bank, clients and shareholders and also engaged in rhetoric suggesting their commitment to higher goals, such as the overall financial system, economy, society and country. Taken together, these "higher goals" quotes were the largest group in the Care category (22

quotes). It is perhaps a sign of the times that CEOs had to make very deliberate efforts to highlight such care, as illustrated by Vikram Pandit (*Care: Economy, Society, Country*):

Mr. Pandit still acknowledges “a significant responsibility” on Citi’s part to help be “an integral part of the American recovery.” He cited Citi’s efforts to help American homeowners and credit-card holders who are having trouble making their payments.

Similarly, Lloyd Blankfein went to great lengths in taking up a position as defender of the profession, arguing that the profession had a higher purpose (*Care: Clients, Society*):

“I know I could slit my wrists and people would cheer. We’re very important. We help companies to grow by helping them to raise capital. Companies that grow create wealth. This, in turn, allows people to have jobs that create more growth and more wealth. It’s a virtuous cycle...We have a social purpose.” He is, he says, just a banker “doing God’s work.”

Stakeholder Rhetoric

We identified three main thematic categories for quotes by various stakeholders based on whether the statements were “Supportive,” “Critical” or “Neutral” towards bank CEOs, their management or other constituents of the banking profession. We identified five sub-categories for the Supportive category, based on differing logics used for the support. Positive Characteristics referred to quotes that praised characteristics of the bank CEO or management, such as experience, skills, talents, etc. Another sub-category comprised statements that praised some aspect of the bank in question, such as its history or its current or future performance, and then reflected this onto the bank CEO or management, suggesting their role in these positive aspects of the bank; we termed this sub-category, Bank Performance. A third group of quotes provided support by highlighting the difficult circumstances and conditions in which the bankers found themselves, thereby absolving them of blame; we termed this sub-category, Circumstances. An interesting fourth sub-category of support emerged from quotes that suggested the CEO or management had provided a valuable service towards something larger than their own bank or industry, and we termed these as Helped System. Finally, in the fifth sub-category, we placed quotes that clearly showed support but did not provide any specific reasons and were thereby Non-Specific Support.

The Critical category similarly provided more sub-categories on closer inspection. Several statements critiqued characteristics of the bank CEOs or management and referred to issues such as poor management style, lack of skills, lack of experience, etc.; we classified these as Negative Characteristics. A second group of statements highlighted problems with practices, including issues such as lack of transparency, problems with transactions, etc.; we termed these Practices. A third sub-category emerged from quotes that brought up the issue of responsibility, obligation and duty, typically suggesting how the CEO or management had failed in this regard; we grouped these quotes under Responsibility. Finally, we

classified all quotes that were critical but did not provide specific reasons under the sub-category Non-Specific Critical.

We classified the various stakeholders into categories and sub-categories to allow us to see finer patterns in stakeholder rhetoric. Within internal stakeholders, we included bank employees (both current and former employees), members of the boards of directors, shareholders and competitor banks. External stakeholders comprised non-bank finance industry actors, academics, policy-makers (including government representatives and officials), regulatory officials, and other non-bank actors such as lawyers, media and investors.

Our stakeholder rhetoric results are presented in Table 3. Aggregate findings for all stakeholders are presented in bold font, while aggregates for internal and external stakeholders are presented in bold and italic font. Stakeholders mostly took clear sides, leaving little ground for neutrality (12 quotes), and with criticism far outweighing support (89 and 50 quotes, respectively). Positive or negative characteristics of bank CEOs and their team were brought up in equal measure for support or critique (23 and 22 quotes, respectively). However, the largest set of criticism shied away from direct focus on the people involved and instead pointed out problems with practices (45 quotes). The third largest set of criticism was expressed in general terms, without singling out a particular person or issue (Non-Specific: 18 quotes). Highlighting lapses in responsibility, with direct references to how the bankers had failed in their duty or obligation, was the least noted criticism (13 quotes). Interestingly, even during the crisis time, and reflecting the pattern observed in CEO rhetoric, references to bank performance in order to support bankers remained a frequently employed approach (16 quotes). In addition, some stakeholders extended support but were not able to, or chose not to, provide specifics (Non-Specific: 9 quotes); very few suggested that CEOs and their team did well considering the circumstances they faced (3 quotes); and a few actually suggested that the bankers had helped the wider “system” during the crisis (5 quotes).

While support from external stakeholders was, surprisingly, somewhat higher than that from internal ones (29 and 21 quotes, respectively), the external stakeholders clearly led in criticism, with almost twice the number of quotes than internal stakeholders (58 and 31, respectively).

Amongst the internal stakeholders, ex-employees were the largest critical group (20 quotes), mostly focusing on problems with practices (12 quotes) and bank CEOs (8 quotes). For example, Brad Hintz pointed towards how certain practices led to Lehman’s problems (*Critical: Practices*),

“It was a series of small steps – rising leverage, retention of risky positions, delay of raising capital and reliance on ‘hot money’ for financing – that one by one took Lehman to the end of the plank.”

and Lawrence McDonald highlighted the CEO’s shortcomings (*Critical: Negative Characteristic*):

“Fuld has a bunker mentality. He blamed the markets, blamed the short-sellers. The truth is, qualified people warned him several times and he wouldn’t listen,” there was still “a lot of anger in the community out there” toward Fuld.

In contrast, current employees were supportive as well as critical (6 and 5 quotes, respectively), e.g. Larry Di Rita portrayed her CEO in a positive manner (*Supportive: Positive Characteristic*):

“[Kenneth Lewis] has discussed these matters on several occasions now. The venues and the questions vary, but the information he has provided has been consistent, truthful and fully responsive.”

The strongest support for bank CEOs from internal constituents came from their Boards of Directors (7 quotes), who had hardly anything critical to say, as illustrated by Richard Parsons’ praise of Citigroup’s CEO (*Supportive: Positive Characteristic*):

“Vikram continues to enjoy the support of the board. When you sit with him and go through the strategy . . . you've got to be impressed with the thoughtfulness and the correctness.”

Table III. Stakeholder Rhetoric

Stakeholder Category	Rhetoric Type											
	Supportive						Critical					Neutral
	Total	Positive Char	Bank Performance	Circumstances	Helped System	Non-Specific	Total	Negative Char	Practices	Responsibility	Non-specific	Total
All Stakeholders	50	23	16	3	5	9	89	22	45	13	18	12
Internal Stakeholders	21	11	10	1	1	1	31	13	16	3	3	7
Current Employees	6	4	2	1	1	0	5	2	0	0	1	4
Ex-Employees	5	2	3	0	0	0	20	8	12	1	1	1
Board of Directors	7	4	3	0	0	1	1	0	0	1	0	1
Shareholders	3	1	2	0	0	0	5	3	4	1	1	1
Banking Industry Actors	3	3	0	0	0	0	2	0	1	0	1	3
External Stakeholders	29	12	6	2	4	10	58	9	29	10	15	5
Non-Bank Finance Industry Actors	7	3	2	1	1	1	6	1	2	0	3	3
Other Non-Bank Actors	7	3	2	1	1	1	6	1	2	0	3	1
Academic	3	1	1	0	1	0	4	1	0	1	2	0
Policy Maker	3	1	0	1	0	1	32	3	18	7	7	0
Regulatory Body	1	0	0	0	0	1	3	2	1	0	0	0

Note: Total counts across sub-categories exceed the counts in some categories due to non-forced coding.

Surprisingly, shareholders did not contribute much rhetoric (9 quotes), but they did have a few critical comments, e.g. John Moore Sr. critiqued Bank of America' practices from a shareholder's perspective (*Critical: Practices*):

"As a shareholder, without disclosure and transparency, it is extremely difficult to make a reasonable investment decision."

Amongst external stakeholders, the largest set of criticism came from policy-makers (32 quotes) but mostly avoided referring directly to the bank CEOs' shortcomings (Negative Characteristics: only 3 quotes). Instead, the bulk of criticism took the form of highlighting problems with practices in a non-personalized manner (18 quotes). For example, even severe-sounding criticism from FCIC Vice Chairman, Bill Thomas (member, House of Representatives) for Bear Sterns pointed to problems in practices (*Critical: Practices*):

"You had no fall back, to your fault, I think, no undergirding structure. To me it seems like it was based on trust of others more than a model where you relied on what you had."

Similarly, Senator Carl Levin pointed to problems at Washington Mutual without emphasis on the individuals involved (*Critical: Practices*):

"Washington Mutual engaged in lending practices that created a mortgage time bomb. Because volume and speed were king, loan quality fell by the wayside."

Criticism from policy-makers also appeared muted at times and avoided pointing to specific problems, as in Senator John McCain's comment (*Critical: Non-Specific*):

"I don't know if Goldman Sachs has done anything illegal, [but] from the reading of these e-mails . . . there's no doubt their behavior was unethical, and the American people will render a judgment as well as the courts."

Surprisingly few comments from policy-makers pointed towards the CEOs' lack of responsibility and duty, but those that did were typically quite emotive and scathing in their attacks, e.g. Rep. Anna Eshoo's attack on Richard Fuld (*Critical: Responsibility*):

"It's no consolation to all the people you've hurt that you have to live with that." She then blurted out, "Why did you sell your house in Florida to your wife for only a few hundred dollars while the company was collapsing?"

The few positive quotes (3) by policy-makers stood out as oddities (*Supportive: Positive Characteristic*), such as this quote from Barak Obama:

"First of all, I know both those guys. They're very savvy businessmen. And I, like most of the American people, don't begrudge people success or wealth. That's part of the free market system."

The comments that competitors, i.e. bank industry actors, had for each other were very few (3) but were in a unique vein, pointing out interesting personality characteristics, as in John Mack's comment (*Supportive: Positive Characteristic*):

"Lloyd [Blankfein] is smart, really engaged, high-energy, funny and quick - very quick"

Amongst stakeholders external to the banking profession, non-bank finance industry actors were about evenly distributed in support and critique (10 and 8 quotes, respectively), possibly reflecting their connections with the profession. Their support for bank CEOs was quite ingenious at times, as in this comment by the head of a large private equity firm (not named) (*Supportive: Circumstances*):

"Nobody has lived through what he [John Mack] has lived through as a major CEO on Wall Street. Nobody has endured all that punishment for as long as he has. You get special points for doing that."

Other non-bank actors were equally distributed across support and criticism (12 and 11 quotes, respectively), though here again most of the criticism focused on practices (7 quotes). For example, Warren Buffett suggested that Kenneth Lewis had saved the financial system, though he also criticized specific actions taken during the crisis (*Supportive: Helped System; Critical: Practices*):

Lewis "inadvertently saved" the global financial system by averting a collapse of Merrill that would have compounded the shock of Lehman Brothers' bankruptcy. But, Buffett queried the wisdom of paying \$50bn for a brokerage flirting with bankruptcy: "Why pay 'x' for Merrill on Sunday when you could have had it for pennies on Monday?"

Academics provided a few quotes (7) that were about equally distributed in criticism and support. Edward Kane's comment provides an interesting example of how bank performance was praised in order to reflect positively on the bank CEOs themselves (*Supportive: Bank Performance*):

"Mr. [Kenneth] Lewis made a few mistakes and is having to fall on his sword for them. But he also helped to make Bank of America become one of the country's and world's great banks, and as time goes on, I would predict that he will look like a better banker than he does at this moment."

While regulatory bodies were not frequently quoted (4 quotes), they were mostly critical, as seen from Ben Bernanke's reference to transparency issues (*Critical: Practices*):

"According to the bankruptcy examiner, Lehman staff did not report these transactions even to the company's board."

The details presented above provide a broad idea of the rhetoric we observed related to the banking profession during the crisis. These findings help us identify the main rhetorical strategies used for institutional work, as discussed in the next section.

Interpretation and Discussion

To interpret the patterns of rhetoric in theoretical terms, we draw on the literature on professions and institutions, recognizing that professions can be considered as institutions (Muzio, Brock and Suddaby, 2010) and at the same time, that professionals play key roles as actors engaged in the maintenance or change of institutions (Hwang and Powell, 2009; Scott, 2008). From this perspective, the banking profession could be considered an institution, and bank CEOs, along with relevant stakeholders, comprise actors engaged in institutional work targeted towards the banking profession (Lawrence et al., 2009). The rhetoric employed by these actors thus represents a rhetorical form of institutional work, whereby the actors engage in the maintenance or change of the banking profession as an institution (Lawrence et al., 2009; Suddaby and Greenwood, 2005; Suddaby, 2010).

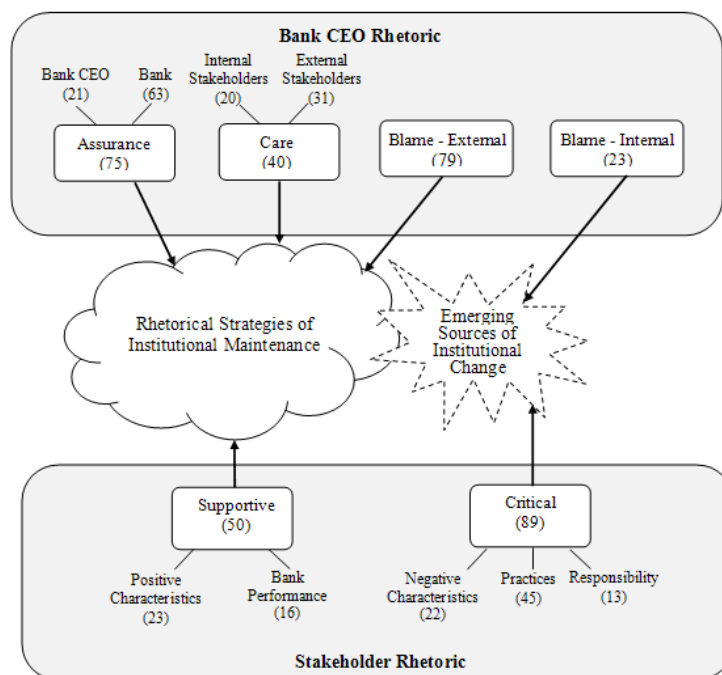

To provide a finer understanding of the institutional work for the banking profession, we interpret the various types of rhetoric we observed in terms of the typology of institutional work defined by Lawrence and Suddaby (2006), i.e. institutional creation, disruption and maintenance. Since our focused time-frame and public data did not allow us to observe finer distinctions between institutional creation and disruption, we combined these categories together as institutional change. Our findings reveal four main rhetorical strategies of institutional maintenance and four main strategies of institutional change (see Figure 1). For simplicity, we refer to the strategies that occurred most frequently as primary strategies and to those that occurred less frequently as secondary strategies.

We observed two primary rhetorical strategies of institutional maintenance, *external blame* and *assurances based on profession's firms (i.e. banks)*. The first strategy involved placing blame on external constituents. The placement of blame on constituents outside the banking profession served to alleviate concerns that anything was wrong within the profession and instead directed critical scrutiny elsewhere. This shift in critical attention could help ensure that existing norms related to the banking profession were not challenged, and could thereby serve as a strategy for institutional maintenance. The representatives of the profession, bank CEOs, were the actors who employed this strategy. We also note the similarity of this finding with research by other scholars on rhetoric used by CEOs in the context of the financial crisis (Hargie et al., 2010). Though we did not explicitly attempt to code for classical rhetorical strategies in a top-down manner, we note that this strategy is similar to the classical rhetorical strategy of *pathos* (emotive appeals) (Suddaby and Greenwood, 2005).

The second primary rhetorical strategy employed for institutional maintenance involved highlighting the positives of the bank and reflecting these onto the bank CEOs and management. In other words, a logical appeal was made, suggesting that if the bank had any

positives, these were due to the representatives of the profession. Through showing these actors in a positive light, such rhetoric could alleviate concerns about the banking profession and avoid challenges to its rules and norms. This strategy could thus help in institutional maintenance of the profession. Both bank CEOs and various internal and external stakeholders engaged in this strategy. We note some similarities between this strategy and the classical rhetorical strategy of *logos* (appeals to logic) (Suddaby and Greenwood, 2005).

Figure 1. Rhetorical Strategies of Institutional Maintenance and Change for the Banking Profession During the Financial Crisis

In addition, we observed two secondary strategies for institutional maintenance, *assurances based on representatives of the profession* and *care for stakeholders*. The first strategy involved providing assurances about bank CEOs and their team by highlighting their positive characteristics, such as skills, experience and personality. Through portraying these actors as experts who were worthy of public confidence, such rhetoric could help to avoid challenges to the profession and thereby serve as a strategy for institutional maintenance of the profession. For example, highlighting that the bankers were not really at fault would imply that the rules and norms that formed the basis of the profession were adequate and changes to these rules in the form of regulative restrictions were not necessary. We note that this was the most direct strategy employed as it sought to directly build confidence in the professionals. This strategy was employed by the bank CEOs and various internal and external stakeholders, and is very similar to the classical rhetorical strategy of *ethos* (appeals on the basis of character) (Suddaby and Greenwood, 2005).

The final rhetorical strategy for institutional maintenance provided an interesting mix of logic and emotions: appeals were made based on arguments that the banks as entities were worth caring about and that the banking profession cared about a wide set of constituents and had a purpose in society. Through suggestions that bankers were fulfilling important roles in society, questions about the role of bankers could be alleviated and challenges to their existing norms and rules could be avoided. Such rhetoric was likely an attempt to preempt institutional change that seemed imminent, given the government bailouts of banks and subsequent recognition of the need to reduce moral hazard (as bankers were seen as pocketing profits in good times and relying on taxpayers in bad times). Though these appeals had an overall reliance on logic i.e. *logos*, at times there were also shades of *pathos*, particularly when references were made to the profession's role in contributing towards more abstract external stakeholders, such as society and country. This strategy was employed by bank CEOs.

Taken together, the four rhetorical strategies described above contributed towards institutional maintenance in a variety of ways. Interestingly, the primary strategies could be seen as "indirect," in that they did not involve directly providing support for the profession but rather focused on external parties, in the first case to direct blame towards others, and in the second case to direct appreciation towards the bankers. These indirect approaches could also suggest the difficulties in institutional work towards maintenance of a profession going through a crisis (Desai, 2011). Direct assurances about the bankers and their roles in society were likely harder to express in the midst of a crisis, and also carried the possibility of being ineffective due to counter-rhetoric that was concurrently focused on the negatives of bankers. Faced with limited options, actors likely resorted to indirect approaches for institutional maintenance.

In contrast to the large-scale use of rhetorical strategies for institutional maintenance, the strategies for institutional change were employed less frequently. The primary rhetorical strategy directed towards institutional change involved questioning the practices prevalent in the banking profession by raising issues such as lack of transparency, lack of due diligence, prevalence of high leverage, etc. While this strategy might not have helped to create new norms or rules in the short-term, through challenging existing practices, it could highlight the need for change in the future, thereby serving as an emerging source of institutional change in the profession. The appeals here relied mostly on logical issues and were similar to the classical rhetorical strategy of *logos*. This strategy was mostly employed by external stakeholders.

We note that this primary strategy for institutional change did not take direct aim at the professionals but rather at the practices in the profession. We believe that this has mixed implications for institutional change in the profession. On one hand, targeting practices could be construed as directing change efforts towards broader issues related to the profession

instead of focusing simply on a few professionals. However, given that professions involve not just business practices but also ethical and moral precepts that are rooted in the professionals (Brint, 1994; Brock, Powell and Hinings, 1999), the shift of attention to practices, and thus away from the behavior of professionals during the crisis, also helps to avoid concerns on moral and ethical issues within the profession. This has wider implications for the literature on professions and institutions. Institutional work directed at changes in professions is likely to take various forms, and theoretical refinements of such work might be necessary. We believe that institutional work directed towards change in practices, such as the one we observe here on a large scale, could be considered distinct from work aimed at deeper changes in cultural-cognitive aspects, including morals, ethics and beliefs.

Amongst the three secondary strategies for institutional change, the first one involved the apportioning of blame by the profession's representatives towards internal constituents, including themselves, the bank and the banking industry. This rhetorical strategy was unique in that it was the only evidence of acceptance by the profession's representatives that all was not well within the profession, and change was possibly needed. However, taken within the context of the overall rhetoric, the instances where bank CEOs personally accepted blame were very few, which raises serious doubts about the possibility of internally led change in the profession. This strategy had some shades of both *logos* and *pathos*, but the few acceptances of blame were couched in muted language rather than presented as outright apologies. We did not observe a single instance where a bank CEO categorically accepted blame and apologized. We believe this was surprising, as apologies could also serve as a valid and effective reparation strategy (Hargie et al., 2010). This lack of introspection could reflect deeper cultural elements within the banking profession (Ho, 2009), such as overconfidence about the appropriateness of existing norms and rules in the profession and a general lack of reflexivity. We believe this finding has broader implications for the emerging literature on professions and institutional change. It is likely that institutional work by professionals directed towards change in their own profession is difficult and rare, yet crucial in order for actual change to take place, and thus deserves further theoretical and empirical attention.

The remaining two secondary strategies that could lead towards institutional change in the profession involve highlighting the faults and shortcomings of the bankers and also pointing towards the lack of responsibility displayed by them during the crisis. The appeals here comprised a form of *ethos* for the former strategy, i.e. criticism on the basis of negative characteristics, and *pathos* for the latter strategy that included some scathing emotional remarks about the personal abdication of responsibility by the CEOs. Criticism directed at the bankers could provide several avenues for change in the profession. These could include regulations to curb the risky behaviors of bankers through restructuring compensation packages, decreasing leverage across the banking industry through increased capital requirements, etc. While these two strategies provided a more direct means of criticizing the

professionals, their limited occurrence raises important questions for the literature on professions and institutional work. We believe institutional work strategies aimed directly at the characteristics of professionals – and particularly those castigating them on lack of responsibility, duty and obligation – have the potential to target deeper cultural-cognitive aspects in the profession related to morals and ethics. However, *how* the responsibility issues are raised provides finer distinctions. We observed mostly emotional personal attacks (*pathos*) rather than arguments logically connecting the bankers' lack of responsibility to their failings as professionals. Dramatic personal attacks, such as those made by some policy-makers towards bank CEOs, could be a means to serve other constituencies (such as the general public) by showing that some action is being taken. However, these undercut the possibility of longer-term moral and ethical reform in the profession, due to the lack of making logical connections between the negatives of these bankers to their failure as trusted *professionals* serving a key role in society.

The four strategies of institutional change thus constitute different types of institutional work. We believe that in the context of professions, institutional work related to change in practices could be distinct from work related to moral and ethical aspects. The limited occurrence of the latter and its focus on emotive aspects suggests that changes in moral and ethical aspects, rooted in cultural-cognitive elements, are likely to be more difficult. In this aspect, professions provide an interesting context to explore the path dependence and incremental nature of institutional change that is related to cultural-cognitive elements (Scott, 2001; North, 1990).

In summary, we observe the dominance of rhetorical strategies aimed at institutional maintenance of the banking profession. Representatives of the banking profession and supportive stakeholders alike engaged in this maintenance, primarily through blaming parties external to the profession and reflecting the positives of the banks onto the bankers. Secondary maintenance was provided through the bankers showing care about various constituents in order to justify the role of bankers in society and also through some stakeholders directly praising bankers. In contrast, rhetorical strategies directed towards institutional change were less frequently observed, were primarily concerned with changes in practices, and were mostly originated by actors external to the profession. Secondary sources of institutional change included some acceptance of internal blame for the profession by bankers, as well as direct criticism of bankers' characteristics and their lack of responsibility by stakeholders. However, institutional change in moral and ethical aspects of the profession, particularly internally led change, appeared difficult.

Our study has broader implications for the emerging literature on institutional work and professions. Our findings demonstrate that rhetorical strategies comprise an important form of institutional work related to professions, and that professionals themselves are also an important source of this institutional work (Lawrence and Suddaby, 2006; Scott, 2008).

Given that professions today are a major source of regulation and control (Cooper & Robson, 2006), a varied set of stakeholders are likely to concern themselves with most professions. Studies on professions thus need to take into account both the work performed by professionals as institutional agents and also the work of a variety of actors who see themselves as relevant stakeholders to the profession. We suggest that in such contexts, developing a list of self-defined stakeholders is more accurate, such as the one we developed from the rhetoric data, to ensure that any actor that considers themselves a stakeholder is included.

Further, the existence of a variety of stakeholders implies that professions cater to diverse audiences and present themselves as serving multiple constituencies. This raises the issue of the identities of some professions being in a state of flux and drawing legitimacy from logics that might differ based on the audience or change over time (Brock, et al., 1999; Brint, 1994; Lounsbury, 2007). For example, it appears that the banking profession was caught in a form of identity crisis during the financial crisis, and its professionals accordingly sought support by relying on multiple logics, which ranged from highlighting bank performance to rambling attempts at explaining how bankers served a social purpose. Some professions are thus likely to face forms of “institutional war” at times, particularly during crises, when members of their institutional field would “compete over the definition of issues and the form of institutions that will guide organizational behavior” (Hoffman, 1999, p. 352).

Institutional wars related to professions are likely to provide unique theoretical and empirical opportunities for the study of institutional work. As observed in our findings, the processes of institutional maintenance and institutional change do not occur in isolation from each other but can coexist and fight for dominance (Hoffman, 1999; Maguire, Hardy, and Lawrence, 2004; Maguire and Hardy, 2009). In particular, rhetoric can be used to foster institutional change (Greenwood and Suddaby, 2006; Hoffman, 1999; Phillips et al., 2004) and can also be used to maintain existing institutional arrangements (Desai, 2011; Maguire and Hardy, 2009) related to professions. Our findings suggest that in professions, institutional change is likely to be more difficult than institutional maintenance due to several factors. First, many professionals themselves are likely to be adept at securing their own interests, since their roles often involve developing and maintaining institutional elements (Cooper and Robson, 2006). Professionals can thus turn these skills towards institutional maintenance of their own profession, particularly when facing threats due to crises. We observed this aspect in the large amount of rhetoric by bank CEOs directed towards institutional maintenance of the banking profession. Second, professions are likely to be more closely bonded than other collective entities, such as industries or organizational fields, since professionals are more interconnected to each other through common norms and belief systems (Suddaby and Greenwood, 2006; Ruef and Scott, 1998). They are thus likely to act collectively to maintain existing rules and norms. Our findings revealed this aspect as we observed bank CEOs stand up for the profession as whole, for example, in instances where the profession’s social

purpose was highlighted, and also in the lack of criticism of any one bank CEO by another. Third, given their collective immersion in specific norms and rules, and their close personal ties, professionals could develop deep cultural-cognitive biases that could limit their ability to be reflexive about their own roles. We observed this in our findings on the very limited categorical acceptance of blame by the bank CEOs for events related to the financial crisis, guided possibly by deep beliefs that whatever they did was acceptable. Fourth, given their close-knit nature, professions are likely to develop practices across their constituents that are very similar, such as the use of high leverage across most major banks. Changing these highly homogenized practices, particularly through reliance on internally led efforts, is likely to be very difficult. This aspect was observed in the rhetoric on practices wherein the similarity of practices across the banking profession was evident. Change then, is more likely to come from external stakeholders but is clearly difficult to achieve, given the ability, incentives and cultural-cognitive biases inherent in professionals towards the institutional maintenance of their own profession.

The institutional work we observed is ongoing and likely to continue in the aftermath of the global financial crisis. For example, the new international standards related to Basel-III were under development and were the subject of sharp debates amongst bankers and stakeholders. Several practices such as proprietary trading desks and over-the-counter derivatives were undergoing change as new regulations in the Dodd-Frank Act were set to roll out in 2011. Consistent with the rhetoric we observed in which bankers attempted to show care for various stakeholders, Goldman Sachs underwent a self-conducted review of practices aimed at providing assurance to clients and other stakeholders. On another front, and signaling the need for drawing support from a variety of stakeholders, the bank also conducted a historically unique advertising campaign aimed at the general public to highlight its positive role in society. Compensation, particularly bonuses, and conflicts of interest continued to be debated in the business press. Perhaps the most interesting evidence for the continued crisis in the profession is indicated by media reports that the banking industry's pre-crisis favor amongst graduates (i.e. as a profession to be aspired for) has waned considerably, with some suggesting that this is indeed better for society (Johnson, 2010).

Abstract

The purpose of this study was to use a self-developed questionnaire to conduct a study among banking clients and bank managers to identify the influence of demographic variables on relationship banking. Primary data has been collected from respondents in South Africa, Canada and the United Kingdom (UK). Convenient sampling was used to select the sample which consisted of 637 banking clients and 67 bank managers. The research instruments to be tested were two similarly structured questionnaires in the form of a 7-point Likert-type scale, one distributed to banking clients and the other to bank managers. Quantitative statistical data analysis was conducted by using the computer programme Statistica Version 9. Descriptive statistics were computed and the reliability of the research instrument was assessed by means of Cronbach Alpha reliability coefficients. A confirmatory factor analysis (CFA) considered validity and linear modelling was performed. The empirical results show that, in addition to the personalisation of banking products and/or services and the fees charged by banks, various demographic characteristics of respondents also influence banks' relationship marketing. This study is of significant value to South African retail banks to consider the relationship marketing strategies of successful banks in Canada and the UK. This study also adds value to the field of relationship marketing as a valid and reliable measuring instrument is developed for future relationship marketing research. The research offers practical strategies to banks on how to personalise offerings, develop fair fee structures and relate to different categories of clients differently. These implemented strategies will ultimately improve bank-client relationships.

Keywords: banks, relationship marketing

Introduction and problem statement

Service firms are important contributors to the economy of any country (Bruhn and Georgi, 2006:11). It is expected that service firms will grow extensively in the future. In South Africa service firms are also major participants towards the growth of the economy. According to Appel (2008), the contribution of the services sector to South Africa's Gross Domestic Product (GDP) stands at a high 74%. This figure was a mere 45.6% in 1980, which increased to 65.9% in 2000 (South Africa, 2003). These increased figures show how services industries'

contribution to the country's economy has increased. Due to this influence many new service firms are entering industries or existing service firms diversify into new markets and industries. This results in fierce competition among service firms.

The development and importance of service industries is also evident in global banking industries. Retail banks are key service sector role players, especially in competitive banking industries in developing countries, for example South Africa, as well as in developed countries such as Canada and the UK (South Africa Yearbook, 2008/09:230; Figueira, Nellis and Parker, 2007:38; Metcalfe, 2003). At the end of December 2007, 33 banking institutions were registered with the Office of the Registrar of Banks in South Africa. The country's banking industry is dominated by four major banking groups holding 85.1% of the total assets of the banking industry at the end of 2007. (South Africa Yearbook, 2008/09:230). The four banking groups are Amalgamated Banks of South Africa (ABSA) Group Limited; FirstRand Holdings Limited (FNB); Nedcor Limited (Nedbank) and Standard Bank Investment Corporation Limited (Standard Bank). These banks, being participants of the country's financial services industry, contribute approximately 20% of South Africa's GDP (Profiles Stock Exchange Handbook, February – May 2010). In 2007 the South African banking industry employed 139 149 people (South Africa Yearbook, 2008/09:229-230). Therefore, the efficiency of South Africa's financial system, including its banks, is of importance because of banks' contribution to the country's employment rate and financial stability (Competition in South African Banking, 2004:4). However, the stability of these banking groups is challenged as they compete to increase market share and improve bank-client relationships.

South Africa's competitive banks, and banks in other developing countries, need to focus on improving bank-client relationships (thus relationship marketing) in order to maintain clients. However, the relationship marketing of banks may be influenced by different bank-related variables as well as demographic aspects of clients.

Prior relationship marketing research in banks was more theoretical, with the focus on the benefits of proper client relationships. Previous research fails to offer practical banking strategies to enhance relationship marketing efforts. The primary objective of this study was to identify the variables, specifically the demographic variables, influencing relationship marketing in banks, both from banking clients' and bank managers' viewpoints in South Africa, Canada and the UK. The study was based in South Africa, whereas Canada and the UK were selected as study areas because research has shown that these two countries' banks are on the forefront with regard to relationship marketing (Ptak, 2001). Therefore, the problem statement of this study is two-fold as presented by the following questions: Which variables influence relationship marketing in banks? Which demographic variables influence clients' perceptions on banks' relationship marketing?

Purpose and Objectives

Following the introduction and problem statement above, it can be stated that the primary objective of this study was to use a self-developed questionnaire to conduct an international study among banking clients and bank managers to identify the influence of selected variables, including demographic variables, on banks' relationship marketing.

In order to assess the variables influencing banks' relationship marketing, the following secondary objectives were pursued:

- to investigate literature on South Africa, Canadian and UK banks;
- to investigate literature on variables possibly influencing relationship marketing;
- to perform an empirical investigation among international banking clients and bank managers; and
- to give recommendations to banks on how to improve their bank-client relationships.

Literature Overview

Based on the objectives stated above, a literature overview was conducted concerning banks in South Africa, Canada and the UK as well as variables possibly influencing relationship marketing in banks.

According to Appel (2008), the financial services industry, which includes banks, has been identified as one of the two most significant contributors to growth in South Africa's service sector, the other being construction. As mentioned before, the highly competitive South African banking industry is dominated by ABSA, FNB, Nedbank and Standard Bank. Financial service firms listed on the Johannesburg Securities Exchange (JSE), the stock exchange of South Africa, represented more than 16% of the total market capitalisation in 2009; the four major banking groups alone accounted for 8.91% of the total market capitalisation in 2009 and employing approximately 122 000 people. (Profiles Stock Exchange Handbook, February – May 2010). With the four major banks controlling over 85% of the banking industry, this South African industry operates as an oligopoly, which makes it highly competitive with participants experiencing various challenges.

Challenges faced by South African banks include operating in the global business environment, overcoming devaluations of banks' shares, countering government intervention and implementing banking technology. Banks' partnerships with other firms, competition for the "un-banked" segment of the population, changing client behaviour, and enquires about fees are additional challenges. (Metcalf, 2009; Whitfield, 2009:47; Harris, 2008:13; Okeahalam, 2008:1131; Whitfield, 2008:20; Nyamakanga, 2007).

However, despite these challenges, the four major banking groups in South Africa aim to increase their number of accounts and clients, by 22% by the year 2012 (Metcalf, 2009:8). Clearly relationship marketing is important for South African banks and it would be useful to

consider the relationship marketing efforts of successful international banks to gain knowledge on practical relationship marketing strategies.

The Canadian banking industry consists of 14 local banks, 33 foreign bank subsidiaries and 20 foreign bank branches (Canada's Banks, 2002). Canada's banking system is mature, sophisticated and highly competitive. Canadian banks are often regarded as leaders in the field of relationship marketing. Since 1997, The Royal Bank of Canada (RBC), Canada's largest bank, has implemented many successful relationship marketing strategies (Ptak, 2001:38), while serving over 10 million clients internationally (Khirallah, 2001:2). It would be to South African banks' advantage to consider and adopt relationship marketing strategies practised by Canadian banks.

UK banks provide services globally and the industry is dominated by a small number of large banks. Figueira *et al.*, (2007:38) mention that UK banks are often regarded as highly efficient and competitive banks. As one South African bank, ABSA, is 58.8% owned by a major UK-based bank, Barclays (Mittner, 2009:24), it is necessary to consider, with the purpose of implementing, the effective relationship marketing strategies of UK banks.

Swartz and Iacobucci (2000:96) state that much focus in marketing is on the concept of developing relationships with clients. Law, Lau and Wong (2003:55) indicate that many financial service providers, including banks, have transformed their firms to strengthen their relationships with clients. The importance of relationship marketing in banks is evident, as Howcroft, Hewer and Durkin (2003) state that the nature of the financial industry's complicated, risky and long-term products and services leads to clients having high involvement relationships with their financial service providers. According to Donaldson and O'Toole (2007:150) a firm-client relationship consists of several non-accidental interactions occurring over time. Therefore, relationship marketing is defined by Grönroos (1994:4-20) as the firm strategy which aims to profitably identify and establish, maintain and enhance, and, when necessary, terminate relationships with clients. If well-executed, relationship marketing may lead to many benefits for firms, including banks, and their clients. Quality firm-client relationships consist of bonds, commitment, satisfaction, benevolence and trust between two parties (Rauyruen and Miller, 2007; Bennett and Barkensjo, 2003; Roberts, Varki and Brodie, 2003; Naude and Buttle, 2000). Swartz and Iacobucci (2000:328) also indicate that clients receive specific benefits from firms which focus on relationship marketing. From a firm's viewpoint, the rationale for implementing relationship marketing strategies is that it improves customer service, enhances customer satisfaction and increases customer loyalty and customer retention (Bergeron, Roy and Fallu, 2008; Eid, 2007:1021; Wilmshurst and Mackay, 2002:346). Baron and Harris (2003:161) also mention that relationship marketing can lead to lower marketing costs and positive word-of-mouth recommendations.

However, despite these advantages offered by relationship marketing, Payant (2004:7) determined that approximately 50% of banks are not satisfied with the returns they receive on

their investments in relationship marketing. This indicates some shortcomings in banks' relationship marketing strategies, which may be due to bank-related variables and clients' demographic variables, influencing relationship marketing.

The literature review on relationship marketing led to the identification of specific bank-related aspects as variables which can possibly influence banks' relationship marketing. Seven bank-related aspects were selected as variables possibly influencing relationship marketing, namely communication, knowledgeability, personalisation, empowerment, ethics, fees and technology. However, for the purpose of this paper, only the findings on the most important variables, as suggested by the empirical findings, will be reported on, namely personalisation and fees.

According to Berndt, Herbst and Roux (2004:36), personalisation in banks occurs when banking products and/or services are adapted in unique ways to the preferences of clients. The importance of personalisation in banks is evident as Jackson (2003:71) states that the only aspect differentiating a bank from its competitors is its personalisation of offerings. A bank's fees refer to its charges or costs to clients for the bank services delivered for example, transaction and administration fees.

As this study's purpose is to investigate the possible influence of two selected variables on the relationship marketing of banks in South Africa, Canada and the UK, it is important to conduct an empirical investigation from the perspectives of both banking clients and bank managers, through the use of a self-developed measuring instrument.

From the literature overview above, it is evident that the focus on relationship marketing can be useful for banks and those in South Africa can possibly adopt relationship marketing strategies as used by banks in Canada and the UK. Therefore, the empirical investigation of this study aims to provide insight into clients' and managers' viewpoints on relationship marketing in international banks in order to improve the delivery of banking services to clients and as a whole improve bank-client relationships.

Research Methodology

To attain this study's primary objective the positivistic as well as the phenomenological research paradigms were used in this study, in order to complement each other. The positivistic paradigm was used to test the clients' perceptions by analysing data quantitatively, whereas the phenomenological research paradigm was used to gain more insight into the managers' perceptions.

Both primary and secondary resources were used in the study. Secondary sources, including books, articles, academic journals and websites, were used to collect information on banks in South Africa, Canada and the UK as well as relationship marketing aspects. The primary research was conducted by means of an empirical study. Primary data has been collected from banking clients as well as bank managers of banks in all three specified

countries. The 637 banking clients and 67 bank managers were selected by means of convenience sampling.

The research instruments were two similarly structured questionnaires, one distributed to banking clients and the other to bank managers. These questionnaires were self-developed and self-administered. The empirical investigation was conducted in English. The literature overview assisted in designing the items in section A and statements revolved around the two selected variables possibly influencing the relationship marketing of banks. Section A used a seven-point Likert-type scale ranging from 'strongly disagree' (1) to 'strongly agree' (7). Section B gathered demographical data of the respondents (banking clients and bank managers). The face validity of the measuring instrument was subjectively decided as experts in the fields of services marketing and relationship marketing as well as bank managers assisted with the questionnaires' designs.

The computer programs Microsoft Excel and Statistica (Version 9) were used and statistical data analyses were performed in four phases as the following statistics were calculated: descriptive statistics, also with the use of analysis of variance (ANOVA) and analysis of covariance (ANCOVA), Cronbach alpha coefficients, linear modelling and descriptive statistics specifically on the bank manager' results.

Descriptive statistics aim to provide an overall summary of a large amount of data (Struwig and Stead, 2001:158) and therefore, during the first phase of data analysis, descriptive statistics were calculated to summarise the sample data distribution. Secondly, to evaluate the construct validity and internal reliability and consistency of the measuring instrument items, a confirmatory factor analysis (CFA) was performed and Cronbach alpha coefficients were computed. A Cronbach alpha coefficient should be greater than 0.70 (Hair, Babin, Money and Samouel, 2003:172). A measuring instrument and its items are more reliable if the Cronbach alpha coefficients are higher than 0.7. In the third data analysis phase linear modelling was performed to identify the influence of the selected variables on the relationship marketing of banks. Finally, descriptive statistics were computed for the bank manager' results.

Empirica Results

From the four phased statistical data analysis, the following section elaborates on the empirical findings of the study. First, findings from the descriptive statistics are described. Secondly, the reliability of the measuring instrument is tested through the calculation of Cronbach alpha coefficients, where after the results from the linear modelling are provided. Lastly, the results from the bank manager' analysis are discussed.

Descriptive statistics

With regard to the descriptive statistics, significant findings related to the demographic variables, namely the country of residence, population group and education level of banking client respondents. ANOVA was used to determine the influence of the demographic

variables on the dependent variable, relationship marketing. This was followed with ANCOVA as the variables personalisation and fees were included in the analysis.

It was important to identify whether respondents' country of residence exert an effect on the perceptions clients have regarding the two selected variables possibly influencing the relationship marketing of banks. Figure 1 illustrates these findings by presenting box plots that show how clients' country of residence influences their perceptions regarding banks' fees and personalisation efforts.

Figure 1: Country of residence and its influence on perceptions on fees and personalisation

The mean scores for personalisation is significantly higher if banking clients are from Canada (4.04) than if banking clients are from South Africa (3.31). In addition, the analysis showed that the mean scores for fees are significantly higher if banking clients are from the UK (4.80) than if respondents are South African banking clients (3.83). Generally, this indicates that banking clients are more positive regarding the personalisation strategies of Canadian banks than South Africans are about the personalisation efforts of South African banks. In addition, banking clients in the UK are more satisfied with the fee structures of UK banks than South Africans are about those of South African banks.

In addition, ANOVA and ANCOVA were performed to establish whether the demographic characteristics of respondents exert an influence on the perceptions clients have regarding the relationship marketing of their banks.

The gender and age of banking client respondents exerted no significant influence on the relationship marketing of banks at the 0.05 level of significance. However, the ANOVA and ANCOVA analyses revealed that the demographic characteristics population group, education level and country of residence exerted an influence on the perceptions clients have regarding banks' relationship marketing.

Figure 2 depicts box plots showing that the population group, education level and country of residence of respondents exerted an influence on the perceptions clients have regarding banks' relationship marketing.

Figure 2: Demographic characteristics and the influences on relationship marketing

Education and

Education 1: School level

Education 2: Tertiary qualification

Country of residence and relationship marketing

Country 1: South Africa

Country 2: Canada

Country 3: UK

A *post hoc* Bonferroni test revealed that at the 0.01 level of significance ($p=0.000002$), the mean score for the relationship marketing of a bank is significantly higher if banking clients are African (5.06) than if banking clients are from the European population group (4.51). The *post hoc* Bonferroni test also showed at the 0.01 level of significance ($p=0.006632$) that the mean score for the relationship marketing of a bank is significantly lower if banking clients are educated with a tertiary qualification (4.52) than if banking clients are not educated with a qualification beyond secondary school level (4.88). In terms of country comparisons, the Fisher LSD estimate showed a significant difference between the relationship marketing responses of South African and Canadian banking clients ($p=0.035949$). This finding suggests that Canadian banking clients are more positive regarding their banks' relationship marketing efforts than South African banking clients are regarding their banks' relationship marketing efforts.

Reliability of the measuring instrument

The results illustrating the internal reliability of the measuring instrument, as measured by the Cronbach alpha coefficients, are shown in Table 1.

Table 1: Cronbach alpha coefficients

<i>Factors</i>	<i>Cronbach alpha</i>
<i>Personalisation</i>	<i>0.894</i>
<i>Fees</i>	<i>0.909</i>
<i>Relationship marketing</i>	<i>0.948</i>

As evident from the table above, all the factors obtained Cronbach alpha coefficient scores above the recommended 0.70. As the Cronbach alpha coefficients indicate the reliability of the questionnaire items and the complete measuring instrument, it can be said that the measuring instrument is reliable and can be used for future studies. Relationship marketing had a high Cronbach alpha of 0.948, thus the items measuring relationship marketing can be regarded as reliable. The most reliable factor thought to influence relationship marketing was fees with a Cronbach alpha coefficient of 0.909.

Linear modelling of bank-related variables

Table 2 illustrates the results from the linear modelling performed to identify whether the two selected variables influence relationship marketing in banks.

Table 2: Linear modelling results

<i>Factors</i>	<i>Estimate</i>	<i>p-value</i>
<i>Personalisation</i>	0.279	***
<i>Fees</i>	0.625	***

****p-value*<0.001

The p-values for both variables personalisation and fees are significant at the 1% level. This provides support to the claim that both variables have an influence on banks' relationship marketing. Given that both parameter estimates are positive, this indicates that both personalisation and fees have positive relationships with the dependent variable, relationship marketing. This can be interpreted in the following way: if banks' personalisation efforts increase and improve and if their fee increases are fully justified, their client relationships would improve. The size of the estimate indicates which variable has the greatest influence. The empirical results of the study indicate that banking fees has the largest influence on relationship marketing.

Considering the above empirical results, one can conclude that both personalisation and fees have an impact on improving banks' client relationships. In addition, banks should be knowledgeable that clients' country of residence, population group and education level may influence their perceptions on banks' relationship marketing efforts.

Bank managers' survey results

As mentioned, the survey results of the bank managers' responses were analysed by considering the means of the variables as well as general comments provided by managers.

Generally, bank managers were very positive towards the current banking services that their bank employers provide to clients. This can be seen by looking at the means of the selected variables in Table 3.

Table 3: Means from bank managers

<i>Factors</i>	<i>Means</i>
<i>Personalisation</i>	5.161
<i>Fees</i>	5.144
<i>Relationship marketing</i>	5.222

The means in the table above indicate that the managers strongly agreed (a mean value of approximately 5) that their banks' personalisation efforts and fees are acceptable to clients. In addition, with a mean of 5.22 for relationship marketing, bank managers stated that their banks' relationship marketing efforts are currently satisfactory. However, selected issues that bank managers mentioned as concerns for their bank's service delivery are: bank employees should address clients by their first names (relating to personalisation), banks should attract

new clients with special fees (relating to fees) and banks should decrease switching costs to attract more clients (referring to positive relationship marketing strategies).

Contribution of the Study

This study has been of significant value to South African banks to consider the relationship marketing strategies of Canadian and UK banks, as these banks are well known for their successful relationship marketing efforts. In particular, this study indicates that banks should adapt relationship marketing strategies for different groups or categories of clients, based on demographic variables.

The international nature of the study makes it unique and the study differs from previous research as it identifies selected bank-related and demographic variables influencing relationship marketing in banks while considering the viewpoints of both banking clients and bank managers.

Thus, it is foreseen that this study will contribute to the services marketing discipline through the provision of theoretical and empirical knowledge on relationship marketing in international banking industries, but specifically in South Africa and other developing countries. If contextualised, this study's valid and reliable measuring instrument can also be used in future relationship marketing studies in other industries.

Conclusions and Managerial Implications
